Old Company Name in Catalogs and Other Documents

On April 1st, 2010, NEC Electronics Corporation merged with Renesas Technology Corporation, and Renesas Electronics Corporation took over all the business of both companies. Therefore, although the old company name remains in this document, it is a valid Renesas Electronics document. We appreciate your understanding.

Renesas Electronics website: http://www.renesas.com

April 1st, 2010 Renesas Electronics Corporation

Issued by: Renesas Electronics Corporation (http://www.renesas.com)

Send any inquiries to http://www.renesas.com/inquiry.

Notice

- 1. All information included in this document is current as of the date this document is issued. Such information, however, is subject to change without any prior notice. Before purchasing or using any Renesas Electronics products listed herein, please confirm the latest product information with a Renesas Electronics sales office. Also, please pay regular and careful attention to additional and different information to be disclosed by Renesas Electronics such as that disclosed through our website.
- Renesas Electronics does not assume any liability for infringement of patents, copyrights, or other intellectual property rights
 of third parties by or arising from the use of Renesas Electronics products or technical information described in this document.
 No license, express, implied or otherwise, is granted hereby under any patents, copyrights or other intellectual property rights
 of Renesas Electronics or others.
- 3. You should not alter, modify, copy, or otherwise misappropriate any Renesas Electronics product, whether in whole or in part.
- 4. Descriptions of circuits, software and other related information in this document are provided only to illustrate the operation of semiconductor products and application examples. You are fully responsible for the incorporation of these circuits, software, and information in the design of your equipment. Renesas Electronics assumes no responsibility for any losses incurred by you or third parties arising from the use of these circuits, software, or information.
- 5. When exporting the products or technology described in this document, you should comply with the applicable export control laws and regulations and follow the procedures required by such laws and regulations. You should not use Renesas Electronics products or the technology described in this document for any purpose relating to military applications or use by the military, including but not limited to the development of weapons of mass destruction. Renesas Electronics products and technology may not be used for or incorporated into any products or systems whose manufacture, use, or sale is prohibited under any applicable domestic or foreign laws or regulations.
- 6. Renesas Electronics has used reasonable care in preparing the information included in this document, but Renesas Electronics does not warrant that such information is error free. Renesas Electronics assumes no liability whatsoever for any damages incurred by you resulting from errors in or omissions from the information included herein.
- 7. Renesas Electronics products are classified according to the following three quality grades: "Standard", "High Quality", and "Specific". The recommended applications for each Renesas Electronics product depends on the product's quality grade, as indicated below. You must check the quality grade of each Renesas Electronics product before using it in a particular application. You may not use any Renesas Electronics product for any application categorized as "Specific" without the prior written consent of Renesas Electronics. Further, you may not use any Renesas Electronics product for any application for which it is not intended without the prior written consent of Renesas Electronics. Renesas Electronics shall not be in any way liable for any damages or losses incurred by you or third parties arising from the use of any Renesas Electronics product for an application categorized as "Specific" or for which the product is not intended where you have failed to obtain the prior written consent of Renesas Electronics. The quality grade of each Renesas Electronics product is "Standard" unless otherwise expressly specified in a Renesas Electronics data sheets or data books, etc.
 - "Standard": Computers; office equipment; communications equipment; test and measurement equipment; audio and visual equipment; home electronic appliances; machine tools; personal electronic equipment; and industrial robots.
 - "High Quality": Transportation equipment (automobiles, trains, ships, etc.); traffic control systems; anti-disaster systems; anti-crime systems; safety equipment; and medical equipment not specifically designed for life support.
 - "Specific": Aircraft; aerospace equipment; submersible repeaters; nuclear reactor control systems; medical equipment or systems for life support (e.g. artificial life support devices or systems), surgical implantations, or healthcare intervention (e.g. excision, etc.), and any other applications or purposes that pose a direct threat to human life.
- 8. You should use the Renesas Electronics products described in this document within the range specified by Renesas Electronics, especially with respect to the maximum rating, operating supply voltage range, movement power voltage range, heat radiation characteristics, installation and other product characteristics. Renesas Electronics shall have no liability for malfunctions or damages arising out of the use of Renesas Electronics products beyond such specified ranges.
- 9. Although Renesas Electronics endeavors to improve the quality and reliability of its products, semiconductor products have specific characteristics such as the occurrence of failure at a certain rate and malfunctions under certain use conditions. Further, Renesas Electronics products are not subject to radiation resistance design. Please be sure to implement safety measures to guard them against the possibility of physical injury, and injury or damage caused by fire in the event of the failure of a Renesas Electronics product, such as safety design for hardware and software including but not limited to redundancy, fire control and malfunction prevention, appropriate treatment for aging degradation or any other appropriate measures. Because the evaluation of microcomputer software alone is very difficult, please evaluate the safety of the final products or system manufactured by you.
- 10. Please contact a Renesas Electronics sales office for details as to environmental matters such as the environmental compatibility of each Renesas Electronics product. Please use Renesas Electronics products in compliance with all applicable laws and regulations that regulate the inclusion or use of controlled substances, including without limitation, the EU RoHS Directive. Renesas Electronics assumes no liability for damages or losses occurring as a result of your noncompliance with applicable laws and regulations.
- 11. This document may not be reproduced or duplicated, in any form, in whole or in part, without prior written consent of Renesas Electronics
- 12. Please contact a Renesas Electronics sales office if you have any questions regarding the information contained in this document or Renesas Electronics products, or if you have any other inquiries.
- (Note 1) "Renesas Electronics" as used in this document means Renesas Electronics Corporation and also includes its majority-owned subsidiaries.
- (Note 2) "Renesas Electronics product(s)" means any product developed or manufactured by or for Renesas Electronics.

R8C/22 Group, R8C/23 Group

Hardware Manual
RENESAS MCU

All information contained in these materials, including products and product specifications, represents information on the product at the time of publication and is subject to change by Renesas Electronics Corp. without notice. Please review the latest information published by Renesas Electronics Corp. through various means, including the Renesas Electronics Corp. website (http://www.renesas.com).

Notes regarding these materials

- This document is provided for reference purposes only so that Renesas customers may select the appropriate Renesas products for their use. Renesas neither makes warranties or representations with respect to the accuracy or completeness of the information contained in this document nor grants any license to any intellectual property rights or any other rights of Renesas or any third party with respect to the information in this document.
- Renesas shall have no liability for damages or infringement of any intellectual property or other rights arising out of the use of any information in this document, including, but not limited to, product data, diagrams, charts, programs, algorithms, and application circuit examples.
 You should not use the products or the technology described in this document for the purpose of military
- 3. You should not use the products or the technology described in this document for the purpose of military applications such as the development of weapons of mass destruction or for the purpose of any other military use. When exporting the products or technology described herein, you should follow the applicable export control laws and regulations, and procedures required by such laws and regulations.
- 4. All information included in this document such as product data, diagrams, charts, programs, algorithms, and application circuit examples, is current as of the date this document is issued. Such information, however, is subject to change without any prior notice. Before purchasing or using any Renesas products listed in this document, please confirm the latest product information with a Renesas sales office. Also, please pay regular and careful attention to additional and different information to be disclosed by Renesas such as that disclosed through our website. (http://www.renesas.com)
- 5. Renesas has used reasonable care in compiling the information included in this document, but Renesas assumes no liability whatsoever for any damages incurred as a result of errors or omissions in the information included in this document.
- 6. When using or otherwise relying on the information in this document, you should evaluate the information in light of the total system before deciding about the applicability of such information to the intended application. Renesas makes no representations, warranties or guaranties regarding the suitability of its products for any particular application and specifically disclaims any liability arising out of the application and use of the information in this document or Renesas products.
- 7. With the exception of products specified by Renesas as suitable for automobile applications, Renesas products are not designed, manufactured or tested for applications or otherwise in systems the failure or malfunction of which may cause a direct threat to human life or create a risk of human injury or which require especially high quality and reliability such as safety systems, or equipment or systems for transportation and traffic, healthcare, combustion control, aerospace and aeronautics, nuclear power, or undersea communication transmission. If you are considering the use of our products for such purposes, please contact a Renesas sales office beforehand. Renesas shall have no liability for damages arising out of the uses set forth above.
- 8. Notwithstanding the preceding paragraph, you should not use Renesas products for the purposes listed below:
 - (1) artificial life support devices or systems
 - (2) surgical implantations
 - (3) healthcare intervention (e.g., excision, administration of medication, etc.)
 - (4) any other purposes that pose a direct threat to human life
 - Renesas shall have no liability for damages arising out of the uses set forth in the above and purchasers who elect to use Renesas products in any of the foregoing applications shall indemnify and hold harmless Renesas Technology Corp., its affiliated companies and their officers, directors, and employees against any and all damages arising out of such applications.
- 9. You should use the products described herein within the range specified by Renesas, especially with respect to the maximum rating, operating supply voltage range, movement power voltage range, heat radiation characteristics, installation and other product characteristics. Renesas shall have no liability for malfunctions or damages arising out of the use of Renesas products beyond such specified ranges.
- 10. Although Renesas endeavors to improve the quality and reliability of its products, IC products have specific characteristics such as the occurrence of failure at a certain rate and malfunctions under certain use conditions. Please be sure to implement safety measures to guard against the possibility of physical injury, and injury or damage caused by fire in the event of the failure of a Renesas product, such as safety design for hardware and software including but not limited to redundancy, fire control and malfunction prevention, appropriate treatment for aging degradation or any other applicable measures. Among others, since the evaluation of microcomputer software alone is very difficult, please evaluate the safety of the final products or system manufactured by you.
- 11. In case Renesas products listed in this document are detached from the products to which the Renesas products are attached or affixed, the risk of accident such as swallowing by infants and small children is very high. You should implement safety measures so that Renesas products may not be easily detached from your products. Renesas shall have no liability for damages arising out of such detachment.
- 12. This document may not be reproduced or duplicated, in any form, in whole or in part, without prior written approval from Renesas.
- 13. Please contact a Renesas sales office if you have any questions regarding the information contained in this document, Renesas semiconductor products, or if you have any other inquiries.

General Precautions in the Handling of MPU/MCU Products

The following usage notes are applicable to all MPU/MCU products from Renesas. For detailed usage notes on the products covered by this manual, refer to the relevant sections of the manual. If the descriptions under General Precautions in the Handling of MPU/MCU Products and in the body of the manual differ from each other, the description in the body of the manual takes precedence.

1. Handling of Unused Pins

Handle unused pins in accord with the directions given under Handling of Unused Pins in the manual.

The input pins of CMOS products are generally in the high-impedance state. In operation with an unused pin in the open-circuit state, extra electromagnetic noise is induced in the vicinity of LSI, an associated shoot-through current flows internally, and malfunctions occur due to the false recognition of the pin state as an input signal become possible. Unused pins should be handled as described under Handling of Unused Pins in the manual.

2. Processing at Power-on

The state of the product is undefined at the moment when power is supplied.

 The states of internal circuits in the LSI are indeterminate and the states of register settings and pins are undefined at the moment when power is supplied.
 In a finished product where the reset signal is applied to the external reset pin, the states

In a finished product where the reset signal is applied to the external reset pin, the states of pins are not guaranteed from the moment when power is supplied until the reset process is completed.

In a similar way, the states of pins in a product that is reset by an on-chip power-on reset function are not guaranteed from the moment when power is supplied until the power reaches the level at which resetting has been specified.

3. Prohibition of Access to Reserved Addresses

Access to reserved addresses is prohibited.

 The reserved addresses are provided for the possible future expansion of functions. Do not access these addresses; the correct operation of LSI is not guaranteed if they are accessed.

4. Clock Signals

After applying a reset, only release the reset line after the operating clock signal has become stable. When switching the clock signal during program execution, wait until the target clock signal has stabilized.

— When the clock signal is generated with an external resonator (or from an external oscillator) during a reset, ensure that the reset line is only released after full stabilization of the clock signal. Moreover, when switching to a clock signal produced with an external resonator (or by an external oscillator) while program execution is in progress, wait until the target clock signal is stable.

5. Differences between Products

Before changing from one product to another, i.e. to one with a different part number, confirm that the change will not lead to problems.

— The characteristics of MPU/MCU in the same group but having different part numbers may differ because of the differences in internal memory capacity and layout pattern. When changing to products of different part numbers, implement a system-evaluation test for each of the products.

How to Use This Manual

1. Purpose and Target Readers

This manual is designed to provide the user with an understanding of the hardware functions and electrical characteristics of the MCU. It is intended for users designing application systems incorporating the MCU. A basic knowledge of electric circuits, logical circuits, and MCUs is necessary in order to use this manual.

The manual comprises an overview of the product; descriptions of the CPU, system control functions, peripheral functions, and electrical characteristics; and usage notes.

Particular attention should be paid to the precautionary notes when using the manual. These notes occur within the body of the text, at the end of each section, and in the Usage Notes section.

The revision history summarizes the locations of revisions and additions. It does not list all revisions. Refer to the text of the manual for details.

The following documents apply to the R8C/22 Group and R8C/23 Group. Make sure to refer to the latest versions of these documents. The newest versions of the documents listed may be obtained from the Renesas Technology Web site.

Document Type	Description	Document Title	Document No.
Datasheet	Hardware overview and electrical characteristics	R8C/22 Group,	REJ03B0097
		R8C/23 Group	
		Datasheet	
Hardware manual	Hardware specifications (pin assignments,	R8C/22 Group,	This hardware
	memory maps, peripheral function	R8C/23 Group	manual
	specifications, electrical characteristics, timing	Hardware Manual	
	charts) and operation description		
	Note: Refer to the application notes for details on		
	using peripheral functions.		
Software manual	Description of CPU instruction set	R8C/Tiny Series	REJ09B0001
		Software Manual	
Application note	Information on using peripheral functions and	Available from Ren	esas
	application examples	Technology Web si	te.
	Sample programs		
	Information on writing programs in assembly		
	language and C		
Renesas	Product specifications, updates on documents,		
technical update	etc.		

2. Notation of Numbers and Symbols

The notation conventions for register names, bit names, numbers, and symbols used in this manual are described below.

(1) Register Names, Bit Names, and Pin Names

Registers, bits, and pins are referred to in the text by symbols. The symbol is accompanied by the word "register," "bit," or "pin" to distinguish the three categories.

Examples the PM03 bit in the PM0 register

P3_5 pin, VCC pin

(2) Notation of Numbers

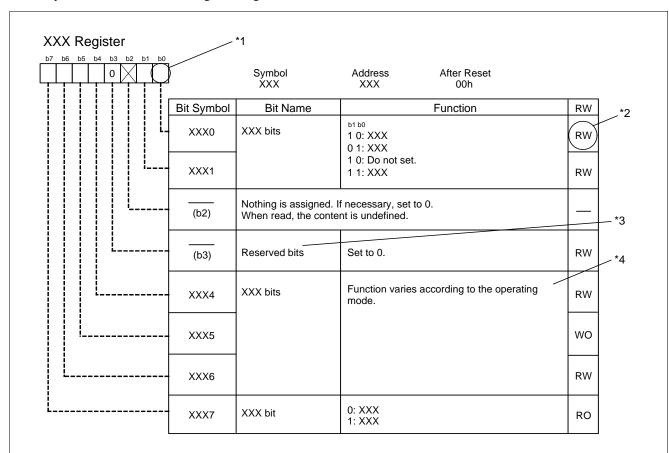

The indication "b" is appended to numeric values given in binary format. However, nothing is appended to the values of single bits. The indication "h" is appended to numeric values given in hexadecimal format. Nothing is appended to numeric values given in decimal format.

Examples Binary: 11b

Hexadecimal: EFA0h Decimal: 1234

3. Register Notation

The symbols and terms used in register diagrams are described below.

*1

Blank: Set to 0 or 1 according to the application.

0: Set to 0.

1: Set to 1.

X: Nothing is assigned.

*2

RW: Read and write.

RO: Read only.

WO: Write only.

-: Nothing is assigned.

*3

• Reserved bit

Reserved bit. Set to specified value.

*4

• Nothing is assigned

Nothing is assigned to the bit. As the bit may be used for future functions, if necessary, set to 0.

• Do not set to a value

Operation is not guaranteed when a value is set.

• Function varies according to the operating mode.

The function of the bit varies with the peripheral function mode. Refer to the register diagram for information on the individual modes.

4. List of Abbreviations and Acronyms

Abbreviation	Full Form	
ACIA	Asynchronous Communication Interface Adapter	
bps	bits per second	
CRC	Cyclic Redundancy Check	
DMA	Direct Memory Access	
DMAC	Direct Memory Access Controller	
GSM	Global System for Mobile Communications	
Hi-Z	High Impedance	
IEBus	Inter Equipment Bus	
I/O	Input / Output	
IrDA	Infrared Data Association	
LSB	Least Significant Bit	
MSB	Most Significant Bit	
NC	Non-Connect	
PLL	Phase Locked Loop	
PWM	Pulse Width Modulation	
SIM	Subscriber Identity Module	
UART	Universal Asynchronous Receiver / Transmitter	
VCO	Voltage Controlled Oscillator	

All trademarks and registered trademarks are the property of their respective owners.

R8C/22 Group, R8C/23 Group RENESAS MCU

REJ09B0251-0200 Rev.2.00 Aug 20, 2008

1. Overview

This MCU is built using the high-performance silicon gate CMOS process using the R8C CPU core and is packaged in a 48-pin plastic molded LQFP. This MCU operates using sophisticated instructions featuring a high level of instruction efficiency. With 1 Mbyte of address space, it is capable of executing instructions at high speed. This MCU is equipped with one CAN module and suited to in-vehicle or FA networking.

Furthermore, the data flash (1 KB x 2 blocks) is embedded in the R8C/23 Group.

The difference between R8C/22 and R8C/23 Groups is only the existence of the data flash. Their peripheral functions are the same.

1.1 Applications

Automotive, etc.

1.2 Performance Overview

Table 1.1 outlines the Functions and Specifications for R8C/22 Group and Table 1.2 outlines the Functions and Specifications for R8C/23 Group.

Table 1.1 Functions and Specifications for R8C/22 Group

	Item	Specification
CPU	Number of fundamental instructions	•
	Minimum instruction execution time	50 ns (f(XIN) = 20 MHz, VCC = 3.0 to 5.5 V)
		100 ns (f(XIN) = 10 MHz, VCC = 2.7 to 5.5 V)
	Operating mode	Single-chip
	Address space	1 Mbyte
	Memory capacity	Refer to Table 1.3 Product Information for R8C/22 Group
Peripheral	Ports	I/O ports: 41 pins, Input port: 3 pins
Function	Timers	Timer RA: 8 bits x 1 channel,
		Timer RB: 8 bits x 1 channel
		(Each timer equipped with 8-bit prescaler)
		Timer RD: 16 bits x 2 channel
		(Circuits of input capture and output compare)
		Timer RE: With compare match function
	Serial interface	1 channel (UART0)
		Clock synchronous I/O, UART
		1 channel (UART1)
		UART
	Clock synchronous serial interface	1 channel
		I ² C bus interface ⁽²⁾ , Clock synchronous serial I/O with chip
		select
	LIN module	Hardware LIN: 1 channel
	CANL	(timer RA, UARTO)
	CAN module	1 channel with 2.0B specification: 16 slots
	A/D converter	10-bit A/D converter: 1 circuit, 12 channels
	Watchdog timer	15 bits x 1 channel (with prescaler)
	Interrupt	Reset start selectable Internal: 14 sources, External: 6 sources, Software: 4 sources,
	Interrupt	Priority level: 7 levels
	Clock generation circuits	2 circuits
	Clock generation circuits	XIN clock generation circuit (with on-chip feedback resistor)
		On-chip oscillator (high speed, low speed)
		High-speed on-chip oscillator has frequency adjustment
		function.
	Oscillation stop detection	Stop detection of XIN clock oscillation
	function	· ·
	Voltage detection circuit	On-chip
	Power-on reset circuit include	On-chip
Electric	Supply voltage	VCC = 3.0 to 5.5 V (f(XIN) = 20 MHz)(D, J version)
Characteristics		VCC = 3.0 to 5.5 V (f(XIN) = 16 MHz)(K version)
		VCC = 2.7 to 5.5 V (f(XIN) = 10 MHz)
	Current consumption	Typ. 12.5 mA (VCC = 5 V, f(XIN) = 20 MHz, High-speed on-
		chip oscillator stopping)
		Typ. 6.0 mA (VCC = 5 V, f(XIN) = 10 MHz, High-speed on-chip
		oscillator stopping)
Flash Memory	Programming and erasure voltage	VCC = 2.7 to 5.5 V
	Programming and erasure	100 times
	endurance	10.1.0500
Operating Ambi	ent Temperature	-40 to 85°C
		-40 to 125°C (option ⁽¹⁾)
Package		48-pin mold-plastic LQFP

NOTES:

- 1. When using options, be sure to inquire about the specification.
- 2. I²C bus is a registered trademark of Koninklijke Philips Electronics N.V.

Functions and Specifications for R8C/23 Group Table 1.2

	Item	Specification
CPU	Number of fundamental instructions	·
	Minimum instruction execution time	50 ns (f(XIN) = 20 MHz, VCC = 3.0 to 5.5 V)
		100 ns (f(XIN) = 10 MHz, VCC = 2.7 to 5.5 V)
	Operating mode	Single-chip
	Address space	1 Mbyte

1.6 Pin Functions

Table 1.5 lists the Pin Functions and Table 1.6 lists the Pin Name Information by Pin Number.

Table 1.5 Pin Functions

Туре	Symbol	I/O Type	Description
Power Supply Input	VCC VSS	I	Apply 2.7 V to 5.5 V to the VCC pin. Apply 0 V to the VSS pin.
Analog Power Supply Input	AVCC, AVSS	I	Applies the power supply for the A/D converter. Connect a capacitor between AVCC and AVSS.
Reset Input	RESET	I	Input "L" on this pin resets the MCU.
MODE	MODE	I	Connect this pin to VCC via a resistor.
XIN Clock Input	XIN	I	These pins are provided for the XIN clock generation
XIN Clock Output	XOUT	0	circuit I/O. Connect a ceramic resonator or a crystal oscillator between the XIN and XOUT pins. To use an externally derived clock, input it to the XIN pin and leave the XOUT pin open.
INT Interrupt Input	INTO to INT3	I	INT interrupt input pins. INT0 Timer RD input pins. INT1 Timer RA input pins.
Key Input Interrupt	KI0 to KI3	I	Key input interrupt input pins.
Timer RA	TRAIO	I/O	Timer RA I/O pin.
	TRAO	0	Timer RA output pin.
Timer RB	TRBO	0	Timer RB output pin.
Timer RD	TRDIOA0, TRDIOA1, TRDIOB0, TRDIOB1, TRDIOC0, TRDIOC1, TRDIOD0, TRDIOD1	I/O	Timer RD I/O ports.
	TRDCLK	I	External clock input pin.
Timer RE	TREO	0	Divided clock output pin.
Serial Interface	CLK0	I/O	Transfer clock I/O pin.
	RXD0, RXD1	I	Serial data input pins.
	TXD0, TXD1	0	Serial data output pins.
I ² C Bus Interface	SCL	I/O	Clock I/O pin.
	SDA	I/O	Data I/O pin.
Clock Synchronous	SSI	I/O	Data I/O pin.
Serial I/O with Chip	SCS	I/O	Chip-select signal I/O pin.
Select	SSCK	I/O	Clock I/O pin.
	SSO	I/O	Data I/O pin.
CAN Module	CRX0	I	CAN data input pin.
	CTX0	0	CAN data output pin.
Reference Voltage Input	VREF	I	Reference voltage input pin to A/D converter.
A/D Converter	AN0 to AN11	I	Analog input pins to A/D converter.
I/O Port	P0_0 to P0_7, P1_0 to P1_7, P2_0 to P2_7, P3_0, P3_1, P3_3 to P3_5, P3_7, P4_3 to P4_5, P6_0 to P6_7	I/O	CMOS I/O ports. Each port contains an input/output select direction register, allowing each pin in that port to be directed for input or output individually. Any port set to input can select whether to use a pull-up resistor or not by a program.
Input Port	P4_2, P4_6, P4_7	I	Input only ports.

I: Input

O: Output

I/O: Input and output

NOTE:

1. Can be assigned to the pin in parentheses by a program.

2. Central Processing Unit (CPU)

Figure 2.1 shows the CPU Registers. The CPU contains 13 registers. Of these, R0, R1, R2, R3, A0, A1, and FB comprise a register bank. Two sets of register banks are provided.

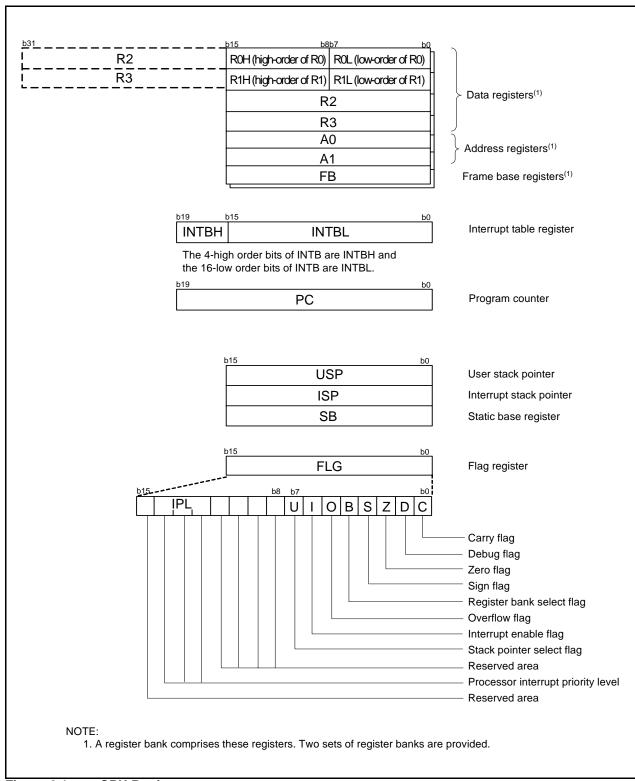

Figure 2.1 CPU Registers

2.1 Data Registers (R0, R1, R2 and R3)

R0 is a 16-bit register for transfer, arithmetic, and logic operations. The same applies to R1 to R3.

R0 can be split into high-order bit (R0H) and low-order bit (R0L) to be used separately as 8-bit data registers. The same applies to R1H and R1L as R0H and R0L. R2 can be combined with R0 to be used as a 32-bit data register (R2R0). The same applies R3R1 as R2R0.

2.2 Address Registers (A0 and A1)

A0 is a 16-bit register for address register indirect addressing and address register relative addressing. They also are used for transfer, arithmetic and logic operations. The same applies to A1 as A0.

A1 can be combined with A0 to be used a 32-bit address register (A1A0).

2.3 Frame Base Register (FB)

FB is a 16-bit register for FB relative addressing.

2.4 Interrupt Table Register (INTB)

INTB, a 20-bit register, indicates the start address of an interrupt vector table.

2.5 Program Counter (PC)

PC, 20 bits wide, indicates the address of an instruction to be executed.

2.6 User Stack Pointer (USP) and Interrupt Stack Pointer (ISP)

The stack pointer (SP), USP and ISP, are 16 bits wide each.

The U flag of FLG is used to switch between USP and ISP.

2.7 Static Base Register (SB)

SB is a 16-bit register for SB relative addressing.

2.8 Flag Register (FLG)

FLG is a 11-bit register indicating the CPU status.

2.8.1 Carry Flag (C)

The C flag retains a carry, borrow, or shift-out bit that has occurred in the arithmetic and logic unit.

2.8.2 Debug Flag (D)

The D flag is for debug only. Set to 0.

2.8.3 **Zero Flag (Z)**

The Z flag is set to 1 when an arithmetic operation resulted in 0; otherwise, 0.

2.8.4 Sign Flag (S)

The S flag is set to 1 when an arithmetic operation resulted in a negative value; otherwise, 0.

2.8.5 Register Bank Select Flag (B)

The register bank 0 is selected when the B flag is 0. The register bank 1 is selected when this flag is set to 1.

2.8.6 Overflow Flag (O)

The O flag is set to 1 when the operation resulted in an overflow; otherwise, 0.

2.8.7 Interrupt Enable Flag (I)

The I flag enables a maskable interrupt.

An interrupt is disabled when the I flag is set to 0, and are enabled when the I flag is set to 1. The I flag is set to 0 when an interrupt request is acknowledged.

2.8.8 Stack Pointer Select Flag (U)

ISP is selected when the U flag is set to 0; USP is selected when the U flag is set to 1.

The U flag is set to 0 when a hardware interrupt request is acknowledged or the INT instruction of software interrupt numbers. 0 to 31 is executed.

2.8.9 Processor Interrupt Priority Level (IPL)

IPL, 3 bits wide, assigns processor interrupt priority levels from level 0 to level 7. If a requested interrupt has greater priority than IPL, the interrupt is enabled.

2.8.10 Reserved Bit

If necessary, set to 0. When read, the content is undefined.

3. Memory

3.1 R8C/22 Group

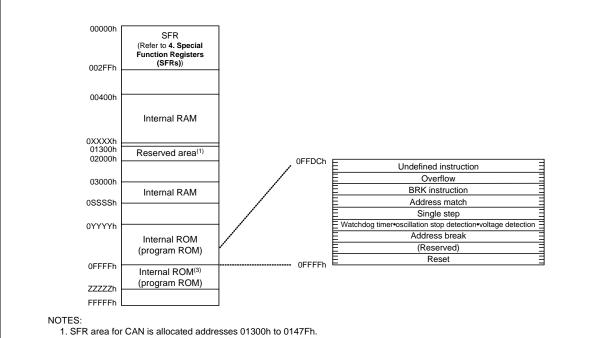

Figure 3.1 shows a Memory Map of R8C/22 Group. The R8C/22 Group has 1 Mbyte of address space from address 00000h to FFFFFh.

The internal ROM is allocated lower addresses, beginning with address 0FFFFh. For example, a 48-Kbyte internal ROM is allocated addresses 04000h to 0FFFFh.

The fixed interrupt vector table is allocated addresses 0FFDCh to 0FFFFh. They store the starting address of each interrupt routine.

The internal RAM is allocated higher addresses, beginning with address 00400h. For example, a 2.5-Kbyte internal RAM is allocated addresses 00400h to 00DFFh. The internal RAM is used not only for storing data but also for calling subroutines and as stacks when interrupt requests are acknowledged.

Special function registers (SFR) are allocated addresses 00000h to 002FFh and 01300h to 0147Fh (SFR area for CAN). The peripheral function control registers are allocated here. All addresses within the SFR, which have nothing allocated are reserved for future user and cannot be accessed by users.

- 2. The blank regions are reserved. Do not access locations in these regions.
- 3. Do not use addresses 20000h to 23FFFh because these areas are used for the emulator debugger. Refer to 24. Notes on **Emulator Debugger.**

Deat Novel en		Internal ROM	1	Internal RAM			
Part Number	Size	Address 0YYYYh	Address ZZZZZh	Size	Address 0XXXXh	Address 0SSSSh

Figure 3.1 Memory Map of R8C/22 Group

3.2 R8C/23 Group

Figure 3.2 shows a Memory Map of R8C/23 Group. The R8C/23 Group has 1 Mbyte of address space from address 00000h to FFFFFh.

The internal ROM (program ROM) is allocated lower addresses, beginning with address 0FFFFh. For example, a 48-Kbyte internal ROM is allocated addresses 04000h to 0FFFFh.

The fixed interrupt vector table is allocated addresses 0FFDCh to 0FFFFh. They store the starting address of each interrupt routine.

The internal ROM (data flash) is allocated addresses 02400h to 02BFFh.

The internal RAM is allocated higher addresses, beginning with address 00400h. For example, a 2.5-Kbyte internal RAM is allocated addresses 00400h to 00DFFh. The internal RAM is used not only for storing data but also for calling subroutines and as stacks when interrupt requests are acknowledged.

Special function registers (SFR) are allocated addresses 00000h to 002FFh and 01300h to 0147Fh (SFR area for CAN). The peripheral function control registers are allocated them. All addresses within the SFR, which have nothing allocated are reserved for future use and cannot be accessed by users.

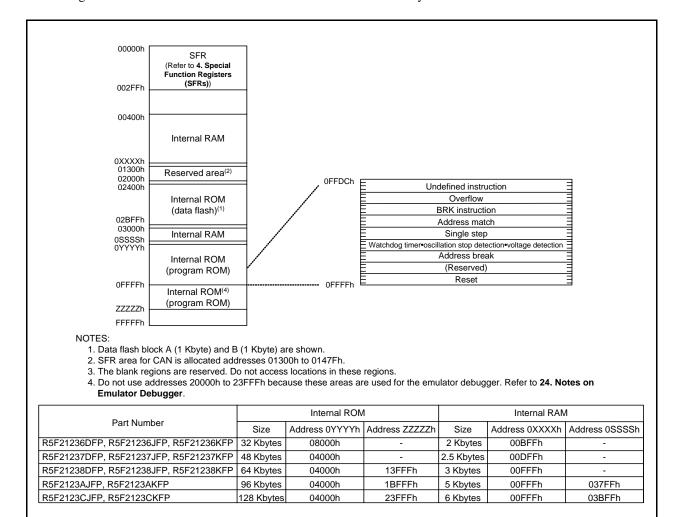

Figure 3.2 Memory Map of R8C/23 Group

4. Special Function Registers (SFRs)

An SFR (special function register) is a control register for a peripheral function. Table 4.1 to Table 4.13 list the SFR Information.

		OFS	(Note 2)

- The blank regions are reserved. Do not access locations in these regions.
 The OFS register cannot be changed by a program. Use a flash programmer to write to it.

5. Resets

There are resets: hardware reset, power-on reset, voltage monitor 1 reset, voltage monitor 2 reset, watchdog timer reset, and software reset.

Table 5.1 lists the Reset Names and Sources.

Table 5.1 Reset Names and Sources

Reset Name	Source
Hardware reset	Input voltage of RESET pin is held "L"
Power-on reset ⁽¹⁾	VCC rises
Voltage monitor 1 reset ⁽¹⁾	VCC falls (monitor voltage: Vdet1)
Voltage monitor 2 reset ⁽¹⁾	VCC falls (monitor voltage: Vdet2)
Watchdog timer reset	Underflow of watchdog timer
Software reset	Write 1 to PM03 bit in PM0 register

NOTE:

1. Because this product is under development, specifications may be changed.

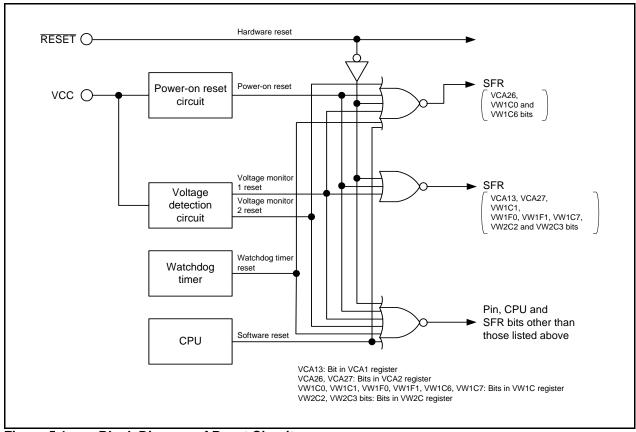

Figure 5.1 Block Diagram of Reset Circuit

Page 28 of 501

Table 5.2 lists the Pin Functions after Reset, Figure 5.2 shows CPU Register Status after Reset, Figure 5.3 shows Reset Sequence, and Figure 5.4 shows the OFS Register.

Table 5.2 Pin Functions after Reset

Pin Name	Pin Functions
P0, P1, P2	Input port
P3_0, P3_1, P3_3 to P3_5, P3_7	Input port
P4_2 to P4_7	Input port
P6	Input port

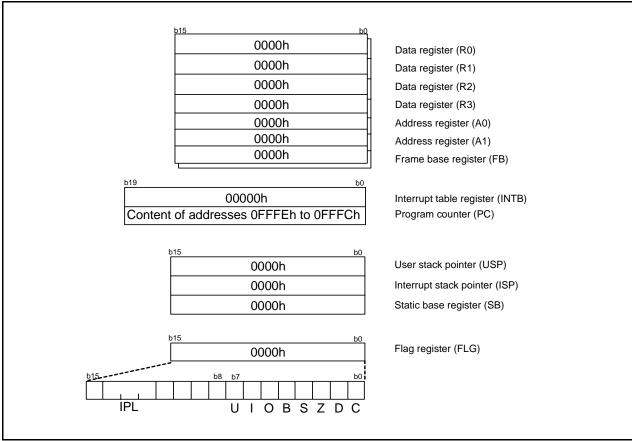

Figure 5.2 CPU Register Status after Reset

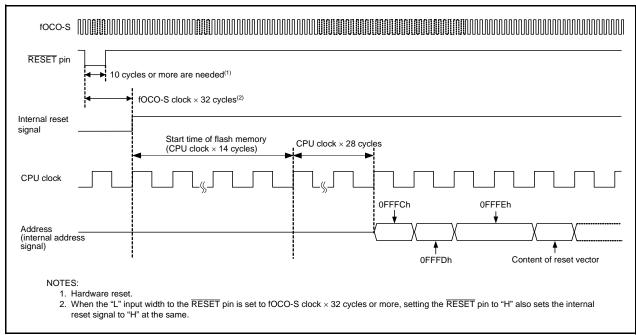

Figure 5.3 Reset Sequence

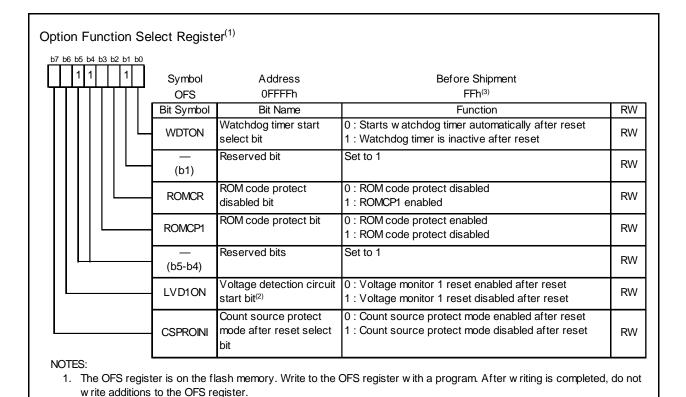

Figure 5.4 OFS Register

2. To use the power-on reset, set the LVD1ON bit to 0 (voltage monitor 1 reset enabled after reset).

3. If the block including the OFS register is erased, FFh is set to the OFS register.

5.1 Hardware Reset

A reset is applied using the \overline{RESET} pin. When an "L" signal is applied to the \overline{RESET} pin while the power supply voltage meets the recommended performance condition, the pins, CPU, and SFR are reset (refer to **Table 5.2 Pin Functions after Reset**). When the input level applied to the \overline{RESET} pin changes "L" to "H", the program is executed beginning with the address indicated by the reset vector. After reset, the low-speed on-chip oscillator clock divided-by-8 is automatically selected for the CPU clock.

Refer to **4. Special Function Registers (SFRs)** for the status of the SFR after reset.

The internal RAM is not reset. If the \overline{RESET} pin is pulled "L" during writing to the internal RAM, the internal RAM will be in indeterminate state.

Figure 5.5 shows the Example of Hardware Reset Circuit and Operation and Figure 5.6 shows the Example of Hardware Reset Circuit (Usage Example of External Supply Voltage Detection Circuit) and Operation.

5.1.1 When Power Supply is Stable

- (1) Apply "L" to the \overline{RESET} pin.
- (2) Wait for 10µs or more.
- (3) Apply "H" to the \overline{RESET} pin.

5.1.2 Power On

- (1) Apply "L" to the \overline{RESET} pin.
- (2) Let the power supply voltage increase until it meets the recommended performance condition.
- (3) Wait for td(P-R) or more to allow the internal power supply to stabilize (refer to **21. Electrical Characteristics**).
- (4) Wait for 10µs or more.
- (5) Apply "H" to the \overline{RESET} pin.

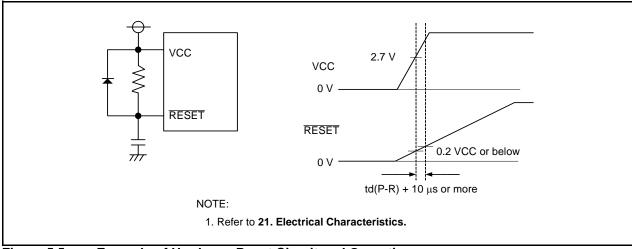

Figure 5.5 Example of Hardware Reset Circuit and Operation

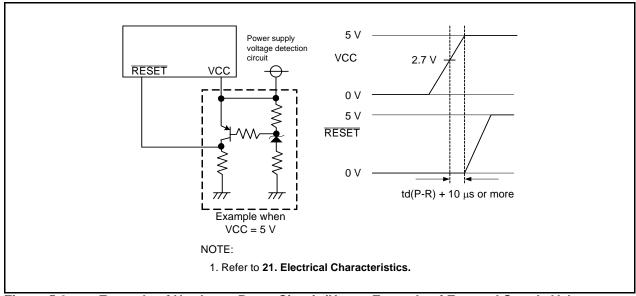

Figure 5.6 Example of Hardware Reset Circuit (Usage Example of External Supply Voltage Detection Circuit) and Operation

5.2 Power-On Reset Function⁽¹⁾

When the RESET pin is connected to the VCC pin via a pull-up resistor, and the VCC pin voltage level rises, the power-on reset function is enabled and the MCU resets its pins, CPU, and SFR. When a capacitor is connected to the RESET pin, too, always keep the voltage to the RESET pin 0.8VCC or more.

When the input voltage to the VCC pin reaches to the Vdet0 level or above, the low-speed on-chip oscillator clock starts counting. When the low-speed on-chip oscillator clock count reaches 32, the internal reset signal is held "H" and the MCU enters the reset sequence (refer to **Figure 5.3**). The low-speed on-chip oscillator clock divide-by-8 is automatically selected for the CPU after reset.

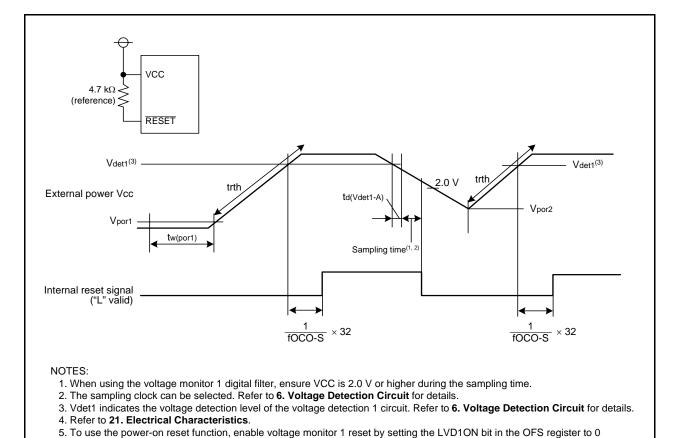

Refer to 4. Special Function Registers (SFRs) for the status of the SFR after power-on reset.

The voltage monitor 0 reset is enabled after power-on reset.

Figure 5.7 shows the Example of Power-On Reset Circuit and Operation.

NOTE:

1. When using power-on reset function, set the LVD1ON bit to 0 (voltage monitor 1 reset enabled after reset).

(voltage monitor 1 reset enabled after reset), bits VW1C0 and VW1C6 in the VW1C register to 1 (enable) and the VCA26 bit

Figure 5.7 Example of Power-On Reset Circuit and Operation

in the VCA2 register to 1 (voltage detection 1 circuit enabled).

5.3 Voltage Monitor 1 Reset

A reset is applied using the on-chip voltage detection 1 circuit. The voltage detection 1 circuit monitors the input voltage to the VCC pin. The voltage to monitor is Vdet1.

When the input voltage to the VCC pin reaches to the Vdet1 level or below, the pins, CPU, and SFR are reset.

And when the input voltage to the VCC pin reaches to the Vdet1 level or above, count operation of the low-speed on-chip oscillator clock starts. When the operation counts the low-speed on-chip oscillator clock for 32 times, the internal reset signal is held "H" and the MCU enters the reset sequence (refer to **Figure 5.3**). The low-speed on-chip oscillator clock divide-by-8 is automatically selected for the CPU after reset.

The LVD1ON bit in the OFS register can select to enable or disable voltage monitor 1 reset after a reset.

To use the power-on reset function, enable voltage monitor 1 reset by setting the LVD1ON bit in the OFS register to 0, bits VW1C0 and VW1C6 in the VW1C register to 1, the VCA bit in the VCA2 register to 1.

The LVD1ON bit cannot be changed by a program. When setting the LVD1ON bit, write 0 (voltage monitor 1 reset enabled after reset) or 1 (voltage monitor 1 reset disabled after reset) to the bit 6 of address 0FFFFh using a flash programmer. Refer to **Figure 5.4 OFS Register** for details of the OFS register.

Refer to **4. Special Function Registers (SFRs)** for the status of the SFR after voltage monitor 1 reset.

The internal RAM is not reset. When the input voltage to the VCC pin reaches to the Vdet1 level or below during writing to the internal RAM, the internal RAM is in indeterminate state.

Refer to **6. Voltage Detection Circuit** for details of voltage monitor 1 reset.

5.4 Voltage Monitor 2 Reset

A reset is applied using the on-chip voltage detection 2 circuit. The voltage detection 2 circuit monitors the input voltage to the VCC pin. The voltage to monitor is Vdet2.

When the input voltage to the VCC pin drops to the Vdet2 level or below, the pins, CPU, and SFR are reset and the program is executed beginning with the address indicated by the reset vector. After reset, the low-speed on-chip oscillator clock divide-by-8 is automatically selected for the CPU clock.

The voltage monitor 2 does not reset some SFRs. Refer to 4. Special Function Registers (SFRs) for details.

The internal RAM is not reset. When the input voltage to the VCC pin reaches to the Vdet2 level or below during writing to the internal RAM, the internal RAM is in indeterminate state.

Refer to **6. Voltage Detection Circuit** for details of voltage monitor 2 reset.

5.5 Watchdog Timer Reset

When the PM12 bit in the PM1 register is set to 1 (reset when watchdog timer underflows), the MCU resets its pins, CPU, and SFR if the watchdog timer underflows. Then the program is executed beginning with the address indicated by the reset vector. After reset, the low-speed on-chip oscillator clock divide-by-8 is automatically selected for the CPU clock.

The watchdog timer reset does not reset some SFRs. Refer to **4. Special Function Registers** (**SFRs**) for details. The internal RAM is not reset. When the watchdog timer underflows, the internal RAM is in indeterminate state. Refer to **13. Watchdog Timer** for watchdog timer.

5.6 Software Reset

When the PM03 bit in the PM0 register is set to 1 (MCU reset), the MCU resets its pins, CPU, and SFR. The program is executed beginning with the address indicated by the reset vector. After reset, the low-speed on-chip oscillator clock divide-by-8 is automatically selected for the CPU clock.

The software reset does not reset some SFRs. Refer to **4. Special Function Registers (SFRs)** for details. The internal RAM is not reset.

6. Voltage Detection Circuit

The voltage detection circuit is a circuit to monitor the input voltage to the VCC pin. This circuit monitors the VCC input voltage by the program. And the voltage monitor 1 reset, voltage monitor 2 interrupt and voltage monitor 2 reset can be used.

Table 6.1 lists the Specifications of Voltage Detection Circuit and Figures 6.1 to 6.3 show the Block Diagrams. Figures 6.4 to 6.6 show the Associated Registers.

Table 6.1 Specifications of Voltage Detection Circuit

Item		Voltage Detection 1	Voltage Detection 2
VCC Monitor	Voltage to monitor	Vdet1	Vdet2

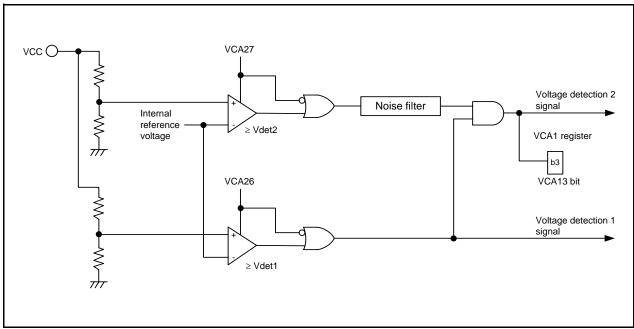

Figure 6.1 Block Diagram of Voltage Detection Circuit

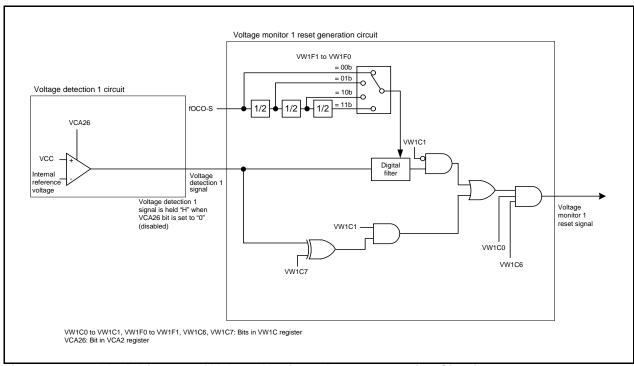

Figure 6.2 Block Diagram of Voltage Monitor 1 Reset Generation Circuit

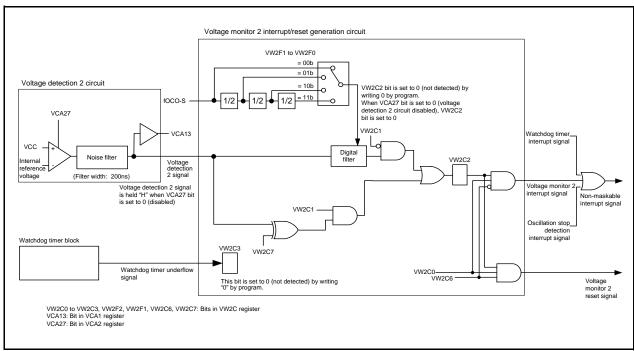

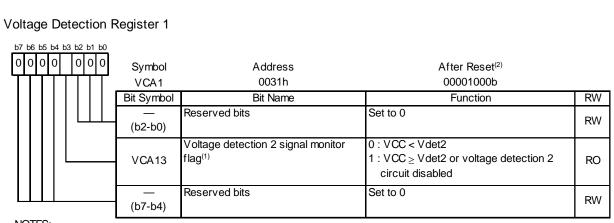

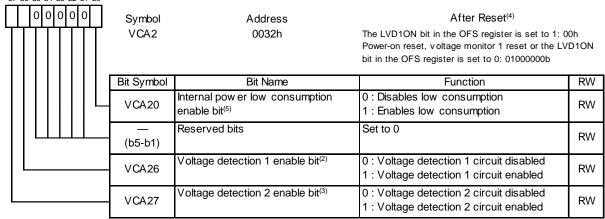

Figure 6.3 Block Diagram of Voltage Monitor 2 Interrupt/Reset Generation Circuit

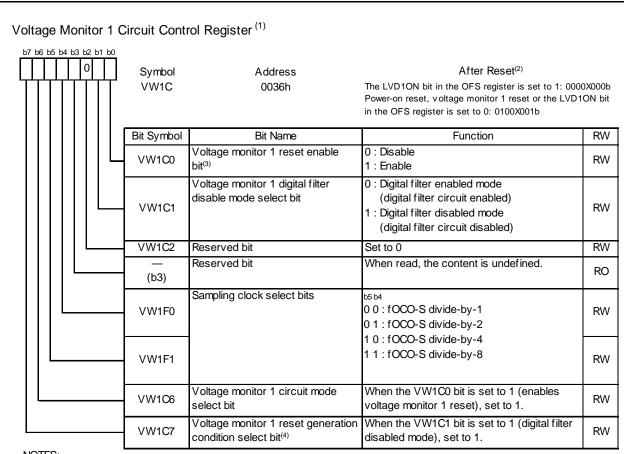

- 1. The VCA13 bit is enabled when the VCA27 bit in the VCA2 register is set to 1 (voltage detection 2 circuit enabled). The VCA13 bit is set to 1 (VCC ≥ Vdet 2) when the VCA27 bit in the VCA2 register is set to 0 (voltage detection 2 circuit disabled).
- 2. The softw are reset, w atchdog timer reset and voltage monitor 2 reset do not affect the VCA1 register.

Voltage Detection Register 2⁽¹⁾

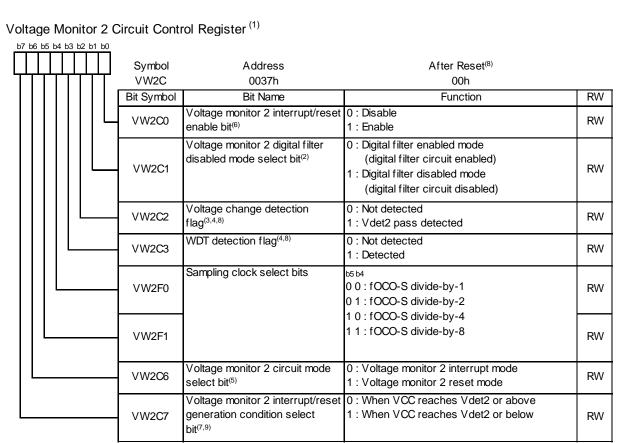

- 1. Set the PRC3 bit in the PRCR register to 1 (enables writing) before writing to the VCA2 register.
- 2. When using the voltage monitor 1 reset, set the VCA26 bit to 1. After the VCA26 bit is set from 0 to 1, the voltage detection circuit elapses for td(E-A) before starting operation.
- 3. When using the voltage monitor 2 interrupt/reset or the VCA13 bit in the VCA1 register, set the VCA27 bit to 1. After the VCA27 bit is from 0 to 1, the voltage detection circuit elapses for td(E-A) before starting operation.
- 4. The VCA27 bit remains unchanged after softw are reset, w atchdog timer reset, and voltage monitor 2 reset.
- 5. Use the VCA20 bit only when entering to wait mode. To set the VCA20 bit, follow the procedure shown in Figure 10.11 Procedure for Enabling Reduced Internal Power Consumption Using VCA20 bit.

Figure 6.4 Registers VCA1 and VCA2

- 1. Set the PRC3 bit in the PRCR register to 1 (write enable) before writing to the VW1C register.
- 2. The value other than the VW1CO and VW1C6 bits remains unchanged after softw are reset, watchdog timer reset, and voltage monitor 2 reset.
- 3. The VW1C0 bit is enabled when the VCA26 bit in the VCA2 register is set to 1 (voltage detection 1 circuit enabled). Set the VW1C0 bit to 0 (disable), when the VCA26 bit is set to 0 (voltage detection 1 circuit disabled).
- 4. The VW1C7 bit is enabled when the VW1C1 bit is set to 1 (digital filter disabled mode).

Figure 6.5 VW1C Register

- 1. Set the PRC3 bit in the PRCR register to 1 (enables writing) before writing to the VW2C register. When writing the VW2C register, the VW2C2 bit may be set to 1. Set the VW2C2 bit to 0 after writing the VW2C register.
- 2. When the voltage monitor 2 interrupt is used to exit stop mode and to return again, write 0 to the VW2C1 bit before writing 1.
- 3. This bit is enabled when the VCA27 bit in the VCA2 register is set to 1 (voltage detection 2 circuit enabled).
- 4. Set this bit to 0 by a program. When w riting 0 by a program, it is set to 0 (it remains unchanged even if it is set to 1).
- 5. This bit is enabled when the VW2C0 bit is set to 1 (voltage monitor 2 interrupt/enables reset).
- 6. The VW2C0 bit is enabled when the VCA27 bit in the VCA2 register is set to 1 (voltage detection 2 circuit enabled). Set the VW2C0 bit to 0 (disable) when the VCA27 bit is set to 0 (voltage detection 2 circuit disabled).
- 7. The VW2C7 bit is enabled when the VW2C1 bit is set to 1 (digital filter disabled mode).
- 8. The VW2C2 and VW2C3 bits remain unchanged in the software reset, watchdog timer reset and voltage monitor 2
- 9. When the VW2C6 bit is set to 1 (voltage monitor 2 reset mode), set the VW2C7 bit to 1 (when VCC reaches to Vdet2 or below) (do not set to 0).

Figure 6.6 VW2C Register

6.1 VCC Input Voltage

6.1.1 Monitoring Vdet1

Vdet1 cannot be monitored.

6.1.2 Monitoring Vdet2

Set the VCA27 bit in the VCA2 register to 1 (voltage detection 2 circuit enabled). After td(E-A) has elapsed (refer to **21. Electrical Characteristics**), Vdet2 can be monitored by the VCA13 bit in the VCA1 register.

6.2 Voltage Monitor 1 Reset

Table 6.2 lists the Procedure for Setting Bits Associated with Voltage Monitor 1 Reset and Figure 6.7 shows an Example of Voltage Monitor 1 Reset Operation. To use the voltage monitor 1 reset to exit stop mode, set the VW1C1 bit in the VW1C register to 1 (digital filter disabled).

Table 6.2 Procedure for Setting Bits Associated with Voltage Monitor 1 Reset

Step	When Using Digital Filter When Not Using Digital Filter		
1	Set the VCA26 bit in the VCA2 register to 1 (voltage detection 1 circuit enabled)		
2	Wait for td(E-A)		
	Select the sampling clock of the digital filter	Set the VW1C7 bit in the VW1C register to	
3	by the VW1F0 to VW1F1 bits in the VW1C	1	
	register		
4(1)	Set the VW1C1 bit in the VW1C register to	Set the VW1C1 bit in the VW1C register to	
4(')	"0" (digital filter enabled)	1 (digital filter disabled)	
5(1)	Set the VW1C6 bit in the VW1C register to	1 (voltage monitor 1 reset mode)	
6	Set the VW1C2 bit in the VW1C register to	0	
7	Set the CM14 bit in the CM1 register to 0	_	
	(low-speed on-chip oscillator on)		
8	Wait for the sampling clock of the digital	- (no wait time)	
	filter x 4 cycles		
9	Set the VW1C0 bit in the VW1C register to	1 (enables voltage monitor 1 reset)	

NOTE:

1. When the VW1C0 bit is set to 0, procedures 3, 4 and 5 can be executed simultaneously (with 1 instruction).

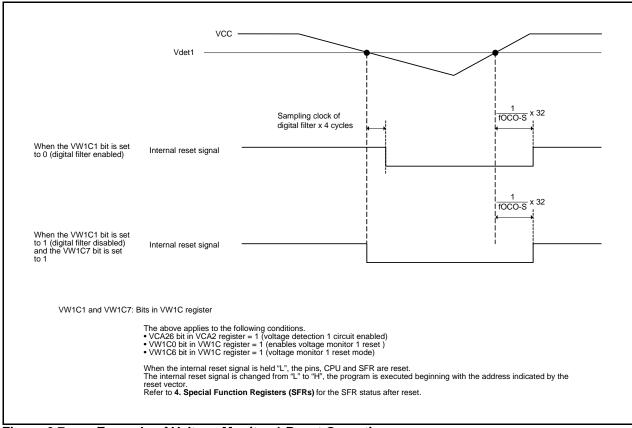

Figure 6.7 Example of Voltage Monitor 1 Reset Operation

6.3 Voltage Monitor 2 Interrupt and Voltage Monitor 2 Reset

Table 6.3 lists the Procedure for Setting Bits Associated with Voltage Monitor 2 Interrupt and Reset. Figure 6.8 shows an Example of Voltage Monitor 2 Interrupt and Voltage Monitor 2 Reset Operation. To use the voltage monitor 2 interrupt or voltage monitor 2 reset to exit stop mode, set the VW2C1 bit in the VW2C register to 1 (digital filter disabled).

Table 6.3 Procedure for Setting Bits Associated with Voltage Monitor 2 Interrupt and Reset

	When Using Digital Filter		When Not Using Digital Filter	
Step	Voltage Monitor 2	Voltage Monitor 2	Voltage Monitor 2	Voltage Monitor 2
	Interrupt	Reset	Interrupt	Reset
1	Set the VCA27 bit in the	ne VCA2 register to 1 (v	voltage detection 2 circ	uit enabled)
2	Wait for td(E-A)

4(-)	(digital filter enabled)		(digital filter disabled)	
5(2)	Set the VW2C6 bit in	Set the VW2C6 bit in	Set the VW2C6 bit in	Set the VW2C6 bit in
	the VW2C register to the VW2C register to		the VW2C register to	the VW2C register to
	0 (voltage monitor 2 1 (voltage monitor 2		0 (voltage monitor 2	1 (voltage monitor 2
	interrupt mode) reset mode)		interrupt mode)	reset mode)
6	Set the VW2C2 bit in t	the VW2C register to 0	(passing of Vdet2 is no	t detected)
7	Set the CM14 bit in the CM1 register to 0		_	
	(low-speed on-chip oscillator on)			
8	Wait for the sampling clock of the digital filter		(no wait time)	
	x 4 cycles			
9	Set the VW2C0 bit in t	the VW2C register to 1	(enables voltage monit	or 2 interrupt/reset)

- 1. Set the VW2C7 bit to 1 (when VCC reaches Vdet2 or below) for the voltage monitor 2 reset.
- 2. When the VW2C0 bit is set to 0, steps 3, 4, and 5 can be executed simultaneously (with 1 instruction).

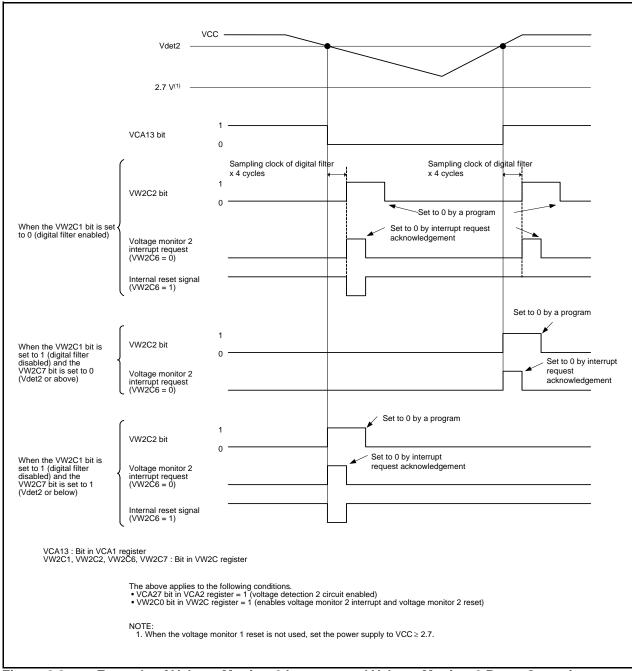

Figure 6.8 Example of Voltage Monitor 2 Interrupt and Voltage Monitor 2 Reset Operation

7. Programmable I/O Ports

There are 41 programmable Input/Output ports (I/O ports) P0 to P2, P3_0, P3_1, P3_3 to P3_5, P3_7, P4_3 to P4_5, and P6. Also, P4_6 and P4_7 can be used as input-only ports if the XIN clock oscillation circuit is not used, and the P4_2 can be used as an input-only port if the A/D converter is not used.

Table 7.1 Overview of Programmable I/O Ports

Ports	I/O	Type of Output	I/O Setting	Internal Pull-Up Resister
P0 to P2, P6	I/O	CMOS3 state	Set every bit	Set every 4 bits ⁽¹⁾
P3_0, P3_1, P3_3 to	I/O	CMOS3 state	Set every bit	Set every 3 bits ⁽¹⁾
P3_5, P3_7				
P4_3	I/O	CMOS3 state	Set every bit	Set every bit ⁽¹⁾
P4_4, P4_5	I/O	CMOS3 state	Set every bit	Set every 2 bits ⁽¹⁾
P4_2 ⁽²⁾	I	(No output function)	None	None
P4_6, P4_7 ⁽³⁾				

NOTES:

- 1. In input mode, whether the internal pull-up resistor is connected or not can be selected by the PUR0 and PUR1 registers.
- 2. When the A/D converter is not used, these ports can be used as the input port only.
- 3. When the XIN clock oscillation circuit is not used, these ports can be used as the input port only.

7.1 Functions of Programmable I/O Ports

The PDi_j (i = 0 to 4, 6, j = 0 to 7) bit in the PDi register controls I/O of the ports P0 to P2, P3_0, P3_1, P3_3 to P3_5, P3_7, P4_3 to P4_5, and P6. The Pi register consists of a port latch to hold output data and a circuit to read pin state.

Figures 7.1 to 7.7 show the Configurations of Programmable I/O Ports. Table 7.2 lists the Functions of Programmable I/O Ports. Also, Figure 7.9 shows the PDi (i = 0 to 4 and 6) Registers. Figure 7.10 shows the Pi (i = 0 to 4 and 6) Registers, Figure 7.11 shows the Registers PUR0 and PUR1 and Figure 7.12 shows the PMR Register.

Table 7.2 Functions of Programmable I/O Ports

Operation When	Value of PDi_j Bit in PDi Register ⁽¹⁾		
Accessing Pi Register	When PDi_j bit is set to 0 (input mode)	When PDi_j bit is set to 1 (output mode)	
Reading	Read pin input level	Read the port latch	
Writing	Write to the port latch	Write to the port latch. The value written in	
		the port latch, it is output from the pin.	

i = 0 to 4, 6, j = 0 to 7

NOTE:

1. Nothing is assigned to bits PD3_2, PD3_6, PD4_0 to PD4_2, PD4_6, and PD4_7.

7.2 Effect on Peripheral Functions

Programmable I/O ports function as I/O of peripheral functions (refer to **Table 1.6 Pin Name Information by Pin Number**).

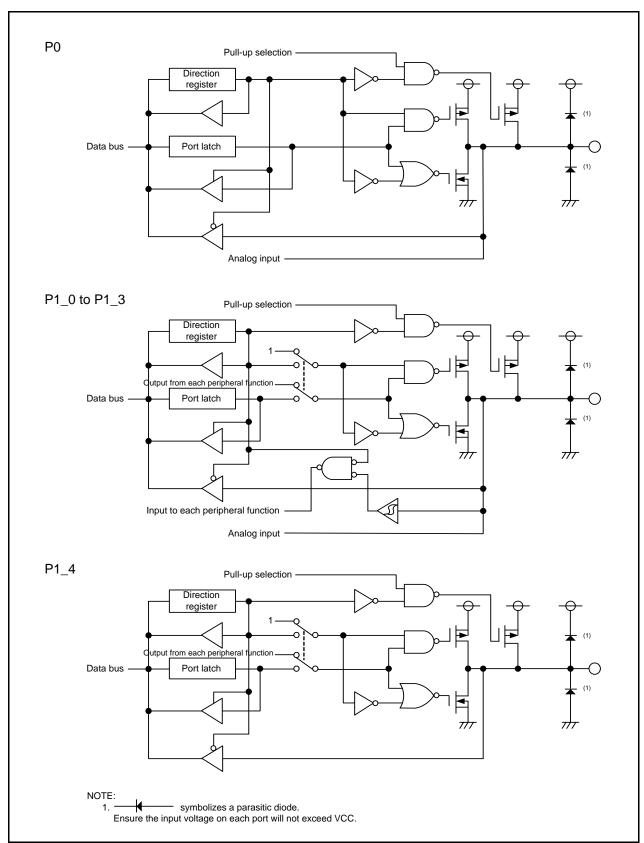

Table 7.3 lists the Setting of PDi_j Bit when Functioning as I/O Ports for Peripheral Functions (i = 0 to 4, 6 j = 0 to 7). Refer to descriptions of each function for how to set peripheral functions.

Table 7.3 Setting of PDi_j Bit when Functioning as I/O Ports for Peripheral Functions (i = 0 to 4, 6 j = 0 to 7)

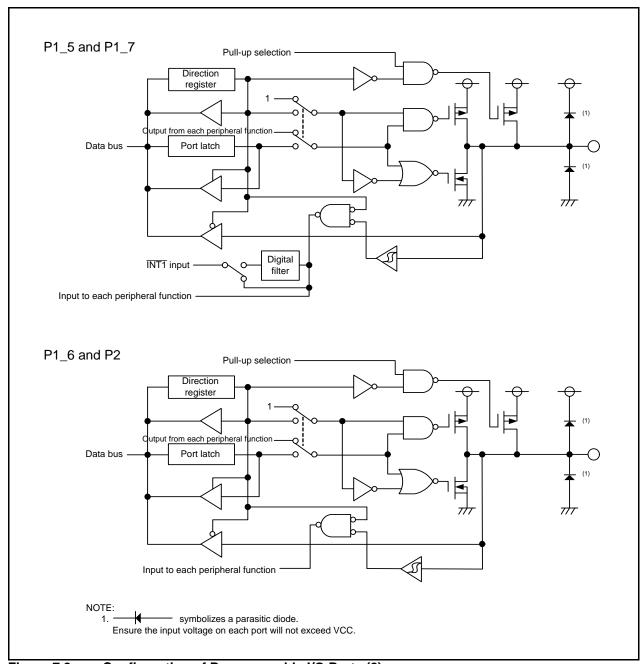

I/O of Peripheral Functions	PDi_j Bit Setting of Port shared with Pin
Input	Set this bit to 0 (input mode).
Output	This bit can be set to both 0 or 1 (output regardless of the port setting)

7.3 Pins Other than Programmable I/O Ports

Figure 7.8 shows the Configuration of I/O Pins.

Configuration of Programmable I/O Ports (1) Figure 7.1

Configuration of Programmable I/O Ports (2) Figure 7.2

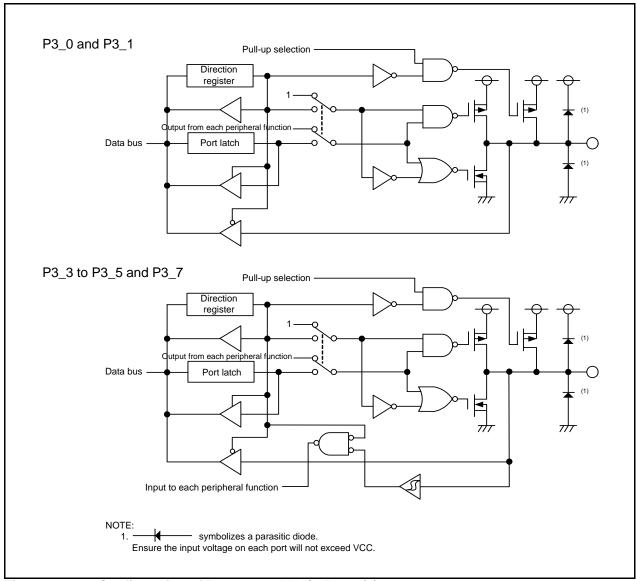

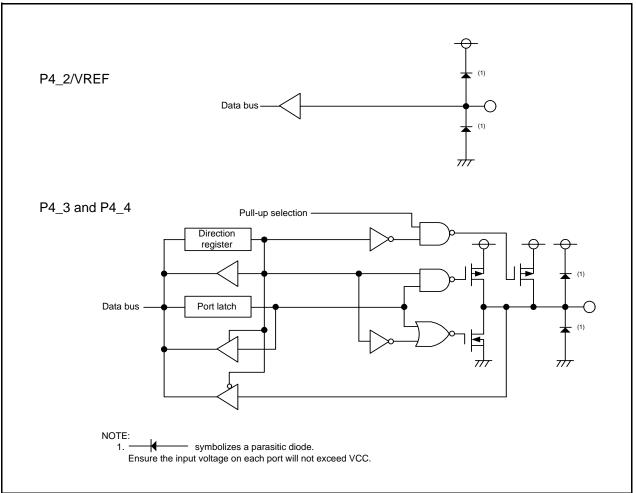

Figure 7.3 Configuration of Programmable I/O Ports (3)

Configuration of Programmable I/O Ports (4) Figure 7.4

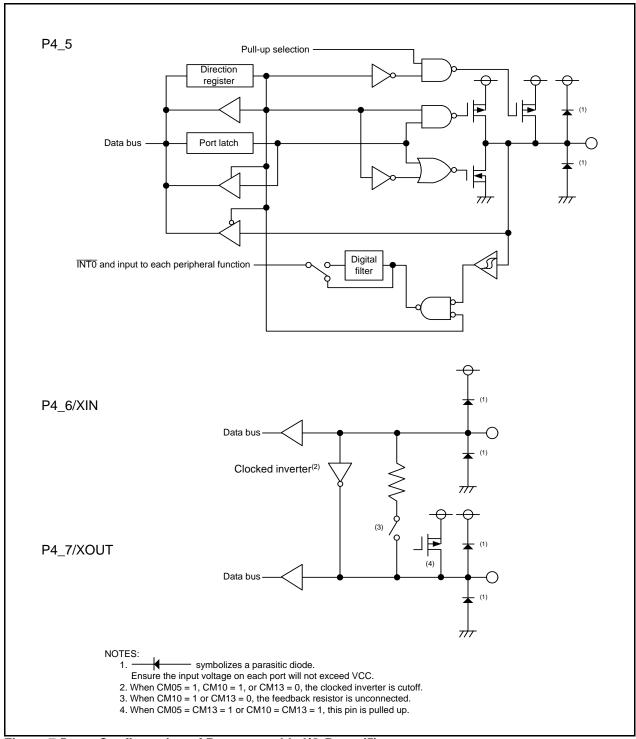

Figure 7.5 Configuration of Programmable I/O Ports (5)

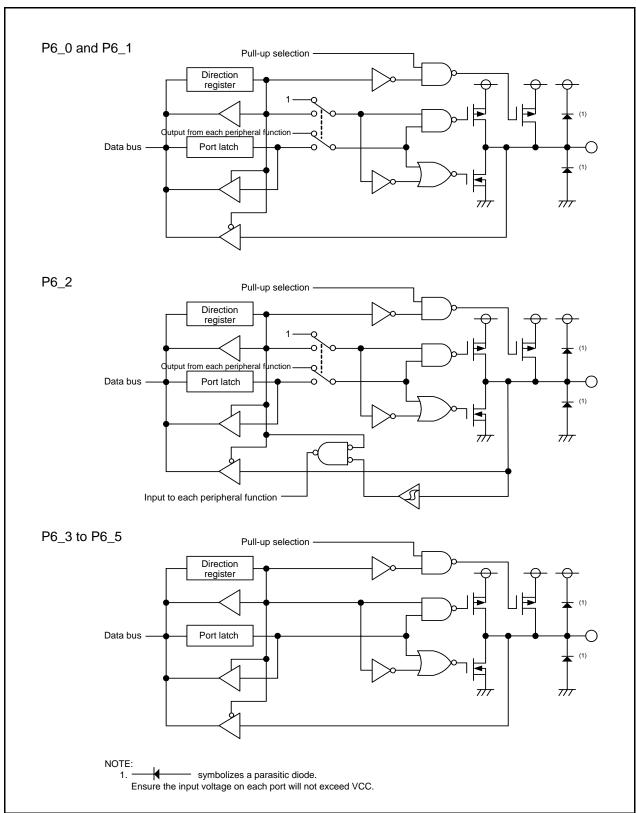

Figure 7.6 Configuration of Programmable I/O Ports (6)

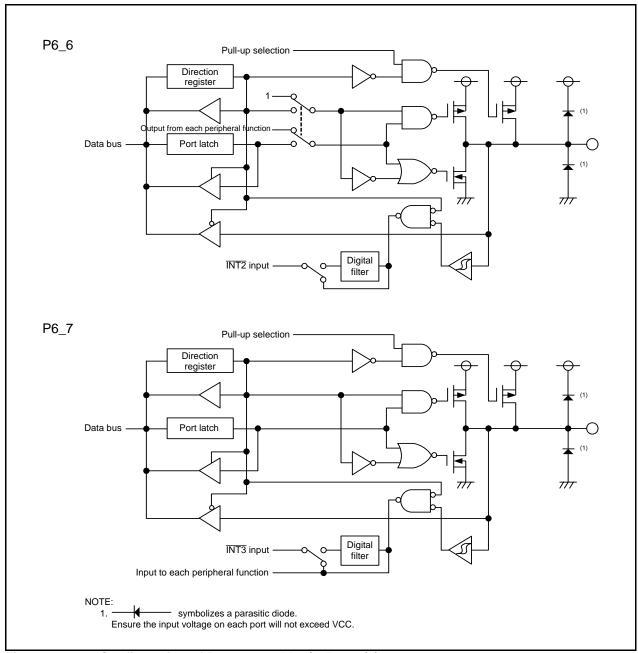

Figure 7.7 Configuration of Programmable I/O Ports (7)

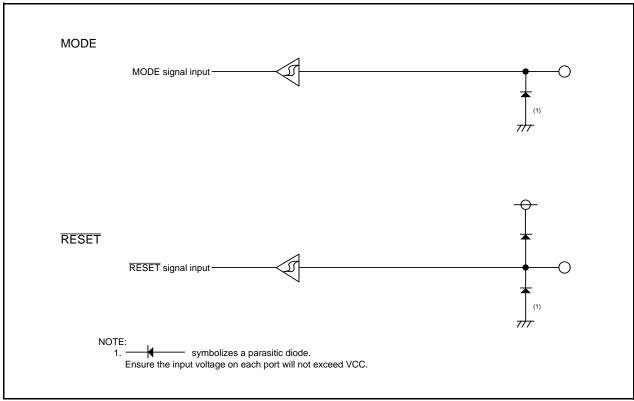

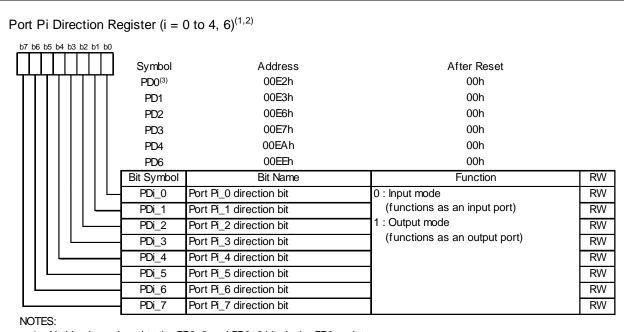

Figure 7.8 Configuration of I/O Pins

- Nothing is assigned to the PD3_2 and PD3_6 bits in the PD3 register.
 When writing to the PD3_2 and PD3_6 bits, write 0 (input mode). When read, its content is 0.
- 2. Nothing is assigned to the PD4_0 to PD4_2, PD4_6 and PD4_7 bits in the PD4 register. When writing to the PD4_0 to PD4_2, PD4_6 and PD4_7 bits in the PD4 register, write 0 (input mode). When read, its content is 0.
- 3. Write to the PD0 register with the next instruction after that used to set the PRC2 bit in the PRCR register to 1 (write enabled).

1. Pulled up by setting the PU15 bit in the PUR0 register to 1.

7.5 Unassigned Pin Handling

Table 7.48 lists Unassigned Pin Handling.

Table 7.48 Unassigned Pin Handling

Pin Name	Connection
Ports P0 to P2, P3_0,	After setting to input mode, connect every pin to VSS via a resistor (pull-
P3_1, P3_3 to P3_7,	down) or connect every pin to VCC via a resistor (pull-up). ⁽²⁾
P4_3 to P4_5, P6	• After setting to output mode, leave these pins open. (1,2)
Ports P4_6, P4_7	Connect to VCC via a resistor (pull-up) ⁽²⁾
Port P4_2/VREF	Connect to VCC
RESET(3)	Connect to VCC via a resistor (pull-up)(2)

NOTES:

- 1. If these ports are set to output mode and left open, they remain input mode until they are switched to output mode by a program. The voltage level of these pins may be undefined and the power current may increase while the ports remain input mode.
 - The content of the direction registers may change due to noise or program runaway caused by noise. In order to enhance program reliability, the program should periodically repeat the setting of the direction registers.
- 2. Connect these unassigned pins to the MCU using the shortest wire length (2 cm or less) as possible.
- 3. When power-on reset function is in use.

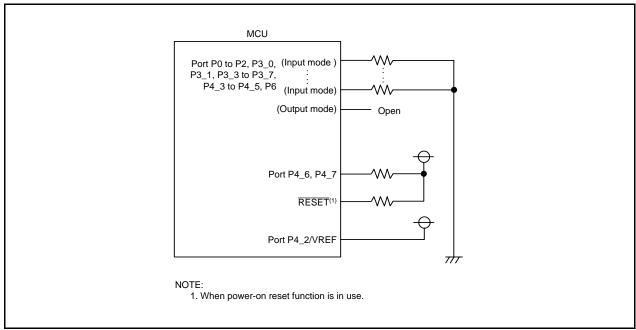

Figure 7.13 Unassigned Pin Handling

8. **Processor Mode**

8.1 **Processor Modes**

Single-chip mode can be selected as processor mode.

Table 8.1 lists Features of Processor Mode. Figure 8.1 shows the PM0 Register and Figure 8.2 shows the PM1 Register.

Table 8.1 **Features of Processor Mode**

Processor Mode	Accessible Areas	Pins Assignable as I/O Port Pins
Single-chip mode	SFR, internal RAM, internal ROM	All pins are I/O ports or peripheral
		function I/O pins

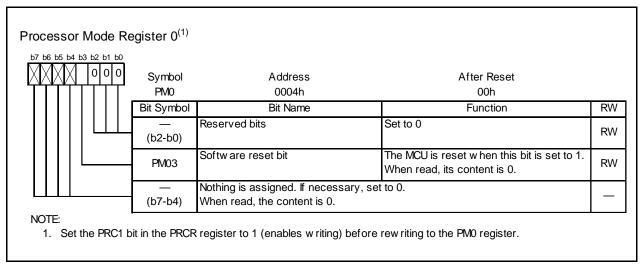

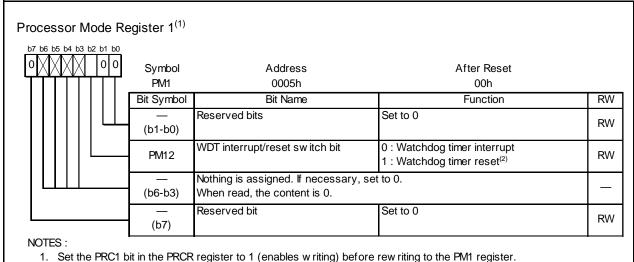

Figure 8.1 PM0 Register

2. The PM12 bit is set to 1 by a program (it remains unchanged even if it is set to 0).

When the CSPRO bit in the CSPR register is set to 1 (selects count source protect mode), the PM12 bit is automatically set to 1.

Figure 8.2 PM1 Register

9. Bus

The bus cycles differ when accessing ROM/RAM, and when accessing SFR.

Table 9.1 lists Bus Cycles by Access Space of the R8C/22 Group and Table 9.2 lists Bus Cycles by Access Space of the R8C/23 Group.

The ROM/RAM and SFR are connected to the CPU through an 8-bit bus. When accessing in word-(16 bits) unit, these area are accessed twice in 8-bit unit.

Table 9.3 lists Access Unit and Bus Operations.

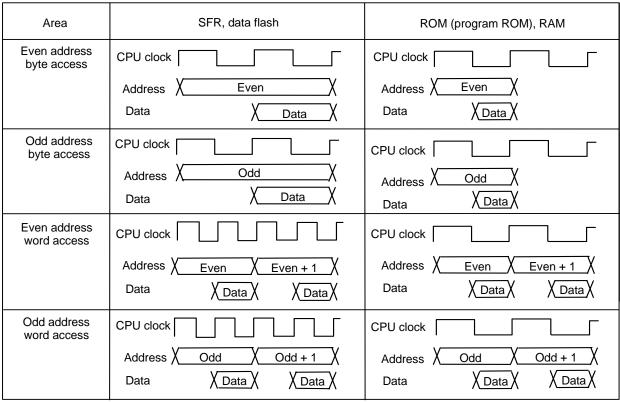

Table 9.1 Bus Cycles by Access Space of the R8C/22 Group

Access Area	Bus Cycle
SFR	2 cycles of CPU clock
ROM/RAM	1 cycle of CPU clock

Table 9.2 Bus Cycles by Access Space of the R8C/23 Group

Access Area	Bus Cycle
SFR/Data flash	2 cycles of CPU clock
Program ROM/RAM	1 cycle of CPU clock

Table 9.3 Access Unit and Bus Operations

However, only following SFRs are connected with the 16-bit bus:

Timer RD: registers TRDi (i = 0, 1), TRDGRAi, TRDGRBi, TRDGRCi, and TRDGRDi

Therefore, they are accessed once in 16-bit units. The bus operation is the same as "Area: SFR, data flash, even address byte access" in Table 9.3 Access Unit and Bus Operations, and 16-bit data is accessed at a time.

10. Clock Generation Circuit

The clock generation circuit has:

- XIN clock oscillation circuit
- Low-speed on-chip oscillator
- High-speed on-chip oscillator

Table 10.1 lists Specifications of Clock Generation Circuit. Figure 10.1 shows a Clock Generation Circuit. Figures 10.2 to 10.8 show clock-associated registers.

Table 10.1 Specifications of Clock Generation Circuit

Item	XIN Clock	On-Chip Oscillator				
item	Oscillation Circuit	High-Speed On-Chip Oscillator	Low-Speed On-Chip Oscillator			
Use of Clock	CPU clock source Peripheral function clock source	CPU clock source Peripheral function clock source CPU and peripheral function clock sources when XIN clock stops oscillating	CPU clock source Peripheral function clock source CPU and peripheral function clock sources when XIN clock stops oscillating			
Clock Frequency	0 to 20 MHz	Approx. 40 MHz ⁽³⁾	Approx. 125 kHz			
Connectable Oscillator	Ceramic resonator Crystal oscillator	_	_			
Oscillator Connect Pins	XIN, XOUT ⁽¹⁾	_(1)	_(1)			
Oscillation Stop, Restart Function	Usable	Usable	Usable			
Oscillator Status After Reset	Stop	Stop	Oscillate			
Others	Externally generated clock can be input ⁽²⁾	_	_			

NOTES:

- 1. These pins can be used as P4_6 and P4_7 when using the on-chip oscillator clock as the CPU clock while the XIN clock oscillation circuit is not used.
- 2. Set the CM05 bit in the CM0 register to 1 (main clock stops) and the CM13 bit in the CM1 register to 1 (XIN-XOUT pin) when the external clock is input.
- 3. The clock frequency is automatically set to up to 20 MHz by a driver when using the high-speed onchip oscillator as the CPU clock source.

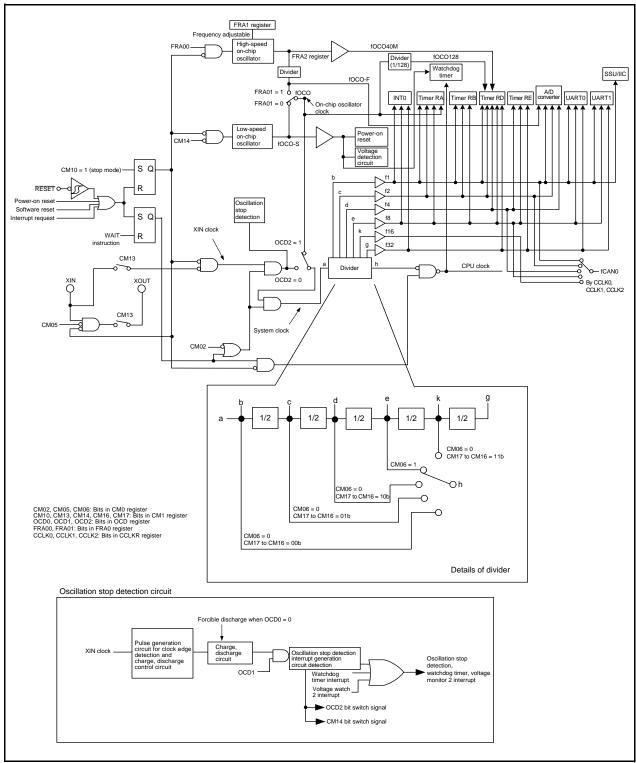

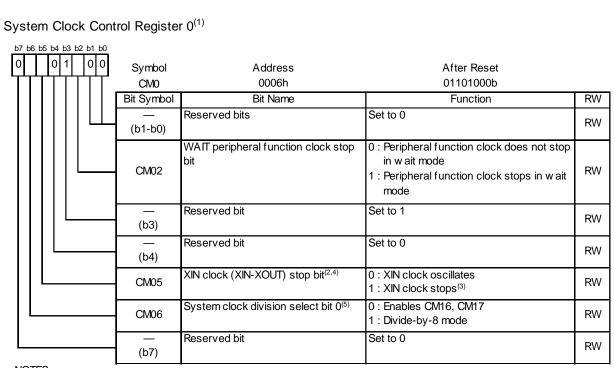

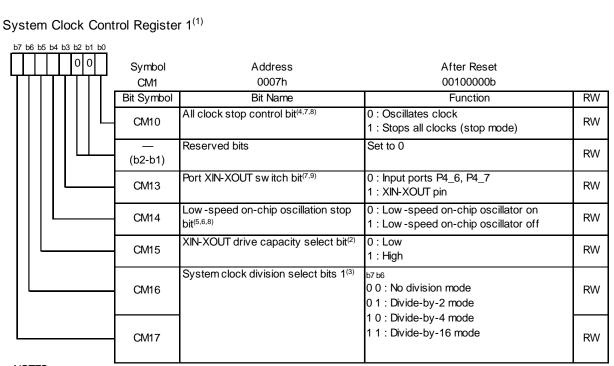

Figure 10.1 Clock Generation Circuit

NOTES

- 1. Set the PRC0 bit in the PRCR register to 1 (enables writing) before rewriting to the CM0 register.
- 2. The CM05 bit is to stop the XIN clock when the high-speed on-chip oscillator mode, low-speed on-chip oscillator mode is selected. Do not use this bit for whether the XIN clock is stopped. To stop the XIN clock, set the bits in the following orders:
 - (a) Set the OCD0 and OCD1 bits in the OCD register to 00b.
 - (b) Set the OCD2 bit to 1 (selects on-chip oscillator clock).
- 3. During external clock input, only the clock oscillation buffer is turned off and clock input is acknowledged.
- 4. P4_6 and P4_7 can be used as input ports when the CM05 bit is set to 1 (XIN clock stops) and the CM13 bit in the CM1 register is set to 0 (P4_6, P4_7).
- 5. When entering stop mode, the CM06 bit is set to 1 (divide-by-8 mode).

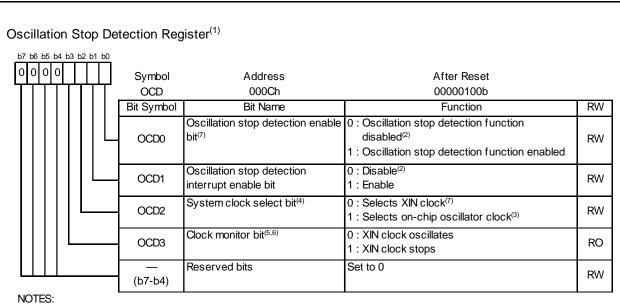

Figure 10.2 CM0 Register

NOTES:

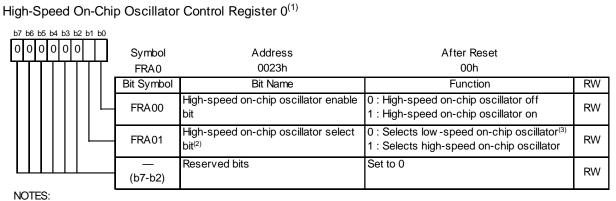

- 1. Set the PRC0 bit in the PRCR register to 1 (enables writing) before rewriting to the CM1 register.
- 2. When entering stop mode, the CM15 bit is set to 1 (drive capacity high).
- 3. When the CM06 bit is set to 0 (CM16, CM17 bits enabled), the CM16 to CM17 bits become enabled.
- 4. If the CM10 bit is 1 (stop mode), the internal feedback resistor becomes disabled.
- 5. When the OCD2 bit is set to 0 (selects XIN clock), the CM14 bit is set to 1 (stops low-speed on-chip oscillator). When the OCD2 bit is set to 1 (selects on-chip oscillator clock), the CM14 bit is set to 0 (low-speed on-chip oscillator on). It remains unchanged even if it is set to 1.
- 6. When using the low voltage 2 detection interrupt (when using the digital filter), set the CM14 bit to 0 (low-speed on-chip oscillator on).
- 7. When the CM10 bit is set to 1 (stop mode) and the CM13 bit is set to 1 (XIN-XOUT pin), the XOUT (P4_7) pin becomes "H". When the CM13 bit is set to 0 (input ports, P4_6, P4_7), the P4_7 (XOUT) enters input mode.
- In count source protect mode (Refer to 13.2 Count Source Protection Mode Enabled), the value remains unchanged even if the CM10 and CM14 bits are set.
- 9. Once the CM13 bit is set to 1, it can not to 0 in a program.

Figure 10.3 CM1 Register

- 1. Set the PRC0 bit in the PRCR register to 1 (enables writing) before rewriting to the OCD register.
- 2. Set the OCD1 to OCD0 bits to 00b before entering stop and high-speed on-chip oscillator mode, low-speed on-chip oscillator mode (XIN clock stops). Set the OCD1 to OCD0 bits to 00b when the FRA01 bit in the FRA0 register is set to 1 (selects high-speed on-chip oscillator).
- 3. The CM14 bit is set to 0 (low-speed on-chip oscillator on) if the OCD2 bit is set to 1 (selects on-chip oscillator clock).
- 4. The OCD2 bit is automatically set to 1 (selects on-chip oscillator clock) if a XIN clock oscillation stop is detected while the OCD1 to OCD0 bits are set to 11b. If the OCD3 bit is set to 1 (XIN clock stops), the OCD2 bit remains unchanged when writing 0 (selects XIN clock).
- 5. The OCD3 bit is enabled when the OCD0 bit is set to 1 (oscillation stop detection function enabled).
- The OCD3 bit remains 0 (XIN clock oscillates) if the OCD1 to OCD0 bits are set to 00b.
- 7. Refer to Figure 10.14 Procedure for Switching Clock Source from Low-Speed On-Chip Oscillator to XIN Clock for the sw itching procedure when the XIN clock re-oscillates after detecting an oscillation stop.

Figure 10.4 **OCD Register**

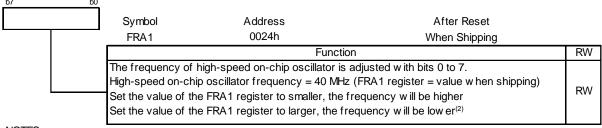

- 1. Set the PRC0 bit in the PRCR register to 1 (enables w riting) before rew riting to the FRA0 register.
- 2. Change the FRA01 bit under the following conditions.
 - FRA00 = 1 (high-speed on-chip oscillation)
 - The CM14 bit in the CM1 register = 0 (low-speed on-chip oscillator on)
 - Bits FRA22 to FRA20 in the FRA2 register

All divide ratio mode settings are supported when VCC = 3.0 V to 5.5 V (D, J version) 000b to 111b Divide ratio of 4 or more when VCC = 2.7 V to 5.5 V and K version

3. When setting the FRA01 bit to 0 (selects low-speed on-chip oscillator), do not set the FRA00 bit to 0 (40MHz on-chip oscillator off) at the same time.

Set the FRA00 bit to 0 after setting the FRA01 bit to 0.

High-Speed On-Chip Oscillator Control Register 1(1)

NOTES:

- 1. Set the PRC0 bit in the PRCR register to 1 (w rite enable) before rew riting to the FRA1 register. When adjusting the FRA1 register, set the value of the FRA1 register to 40 MHz and below.
- 2. When changing the values of the FRA1 register, adjust the FRA1 register so that the frequency of the high-speed on-chip oscillator clock will be 40 MHz or less.

Figure 10.5 Registers FRA0 and FRA1

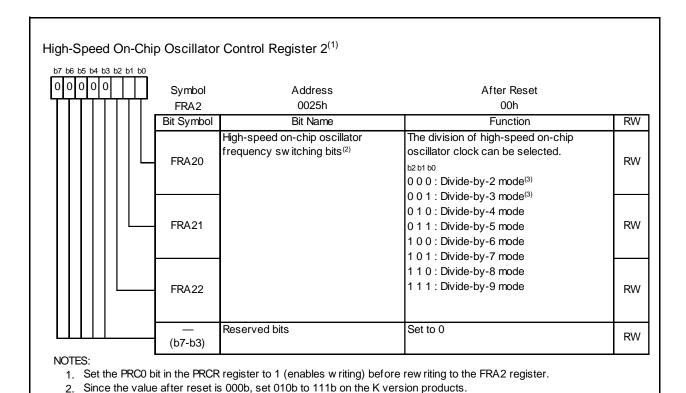

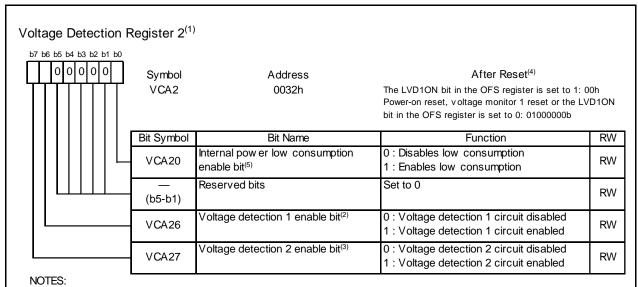

Figure 10.6 FRA2 Register

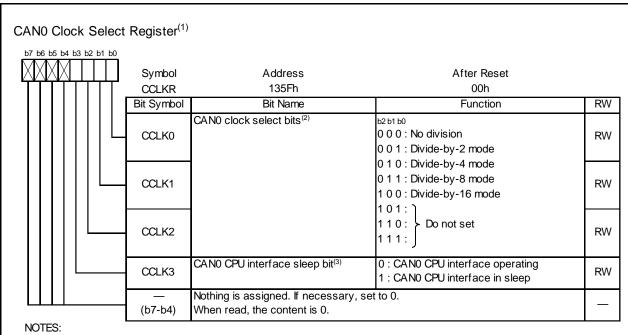

3. Do not set on the K version products.

- 1. Set the PRC3 bit in the PRCR register to 1 (enables w riting) before w riting to the VCA2 register.
- 2. When using the voltage monitor 1 reset, set the VCA26 bit to 1.

 After the VCA26 bit is set from 0 to 1, the voltage detection circuit elapses for td(E-A) before starting operation.
- 3. When using the voltage monitor 2 interrupt/reset or the VCA13 bit in the VCA1 register, set the VCA27 bit to 1. After the VCA27 bit is from 0 to 1, the voltage detection circuit elapses for td(E-A) before starting operation.
- 4. The VCA27 bit remains unchanged after software reset, watchdog timer reset, and voltage monitor 2 reset.
- 5. Use the VCA20 bit only when entering to wait mode. To set the VCA20 bit, follow the procedure shown in Figure 10.11 Procedure for Enabling Reduced Internal Power Consumption Using VCA20 bit.

Figure 10.7 VCA2 Register

- 1. Set the PRC0 bit in the PRCR register to 1 (enables writing) before rewriting to the CCLKR register.
- 2. Set to the CCLK2, CCLK1, CCLK0 bits, only when the Reset bit in the COCTLR register is 1 (reset/initialization mode).
- 3. When set the CCLK3 bit to 1 (CAN0 CPU interface operating), set to the Sleep bit in the C0CTLR register to 1 before setting the CCLK3 bit.

Figure 10.8 CCLKR Register

The following describes the clocks generated by the clock generation circuit.

10.1 XIN Clock

This clock is supplied by a XIN clock oscillation circuit. This clock is used as the clock source for the CPU and peripheral function clocks. The XIN clock oscillation circuit is configured by connecting a resonator between the XIN and XOUT pins. The XIN clock oscillation circuit contains a feedback resistor, which is disconnected from the oscillation circuit in stop mode in order to reduce the amount of power consumed in the chip. The XIN clock oscillation circuit may also be configured by feeding an externally generated clock to the XIN pin.

Figure 10.9 shows Examples of XIN Clock Connection Circuit. During or after reset, the XIN clock stops.

The XIN clock starts oscillating when the CM05 bit in the CM0 register is set to 0 (XIN clock on) after setting the CM13 bit in the CM1 register to 1 (XIN- XOUT pin).

To use the XIN clock for the CPU clock source, set the OCD2 bit in the OCD register to 0 (select XIN clock) after the XIN clock is oscillating stably.

The power consumption can be reduced by setting the CM05 bit in the CM0 register to 1 (stop XIN clock) if the OCD2 bit is set to 1 (select on-chip oscillator clock).

When the clocks externally generated to the XIN pin are input, a XIN clock does not stop if setting the CM05 bit to 1. If necessary, use an external circuit to stop the clock.

In stop mode, all clocks including the XIN clock stop. Refer to 10.4 Power Control for details.

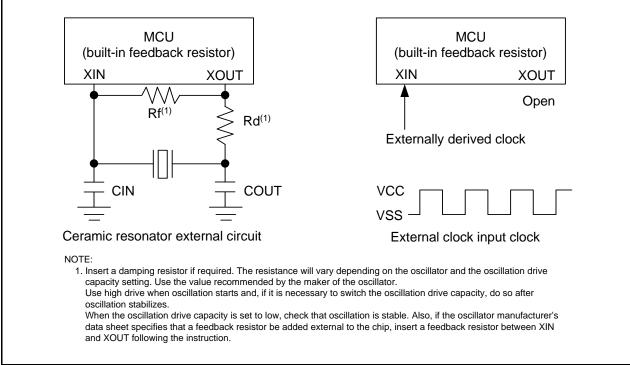

Figure 10.9 Examples of XIN Clock Connection Circuit

10.2 On-Chip Oscillator Clocks

This clock is supplied by an on-chip oscillator. The on-chip oscillator contains a high-speed on-chip oscillator and a low-speed on-chip oscillator. Either an on-chip oscillator clock is selected by the FRA01 bit in the FRA0 register.

10.2.1 Low-Speed On-Chip Oscillator Clock

The clock generated by the low-speed on-chip oscillator is used as the clock source for the CPU clock, peripheral function clock, fOCO, and fOCO-S.

After reset, the on-chip oscillator clock generated by the low-speed on-chip oscillator by divide-by-8 is selected for the CPU clock.

If the XIN clock stops oscillating when the OCD1 to OCD0 bits in the OCD register are set to 11b, the low-speed on-chip oscillator automatically starts operating, supplying the necessary clock for the MCU.

The frequency of the low-speed on-chip oscillator varies depending on the supply voltage and the operating ambient temperature. The application products must be designed with sufficient margin to accommodate the frequency range.

10.2.2 High-Speed On-Chip Oscillator Clock

The clock generated by the high-speed on-chip oscillator is used as the clock source for the CPU clock, peripheral function clock, fOCO, fOCO-F and fOCO40M.

To use the high-speed on-chip oscillator clock as the clock source of the CPU clock, peripheral clock, fOCO, and fOCO-F, set bits FRA20 to FRA22 in the FRA2 register as follows;

All divide ratio mode settings are supported when VCC = 3.0 V to 5.5 V (D, J version)000b to 111b Divide ratio of 4 or more when VCC = 2.7 V to 5.5 V and K version 010b to 111b

After reset, the on-chip oscillator clock generated by the high-speed on-chip oscillator stops. The oscillation starts by setting the FRA00 bit in the FRA0 register to 1 (high-speed on-chip oscillator on). The frequency can be adjusted by the FRA1 and FRA2 registers.

Since there are differences in the amount of frequency adjustment among the bits in the FRA1 register, make adjustments by changing the settings of individual bits.

Adjust the amount of high-speed on-chip oscillator frequency to 40 MHz and below by setting the FRA1 register.

10.3 CPU Clock and Peripheral Function Clock

There are two type clocks: a CPU clock to operate the CPU and a peripheral function clock to operate the peripheral functions. Refer to **Figure 10.1 Clock Generation Circuit**.

10.3.1 System Clock

The system clock is a clock source for the CPU and peripheral function clocks. The XIN clock or on-chip oscillator clock can be selected.

10.3.2 CPU Clock

The CPU clock is an operating clock for the CPU and watchdog timer.

The system clock can be the divide-by-1 (no division), 2, 4, 8 or 16 to produce the CPU clock. Use the CM06 bit in the CM0 register and the CM16 to CM17 bits in the CM1 register to select the value of the division.

After reset, the low-speed on-chip oscillator clock divided-by-8 provides the CPU clock.

When entering stop mode, the CM06 bit is set to 1 (divide-by-8 mode).

10.3.3 Peripheral Function Clock (f1, f2, f4, f8, f32, and fCAN0)

The peripheral function clock is operating clock for the peripheral functions.

The clock fi (i = 1, 2, 4, 8, 32) is generated by the system clock divided-by-i. The clock fi is used for timers RA, RB, RD, RE, serial interface, A/D converter and CAN module.

The clock fCAN0 is generated by the f1 clock divided-by-1(no-division), -2, -4, -8, or -16, and is used for CAN module.

When the WAIT instruction is executed after setting the CM02 bit in the CM0 register to 1 (peripheral function clock stops in wait mode), the clock fi and fCAN0 stop.⁽¹⁾

NOTE:

1. fCAN0 clock stops at high level in CAN0 sleep mode.

10.3.4 fOCO

fOCO is operating clocks for the peripheral functions.

The fOCO run at the same frequency as the on-chip oscillator clock and can be used as the source for the timer RA.

When the WAIT instruction is executed, the clocks fOCO does not stop.

10.3.5 fOCO40M

fOCO40M is used as the count source for the timer RD. The fOCO40M is generated by the high-speed on-chip oscillator and provided by setting the FRA00 bit to 1.

When the WAIT instruction is executed, the clock fOCO40M does not stop.

fOCO40M can be used with supply voltage VCC = 3.0 to 5.5V.

10.3.6 fOCO-F

fOCO-F is used as the count source for the AD converter. The fOCO-F is generated by the high-speed on-chip oscillator and provided by setting the FRA00 bit to 1.

When the WAIT instruction is executed, the clock fOCO-F does not stop.

10.3.7 fOCO-S

fOCO-S is an operating clock for the watchdog timer and voltage detection circuit. When setting the CM14 bit to 0 (low-speed on-chip oscillator on) using the clock generated by the low-speed on-chip oscillator, the fOCO-S can be provided. When the WAIT instruction is executed or in count source protect mode of the watchdog timer, the clock fOCO-S does not stop.

10.3.8 fOCO128

fOCO128 is generated by fOCO divided-by-128. The clock fOCO128 is used for capture signal of timer RD (channel 0).

10.4 Power Control

There are three power control modes. All modes other than wait and stop modes are referred to as standard operating mode.

10.4.1 Standard Operating Mode

Standard operating mode is further separated into three modes.

In standard operating mode, the CPU clock and the peripheral function clock are supplied to operate the CPU and the peripheral function clocks. Power consumption control is enabled by controlling the CPU clock frequency. The higher the CPU clock frequency, the more processing power increases. The lower the CPU clock frequency, the more power consumption decreases. When unnecessary oscillator circuits stop, power consumption is further reduced.

Before the clock sources for the CPU clock can be switched over, the new clock source after switching needs to be stabilized and oscillated. If the new clock source is the XIN clock, allow sufficient wait time in a program until an oscillation is stabilized before exiting.

Table 10.2 Settings and Modes of Clock Associated Bits

Modes		OCD Register	CM1 Register			CM0 Register		FRA0 Register	
		OCD2	CM17, CM16	CM14	CM13	CM06	CM05	FRA01	FRA00
High-speed clock mode	No division	0	00b	_	1	0	0	_	-
	Divide-by-2	0	01b	_	1	0	0	_	-
	Divide-by-4	0	10b	_	1	0	0	_	-
	Divide-by-8	0	_	_	1	1	0	_	_
	Divide-by-16	0	11b	_	1	0	0	_	-
High-speed on-chip oscillator mode	No division	1	00b	_	-	0	_	1	1
	Divide-by-2	1	01b	_	_	0	-	1	1
	Divide-by-4	1	10b	_	_	0	-	1	1
	Divide-by-8	1	_	_	_	1	_	1	1
	Divide-by-16	1	11b	_	-	0	_	1	1
Low-speed on-chip oscillator mode	No division	1	00b	0	_	0	-	0	-
	Divide-by-2	1	01b	0	_	0	-	0	-
	Divide-by-4	1	10b	0	_	0	_	0	_
	Divide-by-8	1		0	_	1	-	0	_
	Divide-by-16	1	11b	0	_	0	ì	0	_

^{-:} can be 0 or 1, no change in outcome.

10.4.1.1 High-Speed Clock Mode

The XIN clock divided-by-1 (no division), -2, -4, -8, or -16 provides the CPU clock. Set the CM06 bit to 1 (divide-by-8 mode) when transiting to high-speed on-chip oscillator mode, low-speed on-chip oscillator mode. If the CM14 bit is set to 0 (low-speed on-chip oscillator on) or the FRA00 bit in the FRA0 register is set to 1 (high-speed on-chip oscillator on), the fOCO can be used for timers RA.

When the FRA00 bit is set to 1, fOCO40M can be used for timer RD.

When the CM14 bit is set to 0 (low-speed on-chip oscillator on), fOCO-S can be used for the watchdog timer and voltage detection circuit.

10.4.1.2 High-Speed On-Chip Oscillator Mode

The high-speed on-chip oscillator is used as the on-chip oscillator clock when the FRA00 bit in the FRA0 register is set to 1 (high-speed on-chip oscillator on) and the FRA01 bit in the FRA0 register is set to 1. The on-chip oscillator divided-by-1 (no division), -2, -4, -8 or -16 provides the CPU clock. Set the CM06 bit to 1 (divide-by-8) when transiting to high-speed clock mode.

If the FRA00 bit is set to 1, fOCO40M can be used for timer RD.

When the CM14 bit is set to 0 (low-speed on-chip oscillator on), fOCO-S can be used for the watchdog timer and voltage detection circuit.

10.4.1.3 Low-Speed On-Chip Oscillator Mode

If the CM14 bit in the CM1 register is set to 0 (low-speed on-chip oscillator on) or the FRA01bit in the FRA0 register is set to 0, the low-speed on-chip oscillator provides the on-chip oscillator clock.

The on-chip oscillator clock divided-by-1 (no division), -2, -4, -8 or -16 provides the CPU clock. The on-chip oscillator clock is also the clock source for the peripheral function clocks. Set the CM06 bit to 1 (divide-by-8 mode) when transiting to high-speed clock mode. When the FRA00 bit is set to 1, fOCO40M can be used for timer RD. When the CM14 bit is set to 0 (low-speed on-chip oscillator on), fOCO-S can be used for the watchdog timer and voltage detection circuit.

In this mode, stopping the XIN clock and high-speed on-chip oscillator, and setting the FMR47 bit in the FMR4 register to 1 (flash memory low consumption current read mode enabled) enables low consumption operation.

To enter wait mode from low-speed on-chip oscillator mode, setting the VCA20 bit in the VCA2 register to 1 (internal power low consumption enabled) enables lower consumption current in wait mode.

When enabling reduced internal power consumption using the VCA20 bit, follow **Figure 10.11 Procedure for Enabling Reduced Internal Power Consumption Using VCA20 bit**.

10.4.2 Wait Mode

Since the CPU clock stops in wait mode, the CPU operated in the CPU clock and the watchdog timer when count source protection mode is disabled stops. The XIN clock and on-chip oscillator clock do not stop and the peripheral functions using these clocks maintain operating.

10.4.2.1 Peripheral Function Clock Stop Function

If the CM02 bit is set to 1 (peripheral function clock stops in wait mode), the f1, f2, f4, f8, f32, and fCAN0 clocks stop in wait mode. The power consumption can be reduced.

10.4.2.2 Entering Wait Mode

The MCU enters wait mode when the WAIT instruction is executed.

When the OCD2 bit in the OCD register is set to 1 (on-chip oscillator selected as system clock), set the OCD1bit in the OCD register to 0 (oscillation stop detection interrupt disabled) before executing the WAIT instruction.

If the MCU enters wait mode while the OCD1 bit is set to 1 (oscillation stop detection interrupt enabled), current consumption is not reduced because the CPU clock does not stop.

10.4.2.3 Pin Status in Wait Mode

The I/O port is the status before wait mode was entered is maintained.

10.4.2.4 Exiting Wait Mode

The MCU exits wait mode by a hardware reset or peripheral function interrupt. When using a hardware reset to exit wait mode, set the ILVL2 to ILVL0 bits for the peripheral function interrupts to 000b (interrupts disabled) before executing the WAIT instruction.

The peripheral function interrupts are affected by the CM02 bit. When the CM02 bit is set to 0 (peripheral function clock does not stop in wait mode), all peripheral function interrupts can be used to exit wait mode. When the CM02 bit is set to 1 (peripheral function clock stops in wait mode), the peripheral functions using the peripheral function clock stop operating and the peripheral functions operated by external signals can be used to exit wait mode.

Table 10.3 lists Interrupts to Exit Wait Mode and Usage Conditions.

Table 10.3 Interrupts to Exit Wait Mode and Usage Conditions

Interrupt	CM02 = 0	CM02 = 1
Serial Interface Interrupt	Usable when operating with	Usable when operating with external
	internal or external clock	clock
Clock Synchronous Serial I/O	Usable in all modes	- (Do not use)
with Chip Select Interrupt /		
I ² C Bus Interface Interrupt		
Key Input Interrupt	Usable	Usable
A/D Conversion Interrupt	Usable in one-shot mode	- (Do not use)
Timer RA Interrupt	Usable in all modes	Can be used if there is no filter in event
		counter mode.
		Usable by selecting fOCO as count
		source.
Timer RB Interrupt	Usable in all modes	- (Do not use)
Timer RD Interrupt	Usable in all modes	Usable by selecting fOCO40M as
		count source
Timer RE Interrupt	Usable in all modes	- (Do not use)
INT Interrupt	Usable	Usable (INT0 to INT3 can be used if
		there is no filter.)
Voltage Monitor 2 Interrupt	Usable	Usable
Oscillation Stop Detection	Usable	- (Do not use)
Interrupt		
CAN0 Wake-Up Interrupt	Usable in CAN sleep mode	Usable in CAN sleep mode

Figure 10.10 shows the Time from Wait Mode to Interrupt Routine Execution.

When using a peripheral function interrupt to exit wait mode, set up the following before executing the WAIT instruction.

- (1) Set the interrupt priority level to the ILVL2 to ILVL0 bits in the interrupt control register of the peripheral function interrupts to use for exiting wait mode. Set the ILVL2 to ILVL0 bits of the peripheral function interrupts not to use for exiting wait mode to 000b (disables interrupt).
- (2) Set the I flag to 1.
- (3) Operate the peripheral function to use for exiting wait mode.

When exiting by a peripheral function interrupt, the time (number of cycles) between interrupt request generation and interrupt routine execution is determined by the settings of the FMSTP bit in the FMR0 register as described in Figure 10.10.

The CPU clock, when exiting wait mode by a peripheral function interrupt, is the same clock as the CPU clock when the WAIT instruction is executed.

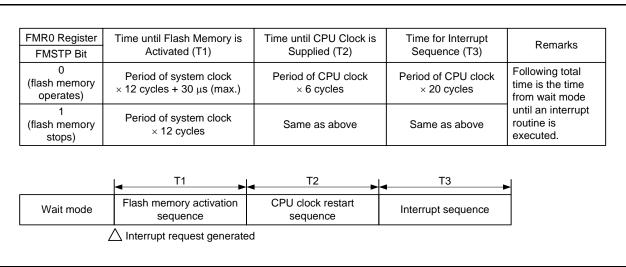

Figure 10.10 Time from Wait Mode to Interrupt Routine Execution

10.4.2.5 Reducing Internal Power Consumption

Internal power consumption can be reduced by using low-speed on-chip oscillator mode. Figure 10.11 shows the Procedure for Enabling Reduced Internal Power Consumption Using VCA20 bit. When enabling reduced internal power consumption using the VCA20 bit, follow **Figure 10.11 Procedure for Enabling Reduced Internal Power Consumption Using VCA20 bit**.

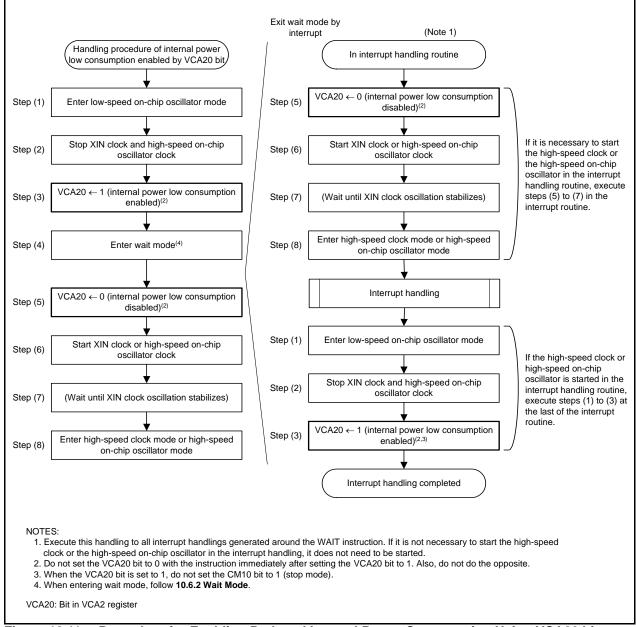

Figure 10.11 Procedure for Enabling Reduced Internal Power Consumption Using VCA20 bit

10.4.3 **Stop Mode**

Since the oscillator circuits stop in wait mode, the CPU clock and peripheral function clock stop and the CPU and peripheral functions clocked by these clocks stop operating. The least power required to operate the MCU is in stop mode. If the voltage applied to the VCC pin is VRAM or more, the internal RAM is maintained.

The peripheral functions clocked by external signals maintain operating.

Table 10.4 lists Interrupts to Exit Stop Mode and Usage Conditions.

Table 10.4 Interrupts to Exit Stop Mode and Usage Conditions

Interrupt	Usage Conditions
Key Input Interrupt	-
INTO to INT3 Interrupt	Can be used if there is no filter
Timer RA Interrupt	When there is no filter and external pulse is counted in event counter mode
Serial Interface Interrupt	When external clock is selected
Voltage Monitor 2 Interrupt	Usable in digital filter disabled mode (VW2C1 bit in VW2C register is set to 1)
CAN0 Wake-Up Interrupt	Usable in CAN sleep mode

10.4.3.1 Entering Stop Mode

The MCU enters stop mode by setting the CM10 bit in the CM1 register to 1 (all clocks stop). At the same time, the CM06 bit in the CM0 register is set to 1 (divide-by-8 mode) and the CM15 bit in the CM10 register is set to 1 (drive capability HIGH of XIN clock oscillator circuit).

When using stop mode, set the OCD1 to OCD0 bits to 00b before entering stop mode.

10.4.3.2 Pin Status in Stop Mode

The status before entering wait mode is maintained.

However, when the CM13 bit in the CM1 register is set to 1 (XIN-XOUT pins), the XOUT(P4_7) pin is held "H". When the CM13 bit is set to 0 (input port P4_6 and P4_7), the P4_7(XOUT) is held in input status.

10.4.3.3 Exiting Stop Mode

The MCU exits stop mode by a reset or peripheral function interrupt.

When using a reset to exit stop mode, set the ILVL2 to ILVL0 bits for the peripheral function interrupts to 000b (disables interrupts) before setting the CM10 bit to 1.

Figure 10.12 shows the Time from Stop Mode to Interrupt Routine Execution.

When using a peripheral function interrupt to exit stop mode, set up the following before setting the CM10 bit to 1.

- (1) Set the interrupt priority level to the ILVL2 to ILVL0 bits of the peripheral function interrupts to use for exiting stop mode. Set the ILVL2 to ILVL0 bits of the peripheral function interrupts not to use for exiting stop mode to 000b (disables interrupt).
- (2) Set the I flag to 1.
- (3) Operates the peripheral function to use for exiting stop mode.

 When exiting by a peripheral function interrupt, the interrupt sequence is executed when an interrupt request is generated and the CPU clock supply is started.

If the clock used immediately before stop mode is a system clock and stop mode is exited by a peripheral function interrupt, the CPU clock becomes the previous system clock divided by 8.

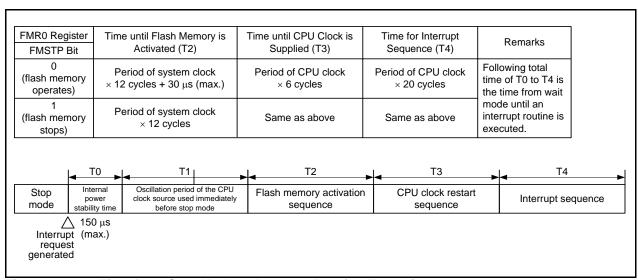

Figure 10.12 Time from Stop Mode to Interrupt Routine Execution

Figure 10.13 shows the State Transitions in Power Control Mode.

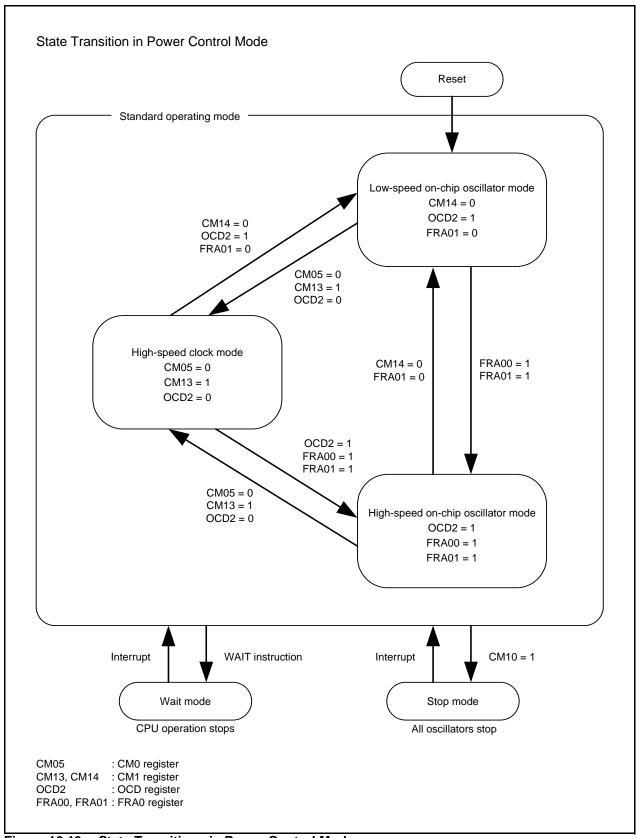

Figure 10.13 State Transitions in Power Control Mode

10.5 Oscillation Stop Detection Function

The oscillation stop detection function is a function to detect the stop of the XIN clock oscillating circuit. The oscillation stop detection function can be enabled and disabled by the OCD0 bit in the OCD register.

Table 10.5 lists the Specifications of Oscillation Stop Detection Function.

When the XIN clock is the CPU clock source and the OCD1 to OCD0 bits are set to 11b, the system is placed in the following state if the XIN clock stops.

- OCD2 bit in OCD register = 1 (on-chip oscillator clock selected)
- OCD3 bit in OCD register = 1 (XIN clock stops)
- CM14 bit in CM1 register = 0 (low-speed on-chip oscillator oscillates)
- Oscillation stop detection interrupt request is generated

Table 10.5 Specifications of Oscillation Stop Detection Function

Item	Specification
Oscillation Stop Detection Clock and	$f(XIN) \ge 2 MHz$
Frequency Bandwidth	
Enabled Condition for Oscillation Stop	Set OCD1 to OCD0 bits to 11b
Detection Function	
Operation at Oscillation Stop Detection	Oscillation stop detection interrupt is generated

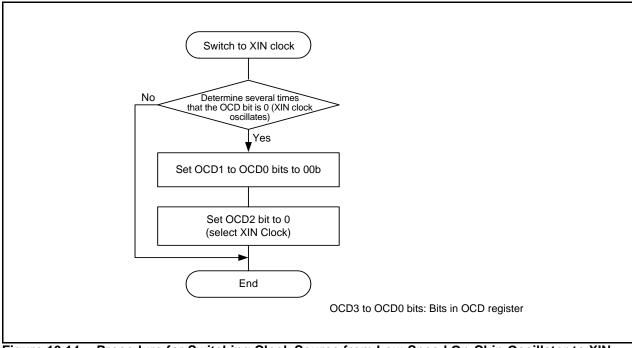

10.5.1 How to Use Oscillation Stop Detection Function

- The oscillation stop detection interrupt shares the vector with the voltage monitor 2 interrupt and the watchdog timer interrupt. When using the oscillation stop detection interrupt and watchdog timer interrupt, the interrupt cause needs to be determined.
 - Table 10.6 lists the Determining Interrupt Source for Oscillation Stop Detection, Watchdog Timer, Voltage Monitor 1, and Voltage Monitor 2 Interrupts.
 - Figure 10.15 shows an Example of Determining Interrupt Source for Oscillation Stop Detection, Watchdog Timer, Voltage Monitor 1, or Voltage Monitor 2 Interrupt.
- When the XIN clock is re-oscillated after oscillation stop, switch the XIN clock to the clock source of the CPU clock and peripheral functions by a program.
 - Figure 10.14 shows the Procedure for Switching Clock Source from Low-Speed On-Chip Oscillator to XIN Clock.
- To enter wait mode while using the oscillation stop detection function, set the CM02 bit to 0 (peripheral function clock does not stop in wait mode).
- Since the oscillation stop detection function is a function preparing to stop the XIN clock by the external cause, set the OCD1 to OCD0 bits to 00b when the XIN clock stops or oscillates in the program, that is stop mode is selected or the CM05 bit is changed.
- This function cannot be used when the XIN clock frequency is less than 2 MHz. Set the OCD1 to OCD0 bits to 00b.
- When using the low-speed on-chip oscillator clock for the CPU clock and clock sources of peripheral functions after detecting the oscillation stop, set the FRA01 bit in the FRA0 register to 0 (low-speed on-chip oscillator selected) and the OCD1 to OCD0 bits to 11b.
 - When using the high-speed on-chip oscillator clock for the CPU clock and clock sources of peripheral functions after detecting the oscillation stop, set the FRA00 bit to 1 (high-speed on-chip oscillator on) and the FRA01 bit to 1 (high-speed on-chip oscillator selected) and the OCD1 to OCD0 bits to 11b.

Table 10.6 Determining Interrupt Source for Oscillation Stop Detection, Watchdog Timer, Voltage Monitor 1, and Voltage Monitor 2 Interrupts

Generated Interrupt Source	Bit Showing Interrupt Cause
Oscillation Stop Detection	(a) OCD3 bit in OCD register = 1
((a) or (b))	(b) OCD1 to OCD0 bits in OCD register = 11b and the OCD2 bit = 1
Watchdog Timer	VW2C3 bit in VW2C register = 1
Voltage Monitor 2	VW2C2 bit in VW2C register = 1

Procedure for Switching Clock Source from Low-Speed On-Chip Oscillator to XIN Figure 10.14 Clock

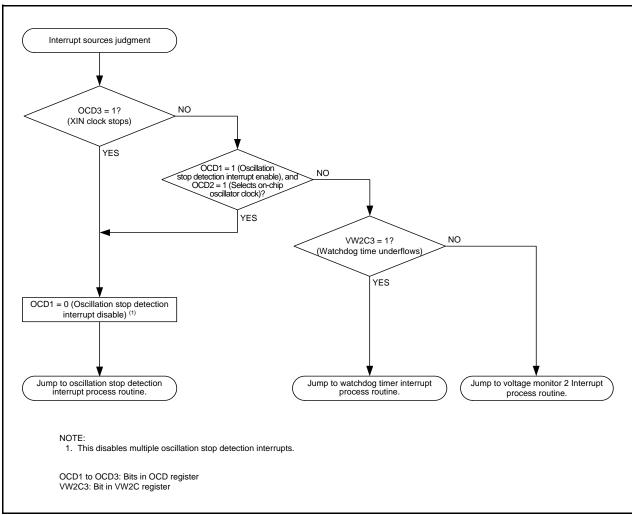

Figure 10.15 Example of Determining Interrupt Source for Oscillation Stop Detection, Watchdog Timer, Voltage Monitor 1, or Voltage Monitor 2 Interrupt

10.6 Notes on Clock Generation Circuit

10.6.1 Stop Mode

When entering stop mode, set the FMR01 bit to "0" (CPU rewrite mode disabled) and the CM10 bit to "1" (stop mode). An instruction queue pre-reads 4 bytes from the instruction which sets the CM10 bit in the CM1 register to "1" (stop mode) and the program stops. Insert at least 4 NOP instructions following the JMP.B instruction after the instruction which sets the CM10 bit to "1".

• Example to enter stop mode

; CPU rewrite mode disabled **BCLR** 1.FMR0 **BSET** 0,PRCR ; Protect disabled ; Enable interrupt **FSET** Ι **BSET** 0,CM1 ; Stop mode LABEL_001 JMP.B LABEL_001: NOP NOP NOP **NOP**

10.6.2 Wait Mode

When entering wait mode, set the FMR01 bit to "0" (CPU rewrite mode disabled) and execute the WAIT instruction. An instruction queue pre-reads 4 bytes from the WAIT instruction and the program stops. Insert at least 4 NOP instructions after the WAIT instruction.

• Example to execute the WAIT instruction

BCLR 1,FMR0 ; CPU rewrite mode disabled
FSET I ; Enable interrupt
WAIT ; Wait mode
NOP
NOP
NOP
NOP
NOP

10.6.3 Oscillation Stop Detection Function

Since the oscillation stop detection function cannot be used if the XIN clock frequency is less than 2 MHz, set the OCD1 to OCD0 bits to 00b.

10.6.4 Oscillation Circuit Constants

Ask the maker of the oscillator to specify the beat oscillation circuit constants on your system.

11. Protection

Protection function protects important registers from being easily overwritten when a program runs out of control. Figure 11.1 shows the PRCR Register. The following lists the registers protected by the PRCR register.

- Registers protected by PRC0 bit: CM0, CM1, OCD, FRA0, FRA1, FRA2, and CCLKR registers
- Registers protected by PRC1 bit: PM0 and PM1 registers
- Registers protected by PRC2 bit: PD0 register
- Registers protected by PRC3 bit: VCA2, VW1C and VW2C registers

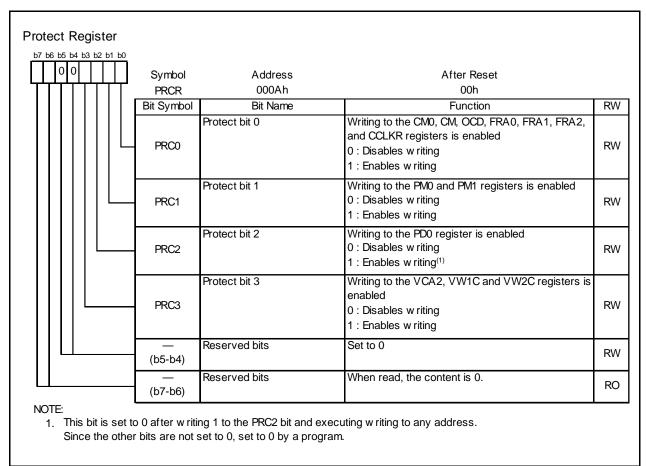

Figure 11.1 PRCR Register

12. Interrupts

12.1 Interrupt Overview

12.1.1 Types of Interrupts

Figure 12.1 shows the Interrupts.

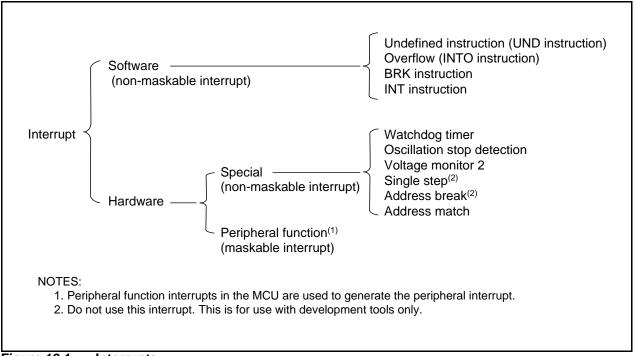

Figure 12.1 Interrupts

• Maskable interrupt: The interrupt enable flag (I flag) enables or disables these interrupt. The interrupt priority order can be changed based on the interrupt priority level.

• Non-maskable interrupt: The interrupt enable flag (I flag) does not enable or disable an interrupt. The interrupt priority order based on interrupt priority level cannot be changed.

Page 96 of 501

12.1.2 Software Interrupts

A software interrupt is generated when an instruction is executed. The software interrupts are non-maskable interrupts.

12.1.2.1 Undefined Instruction Interrupt

The undefined instruction interrupt is generated when the UND instruction is executed.

12.1.2.2 Overflow Interrupt

The overflow interrupt is generated when the O flag is set to 1 (arithmetic operation overflow) and the INTO instruction is executed. Instructions to set the O flag are:

ABS, ADC, ADCF, ADD, CMP, DIV, DIVU, DIVX, NEG, RMPA, SBB, SHA, SUB

12.1.2.3 BRK Interrupt

A BRK interrupt is generated when the BRK instruction is executed.

12.1.2.4 INT Instruction Interrupt

An INT instruction interrupt is generated when the INT instruction is executed. The INT instruction can select software interrupt numbers 0 to 63. Software interrupt numbers 3 to 31 are assigned to the peripheral function interrupt. Therefore, the MCU executes the same interrupt routine when the INT instruction is executed as when a peripheral function interrupt is generated. In software interrupt numbers 0 to 31, the U flag is saved to the stack during instruction execution and set the U flag to 0 (ISP selected) before executing an interrupt sequence. The U flag is restored from the stack when returning from the interrupt routine. In software interrupt numbers 32 to 63, the U flag does not change state during instruction execution, and the selected SP is used.

12.1.3 Special Interrupts

Special interrupts are non-maskable interrupts.

12.1.3.1 Watchdog Timer Interrupt

The watchdog timer interrupt is generated by the watchdog timer. For details, refer to 13. Watchdog Timer.

12.1.3.2 Oscillation Stop Detection Interrupt

Oscillation Stop Detection Interrupt is generated by the oscillation stop detection function. For details of the oscillation stop detection function, refer to **10. Clock Generation Circuit**.

12.1.3.3 Voltage Monitor 2 Interrupt

The voltage monitor 2 interrupt is generated by the voltage detection circuit. For details of the voltage detection circuit, refer to **6. Voltage Detection Circuit**.

12.1.3.4 Single-Step Interrupt, and Address Break Interrupt

Do not use the single-step interrupt. For development tools only.

12.1.3.5 Address Match Interrupt

The address match interrupt is generated immediately before executing an instruction that is stored into an address indicated by the RMAD0 to RMAD1 registers when the AIER0 or AIER1 bit in the AIER register which is set to 1 (address match interrupt enable).

For details of the address match interrupt, refer to 12.5 Address Match Interrupt.

12.1.4 Peripheral Function Interrupt

The peripheral function interrupt is generated by the internal peripheral function of the MCU and a maskable interrupt. Refer to **Table 12.2 Relocatable Vector Tables** for sources of the peripheral function interrupt. For details of the peripheral function, refer to the description of each peripheral function.

12.1.5 Interrupts and Interrupt Vector

There are 4 bytes in one vector. Set the starting address of interrupt routine in each vector table. When an interrupt request is acknowledged, the CPU branches to the address set in the corresponding interrupt vector. Figure 12.2 shows the Interrupt Vector.

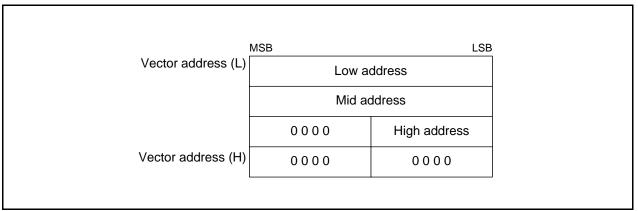

Figure 12.2 Interrupt Vector

12.1.5.1 Fixed Vector Tables

The fixed vector tables are allocated addresses 0FFDCh to 0FFFFh.

Table 12.1 lists the Fixed Vector Tables. The vector addresses (H) of fixed vectors are used by the ID code check function. For details, refer to **20.3 Functions to Prevent Rewriting of Flash Memory**.

Table 12.1 Fixed Vector Tables

Interrupt Source	Vector Addresses Address (L) to (H)	Remarks	Reference
Undefined Instruction	0FFDCh to 0FFDFh	Interrupt on UND	R8C/Tiny Series software
		instruction	manual
Overflow	0FFE0h to 0FFE3h	Interrupt on INTO	
		instruction	
BRK Instruction	0FFE4h to 0FFE7h	If the content of address	
		0FFE7h is FFh, program	
		execution starts from the	
		address shown by the	
		vector in the relocatable	
		vector table.	
Address Match	0FFE8h to 0FFEBh		12.5 Address Match
			Interrupt
Single Step ⁽¹⁾	0FFECh to 0FFEFh		
Watchdog Timer	0FFF0h to 0FFF3h		13. Watchdog Timer
Oscillation Stop			10. Clock Generation Circuit
Detection			6. Voltage Detection Circuit
Voltage Monitor 2			
Address Break ⁽¹⁾	0FFF4h to 0FFF7h		
(Reserved)	0FFF8h to 0FFFBh		
Reset	0FFFCh to 0FFFFh		5. Resets

NOTE:

1. Do not use the single-step interrupt. For development tools only.

12.1.5.2 Relocatable Vector Tables

The relocatable vector tables occupy 256 bytes from the starting address set in the INTB register. Table 12.2 lists the Relocatable Vector Tables.

Table 12.2 Relocatable Vector Tables

				I
Interrupt Source	Vector Address ⁽¹⁾ Address (L) to Address (H)	Software Interrupt Number	Interrupt Control Register	Reference

NOTES:

- 1. These addresses are relative to those in the INTB register.
- 2. The IICSEL bit in the PMR register switches functions.
- 3. The I flag does not disable these interrupts.

12.1.6 **Interrupt Control**

The following describes enable/disable the maskable interrupts and set the priority order to acknowledge. The contents explained does not apply to the nonmaskable interrupts.

Use the I flag in the FLG register, IPL and the ILVL2 to ILVL0 bits in each interrupt control register to enable/ disable the maskable interrupts. Whether an interrupt is requested is indicated by the IR bit in each interrupt control register.

Figure 12.3 shows the Interrupt Control Register, Figure 12.4 shows Registers TRD0IC, TRD1IC, SSUIC, and IICIC and Figure 12.5 shows the Registers INT0IC to INT3IC.

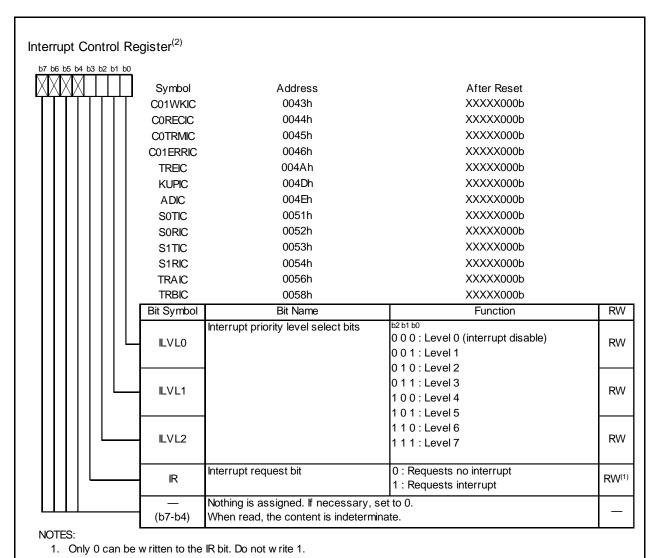

Figure 12.3 Interrupt Control Register

^{2.} Rew rite the interrupt control register, rew rite it when the interrupt request which is applicable for its register is not generated. Refer to 12.7.5 Changing Interrupt Control Register Contents.

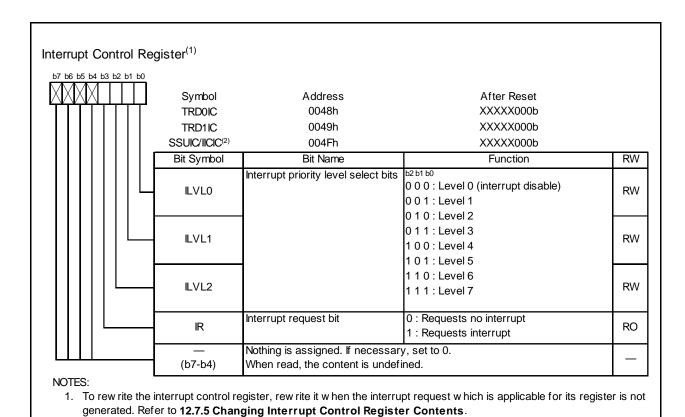

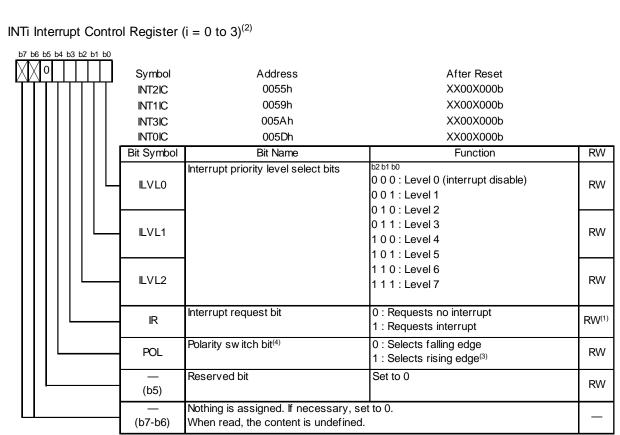

Figure 12.4 Registers TRD0IC, TRD1IC, SSUIC, and IICIC

2. The IICSEL bit in the PMR register switches functions.

- NOTES:
 - 1. Only 0 can be written to the IR bit. (Do not write 1.)
 - 2. Rew rite the interrupt control register, rew rite it when the interrupt request which is applicable for its register is not generated. Refer to 12.7.5 Changing Interrupt Control Register Contents.
 - 3. If the INTIPL bit in the INTEN register is set to 1 (both edges), set the POL bit to 0 (selects falling edge).
 - 4. The IR bit may be set to 1 (requests interrupt) when the POL bit is rewritten. Refer to 12.7.4 Changing Interrupt Sources.

Figure 12.5 Registers INT0IC to INT3IC

12.1.6.1 I Flag

The I flag enables or disables the maskable interrupt. Setting the I flag to 1 (enabled) enables the maskable interrupt. Setting the I flag to 0 (disabled) disables all maskable interrupts.

12.1.6.2 IR Bit

The IR bit is set to 1 (interrupt requested) when an interrupt request is generated. Then, when the interrupt request is acknowledged and the CPU branches to the corresponding interrupt vector, the IR bit is set to 0 (= interrupt not requested).

The IR bit can be set to 0 by a program. Do not write 1 to this bit.

Operations of the IR bit vary by Timer RD interrupt, clock synchronous serial I/O interrupt with chip select or I²C bus interface interrupt.

For details, refer to 12.6 Timer RD Interrupt, Clock Synchronous Serial I/O with Chip Select Interrupts and I²C bus Interface Interrupts (Interrupts with Multiple Interrupt Request Sources).

12.1.6.3 Bits ILVL2 to ILVL0 and IPL

Interrupt priority levels can be set using the ILVL2 to ILVL0 bits.

Table 12.3 lists the Settings of Interrupt Priority Levels and Table 12.4 lists the Interrupt Priority Levels Enabled by IPL.

The following are conditions under which an interrupt is acknowledged:

- I flag = 1
- IR bit = 1
- Interrupt priority level > IPL

The I flag, IR bit, ILVL2 to ILVL0 bits and IPL are independent of each other. They do not affect one another.

Table 12.3 Settings of Interrupt Priority Levels

ILVL2 to ILVL0 Bits	Interrupt Priority Level	Priority Order
000b	Level 0 (interrupt disabled)	-
001b	Level 1	Low
010b	Level 2	ı
011b	Level 3	
100b	Level 4	
101b	Level 5	
110b	Level 6	▼
111b	Level 7	High

Table 12.4 Interrupt Priority Levels Enabled by IPL

IPL	Enabled Interrupt Priority Levels
000b	Interrupt level 1 and above
001b	Interrupt level 2 and above
010b	Interrupt level 3 and above
011b	Interrupt level 4 and above
100b	Interrupt level 5 and above
101b	Interrupt level 6 and above
110b	Interrupt level 7 and above
111b	All maskable interrupts are disabled

12.1.6.4 Interrupt Sequence

An interrupt sequence is performed between an interrupt request acknowledgement and interrupt routine execution.

When an interrupt request is generated while an instruction is executed, the CPU determines its interrupt priority level after the instruction is completed. The CPU starts the interrupt sequence from the following cycle. However, in regards to the SMOVB, SMOVF, SSTR or RMPA instruction, if an interrupt request is generated while executing the instruction, the MCU suspends the instruction to start the interrupt sequence. The interrupt sequence is performed as follows.

Figure 12.6 shows the Time Required for Executing Interrupt Sequence.

- (1) The CPU gets interrupt information (interrupt number and interrupt request level) by reading the address 00000h. The IR bit for the corresponding interrupt is set to 0 (interrupt not requested)⁽²⁾.
- (2) The FLG register immediately before entering the interrupt sequence is saved to the CPU internal temporary register⁽¹⁾.
- (3) The I, D and U flags in the FLG register are set as follows:
 - The I flag is set to 0 (disables interrupts).
 - The D flag is set to 0 (disables single-step interrupt).
 - The U flag is set to 0 (ISP selected).
 - However, the U flag does not change state if an INT instruction for software interrupt number 32 to 63 is executed
- (4) The CPU's internal temporary register⁽¹⁾ is saved to the stack.
- (5) The PC is saved to the stack.
- (6) The interrupt priority level of the acknowledged interrupt is set in the IPL.
- (7) The starting address of the interrupt routine set in the interrupt vector is stored in the PC.

After the interrupt sequence is completed, the instructions are

NOTES:

1. This register cannot be used by user.

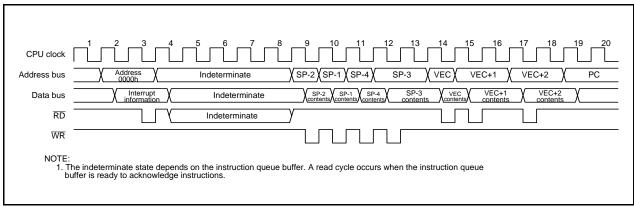

Figure 12.6 Time Required for Executing Interrupt Sequence

2. For operations of the IR bit, refer to 12.6 Timer RD Interrupt, Clock Synchronous Serial I/O with Chip Select Interrupts and I²C bus Interface Interrupts (Interrupts with Multiple Interrupt Request Sources).

12.1.6.5 Interrupt Response Time

Figure 12.7 shows an Interrupt Response Time. The interrupt response time is the period between an interrupt request generation and the execution of the first instruction in an interrupt routine. An interrupt response time includes the period between an interrupt request generation and the completed execution of an instruction (refer to (a) in **Figure 12.7**) and the period required to perform an interrupt sequence (20 cycles, refer to (b) in **Figure 12.7**).

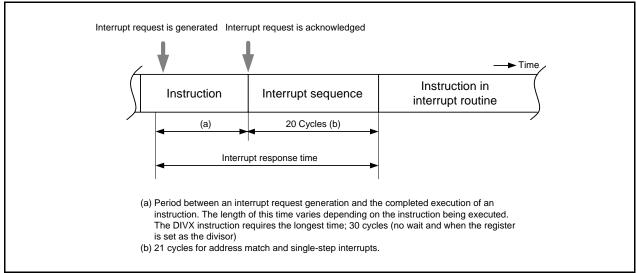

Figure 12.7 Interrupt Response Time

12.1.6.6 IPL Change when Interrupt Request is Acknowledged

When an interrupt request of a maskable interrupt is acknowledged, the interrupt priority level of the acknowledged interrupt is set in the IPL.

When a software interrupt and special interrupt request are acknowledged, the level listed in Table 12.5 is set to the IPL.

Table 12.5 lists the IPL Value When Software or Special Interrupt Is Acknowledged.

Table 12.5 IPL Value When Software or Special Interrupt Is Acknowledged

Interrupt Sources	Value Set to IPL
Watchdog Timer, Oscillation Stop Detection, Voltage Monitor 2, Address Break	7
Software, Address Match, Single-Step	Not changed

12.1.6.7 Saving a Register

In the interrupt sequence, the FLG register and PC are saved to the stack.

After 4 high-order bits in the PC and 4 high-order (IPL) and 8 low-order bits in the FLG register, extended to 16 bits, are saved to the stack, the 16 low-order bits in the PC are saved.

Figure 12.8 shows the Stack State Before and After Acknowledgement of Interrupt Request.

The other necessary registers are saved by a program at the beginning of the interrupt routine. The PUSHM instruction can save several registers in the register bank being currently used⁽¹⁾ with 1 instruction.

NOTE:

1. Selectable from the R0, R1, R2, R3, A0, A1, SB and FB registers.

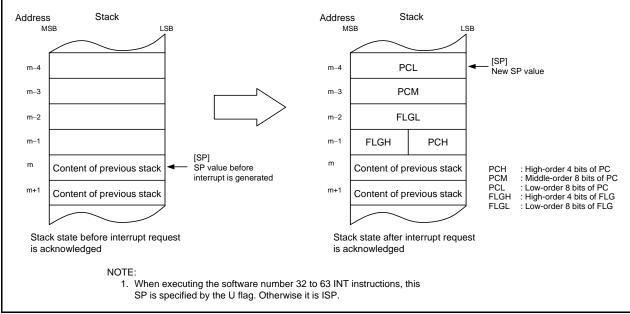

Figure 12.8 Stack State Before and After Acknowledgement of Interrupt Request

The register saving operation which is performed in the interrupt sequence is saved in 8 bits every 4 steps. Figure 12.9 shows the Register Saving Operation.

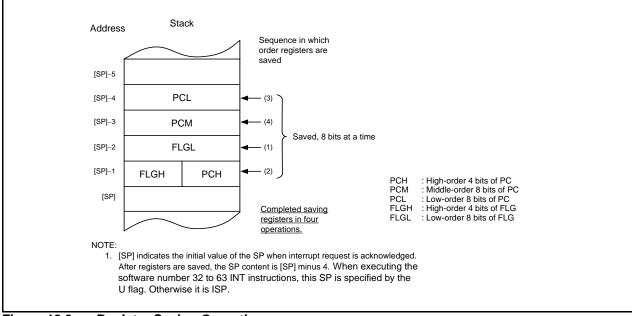

Figure 12.9 Register Saving Operation

12.1.6.8 Returning from an Interrupt Routine

When the REIT instruction is executed at the end of an interrupt routine, the FLG register and PC, which have been saved to the stack, are automatically returned. The program, executed before the interrupt request has been acknowledged, starts running again.

Return the register saved by a program in an interrupt routine using the POPM instruction or others before the REIT instruction.

12.1.6.9 Interrupt Priority

If two or more interrupt requests are generated while executing one instruction, the interrupt with the higher priority is acknowledged.

Set the ILVL2 to ILVL0 bits to select the desired priority level for maskable interrupts (peripheral functions). However, if two or more maskable interrupts have the same priority level, their interrupt priority is resolved by hardware, with the higher priority interrupt acknowledged in hardware.

The priority levels of special interrupts such as reset (reset has the highest priority) and watchdog timer are set by hardware.

Figure 12.10 shows the Priority Levels of Hardware Interrupts.

The interrupt priority does not affect software interrupts. The MCU jumps to the interrupt routine when the instruction is executed.

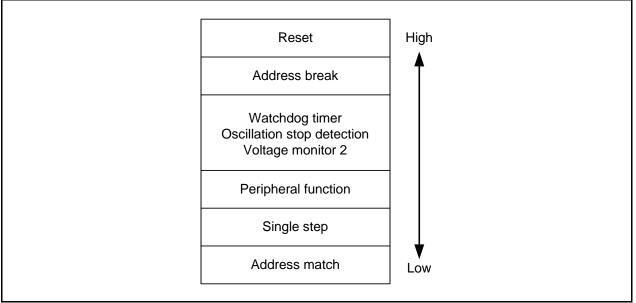

Figure 12.10 Priority Levels of Hardware Interrupts

12.1.6.10 Interrupt Priority Judgement Circuit

The interrupt priority judgement circuit selects the highest priority interrupt.

Figure 12.11 shows the Interrupt Priority Level Judgement Circuit.

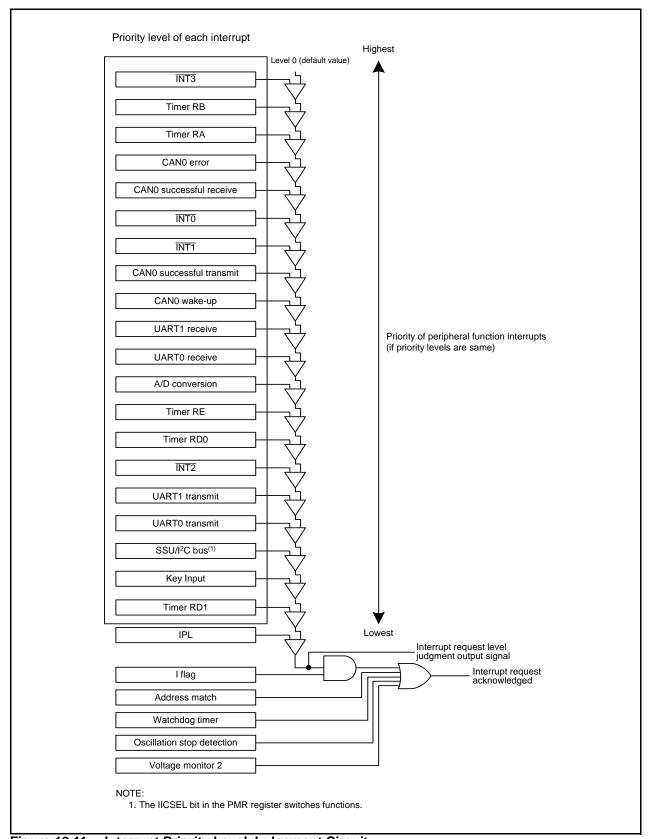

Figure 12.11 Interrupt Priority Level Judgement Circuit

12.2 INT Interrupt

12.2.1 \overline{INTi} Interrupt (i = 0 to 3)

The INTi interrupt is generated by an INTi input. When using the INTi interrupt, the INTiEN bit in the INTEN register is set to 1 (enable). The edge polarity is selected using the INTiPL bit in the INTEN register and the POL bit in the INTiIC register.

Inputs can be passed through a digital filter with three different sampling clocks.

The $\overline{\text{INT0}}$ pin is shared with the pulse output forced cutoff of timer RD and shared with the external trigger input of timer RB.

Figure 12.12 shows the INTEN Register. Figure 12.13 shows the INTF Register.

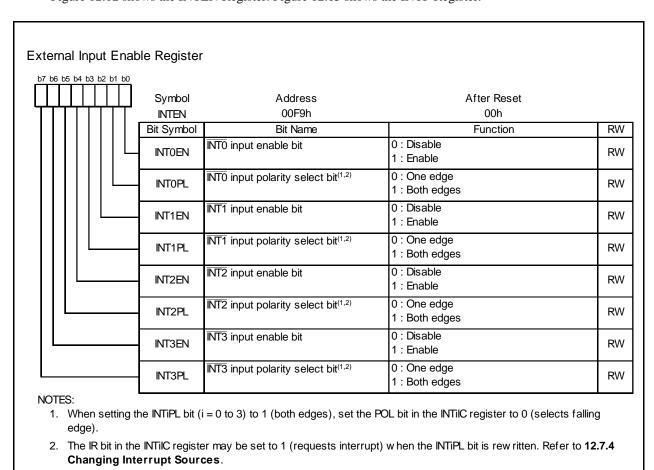

Figure 12.12 INTEN Register

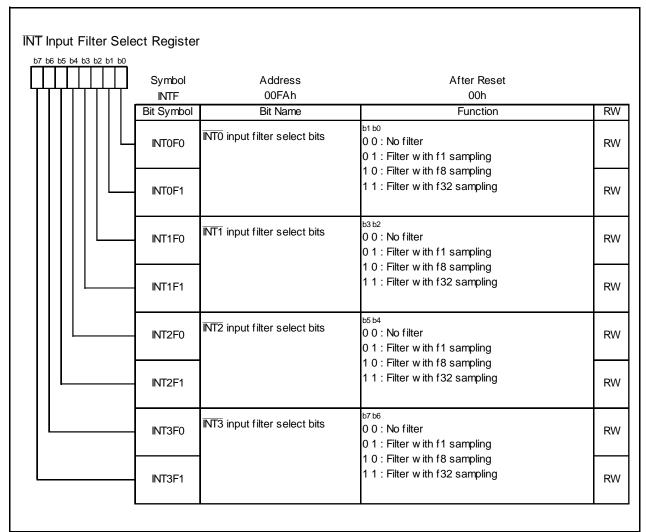

Figure 12.13 INTF Register

12.2.2 **INTi** Input Filter (i = 0 to 3)

The $\overline{\text{INTi}}$ input contains a digital filter. The sampling clock is selected by the INTiF1 to INTiF0 bits in the INTF register. The IR bit in the INTiIC register is set to 1 (interrupt requested) when the $\overline{\text{INTi}}$ level is sampled for every sampling clock and the sampled input level matches three times.

Figure 12.14 shows the Configuration of INTi Input Filter. Figure 12.15 shows Operating Example of INTi Input Filter.

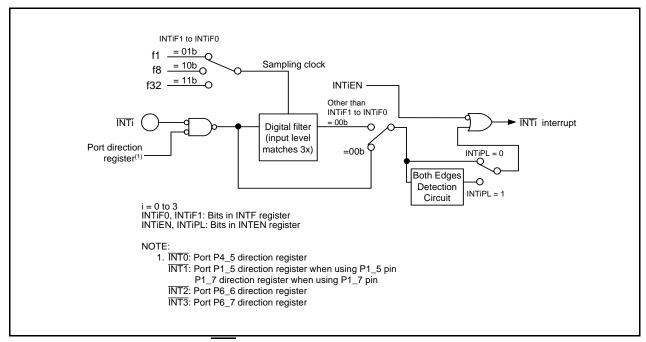

Figure 12.14 Configuration of INTi Input Filter

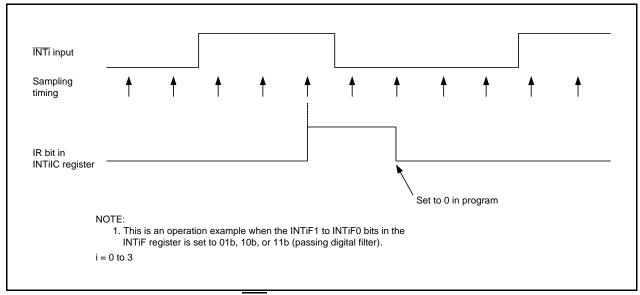

Figure 12.15 Operating Example of INTi Input Filter

12.3 Key Input Interrupt

A key input interrupt request is generated by one of the input edges of the $\overline{K10}$ to $\overline{K13}$ pins. The key input interrupt can be used as a key-on wake-up function to exit wait or stop mode.

The KIiEN (i = 0 to 3) bit in the KIEN register can select whether the pins are used as $\overline{\text{KIi}}$ input. The KIiPL bit in the KIEN register can select the input polarity.

When inputting "L" to the $\overline{\text{KIi}}$ pin which sets the KIiPL bit to 0 (falling edge), the input of the other $\overline{\text{K10}}$ to $\overline{\text{K13}}$ pins are not detected as interrupts. Also, when inputting "H" to the $\overline{\text{K1i}}$ pin which sets the KIiPL bit to 1 (rising edge), the input of the other $\overline{\text{K10}}$ to $\overline{\text{K13}}$ pins are not detected as interrupts.

Figure 12.16 shows a Block Diagram of Key Input Interrupt.

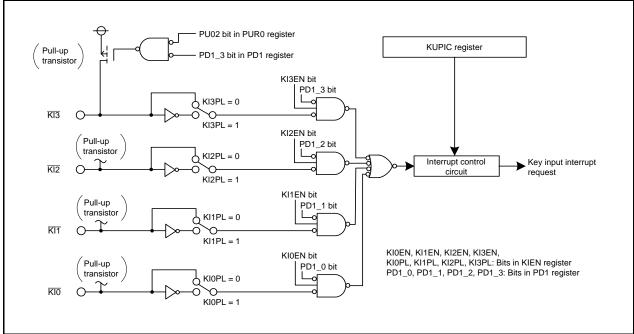

Figure 12.16 Block Diagram of Key Input Interrupt

Page 113 of 501

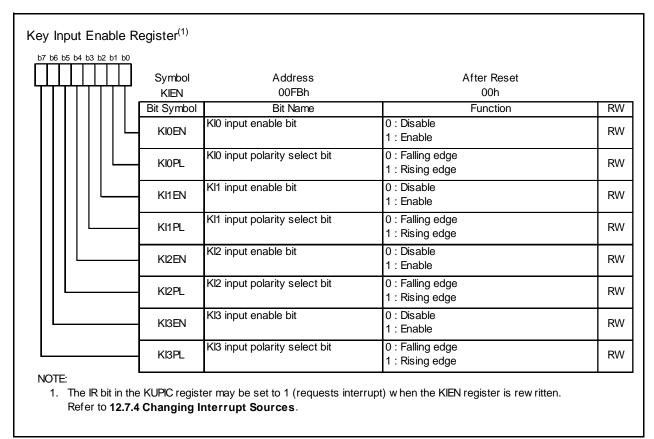

Figure 12.17 KIEN Register

12.4 CAN0 Wake-Up Interrupt

A CAN0 wake-up interrupt request is generated by a falling edge of the CRX pin. The CAN0 wake-up interrupt is enabled when the PortEn bit is 1 (CTX/CRX function) and Sleep bit is 1 (Sleep mode enabled) in the C0CTLR register.

Figure 12.18 shows the Block Diagram of CAN0 Wake-Up Interrupt.

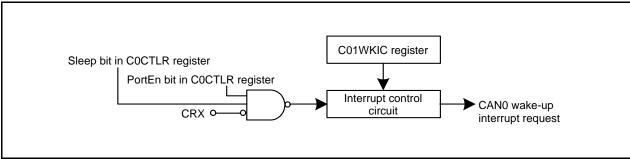

Figure 12.18 Block Diagram of CAN0 Wake-Up Interrupt

12.5 Address Match Interrupt

An address match interrupt request is generated immediately before executing the instruction at the address indicated by the RMADi register (i = 0 or 1). This interrupt is used for a break function of the debugger. When using the on-chip debugger, do not set an address match interrupt (the AIER, RMAD0 to RMAD1 registers, and relocatable vector tables) in a user system.

Set the starting address of any instruction in the RMADi register. The AIER0 and AIER1 bits in the AIER0 register can select to enable or disable the interrupt. The I flag and IPL do not affect the address match interrupt. The value of the PC (refer to 12.1.6.7 Saving a Register for the value of the PC) which is saved to the stack when an address match interrupt is acknowledged varies depending on the instruction at the address indicated by the RMADi register (the appropriate return address is not pushed on the stack). When returning from the address match interrupt, return by one of the following:

- Change the content of the stack and use the REIT instruction.
- Use an instruction such as POP to restore the stack as it was before an interrupt request was acknowledged. And then use a jump instruction.

Table 12.6 lists the Value of PC Saved to Stack when Address Match Interrupt is Acknowledged. Figure 12.19 shows the Registers AIER and RMAD0 to RMAD1.

Table 12.6 Value of PC Saved to Stack when Address Match Interrupt is Acknowledged

Address Indicated by RMADi Register (i = 0 or 1)					PC Value Saved ⁽¹⁾	
 Instruction 	• Instruction with 2-byte operation code ⁽²⁾					Address indicated by
 Instruction 	with 1-byte op	peration cod	de ⁽²⁾			RMADi register + 2

MOV.B:S #IMM,dest (However, dest = A0 or A1)						
Instructions	Instructions other than the above				Address indicated by	
						RMADi register + 1

NOTES:

- 1. Refer to the 12.1.6.7 Saving a Register for the PC value saved.
- Operation code: Refer to the R8C/Tiny Series Software Manual (REJ09B0001).
 Chapter 4. Instruction Code/Number of Cycles contains diagrams showing operation code below each syntax. Operation code is shown in the bold frame in the diagrams.

Table 12.7 Correspondence Between Address Match Interrupt Sources and Associated Registers

Address Match Interrupt Source	Address Match Interrupt Enable Bit	Address Match Interrupt Register
Address Match Interrupt 0	AIER0	RMAD0
Address Match Interrupt 1	AIER1	RMAD1

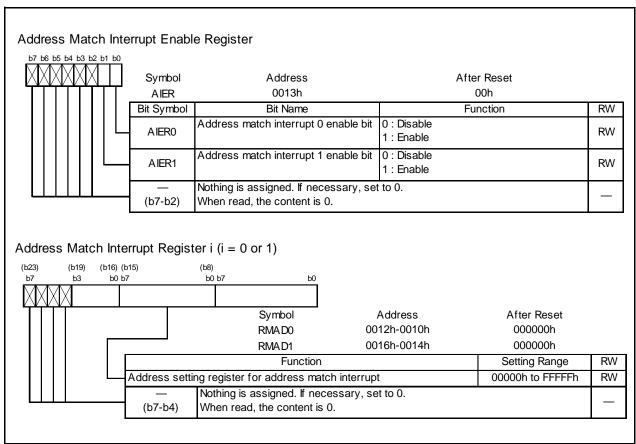

Figure 12.19 Registers AIER and RMAD0 to RMAD1

12.6 Timer RD Interrupt, Clock Synchronous Serial I/O with Chip Select Interrupts and I²C bus Interface Interrupts (Interrupts with Multiple Interrupt Request Sources)

Timer RD (channel 0), timer RD (channel 1), clock synchronous serial I/O with chip select and I²C bus interface have several interrupt request sources and an interrupt request is generated by the logical OR of several interrupt request sources and the logical OR is reflected in the IR bit in the interrupt control register. Therefore, these peripheral functions which have the status register of its own interrupt request sources (status register) and the enable register of the interrupt request sources (enable register) control the generations of the interrupt request (change of the IR bit in the interrupt control register). Table 12.8 lists the Registers Associated with Timer RD Interrupt, Clock Synchronous Serial I/O with Chip Select Interrupt, and I²C bus Interface Interrupt and Figure 12.20 shows the Block Diagram of Timer RD Interrupt.

Table 12.8 Registers Associated with Timer RD Interrupt, Clock Synchronous Serial I/O with Chip Select Interrupt, and I²C bus Interface Interrupt

		Status Register of	Enable Register of	Interrupt Control
		Interrupt Request Source	Interrupt Request Source	Register
Timer RD	Channel 0	TRDSR0	TRDIER0	TRD0IC
	Channel 1	TRDSR1	TRDIER1	TRD1IC
Clock Synchronous		SSSR	SSER	SSUIC
Serial I/O w	ith Chip			
Select				
I ² C Bus Inte	erface	ICSR	ICIER	IICIC

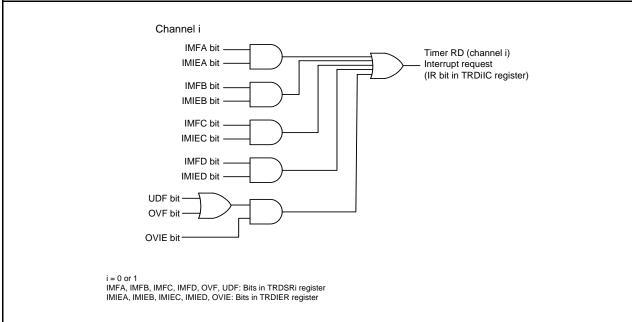

Figure 12.20 Block Diagram of Timer RD Interrupt

Controlling an interrupt with the I flag, IR bit, ILVL0 to ILVL2 bits and IPL by Timer RD (channel 0), Timer RD (channel 1), clock synchronous serial I/O with chip select and I²C bus interface is the same as that by other maskable interrupts. However, since an interrupt source is generated based on multiple interrupt request sources, there are the following differences from other maskable interrupts:

- When bits in the enable register corresponding to set bits in the status register to 1 are set to 1 (enable interrupt), the IR bit in the interrupt control register is set to 1 (interrupt requested).
- When either bits in the status register or bits in the enable register corresponding to bits in the status register, or both of them are set to 0, the IR bit is set to 0 (interrupt not requested). Basically, even though the interrupt is not acknowledged after the IR bit is set to 1, the interrupt request will not be maintained. Also, the IR bit is not set to 0 although 0 is written to the IR bit.
- Since each bit in the status register is not automatically set to 0 even if the interrupt is acknowledged. Therefore, the IR bit is not also automatically set to 0 when the interrupt is acknowledged. Set each bit in the status register to 0 in the interrupt routine. Refer to the status register figure how to set each bit in the status register to 0.
- When multiple bits in the enable register are set to 1 and other request sources are generated after the IR bit is set to 1, the IR bit remains 1.
- When multiple bits in the enable register are set to 1, determine by the status register which request source causes an interrupt.

Refer to chapters of each peripheral function (14.3 Timer RD, 16.2 Clock Synchronous Serial I/O with Chip Select (SSU) and 16.3 I²C Bus Interface) for the status register and enable register.

Refer to 12.1.6 Interrupt Control for the interrupt control register.

12.7 Notes on Interrupts

12.7.1 Reading Address 00000h

Do not read the address 00000h by a program. When a maskable interrupt request is acknowledged, the CPU reads interrupt information (interrupt number and interrupt request level) from 00000h in the interrupt sequence. At this time, the acknowledged interrupt IR bit is set to 0.

If the address 00000h is read in a program, the IR bit for the interrupt which has the highest priority among the enabled interrupts is set to 0. This may cause a problem that the interrupt is canceled, or an unexpected interrupt is generated.

12.7.2 SP Setting

Set any value in the SP before an interrupt is acknowledged. The SP is set to 0000h after reset. Therefore, if an interrupt is acknowledged before setting any value in the SP, the program may run out of control.

12.7.3 External Interrupt and Key Input Interrupt

Either an "L" level or an "H" level of width shown in the Electrical Characteristics is necessary for the signal input to the $\overline{\text{INT0}}$ to $\overline{\text{INT3}}$ pins and $\overline{\text{KI0}}$ to $\overline{\text{KI3}}$ pins regardless of the CPU clocks. For details, refer to Table 21.19 External Interrupt INTi (i = 0 to 3) Input, Table 21.25 External Interrupt INTi (i = 0 to 3) Input.

12.7.4 Changing Interrupt Sources

The IR bit in the interrupt control register may be set to 1 (interrupt requested) when the interrupt source changes. When using an interrupt, set the IR bit to 0 (no interrupt requested) after changing the interrupt source. In addition, the changes of interrupt sources include all sources that change the interrupt sources assigned to individual software interrupt numbers, polarities, and timing. Therefore, when a mode change of the peripheral functions involves interrupt sources, edge polarities, and timing, Set the IR bit to 0 (no interrupt requested) after the change. Refer to each peripheral function for the interrupts caused by the peripheral functions. Figure 12.21 shows an Example of Procedure for Changing Interrupt Sources.

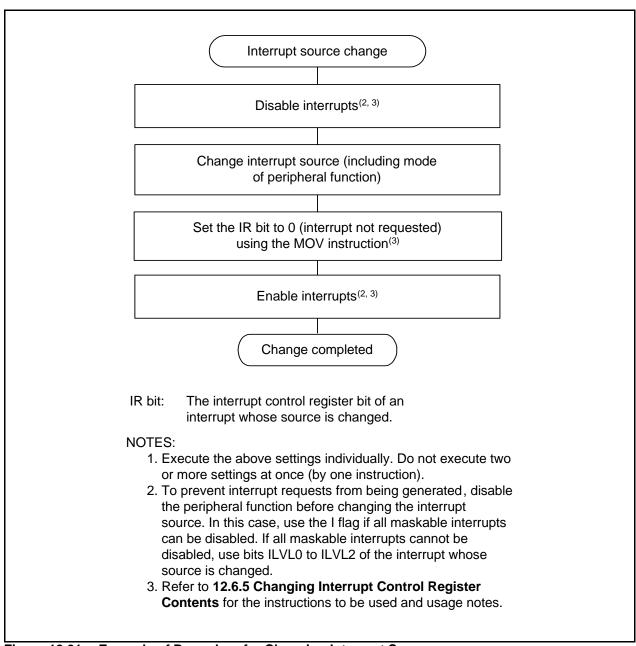

Figure 12.21 Example of Procedure for Changing Interrupt Sources

12.7.5 Changing Interrupt Control Register Contents

- (a) Each interrupt control register can only be changed while interrupt requests corresponding to that register are not generated. If interrupt requests may be generated, disable the interrupts before changing the interrupt control register.
- (b) When changing any interrupt control register after disabling interrupts, be careful with the instructions to be used.

When changing any bit other than IR bit

If an interrupt request corresponding to that register is generated while executing the instruction, the IR bit may not be set to 1 (interrupt requested), and the interrupt request may be ignored. If this causes a problem, use the following instructions to change the register.

Instructions to use: AND, OR, BCLR, BSET

When changing IR bit

If the IR bit is set to 0 (interrupt not requested), it may not be set to 0 depending on the instruction to be used. Therefore, use the MOV instruction to set the IR bit to 0.

(c) When disabling interrupts using the I flag, set the I flag according to the following sample programs. Refer to (b) for the change of interrupt control registers in the sample programs.

Sample programs 1 to 3 are preventing the I flag from being set to 1 (interrupt enables) before changing the interrupt control register for reasons of the internal bus or the instruction queue buffer.

Example 1: Use NOP instructions to prevent I flag being set to 1 before interrupt control register is changed

INT SWITCH1:

FCLR I ; Disable interrupts

AND.B #00H,0056H ; Set TRAIC register to 00h

NOP ;

NOP

FSET I ; Enable interrupts

Example 2: Use dummy read to have FSET instruction wait

INT_SWITCH2:

FCLR I ; Disable interrupts

AND.B #00H,0056H ; Set TRAIC register to 00h

MOV.W MEM,R0 ; <u>Dummy read</u> FSET I ; Enable interrupts

Example 3: Use POPC instruction to change I flag

INT SWITCH3:

PUSHC FLG

FCLR I ; Disable interrupts

AND.B #00H,0056H ; Set TRAIC register to 00h

POPC FLG ; Enable interrupts

13. Watchdog Timer

The watchdog timer is a function to detect when the program is out of control. To use the watchdog timer is recommend for improving reliability of a system. The watchdog timer contains a 15-bit counter and can select count source protection mode is enabled or disabled.

Table 13.1 lists the Count Source Protection Mode

Refer to **5.5 Watchdog Timer Reset** for details of the watchdog timer reset.

Figure 13.1 shows the Block Diagram of Watchdog Timer, Figure 13.2 shows Registers OFS and WDC and Figure 13.3 shows Registers WDTR, WDTS, and CSPR.

Table 13.1 Count Source Protection Mode

Item	Count Source Protection	Count Source Protection
item	Mode Disabled	Mode Enabled
Count Source	CPU clock	Low-speed on-chip oscillator
		clock
Count Operation	Decrement	•
Count Start Condition	Either of following can be select	ed
	After reset, count starts autom	atically
	Count starts by writing to WDTS register	
Count Stop Condition	Stop mode, wait mode None	
Reset Condition of Watchdog	Reset	
Timer	Write 00h to the WDTR register before writing FFh	
	Underflow	
Operation at the Time of	Watchdog timer interrupt or Watchdog timer reset	
Underflow	watchdog timer reset	

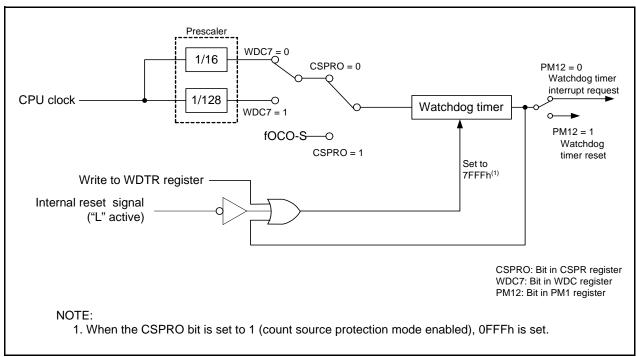

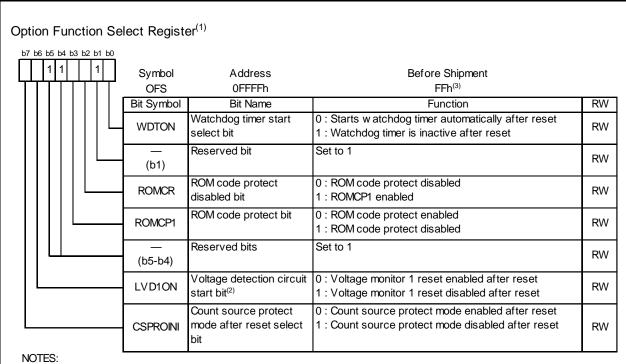

Figure 13.1 Block Diagram of Watchdog Timer

- 1. The OFS register is on the flash memory. Write to the OFS register with a program. After writing is completed, do not write additions to the OFS register.
- 2. To use the power-on reset, set the LVD1ON bit to 0 (voltage monitor 1 reset enabled after reset).
- 3. If the block including the OFS register is erased, FFh is set to the OFS register.

Watchdog Timer Control Register

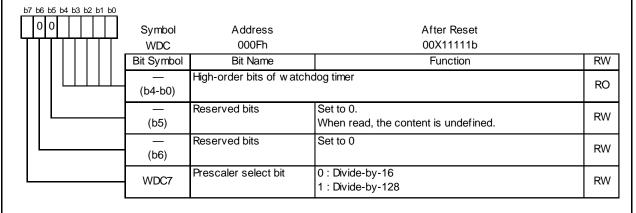

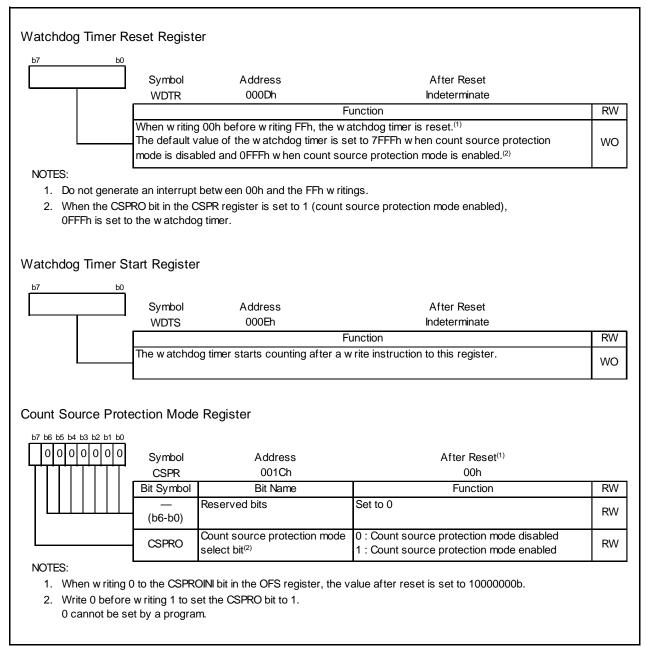

Figure 13.2 **Registers OFS and WDC**

Registers WDTR, WDTS, and CSPR Figure 13.3

13.1 **Count Source Protection Mode Disabled**

The count source of the watchdog timer is the CPU clock when count source protection mode is disabled. Table 13.2 lists the Watchdog Timer Specifications (with Count Source Protection Mode Disabled).

Table 13.2 Watchdog Timer Specifications (with Count Source Protection Mode Disabled)

Item	Specification
Count Source	CPU clock
Count Operation	Decrement
Period	Division ratio of prescaler(n) x count value of watchdog timer(32768)(1)
	CPU clock
	n: 16 or 128 (selected by WDC7 bit in WDC register)
	e.g.When the CPU clock is 16 MHz and prescaler is divided by 16, the
	period is approximately 32.8 ms
Count Start Condition	The WDTON bit ⁽²⁾ in the OFS register (0FFFFh) selects the operation
	of watchdog timer after reset
	 When the WDTON bit is set to 1 (watchdog timer is in stop state after reset)
	The watchdog timer and prescaler stop after reset and the count
	starts by writing to the WDTS register
	When the WDTON bit is set to 0 (watchdog timer starts automatically after exiting)
	The watchdog timer and prescaler start counting automatically after reset
Reset Condition of Watchdog	• Reset
Timer	Write 00h to the WDTR register before writing FFh Underflow
Count Ston Condition	- Chiestine II
Count Stop Condition	Stop and wait modes (inherit the count from the held value after exiting modes)
Operation at the Time of	When the PM12 bit in the PM1 register is set to 0
Underflow	Watchdog timer interrupt
	When the PM12 bit in the PM1 register is set to 1
	Watchdog timer reset (refer to 5.5 Watchdog Timer Reset)

- 1. The watchdog timer is reset when writing 00h to the WDTR register before writing FFh. The prescaler is reset after the MCU is reset. Some errors occur by the prescaler for the period of the watchdog timer.
- 2. The WDTON bit cannot be changed by a program. When setting the WDTON bit, write 0 to the bit 0 of the address 0FFFFh using a flash programmer.

13.2 Count Source Protection Mode Enabled

The count source of the watchdog timer is the low-speed on-chip oscillator clock when count source protection mode is enabled. If the CPU clock stops when the program is out of control, the clock can be supplied to the watchdog timer.

Table 13.3 lists the Watchdog Timer Specifications (with Count Source Protection Mode Enabled).

Table 13.3 Watchdog Timer Specifications (with Count Source Protection Mode Enabled)

Item	Specification
Count Source	Low-speed on-chip oscillator clock
Count Operation	Decrement
Period	Count value of watchdog timer (4096) Low-speed on-chip oscillator clock e.g. Period is approximately 32.8 ms when the low-speed on-chip oscillator clock is 125 kHz
Count Start Condition	The WDTON bit ⁽¹⁾ in the OFS register (0FFFh) selects the operation of the watchdog timer after reset. • When the WDTON bit is set to 1 (watchdog timer is in stop state after reset) The watchdog timer and prescaler stop after reset and the count starts by writing to the WDTS register • When the WDTON bit is set to 0 (watchdog timer starts automatically after reset) The watchdog timer and prescaler start counting automatically after reset
Reset Condition of Watchdog Timer	ResetWrite 00h to the WDTR register before writing FFhUnderflow
Count Stop Condition	None (the count does not stop in wait mode after the count starts. The MCU does not enter stop mode)
Operation at the Time of Underflow	Watchdog timer reset (refer to 5.5 Watchdog Timer Reset)
Register, Bit	 When setting the CSPPRO bit in the CSPR register to 1 (count source protection mode is enabled)⁽²⁾, the following are set automatically Set 0FFFh to the watchdog timer Set the CM14 bit in the CM1 register to 0 (low-speed on-chip oscillator on) Set the PM12 bit in the PM1 register to 1 (The watchdog timer is reset when watchdog timer underflows) The following states are held in count source protection mode Writing to the CM10 bit in the CM1 register disables (It remains unchanged even if it is set to 1. The MCU does not enter stop mode) Writing to the CM14 bit in the CM1 register disables (It remains unchanged even if it is set to 1. The low-speed on-chip oscillator does not stop)

- 1. The WDTON bit cannot be changed by a program. When setting the WDTON bit, write 0 to the bit 0 of the address 0FFFFh using a flash programmer.
- 2. Even if writing 0 to the CSPROINI bit in the OFS register, the CSPRO bit is set to 1. The CSPROINI bit cannot be changed by a program. When setting the CSPROINI bit, write 0 to the bit 7 of the address 0FFFFh using a flash programmer.

14. Timers

The MCU contains two 8-bit timers with 8-bit prescaler, two 16-bit timers, and a timer with a 4-bit counter, and an 8-bit counter. The two 8-bit timers with the 8-bit prescaler contain timer RA and timer RB. These timers contain a reload register to memorize the default value of the counter. The 16-bit timer is timer RD which contains the input capture and output compare. The 4 and 8-bit counters are timer RE which contains the output compare. All these timers operate independently.

Table 14.1 lists Functional Comparison of Timers.

Functional Comparison of Timers Table 14.1

	Item	Timer RA	Timer RB	Timer RD	Timer RE

NOTE:

1. The underflow interrupt can be set to channel 1.

14.1 Timer RA

Timer RA is an 8-bit timer with an 8-bit prescaler.

The prescaler and timer consist of the reload register and counter. The reload register and counter are allocated at the same address. When accessing the TRAPRE and TRA registers, the reload register and counter can be accessed (refer to **Table 14.2 to 14.6 the Specification of Each Modes**).

The count source for timer RA is the operating clock that regulates the timing of timer operations such as counting and reloading.

Figure 14.1 shows the Block Diagram of Timer RA. Figures 14.2 to 14.4 show the registers associated with Timer RA.

Timer RA contains five operation modes listed as follows:

• Timer mode: The timer counts an internal count source.

• Pulse output mode: The timer counts an internal count source and outputs the pulses which

invert the polarity by underflow of the timer.

• Event counter mode: The timer counts external pulses.

• Pulse width measurement mode: The timer measures the pulse width of an external pulse.

• Pulse period measurement mode: The timer measures the pulse period of an external pulse.

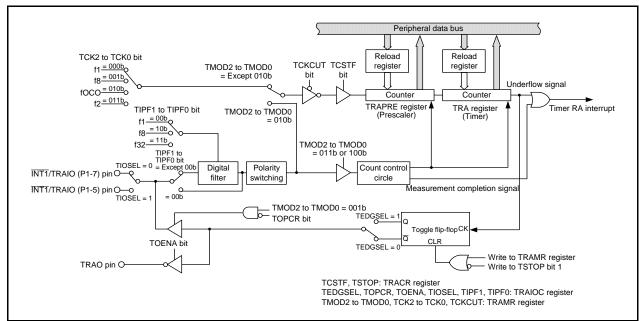

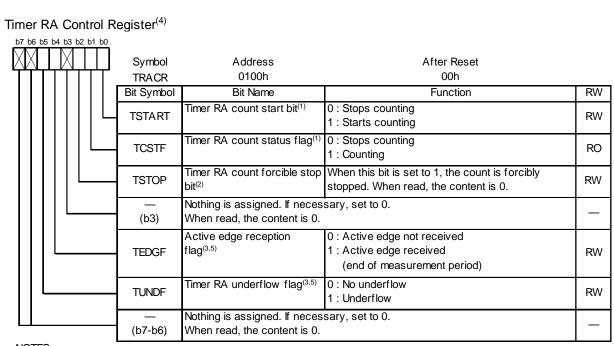

Figure 14.1 Block Diagram of Timer RA

NOTES:

- 1. Refer to 14.1.6 Notes on Timer RA.
- 2. When the TSTOP bit is set to 1, bits TSTART and TCSTF and registers TRAPRE and TRA are set to the values after a
- 3. Bits TEDGF and TUNDF can be set to 0 by writing 0 to these bits by a program. How ever, their value remains unchanged w hen 1 is written.
- 4. In pulse width measurement mode and pulse period measurement mode, use the MOV instruction to set the TRACR register. If it is necessary to avoid changing the values of bits TEDGF and TUNDF, write 1 to them.
- 5. Set to 0 in timer mode, pulse output mode, and event counter mode.

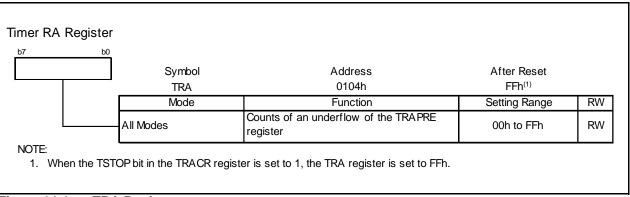

Figure 14.4 TRA Register

14.1.1 **Timer Mode**

In this mode, the timer counts an internally generated count source (see Table 14.2 Timer Mode Specifications).

Figure 14.5 shows the TRAIOC Register in Timer Mode.

Table 14.2 Timer Mode Specifications

Item	Specification
Count Sources	f1, f2, f8, fOCO
Count Operations	Decrement
	• When the timer underflows, the contents in the reload register is reloaded and the count is inherited
Divide Ratio	1/(n+1)(m+1)
	n: setting value of TRAPRE register, m: setting value of TRA register
Count Start Condition	Write 1 (count starts) to the TSTART bit in the TRACR register
Count Stop Conditions	Write 0 (count stops) to the TSTART bit in the TRACR register
	Write 1 (count forcibly stops) to the TSTOP bit in the TRACR register
Interrupt Request	When Timer RA underflows [Timer RA interrupt]
Generation Timing	
INT1/TRAIO Pin	Programmable I/O port or INT1 interrupt input
	Programmable I/O part
TRAO Pin Function	Programmable I/O port
Read from Timer	The count value can be read by reading the TRA and TRAPRE registers
Write to Timer	• When registers TRAPRE and TRA are written while the count is stopped,
	values are written to both the reload register and counter.
	When registers TRAPRE and TRA are written during the count, values are
	written to the reload register and counter (refer to 14.1.1.1 Timer Write
	Control during Count Operation).

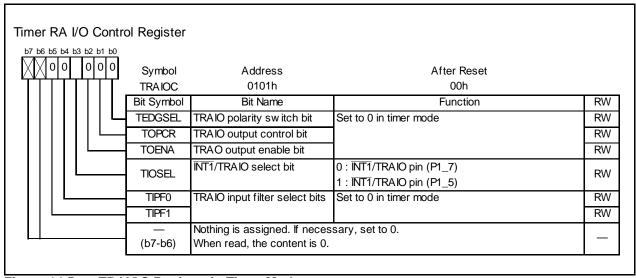

Figure 14.5 **TRAIOC Register in Timer Mode**

Timer Write Control during Count Operation 14.1.1.1

Timer RA has a prescaler and a timer (which counts the prescaler underflows). The prescaler and timer each consist of a reload register and a counter. When writing to the prescaler or timer, values are written to both the reload register and counter.

However, values are transferred from the reload register to the counter of the prescaler in synchronization with the count source. In addition, values are transferred from the reload register to the counter of the timer in synchronization with prescaler underflows. Therefore, if the prescaler or timer is written to when count operation is in progress, the counter value is not updated immediately after the WRITE instruction is executed. Figure 14.6 shows an Operating Example of Timer RA when Counter Value is Rewritten during Count Operation.

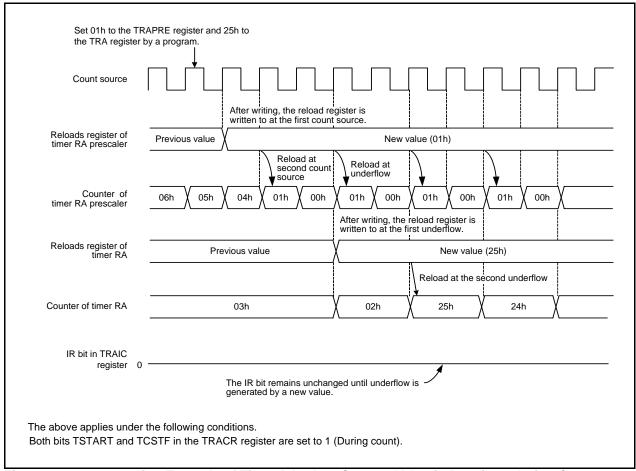

Figure 14.6 Operating Example of Timer RA when Counter Value is Rewritten during Count Operation

14.1.2 Pulse Output Mode

Pulse output mode is mode to count the count source internally generated and outputs the pulse which inverts the polarity from the TRAIO pin each time the timer underflows (see **Table 14.3 Pulse Output Mode Specifications**).

Figure 14.7 shows the TRAIOC Register in Pulse Output Mode.

Table 14.3 Pulse Output Mode Specifications

Item	Specification
Count Sources	f1, f2, f8, fOCO
Count Operations	 Decrement When the timer underflows, the contents in the reload register is reloaded and the count is inherited
Divide Ratio	1/(n+1)(m+1) n: setting value of TRAPRE register, m: setting value of TRA register
Count Start Condition	Write 1 (count starts) to the TSTART bit in the TRACR register
Count Stop Conditions	 Write 0 (count stops) to the TSTART bit in the TRACR register Write 1 (count forcibly stops) to the TSTOP bit in the TRACR register
Interrupt Request Generation Timing	When timer RA underflows [timer RA interrupt]
INT1/TRAIO Pin Function	Pulse output, programmable output port, or INT1 interrupt ⁽¹⁾
TRAO Pin Function	Programmable I/O port or inverted output of TRAIO(1)
Read from Timer	The count value can be read by reading the TRA and TRAPRE registers
Write to Timer	 When registers TRAPRE and TRA are written while the count is stopped, values are written to both the reload register and counter. When registers TRAPRE and TRA are written during the count, values are written to the reload register and counter (refer to 14.1.1.1 Timer Write Control during Count Operation).
Select Functions	 TRAIO output polarity switch function The TEDGSEL bit in the TRAIOC register can select the polarity level when the pulse output starts⁽¹⁾ Inverted pulse output function The pulse which inverts the polarity of the TRAIO output can be output from the TRAO pin (selected by the TOENA bit in the TRAIOC register) Pulse output stop function The pulse output from the TRAIO pin can be stopped by the TOPCR bit. INT1/TRAIO pin select function P1_7 or P1_5 is selected by the TIOSEL bit in the TRAIOC register.

NOTE:

1. The level of output pulse turn into the level when the pulse output starts by writing the TRAMR register.

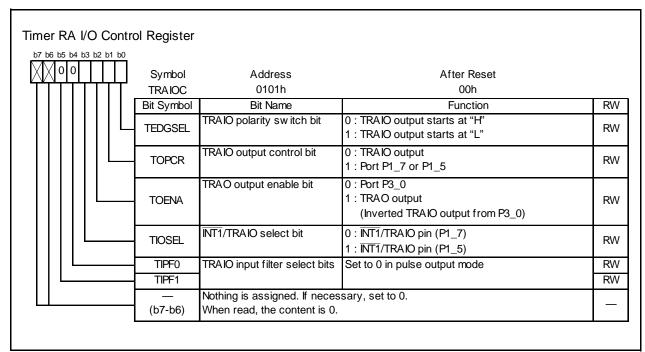

Figure 14.7 TRAIOC Register in Pulse Output Mode

14.1.3 Event Counter Mode

Event counter mode is mode to count an external signal which inputs from the $\overline{INT1}/TRAIO$ pin (see **Table 14.4 Event Counter Mode Specifications**).

Figure 14.8 shows the TRAIOC Register in Event Counter Mode.

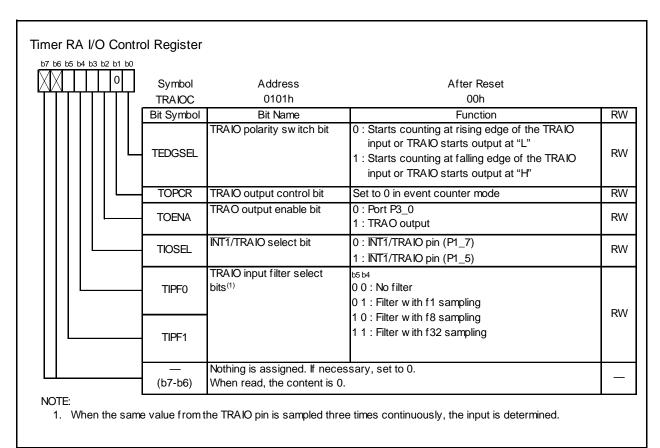

Table 14.4 Event Counter Mode Specifications

	Bits TIPF0 and TIPF1 in the TRAIOC register enable or disable the digital filter and select the sampling frequency.

NOTE:

1. The level of output pulse turn into the level when the pulse output starts by writing the TRAMR register.

TRAIOC Register in Event Counter Mode Figure 14.8

14.1.4 Pulse Width Measurement Mode

Pulse width measurement mode is mode to measure the pulse width of an external signal which inputs from the INT1/TRAIO pin (see **Table 14.5 Pulse Width Measurement Mode Specifications**).

Figure 14.9 shows the TRAIOC Register in Pulse Width Measurement Mode and Figure 14.10 shows the Operating Example of Pulse Width Measurement Mode.

Table 14.5 Pulse Width Measurement Mode Specifications

Item	Specification
Count Sources	f1, f2, f8, fOCO
Count Operations	 Decrement Continuously counts the selected signal only when measurement pulse is "H" level, or conversely only "L" level. When the timer underflows, the contents in the reload register is reloaded and the count is inherited
Count Start Condition	Write 1 (count starts) to the TSTART bit in the TRACR register
Count Stop Conditions	 Write 0 (count stops) to the TSTART bit in the TRACR register Write 1 (count forcibly stops) to the TSTOP bit in the TRACR register
Interrupt Request Generation Timing	When timer RA underflows [timer RA interrupt] Rising or falling of the TRAIO input (end of measurement period) [timer RA interrupt]
INT1/TRAIO Pin Function	Measurement pulse input (INT1 interrupt input)
TRAO Pin Function	Programmable I/O port
Read from Timer	The count value can be read by reading the TRA and TRAPRE registers.
Write to Timer	 When registers TRAPRE and TRA are written while the count is stopped, values are written to both the reload register and counter. When registers TRAPRE and TRA are written during the count, values are written to the reload register and counter (refer to 14.1.1.1 Timer Write Control during Count Operation).
Select Functions	 Measurement level select The TEDGSEL bit in the TRAIOC register can select during "H" or "L" level Measurement pulse input pin select function P1_7 or P1_5 is selected by the TIOSEL bit in the TRAIOC register. Digital filter function Bits TIPF0 and TIPF1 in the TRAIOC register enable or disable the digital filter and select the sampling frequency.

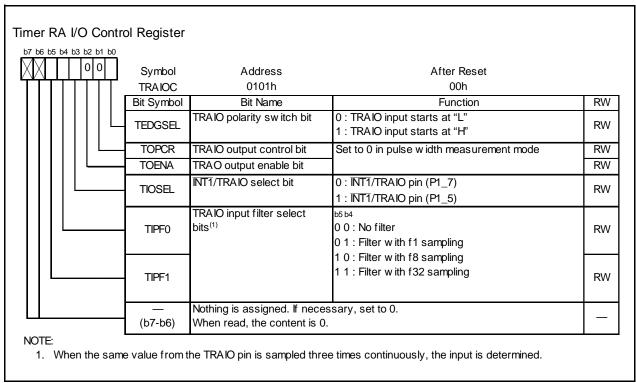

Figure 14.9 TRAIOC Register in Pulse Width Measurement Mode

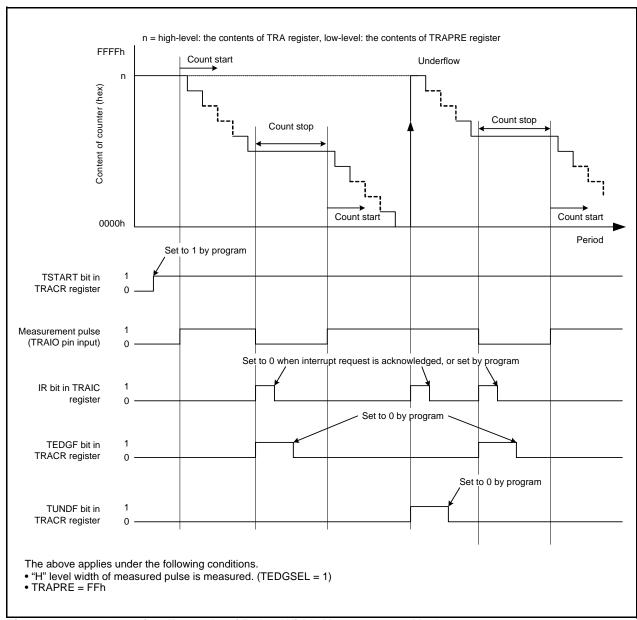

Figure 14.10 Operating Example of Pulse Width Measurement Mode

14.1.5 Pulse Period Measurement Mode

Pulse period measurement mode is mode to measure the pulse period of an external signal which inputs from the $\overline{INT1}/TRAIO$ pin (see **Table 14.6 Pulse Period Measurement Mode Specifications**).

Figure 14.11 shows the TRAIOC Register in Pulse Period Measurement Mode and Figure 14.12 shows the Operating Example of Pulse Period Measurement Mode.

Table 14.6 Pulse Period Measurement Mode Specifications

Item	Specification
Count Sources	f1, f2, f8, fOCO
Count Operations	 Decrement After an active edge of measurement pulse is input, contents for the read-out buffer are retained at the first underflow of timer RA prescaler. Then timer RA reloads contents in the reload register at the second underflow of timer RA prescaler and continues counting.
Count Start Condition	Write 1 (count start) to the TSTART bit in the TRACR register
Count Stop Conditions	 Write 0 (count stop) to TSTART bit in the TRACR register Write 1 (count forcibly stops) to the TSTOP bit in the TRACR register
Interrupt Request Generation Timing	 When timer RA underflows or reloads [timer RA interrupt] Rising or falling of the TRAIO input (end of measurement period) [timer RA interrupt]
INT1/TRAIO Pin	Measurement pulse input ⁽¹⁾ (INT1 interrupt input)
TRAO Pin Function	Programmable I/O port
Read from Timer	The count value can be read by reading the TRA and TRAPRE registers.
Write to Timer	 When registers TRAPRE and TRA are written while the count is stopped, values are written to both the reload register and counter. When registers TRAPRE and TRA are written during the count, values are written to the reload register and counter (refer to 14.1.1.1 Timer Write Control during Count Operation).
Select Functions	 Measurement level select The TEDGSEL bit in the TRAIOC register can select the measurement period of input pulse. Measurement pulse input pin select function P1_7 or P1_5 is selected by the TIOSEL bit in the TRAIOC register. Digital filter function Bits TIPF0 and TIPF1 in the TRAIOC register enable or disable the digital filter and select the sampling frequency.

NOTE:

1. Input the pulse whose period is longer than twice of the timer RA prescaler period. Input the longer pulse for "H" width and "L" width than the timer RA prescaler period. If the shorter pulse than the period is input to the TRAIO pin, the input may be disabled.

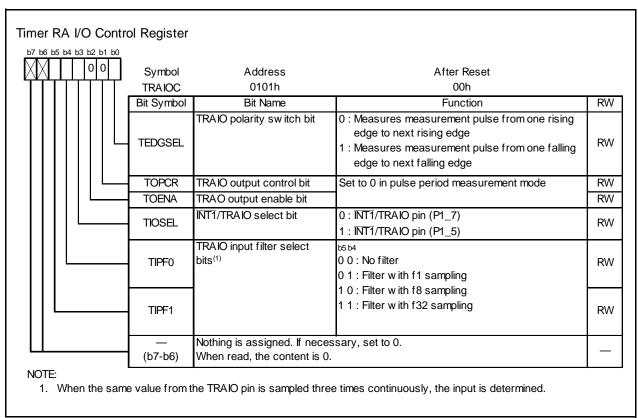

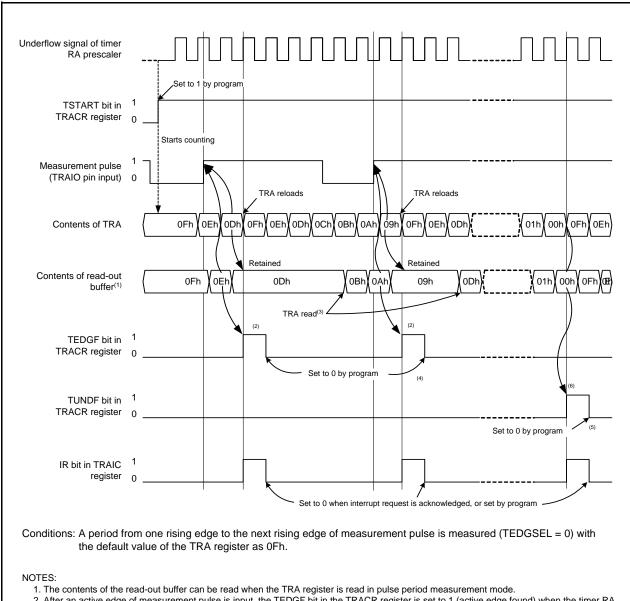

Figure 14.11 TRAIOC Register in Pulse Period Measurement Mode

- 2. After an active edge of measurement pulse is input, the TEDGF bit in the TRACR register is set to 1 (active edge found) when the timer RA prescaler underflows for the second time.
- 3. The TRA register should be read before the next active edge is input after the TEDGF bit is set to 1 (active edge found). The content in the read-out buffer is retained until the TRA register is read. If the TRA register is not read before the next active edge is input, the measured result of the previous period is retained.
- 4. When set to 0 by a program, use a MOV instruction to write 0 to the TEDGF bit in the TRACR register. At the same time, write 1 to the TUNDF bit in the TRACR register.
- 5. When set to 0 by a program, use a MOV instruction to write 0 to the TUNDF bit. At the same time, write 1 to the TEDGF bit.
- 6. The TUNDF and TEDGF bits are both set to 1 if the timer RA underflows and reloads on an active edge simultaneously.

Figure 14.12 Operating Example of Pulse Period Measurement Mode

14.1.6 **Notes on Timer RA**

- Timer RA stops counting after reset. Set the value to timer RA and timer RA prescaler before the count starts.
- Even if the prescaler and timer RA is read out in 16-bit units, these registers are read by 1 byte in the MCU. Consequently, the timer value may be updated during the period these two registers are being read.
- In pulse width measurement mode and pulse period measurement mode, the TEDGF and TUNDF bits in the TRACR register can be set to 0 by writing 0 to these bits by a program. However, these bits remain unchanged when 1 is written. When using the READ-MODIFY-WRITE instruction for the TRACR register, the TEDGF or TUNDF bit may be set to 0 although these bits are set to 1 while the instruction is executed. At the time, write 1 to the TEDGF or TUNDF bit which is not supposed to be set to 0 with the MOV instruction.
- When changing to pulse width measurement mode and pulse period measurement mode from other mode, the contents of the TEDGF and TUNDF bits are indeterminate. Write 0 to the TEDGF and TUNDF bits before the count starts.
- The TEDGF bit may be set to 1 by timer RA prescaler underflow which is generated for the first time since the count starts.
- When using the pulse period measurement mode, leave two periods or more of timer RA prescaler immediately after count starts, and set the TEDGF bit to 0.
- The TCSTF bit retains 0 (count stops) for 0 to 1 cycle of the count source after setting the TSTART bit to 1 (count starts) while the count stops.

During this time, do not access registers associated with timer RA⁽¹⁾ other than the TCSTF bit. Timer RA starts counting at the first valid edge of the count source after The TCSTF bit is set to 1 (during count). The TCSTF bit retains 1 for 0 to 1 cycle of the count source after setting the TSTART bit to 0 (count stops) while the count is performing. Timer RA counting is stopped when the TCSTF bit is set to 0. During this time, do not access registers associated with timer RA⁽¹⁾ other than the TCSTF bit.

- 1. Registers associated with timer RA: TRACR, TRAIOC, TRAMR, TRAPRE, TRA
- When the TRAPRE register is continuously written during count operation (TCSTF bit is set to 1), allow three or more cycles of the count source clock for each write interval.
- When the TRA register is continuously written during count operation (TCSTF bit is set to 1), allow three or more cycles of the prescaler underflow for each write interval.

14.2 Timer RB

Timer RB is an 8-bit timer with an 8-bit prescaler.

The prescaler and timer consist of the reload register and counter. (Refer to **Table 14.7 to 14.10 the Specification of Each Modes**).

Timer RB contains the timer RB primary and timer RB secondary as the reload register.

The count source for timer RB is the operating clock that regulates the timing of timer operations such as counting and reloading.

Figure 14.13 shows the Block Diagram of Timer RB. Figures 14.14 and 14.16 show the registers associated with timer RB.

Timer RB contains four operation modes listed as follows:

• Timer mode: The timer counts an internal count source (peripheral function

clock or timer RA underflows).

• Programmable waveform generation mode: The timer outputs pulses of a given width successively.

• Programmable one-shot generation mode: The timer outputs one-shot pulse.

• Programmable wait one-shot generation mode: The timer outputs delayed one-shot pulse.

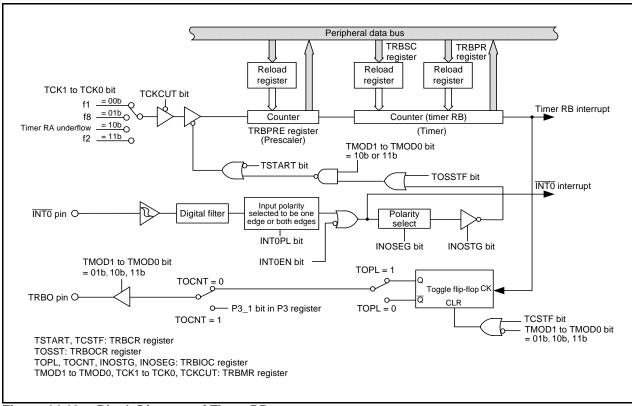

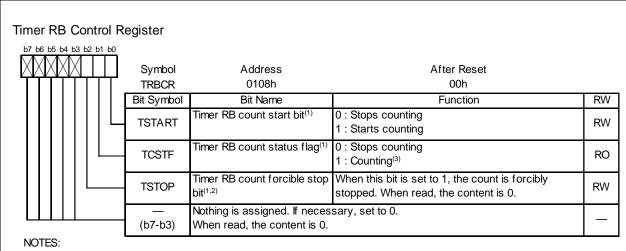

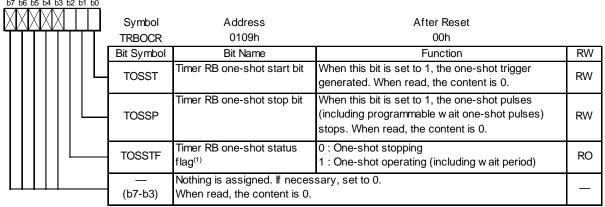

Figure 14.13 Block Diagram of Timer RB

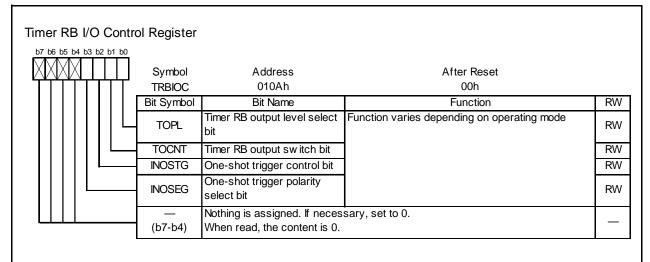

- 1. Refer to 14.2.5 Notes on Timer RB.
- 2. When the TSTOP bit is set to 1, registers TRBPRE, TRBSC, TRBPR, and bits TSTART and TCSTF, and the TOSSTF bit in the TRBOCR register are set to values after a reset.
- Indicates that count operation is in progress in timer mode or programmable waveform mode. In programmable oneshot generation mode or programmable wait one-shot generation mode, indicates that a one-shot pulse trigger has been acknow ledged.

Timer RB One-Shot Control Register⁽²⁾

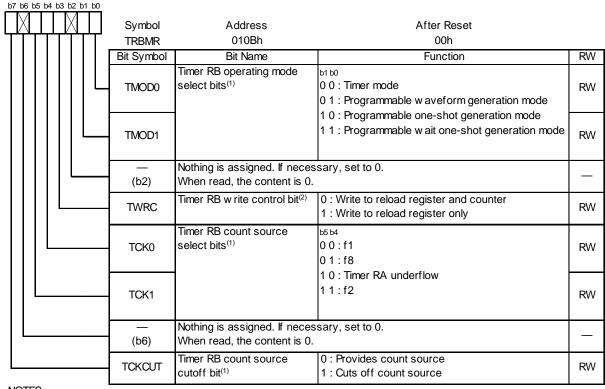

- 1. When 1 is set to the TSTOP bit in the TRBCR register, the TOSSTF bit is set to 0.
- This register is enabled when bits TMOD1 to TMOD0 in the TRBMR register is set to 10b (programmable one-shot generation mode) or 10b (programmable wait one-shot generation mode).

Figure 14.14 Registers TRBCR and TRBOCR

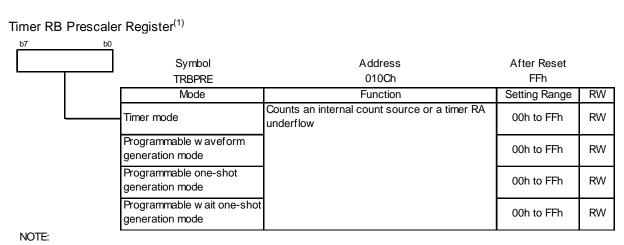

Timer RB Mode Register

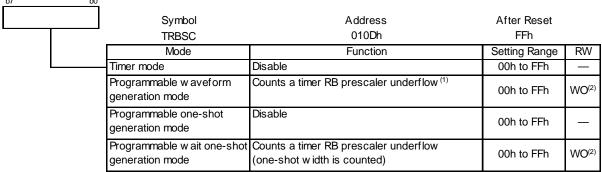

- 1. Change bits TMOD1 and TMOD0; TCK1 and TCK0; and TCKCUT when both the TSTART and TCSTF bits in the TRBCR register set to 0 (count stops).
- 2. The TWRC bit can be set to either 0 or 1 in timer mode. In programmable waveform generation mode, programmable one-shot generation mode, or programmable w ait one-shot generation mode, the TWRC bit must be set to 1 (w rite to reload register only).

Figure 14.15 Registers TRBIOC and TRBMR

1. When the TSTOP bit in the TRBCR register is set to 1, the TRBPRE register is set to FFh.

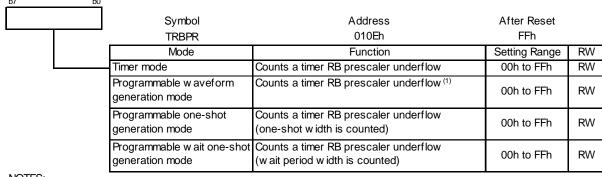

Timer RB Secondary Register^(3,4)

NOTES:

- 1. Each value in the TRBPR register and TRBSC register is reloaded to the counter alternately and counted.
- 2. The count value can be read out by reading the TRBPR register even when the secondary period is being counted.
- 3. When the TSTOP bit in the TRBCR register is set to 1, the TRBSC register is set to FFh.
- 4. To write to the TRBSC register, perform the following steps.
 - (1) Write the value to the TRBSC register.
 - (2) Write the value to the TRBPR register. (If the value does not change, write the same value second time.)

Timer RB Primary Register⁽²⁾

- 1. Each value in the TRBPR register and TRBSC register is reloaded to the counter alternately and counted.
- 2. When the TSTOP bit in the TRBCR register is set to 1, the TRBPR register is set to FFh.

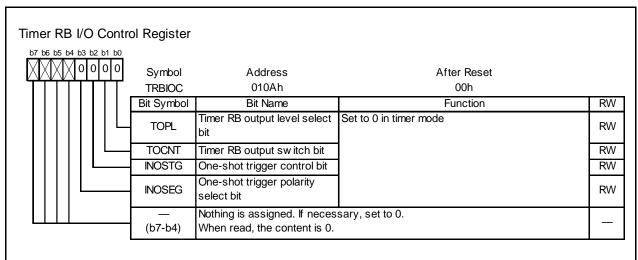

Figure 14.16 Registers TRBPRE, TRBSC, and TRBPR

14.2.1 **Timer Mode**

Timer mode is mode to count a count source which is internally generated or timer RA underflow (see Table 14.7 Timer Mode Specifications). The TRBOCR and TRBSC registers are unused in timer mode. Figure 14.17 shows the TRBIOC Register in Timer Mode.

Table 14.7 Timer Mode Specifications

Item	Specification
Count Sources	f1, f2, f8, Timer RA underflow
Count Operations	Decrement When the timer underflows, it reloads the reload register contents before the count continues (when timer RB underflows, the contents of timer RB primary reload register is reloaded)
Divide Ratio	1/(n+1)(m+1) n: setting value in TRBPRE register, m: setting value in TRBPR register
Count Start Condition	Write 1 (count starts) to the TSTART bit in the TRBCR register
Count Stop Conditions	 Write 0 (count stops) to the TSTART bit in the TRBCR register Write 1 (count forcibly stop) to the TSTOP bit in the TRBCR register
Interrupt Request Generation Timing	When timer RB underflows [timer RB interrupt]
TRBO Pin Function	Programmable I/O port
INTO Pin Function	Programmable I/O port or INT0 interrupt input
Read from Timer	The count value can be read out by reading the TRBPR and TRBPRE registers
Write to Timer	 When registers TRBPRE and TRBPR are written while the count is stopped, values are written to both the reload register and counter. When registers TRBPRE and TRBPR are written to while count operation is in progress: If the TWRC bit in the TRBMR register is set to 0, the value is written to both the reload register and the counter. If the TWRC bit is set to 1, the value is written to the reload register only. (Refer to 14.2.1.1 Timer Write Control during Count Operation.)

TRBIOC Register in Timer Mode Figure 14.17

14.2.1.1 Timer Write Control during Count Operation

Timer RB has a prescaler and a timer (which counts the prescaler underflows). The prescaler and timer each consist of a reload register and a counter. In timer mode, the TWRC bit in the TRBMR register can be used to select whether writing to the prescaler or timer during count operation is performed to both the reload register and counter or only to the reload register.

However, values are transferred from the reload register to the counter of the prescaler in synchronization with the count source. In addition, values are transferred from the reload register to the counter of the timer in synchronization with prescaler underflows. Therefore, even if the TWRC bit is set for writing to both the reload register and counter, the counter value is not updated immediately after the WRITE instruction is executed. In addition, if the TWRC bit is set for writing to the reload register only, the synchronization of the writing will be shifted if the prescaler value changes.

Figure 14.18 shows an Operating Example of Timer RB when Counter Value is Rewritten during Count Operation.

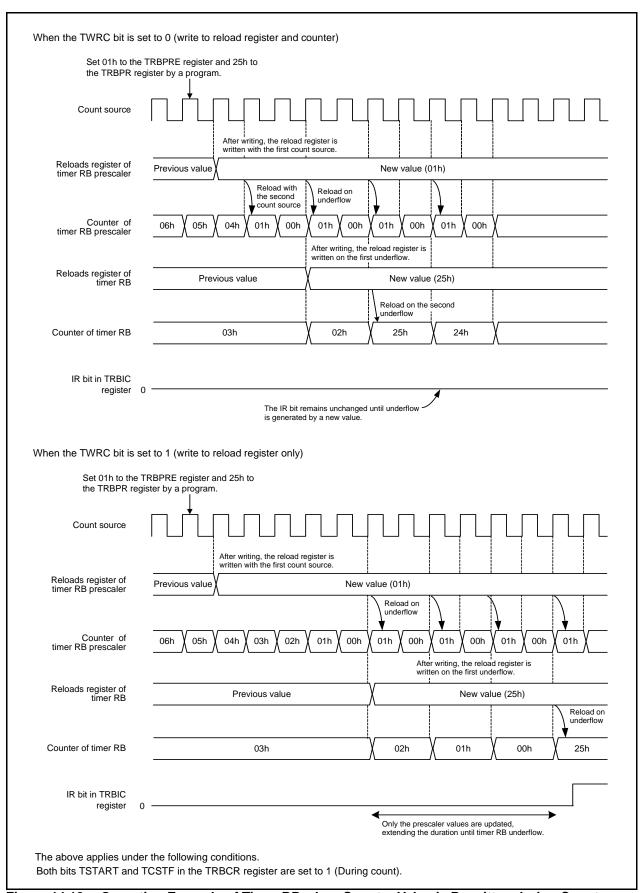

Figure 14.18 Operating Example of Timer RB when Counter Value is Rewritten during Count Operation

14.2.2 **Programmable Waveform Generation Mode**

Programmable waveform generation mode is mode to invert the signal output from the TRBO pin each time the counter underflows, while the values in the TRBPR and TRBSC registers are counted alternately (see Table 14.8 Programmable Waveform Generation Mode Specifications). A counting starts by counting the setting value in the TRBPR register. The TRBOCR register is unused in this mode.

Figure 14.19 shows the TRBIOC Register in Programmable Waveform Generation Mode. Figure 14.20 shows the Operation Example of Timer RB in Programmable Waveform Generation Mode.

Table 14.8 Programmable Waveform Generation Mode Specifications

Item	Specification
Count Sources	f1, f2, f8, timer RA underflow
Count Operations	Decrement
	When the timer underflows, it reloads the contents of the primary reload and secondary reload registers alternately before the count continues.
Width and Period of	Primary period: (n+1)(m+1)/fi
Output Waveform	Secondary period: (n+1)(p+1)/fi
	Period: (n+1){(m+1)+(p+1)}/fi
	fi: Count source frequency
	n: Setting value in TRBPRE register
	m: Setting value in TRBPR register
	p: Setting value in TRBSC register
Count Start Condition	Write 1 (count start) to the TSTART bit in the TRBCR register
Count Stop	Write 0 (count stop) to the TSTART bit in the TRBCR register
Conditions	Write 1 (count forcibly stop) to the TSTOP bit in the TRBCR register
Interrupt Request	In half of count source, after timer RB underflows during secondary period (at the
Generation Timing	same time as the TRBO output change) [timer RB interrupt]
TRBO Pin Function	Programmable output port or pulse output
INTO Pin Function	Programmable I/O port or INTO interrupt input
Read from Timer	The count value can be read out by reading the TRBPR and TRBPRE registers ⁽¹⁾
Write to Timer	 When registers TRBPRE, TRBSC, and TRBPR are written while the count is stopped, values are written to both the reload register and counter. When registers TRBPRE, TRBSC, and TRBPR are written to during count operation, values are written to the reload registers only.⁽²⁾
Select Functions	 Output level select function The TOPL bit can select the output level during primary and secondary periods. TRBO pin output switch function Timer RB pulse output or P3_1 latch output is selected by the TOCNT bit in the TRBIOC register.⁽³⁾

- 1. Even when counting the secondary period, read out the TRBPR register.
- 2. The set values are reflected to the waveform output beginning with the following primary period after writing to the TRBPR register.
- 3. The value written to the TOCNT bit is enabled by the following.
 - · When count starts.
 - When the timer RB interrupt request is generated. The contents after the TOCNT bit is changed are reflected from the output of the following primary period.

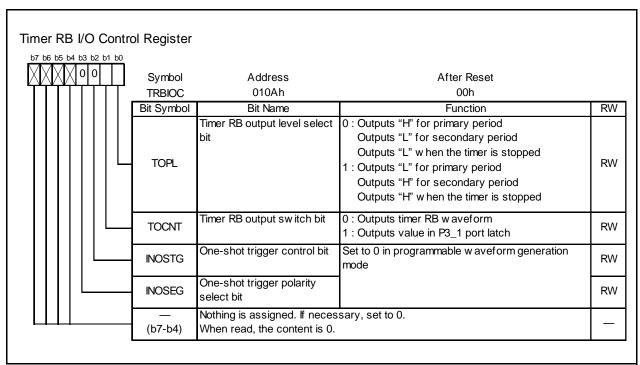

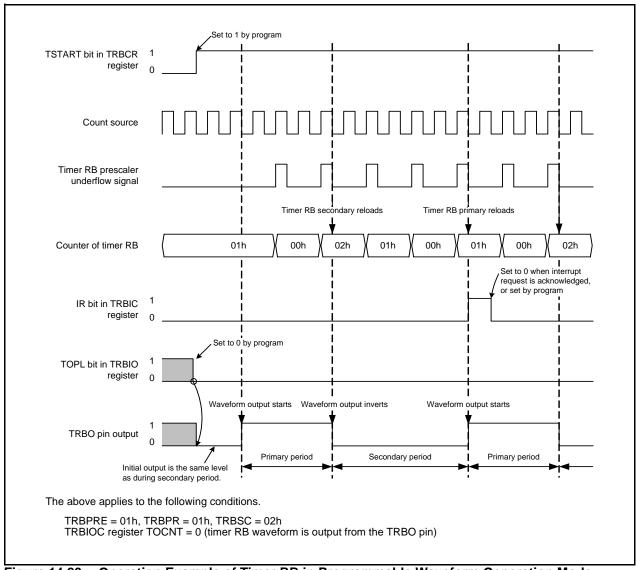

Figure 14.19 TRBIOC Register in Programmable Waveform Generation Mode

Operation Example of Timer RB in Programmable Waveform Generation Mode **Figure 14.20**

14.2.3 Programmable One-shot Generation Mode

Programmable one-shot generation mode is mode to output the one-shot pulse from the TRBO pin by a program or an external trigger input (input to the $\overline{\text{INT0}}$ pin) (see **Table 14.9 Programmable One-Shot Generation Mode Specifications**). When a trigger is generated, the timer starts operating from the point only once for a given period equal to the set value in the TRBPR register. The TRBSC register is unused in this mode.

Figure 14.21 shows the TRBIOC Register in Programmable One-Shot Generation Mode. Figure 14.22 shows the Operation Example of Programmable One-Shot Generation Mode.

Table 14.9 Programmable One-Shot Generation Mode Specifications

Item	Specification
Count Sources	f1, f2, f8, timer RA underflow
Count Operations	 Decrement the setting value in the TRBPR register When the timer underflows, it reloads the contents of the reload register before the count completes and the TOSSTF bit is set to 0 (one-shot stops). When a count stops, the timer reloads the contents of the reload register before it stops.
One-Shot Pulse	(n+1)(m+1)/fi
Output Time	fi: Count source frequency, n: Setting value in TRBPRE register, m: Setting value in TRBPR register ⁽²⁾
Count Start Conditions	 The TSTART bit in the TRBCR register is set to 1 (count starts) and the next trigger is generated. Set the TOSST bit in the TRBOCR register to 1 (one-shot starts) Input trigger to the INTO pin
Count Stop Conditions	 When reloading completes after Timer RB underflows during primary period. When the TOSSP bit in the TRBOCR register is set to 1 (one-shot stops) When the TSTART bit in the TRBCR register is set to 0 (stops counting) When the TSTOP bit in the TRBCR register is set to 1 (forcibly stops counting)
Interrupt Request Generation Timing	In half cycles of count source, after the timer underflows (at the same time as the TRBO output ends) [timer RB interrupt]
TRBO Pin Function	Pulse output
INTO Pin Functions	When the INOSTG bit in the TRBIOC register is set to 0 (INTO one-shot trigger disabled), programmable I/O port or INTO interrupt input When the INOSTG bit in the TRBIOC register is set to 1 (INTO one-shot trigger enabled), external trigger (INTO interrupt input)
Read from Timer	The count value can be read out by reading the TRBPR and TRBPRE registers.
Write to Timer	 When registers TRBPRE and TRBPR are written while the count is stopped, values are written to both the reload register and counter. When registers TRBPRE and TRBPR are written during the count, values are written to the reload register only (the data is transferred to the counter at the following reload)⁽¹⁾.
Select Functions	 Output level select function The TOPL bit in the TRBIOC register can select the output level of the one-shot pulse waveform. One-shot trigger select function Refer to 14.2.3.1 One-Shot Trigger Selection.

- 1. The set value is reflected at the following one-shot pulse after writing to the TRBPR register.
- 2. Do not set both the TRBPRE and TRBPR registers to 00h.

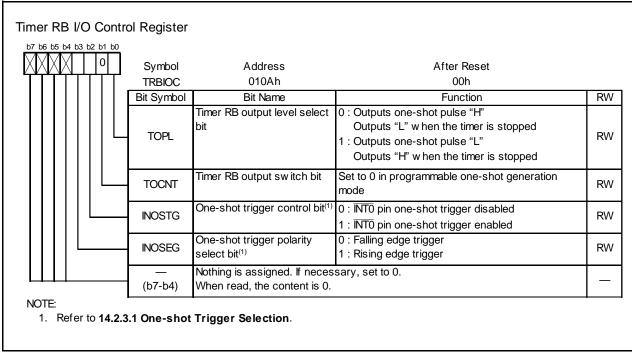

Figure 14.21 TRBIOC Register in Programmable One-Shot Generation Mode

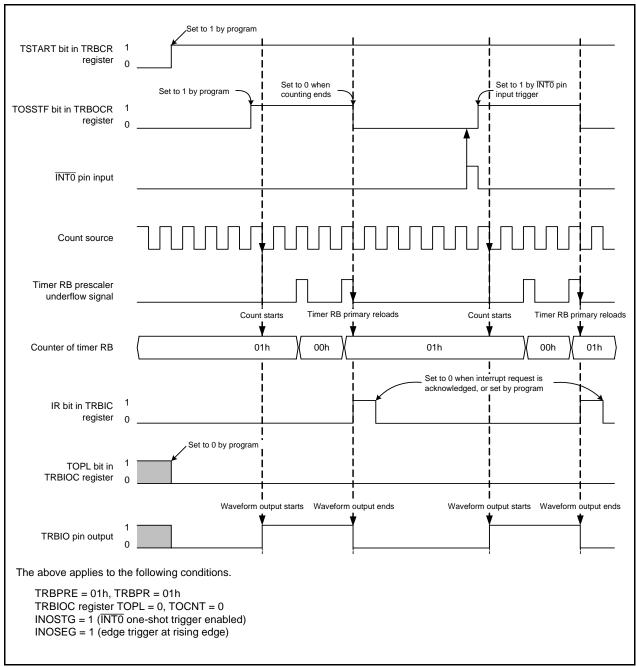

Figure 14.22 Operation Example of Programmable One-Shot Generation Mode

14.2.3.1 One-Shot Trigger Selection

In programmable one-shot generation mode and programmable wait one-shot generation mode, operation starts when a one-shot trigger is generated while the TCSTF bit in the TRBCR register is set to 1 (count starts). A one-shot trigger can be generated by either of the following causes:

- 1 is written to the TOSST bit in the TRBOCR register by a program.
- Trigger input from the $\overline{\text{INT0}}$ pin.

When a one-shot trigger occurs, the TOSSTF bit in the TRBOCR register is set to 1 (one-shot operation in progress) after one or two cycles of the count source have elapsed. Then, in programmable one-shot generation mode, count operation begins and one-shot waveform output starts. (In programmable wait one-shot generation mode, count operation starts for the wait period.) If a one-shot trigger occurs while the TOSSTF bit is set to 1, no retriggering occurs.

To use trigger input from the $\overline{\text{INT0}}$ pin, input the trigger after making the following settings:

- Set the PD4_5 bit in the PD4 register to 0 (input port).
- Select the INTO digital filter with bits INTOF1 and INTOF0 in the INTF register.
- Select both edges or one edge with the INTOPL bit in INTEN register. If one edge is selected, further select falling or rising edge with the INOSEG bit in TRBIOC register.
- Set the INT0EN bit in the INTEN register to 0 (enabled).
- After completing the above, set the INOSTG bit in the TRBIOC register to 1 (INT pin one-shot trigger enabled).

Note the following points with regard to generating interrupt requests by trigger input from the $\overline{\text{INT0}}$ pin.

- Processing to handle the interrupts is required. Refer to 12. Interrupts for details.
- If one edge is selected, use the POL bit in the INTOIC register to select falling or rising edge. (The INOSEG bit in the TRBIOC register does not affect INTO interrupts).
- If a one-shot trigger occurs while the TOSSTF bit is set to 1, timer RB operation is not affected, but the value of the IR bit in the INT0IC register changes.

14.2.4 Programmable Wait One-shot Generation Mode

Programmable wait one-shot generation mode is $\overline{\text{mode}}$ to output the one-shot pulse from the TRBO pin by a program or an external trigger input (input to the $\overline{\text{INTO}}$ pin) (see **Table 14.10 Programmable Wait One-Shot Generation Mode Specifications**). When a trigger is generated from this point, the timer starts outputting pulses only once for a given length of time equal to the setting value in the TRBSC register after waiting for a given length of time equal to the setting value in the TRBPR register.

Figure 14.23 shows the TRBIOC Register in Programmable Wait One-Shot Generation Mode. Figure 14.24 shows the Operation Example of Programmable Wait One-Shot Generation Mode.

Table 14.10 Programmable Wait One-Shot Generation Mode Specifications

Item	Specification
Count Sources	f1, f2, f8, timer RA underflow
Count Operations	 Decrement the setting value in timer RB primary When a count of timer RB primary underflows, the timer reloads the contents of the timer RB secondary before the count continues. When a count of timer RB secondary underflows, the timer reloads the contents of the timer RB primary before the count completes and the TOSSTF bit is set to 0 (one-shot stops). When a count stops, the timer reloads the contents of the reload register before it stops.
Wait Time	(n+1)(m+1)/fi
	fi: Count source frequency
	n: Setting value in the TRBPRE register, m: Setting value in the TRBPR register ⁽²⁾
One-Shot Pulse Output Time	
	fi: Count source frequency
	n: Setting value in the TRBPRE register, p: Setting value in the TRBSC register
Count Start Conditions	 The TSTART bit in the TRBCR register is set to 1 (count starts) and the next trigger is generated. Set the TOSST bit in the TRBOCR register to 1 (one-shot starts) Input trigger to the INTO pin
Count Stop Conditions	 When reloading completes after timer RB underflows during secondary period When the TOSSP bit in the TRBOCR register is set to 1 (one-shot stops) When the TSTART bit in the TRBCR register is set to 0 (starts counting) When the TSTOP bit in the TRBCR register is set to 1 (forcibly stops counting)
Interrupt Request	In half cycles of the count source after timer RB underflows during
Generation Timing	secondary period (complete at the same time as waveform output from the TRBO pin) [timer RB interrupt]
TRBO Pin Function	Pulse output
INT0 Pin Functions	When the INOSTG bit in the TRBIOC register is set to 0 (INT0 one-shot trigger disabled), programmable I/O port or INT0 interrupt input When the INOSTG bit in the TRBIOC register is set to 1 (INT0 one-shot trigger enabled), external trigger (INT0 interrupt input)
Read from Timer	The count value can be read out by reading the TRBPR and TRBPRE registers.
Write to Timer	 When registers TRBPRE, TRBSC, and TRBPR are written while the count stops, values are written to both the reload register and counter. When registers TRBPRE, TRBSC, and TRBPR are written to during count operation, values are written to the reload registers only.⁽¹⁾
Select Functions	 Output level select function The TOPL bit in the TRBIO register can select the output level of the one-shot pulse waveform. One-shot trigger select function Refer to 14.2.3.1 One-Shot Trigger Selection.

- 1. The set value is reflected at the following one-shot pulse after writing to registers TRBSC and TRBPR.
- 2. Do not set both the TRBPRE and TRBPR registers to 00h.

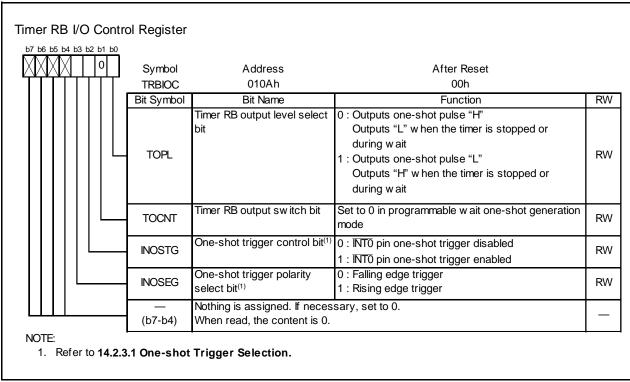

Figure 14.23 TRBIOC Register in Programmable Wait One-Shot Generation Mode

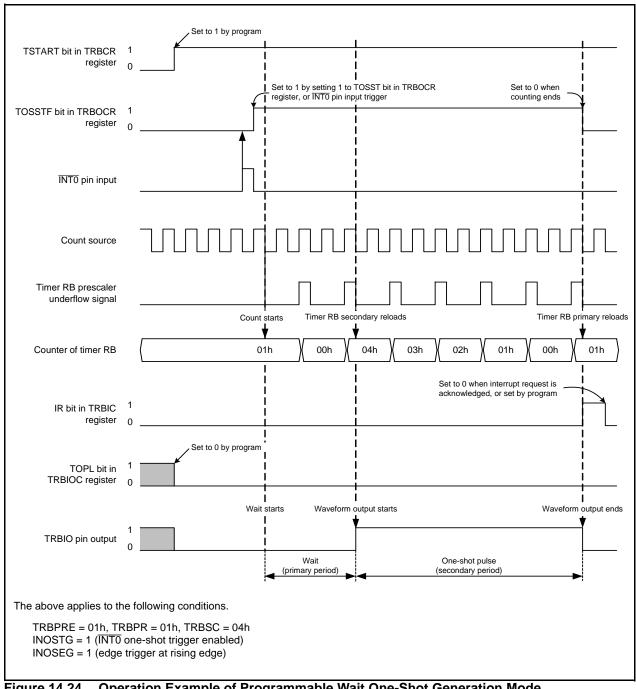

Figure 14.24 Operation Example of Programmable Wait One-Shot Generation Mode

14.2.5 **Notes on Timer RB**

- Timer RB stops counting after reset. Set the value to timer RB and timer RB prescaler before the count starts.
- Even if the prescaler and timer RB is read out in 16-bit units, these registers are read by 1 byte in the MCU. Consequently, the timer value may be updated during the period these two registers are being read.
- In programmable one-shot generation mode and programmable wait one-shot generation mode, when setting the TSTART bit in the TRBCR register to 0, 0 (stops counting) or setting the TOSSP bit in the TRBOCR register to 1 (stops one-shot), the timer reloads the value of reload register and stops. Therefore, read the timer count value in programmable one-shot generation mode and programmable wait one-shot generation mode before the timer stops.
- The TCSTF bit retains 0 (count stops) for 1 to 2 cycles of the count source after setting the TSTART bit to 1 (count starts) while the count stops.

During this time, do not access registers associated with timer RB⁽¹⁾ other than the TCSTF bit. The TCSTF bit retains 1 for 1 to 2 cycles of the count source after setting the TSTART bit to 0 (count stops) while the count is performing. Timer RB counting is stopped when the TCSTF bit is set to 0. During this time, do not access registers associated with timer RB⁽¹⁾ other than the TCSTF bit.

NOTE:

- 1. Registers associated with timer RB: TRBCR, TRBOCR, TRBIOC, TRBMR, TRBPRE, TRBSC, TRBPR
- If the TSTOP bit in the TRBCR register is set to 1 during timer operation, timer RB stops immediately.
- If 1 is written to the TOSST or TOSSP bit in the TRBOCR register, the value of the TOSSTF bit changes after one or two cycles of the count source have elapsed. If the TOSSP bit is written to 1 during the period between when the TOSST bit is written to 1 and when the TOSSTF bit is set to 1, the TOSSTF bit may be set to either 0 or 1 depending on the content state. Likewise, if the TOSST bit is written to 1 during the period between when the TOSSP bit is written to 1 and when the TOSSTF bit is set to 0, the TOSSTF bit may be set to either 0 or 1.

14.2.5.1 **Timer mode**

The following workaround should be performed in timer mode.

To write to registers TRBPRE and TRBPR during count operation (TCSTF bit is set to 1), note the following points:

- When the TRBPRE register is written continuously, allow three or more cycles of the count source for each write interval.
- When the TRBPR register is written continuously, allow three or more cycles of the prescaler underflow for each write interval.

14.2.5.2 Programmable waveform generation mode

The following three workarounds should be performed in programmable waveform generation mode.

- (1) To write to registers TRBPRE and TRBPR during count operation (TCSTF bit is set to 1), note the following points:
- When the TRBPRE register is written continuously, allow three or more cycles of the count source for each write interval.
- When the TRBPR register is written continuously, allow three or more cycles of the prescaler underflow for each write interval.
- (2) To change registers TRBPRE and TRBPR during count operation (TCSTF bit is set to 1), synchronize the TRBO output cycle using a timer RB interrupt, etc. This operation should be preformed only once in the same output cycle. Also, make sure that writing to the TRBPR register does not occur during period A shown in Figures 14.25 and 14.26.

The following shows the detailed workaround examples.

write operations must be completed by the beginning of period A.

• Workaround example (a): As shown in Figure 14.25, write to registers TRBSC and TRBPR in the timer RB interrupt routine. These

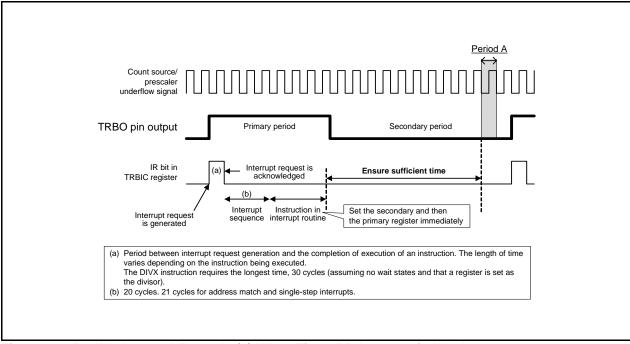

Figure 14.25 Workaround Example (a) When Timer RB Interrupt is Used

• Workaround example (b):

As shown in Figure 14.26 detect the start of the primary period by the TRBO pin output level and write to registers TRBSC and TRBPR. These write operations must be completed by the beginning of period A. If the port register's bit value is read after the port direction register's bit corresponding to the TRBO pin is set to 0 (input mode), the read value indicates the TRBO pin output value.

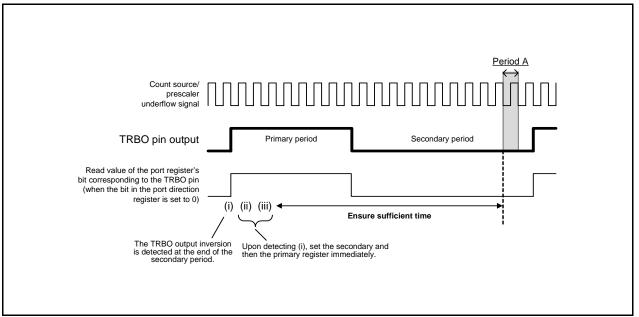

Figure 14.26 Workaround Example (b) When TRBO Pin Output Value is Read

(3) To stop the timer counting in the primary period, use the TSTOP bit in the TRBCR register. In this case, registers TRBPRE and TRBPR are initialized and their values are set to the values after reset.

14.2.5.3 Programmable one-shot generation mode

The following two workarounds should be performed in programmable one-shot generation mode.

- (1) To write to registers TRBPRE and TRBPR during count operation (TCSTF bit is set to 1), note the following points:
- When the TRBPRE register is written continuously during count operation (TCSTF bit is set to 1), allow three or more cycles of the count source for each write interval.
- When the TRBPR register is written continuously during count operation (TCSTF bit is set to 1), allow three or more cycles of the prescaler underflow for each write interval.
- (2) Do not set both the TRBPRE and TRBPR registers to 00h.

14.2.5.4 Programmable wait one-shot generation mode

The following three workarounds should be performed in programmable wait one-shot generation mode.

- (1) To write to registers TRBPRE and TRBPR during count operation (TCSTF bit is set to 1), note the following points:
- When the TRBPRE register is written continuously, allow three or more cycles of the count source for each write interval.
- When the TRBPR register is written continuously, allow three or more cycles of the prescaler underflow for each write interval.
- (2) Do not set both the TRBPRE and TRBPR registers to 00h.
- (3) Set registers TRBSC and TRBPR using the following procedure.
 - (a) To use "INTO pin one-shot trigger enabled" as the count start condition

 Set the TRBSC register and then the TRBPR register. At this time, after writing to the TRBPR register, allow an interval of 0.5 or more cycles of the count source before trigger input from the INTO pin.
 - (b) To use "writing 1 to TOSST bit" as the start condition
 Set the TRBSC register, the TRBPR register, and then TOSST bit. At this time, after writing to the
 TRBPR register, allow an interval of 0.5 or more cycles of the count source before writing to the
 TOSST bit.

14.3 Timer RD

Timer RD has 2 16-bit timers (channels 0 and 1). Each channel has 4 I/O pins.

The operation clock of Timer RD is f1 or fOCO40M.

Table 14.11 lists the Timer RD Operation Clocks.

Table 14.11 Timer RD Operation Clocks

Condition	Operation Clock of Timer RD
The count source is f1, f2, f4, f8, f32 and TRDCLK input. (The TCK2 to TCK0 bits in the TRDCR0 and TRDCR1 registers are set to 000b to 101b.)	f1
The count source is fOCO40M. (The TCK2 to TCK0 bits in the TRDCR0 and TRDCR1 registers are set to 110b.)	fOCO40M

Figure 14.27 shows the Block Diagram of Timer RD. Timer RD has 5 modes:

• Timer mode

- Input capture function Transfer the counter value to a register as a trigger of the external signal

- Output compare function Detect the register value match with a counter

(Pin output can be changed at detection)

The following 4 modes using the output compare function.

PWM mode
 Output any-wide pulse continuously

• Reset synchronous PWM mode Output three-phase waveforms (6) without sawtooth

wave modulation and dead time

• Complementary PWM mode Output three-phase waveforms (6) with triangular

wave modulation and dead time

• PWM3 mode Output PWM waveform (2) with same period

In the input capture function, output compare function and PWM mode, Channels 0 and 1 have the equivalent functions, and functions or modes can be selected every pin. Also, a combination of these functions and modes can be used in 1 channel.

In reset synchronous PWM mode, complementary PWM mode and PWM3 mode, a waveform is output with a combination of counters and registers in Channels 0 and 1.

Tables 14.12 to 14.20 lists the Pin Functions of timer RD.

Table 14.12 Pin Functions TRDIOA0/TRDCLK(P2_0)

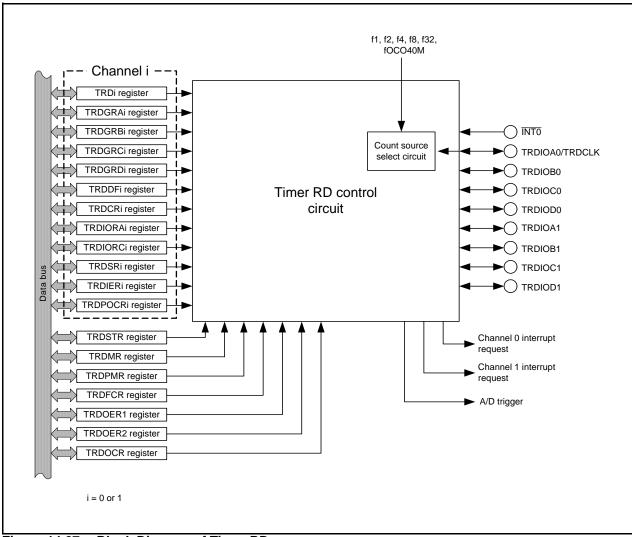

Figure 14.27 Block Diagram of Timer RD

14.3.1 **Count Source**

The count source selection can be used in all modes. However, in PWM3 mode, the external clock cannot be selected.

Table 14.21 Count Source Selection

Count Source	Selection
f1, f2, f4, f8, f32	The count source is selected by bits TCK2 to TCK0 in the TRDCRi register.
fOCO40M ⁽¹⁾	The FRA00 bit in the FRA0 register is set to 1 (high-speed on-chip oscillator frequency). Bits TCK2 to TCK0 in the TRDCRi register is set to 110b (fOCO40M).
External Signal Input to TRDCLK Pin	The STCLK bit in the TRDFCR register is set to 1 (external clock input enabled). The TCK2 to TCK0 bits in the TRDCRi register are set to 101b (count source: external clock). The valid edge selected by the CKEG1 to CKEG0 bits in the TRDCRi register. The PD2_0 bit in the PD2 register is set to 0 (input mode).

i = 0 or 1 NOTE:

1. The count source fOCO40M can be used with VCC = 3.0 to 5.5 V.

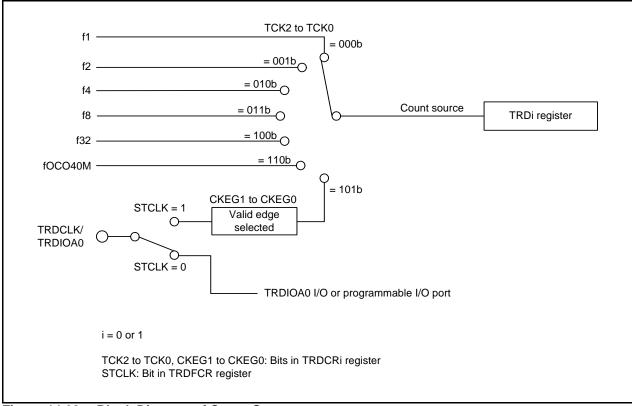

Figure 14.28 Block Diagram of Count Source

Set the pulse width of the external clock which inputs to the TRDCLK pin to 3 cycles or above of the operation clock of Timer RD (refer to Table 14.11 Timer RD Operation Clocks).

When selecting fOCO40M for the count source, set the FRA00 bit in the FRA0 register to 1 (high-speed onchip oscillator on) before setting the TCK2 to TCK0 bits in the TRDCRi register (i = 0 or 1) to 110b (fOCO40M).

14.3.2 Buffer Operation

The TRDGRCi register can be used as the buffer register of the TRDGRAi register, and the TRDGRDi register can be used as the buffer register of the TRDGRBi register by the BFCi and BFDi bits in the TRDMR register.

- TRDGRAi buffer register: TRDGRCi register
- TRDGRBi buffer register: TRDGRDi register

Buffer operation depends on modes. Table 14.22 lists the Buffer Operation in Each Mode.

Figure 14.29 shows the Buffer Operation in Input Capture Function, and Figure 14.30 shows the Buffer Operation in Output Compare Function.

Table 14.22 Buffer Operation in Each Mode

Function and Mode	Transfer Timing	Transfer Register	
Input Capture Function	Input capture signal input	Transfer content in TRDGRAi	
		(TRDGRBi) register to buffer register	
Output Compare Function	Compare match with TRDi register	Transfer content in buffer register to	
PWM Mode	and TRDGRAi (TRDGRBi) register	TRDGRAi (TRDGRBi) register	
Reset Synchronous PWM	Compare match withTRD0 register	Transfer content in buffer register to	
Mode	and TRDGRA0 register	TRDGRAi (TRDGRBi) register	
Complementary PWM	Compare match with TRD0 register	Transfer content in buffer register to	
Mode	and TRDGRA0 register	TRDGRB0, TRDGRA1 and	
	TRD1 register underflow	TRDGRB1 registers	
PWM3 Mode	Compare match with TRD0 register	Transfer content in buffer register to	
	and TRDGRA0 register	TRDGRA0, TRDGRB0, TRDGRA1	
		and TRDGRB1 registers	

i = 0 or 1

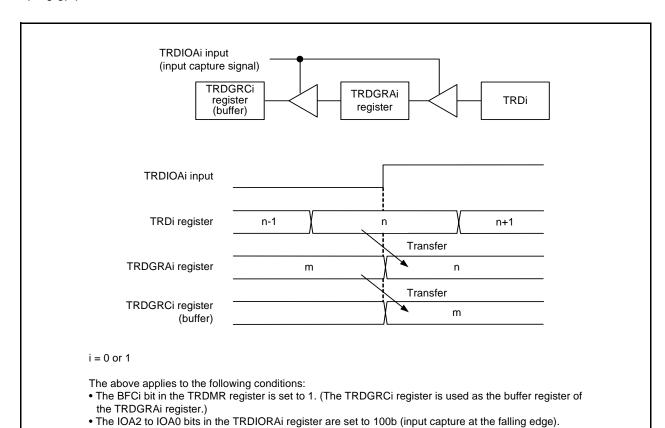

Figure 14.29 Buffer Operation in Input Capture Function

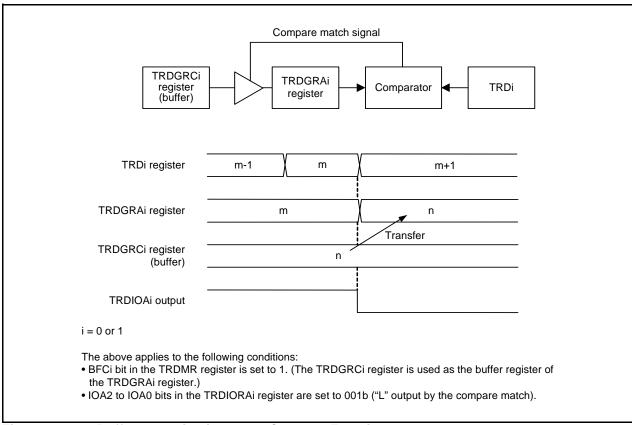

Figure 14.30 Buffer Operation in Output Compare Function

Perform the following for the timer mode (input capture and output compare functions). When using the TRDGRCi (i = 0 or 1) register as the buffer register of the TRDGRAi register

- Set the IOC3 bit in the TRDIORCi register to 1 (general register or buffer register).
- Set the IOC2 bit in the TRDIORCi register to the same as the IOA2 bit in the TRDIORAi register.

When using the TRDGRDi register as the buffer register of the TRDGRBi register

- Set the IOD3 bit in the TRDIORDi register to 1 (general register or buffer register).
- Set the IOD2 bit in the TRDIORCi register to the same value as the IOB2 bit in the TRDIORAi register.

Bits IMFC and IMFD in the TRDSRi register are set to 1 at the input edge of the TRDIOCi pin when also using registers TRDGRCi and TRDGRDi as the buffer register in the input capture function.

When using the TRDGRCi and TRDGRDi registers for the buffer register in output compare function, reset synchronous PWM mode, complementary PWM mode and PWM3 mode, the IMFC and IMFD bits in the TRDSRi register are set to 1 by the compare match with the TRDi register.

14.3.3 **Synchronous Operation**

The TRD1 register is synchronized with the TRD0 register.

- Synchronous preset
 - When the SYNC bit in the TRDMR register is set to 1 (synchronous operation), the data is written to both the TRD0 and TRD1 registers after writing to the TRDi register.
- Synchronous clear

When the SYNC bit in the TRDMR register is set to 1 and the CCLR2 to CCLR0 bits in the TRDCRi register are set to 011b (synchronous clear), and the TRD0 register is set to 0000h at the same time as the TRD1 register is set to 0000h.

Also, when the SYNC bit in the TRDMR register is set to 1 and the CCLR2 to CCLR0 bits in the TRDCRi register are set to 011b (synchronous clear), and the TRD1 register is set to 0000h at the same time as the TRD0 register is set to 0000h.

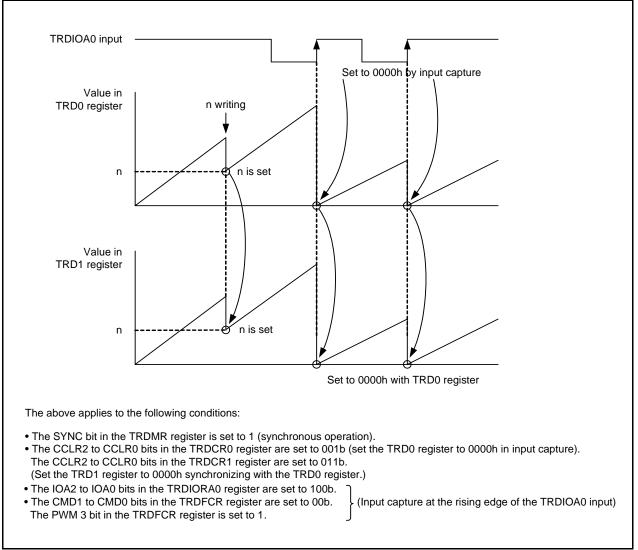

Figure 14.31 Synchronous Operation

14.3.4 Pulse Output Forced Cutoff

In the output compare function, PWM mode, reset synchronous PWM mode, complementary PWM mode and PWM3 mode, the TRDIOji output pin can be forcibly set to the programmable I/O port by the $\overline{\text{INTO}}$ pin input, and pulse output can be cut off.

The used pins for the output in these functions or modes can function as the output pin of Timer RD when setting the applicable bit in the TRDOER1 register to 0 (enable Timer RD output). When the PTO bit in the TRDOER2 register to 1 (INTO of pulse output forced cutoff signal input enabled), all bits in the TRDOER1 register are set to 1 (disable Timer RD output, the TRDIOji output pin is used as the programmable I/O port) after "L" is applied to the INTO pin. The TRDIOji output pin is set to the programmable I/O port after "L" is applied to the INTO pin and waiting for 1 to 2 cycles of the Timer RD operation clock (refer to **Table 14.11 Timer RD Operation Clocks**).

Set as below when using this function:

- Set the pin status (high impedance, "L" or "H" output) with the pulse output forced cutoff by the P2 and PD2 registers.
- Set the INT0EN bit in the INTEN register to 1 (enable INT0 input) and the INT0PL bit to 0 (one edge).
- Set the PD4_5 bit in the PD4 register to 0 (input mode).
- Set the INTO digital filter by the INTOF1 to INTOF0 bits in the INTF register.
- Set the PTO bit in the TRDOER2 register to 1 (enable pulse output forced cutoff signal input $\overline{\text{INTO}}$).

According to the selection of the POL bit in the INT0IC register and change of the $\overline{\text{INT0}}$ pin input, the IR bit in the INT0IC register is set to 1 (interrupt request). Refer to **12. Interrupts** for details of interrupts.

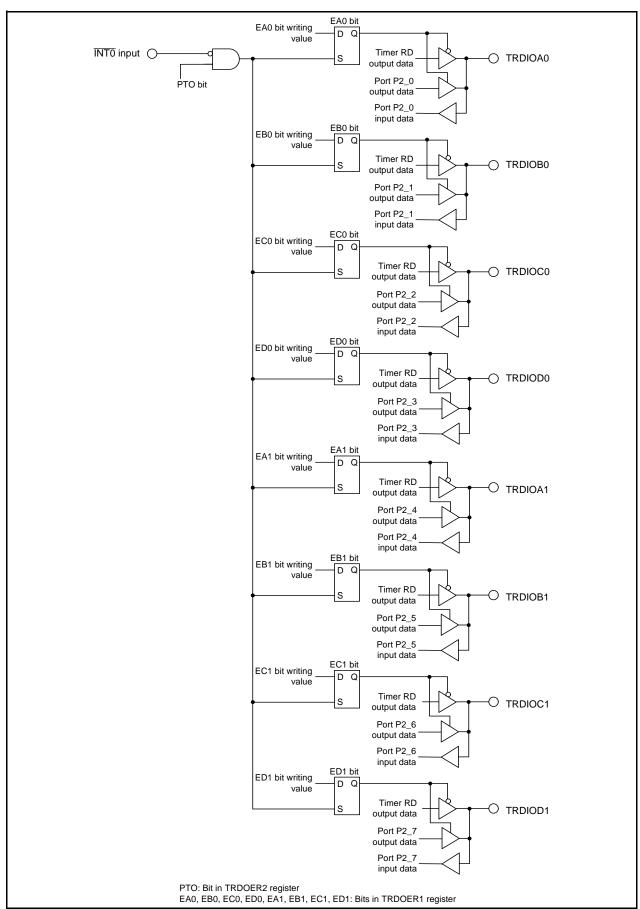

Figure 14.32 Pulse Output Forced Cutoff

14.3.5 Input Capture Function

The input capture function is to measure the external signal width and period. The content in the TRDi register (counter) is transferred to the TRDGRji register as a trigger of the TRDIOji (i = 0 or 1, j = either A, B, C or D) pin external signal (input capture). Since this function is enabled with a combination of the TRDIOji pin and TRDGRji register, any of the input capture function, other modes or functions can be selected every pin.

The TRDGRA0 register can also select fOCO128 signal as input-capture trigger input.

Figure 14.33 shows the Block Diagram of Input Capture Function, Table 14.23 lists the Input Capture Function Specifications. Figures 14.34 to 14.44 show the Registers Associated with Input Capture Function and Figure 14.45 shows the Operating Example of Input Capture Function.

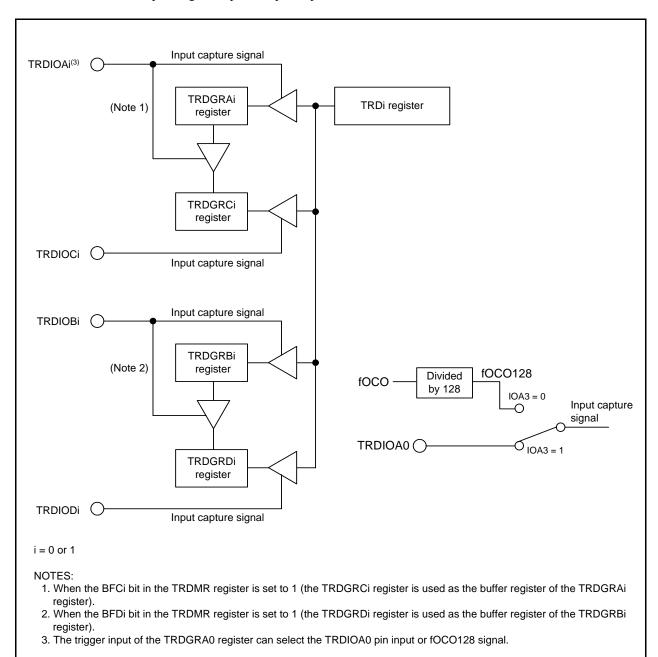

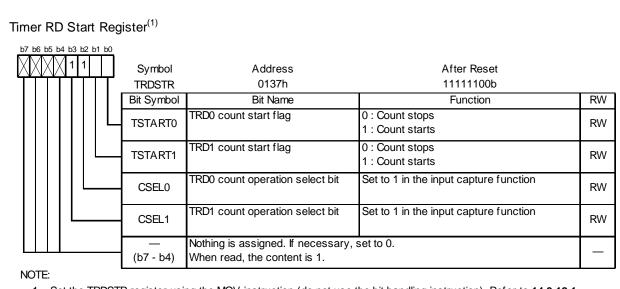

Figure 14.33 Block Diagram of Input Capture Function

Table 14.23 Input Capture Function Specifications

Item	Specification	
Count Sources	f1, f2, f4, f8, f32, fOCO40M External signal input to the TRDCLK pin (valid edge selected by a program)	
Count Operations	Increment	
Count Period	When the CCLR2 to CCLR0 bits in the TRDCRi register are set to 000b (free-running operation). 1/fk × 65536 fk: Frequency of count source	
Count Start Condition	Write 1 (count starts) to the TSTARTi bit in the TRDSTR register.	
Count Stop Condition	Write 0 (count stops) to the TSTARTi bit in the TRDSTR register when the CSELi bit in the TRDSTR register is set to 1.	
Interrupt Request Generation Timing	 Input capture (valid edge of TRDIOji input or fOCO128 signal edge) TRDi register overflows 	
TRDIOA0 Pin Function	Programmable I/O port, input-capture input, or TRDCLK (external clock) input	
TRDIOB0, TRDIOC0, TRDIOD0, TRDIOA1 to TRDIOD1 Pin Functions	Programmable I/O port, or input-capture input (Select every pin)	
INTO Pin Function	Programmable I/O port or INTO interrupt input	
Read from Timer	The count value can be read by reading the TRDi register.	
Write to Timer	 When the SYNC bit in the TRDMR register is set to 0 (channels 0 and 1 operate independently). Data can be written to the TRDi register. When the SYNC bit in the TRDMR register is set to 1 (channels 0 and 1 operate synchronously.) Data can be written to both the TRD0 and TRD1 registers by writing to the TRDi register. 	
Selection Functions	 Input-capture input pin selected Either 1 pin or multiple pins of the TRDIOAi, TRDIOBi, TRDIOCi or TRDIODi pin. Input-capture input valid edge selected The rising edge, falling edge or both the rising and falling edges The timing when the TRDi register is set to 0000h At overflow or input capture Buffer operation (refer to 14.3.2 Buffer Operation) Synchronous operation (refer to 14.3.3 Synchronous Operation) Digital filter The TRDIOji input is sampled, and when the sampled input level match 3 times, its level is assumed as a determination. Input-capture trigger selected fOCO128 can be selected for input-capture trigger input of the TRDGRA0 register. 	

i = 0 or 1, j = either A, B, C or D

1. Set the TRDSTR register using the MOV instruction (do not use the bit handling instruction). Refer to 14.3.12.1 TRDSTR Register of Notes on Timer RD.

Timer RD Mode Register

Registers TRD0 to TRD1 in Input Capture Function **Figure 14.43**

Registers TRDGRAi, TRDGRBi, TRDGRCi and TRDGRDi in Input Capture Function

The following registers are disabled in the input capture function: TRDOER1, TRDOER2, TRDOCR, TRDPOCR0 and TRDPOCR1

TRDGRji Register Functions in Input Capture Function **Table 14.24**

Register	Setting	Register Function	Input-Capture Input Pin
TRDGRAi	_	General register	TRDIOAi
TRDGRBi		The value in the TRDi register can be read at the input capture.	TRDIOBi
TRDGRCi	BFCi = 0	General register	TRDIOCi
TRDGRDi	BFDi = 0	The value in the TRDi register can be read at the input capture.	TRDIODi
TRDGRCi	BFCi = 1	Buffer register	TRDIOAi
TRDGRDi	BFDi = 1	The value in the TRDi register can be read at the input capture. (Refer to 14.3.2 Buffer Operation)	TRDIOBi

i = 0 or 1, j = either A, B, C or DBFCi, BFDi: Bits in TRDMR Register

> Set the pulse width of the input capture signal applied to the TRDIOji pin to 3 cycles or more of the Timer RD operation clock (refer to Table 14.11 Timer RD Operation Clocks) for "no digital filter" (the DFj bit in the TRDDFi register is set to 0).

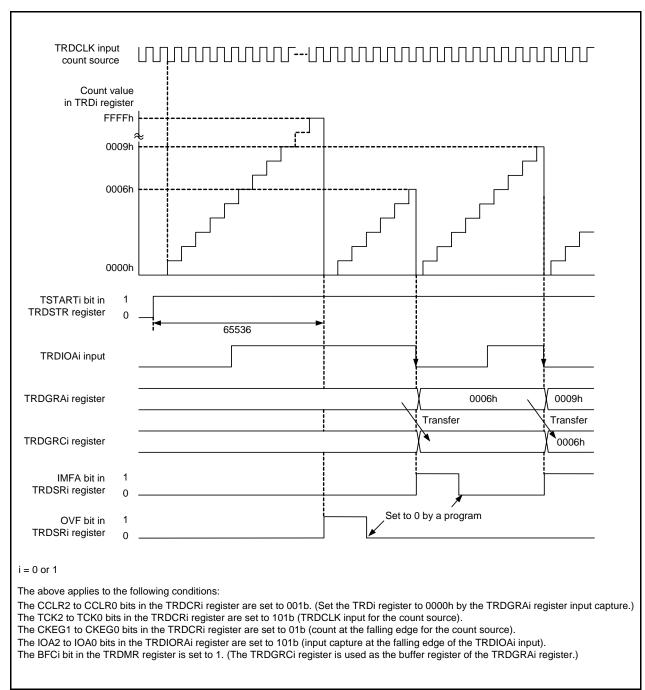

Figure 14.45 Operating Example of Input Capture Function

14.3.5.1 Digital Filter

The TRDIOji input is sampled, and when the sampled input level matches 3 times, its level is assumed as a determination. Select the digital filter function and sampling clock by the TRDDFi register.

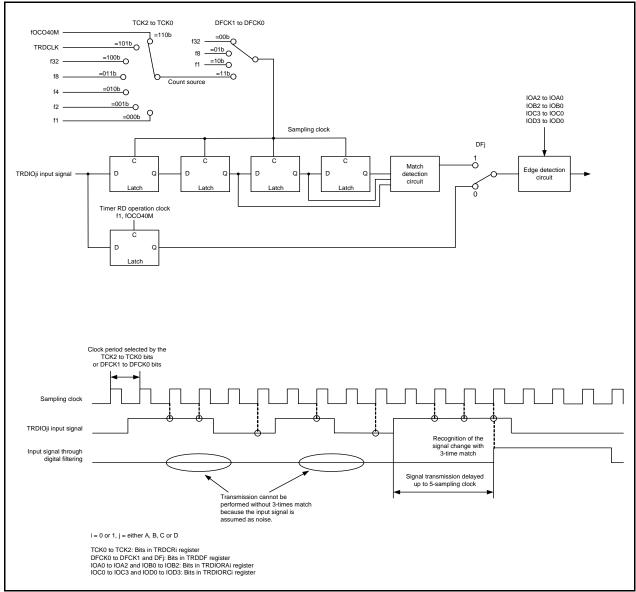

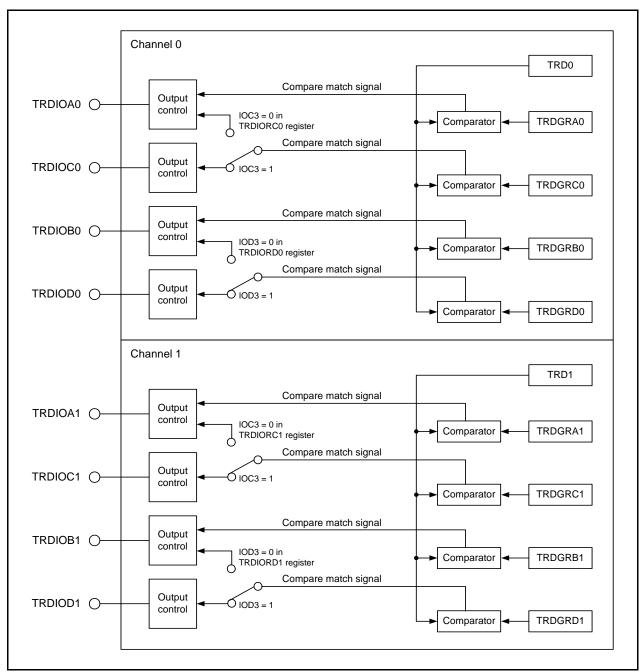

Figure 14.46 Block Diagram of Digital Filter

14.3.6 **Output Compare Function**

This function is to detect the match (compare match) of the content in the TRDGRji (j = either A, B, C and D) register with the content in the TRDi (i = 0 or 1) register. When the content matches, any level is output from the TRDIOji pin. Since this function is enabled with a combination of the TRDIOji pin and TRDGRji register, any of the output compare function, other modes or functions can be selected every pin.

Figure 14.47 shows the Block Diagram of Output Compare Function, Table 14.25 lists the Output Compare Function Specifications. Figures 14.48 to 14.59 list the Registers Associated with Output Compare Function and Figure 14.60 shows the Operating Example of Output Compare Function.

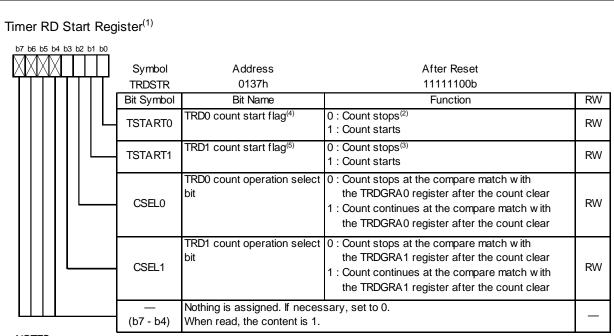

Block Diagram of Output Compare Function Figure 14.47

Table 14.25 Output Compare Function Specifications

Item	Specification
Count Sources	f1, f2, f4, f8, f32, fOCO40M External signal input to the TRDCLK pin (valid edge selected by a program)
Count Operations	Increment
Count Period	 When the CCLR2 to CCLR0 bits in the TRDCRi register are set to 000b (free-running operation) 1/fk x 65536 fk: Frequency of count source The CCLR1 to CCLR0 bits in the TRDCRi register are set to 01b or 10b (set the TRDi register to 0000h at the compare match in the TRDGRji register.) Frequency of count source x (n + 1) n: Setting value in the TRDGRji register
Waveform Output Timing	Compare match
Count Start Condition	Write 1 (count starts) to the TSTARTi bit in the TRDSTR register.
Count Stop Conditions	 Write 0 (count stops) to the TSTARTi bit in the TRDSTR register when the CSELi bit in the TRDSTR register is set to 1. The output compare output pin holds output level before the count stops. When the CSELi bit in the TRDSTR register is set to 0, the count stops at the compare match in the TRDGRAi register. The output compare output pin holds level after output change by the compare match.
Interrupt Request Generation Timing	Compare match (the content in the TRDi register matches with the content in the TRDGRji register.) TRDi register overflows
TRDIOA0 Pin Function	Programmable I/O port, output-compare output or TRDCLK (external clock) input
TRDIOB0, TRDIOC0, TRDIOD0, TRDIOA1 to TRDIOD1 Pin Functions	Programmable I/O port or output-compare output (select every pin)
INT0 Pin Function	Programmable I/O port, pulse output forced cutoff signal input or INTO interrupt input
Read from Timer	The count value can be read by reading the TRDi register.
Write to Timer	 When the SYNC bit in the TRDMR register is set to 0 (channels 0 and 1 operate independently) Data can be written to the TRDi register. When the SYNC bit in the TRDMR register is set to 1 (channels 0 and 1 operate synchronously). Data can be written to both the TRD0 and TRD1 registers by writing to the TRDi register.
Selection Functions	 Output-compare output pin selected Either 1 pin or multiple pins of the TRDIOAi, TRDIOBi, TRDIOCi or TRDIODi pin. Output level at the compare match selected "L" output, "H" output or output level inversed Initial output level selected Set the level at period from the count start to the compare match. Timing to set the TRDi register to 0000h Overflow or compare match in the TRDGRAi register Buffer operation (refer to 14.3.2 Buffer Operation) Synchronous operation (refer to 14.3.3 Synchronous Operation) Output pin in the TRDGRCi and TRDGRDi registers changed The TRDGRCi register can be used as output control of the TRDIOAi pin and the TRDGRDi register can be used as output control of the TRDIOBi pin. Pulse output forced cutoff signal input (refer to 14.3.4 Pulse Output Forced Cutoff) Timer RD can be used as the internal timer without output.

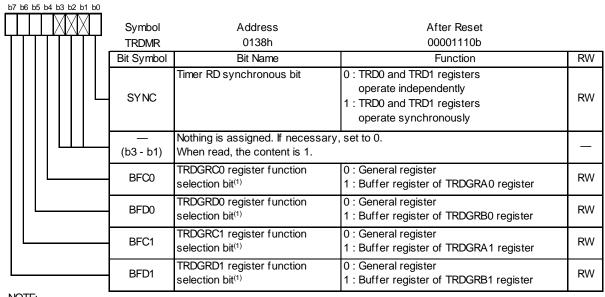

i = 0 or 1, j = either A, B, C or D

- 1. Set the TRDSTR register using the MOV instruction (do not use the bit handling instruction). Refer to 14.3.12.1 TRDSTR Register of Notes on Timer RD.
- 2. When the CSEL0 bit is set to 1, write 0 to the TSTART0 bit.
- 3. When the CSEL1 bit is set to 1, write 0 to the TSTART1 bit.
- 4. When the CSEL0 bit is set to 0 and generating the compare match signal (TRDIOA0), this bit is set to 0 (count stops).
- 5. When the CSEL1 bit is set to 0 and generating the compare match signal (TRDIOA1), this bit is set to 0 (count stops).

Timer RD Mode Register

NOTE:

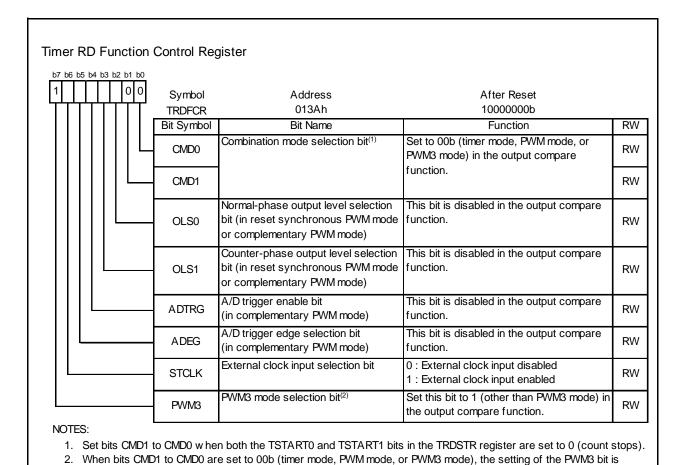

1. When selecting 0 (change the TRDGRji register output pin) by the IOj3 (j = C or D) bit in the TRDIORCi (i = 0 or 1) register, set the BFji bit in the TRDMR register to 0.

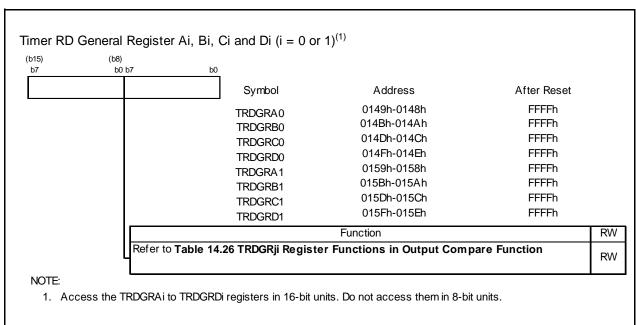

Figure 14.59 Registers TRDGRAi, TRDGRBi, TRDGRCi and TRDGRDi in Output Compare Function

The following registers are disabled in the output compare function: TRDDF0, TRDDF1, TRDPOCR0 and TRDPOCR1

Table 14.26 TRDGRji Register Functions in Output Compare Function

Register	Setting		Register Function	Output-Compare
	BFji	IOj3	ixegister i unction	Output Pin
TRDGRAi	_	_	General register. Write the compare value.	TRDIOAi
TRDGRBi				TRDIOBi
TRDGRCi	0	1	General register. Write the compare value.	TRDIOCi
TRDGRDi				TRDIODi
TRDGRCi	1	1	Buffer register. Write the next compare value	TRDIOAi
TRDGRDi			(refer to 14.3.2 Buffer Operation.)	TRDIOBi
TRDGRCi	0	0	TRDIOAi output control (refer to 14.3.6.1 Changing	TRDIOAi
TRDGRDi			Output Pins in Registers TRDGRCi (i = 0 or 1) and	TRDIOBi
			TRDGRDi.)	

i = 0 or 1, j = either A, B, C or D

BFji: Bit in TRDMR register IOj3: Bit in TRDIORCi register

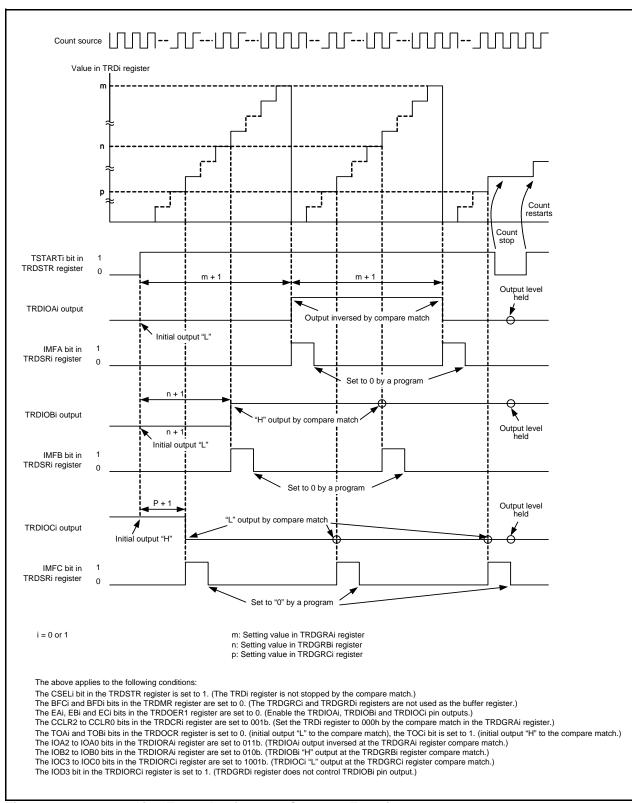

Figure 14.60 Operating Example of Output Compare Function

14.3.6.1 Changing Output Pins in Registers TRDGRCi (i = 0 or 1) and TRDGRDi

The TRDGRCi register can be used as output control of the TRDIOAi pin and the TRDGRDi register can be used as output control of the TRDIOBi pin. Therefore, each pin output can be controlled as follows:

- TRDIOAi output is controlled by the values in the TRDGRAi and TRDGRCi registers.
- TRDIOBi output is controlled by the values in the TRDGRBi and TRDGRDi registers.

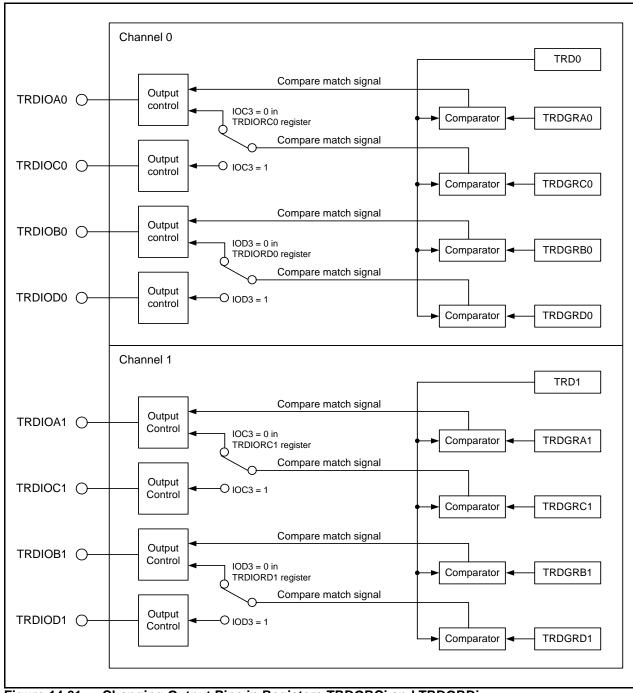

Figure 14.61 Changing Output Pins in Registers TRDGRCi and TRDGRDi

Change output pins in the TRDGRCi and TRDGRDi registers as below:

- Select 0 (change TRDGRji register output pin) by the IOj3 (j = C or D) bit in the TRDIORCi register.
- Set the BFji bit in the TRDMR register to 0 (general register).
- Set the different value in the TRDGRCi register and the TRDGRAi register. Also, set the different value in the TRDGRDi register and the TRDGRBi register.

Figure 14.62 lists the Operating Example When TRDGRCi Register is Used for Output Control of TRDIOAi Pin and TRDGRDi Register is Used for Output Control of TRDIOBi Pin.

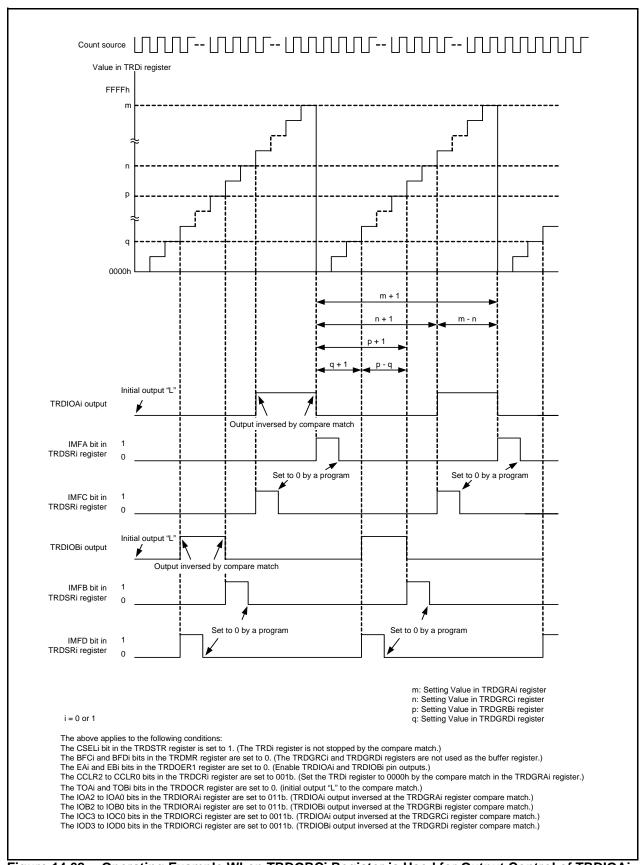

Figure 14.62 Operating Example When TRDGRCi Register is Used for Output Control of TRDIOAi Pin and TRDGRDi Register is Used for Output Control of TRDIOBi Pin

14.3.7 PWM Mode

PWM mode is to output a PWM waveform. Up to 3 PWM waveforms with the same period can be output by 1 channel. Also, Up to 6 PWM waveforms with the same period can be output by synchronizing Channels 0 and 1. Since this mode functions by a combination of the TRDIOji (i = 0 or 1, j = B, C or D) pin and TRDGRji register, any of PWM mode, other modes or functions can be selected every pin. (However, since the TRDGRAi register is used when using any pin for PWM mode, the TRDGRAi register cannot be used for other modes.)

Figure 14.63 shows the Block Diagram of PWM Mode, Table 14.27 lists the PWM Mode Specifications. Figures 14.64 to 14.73 show the Registers Associated with PWM Mode and Figures 14.74 to 14.75 show the Operations of PWM Mode.

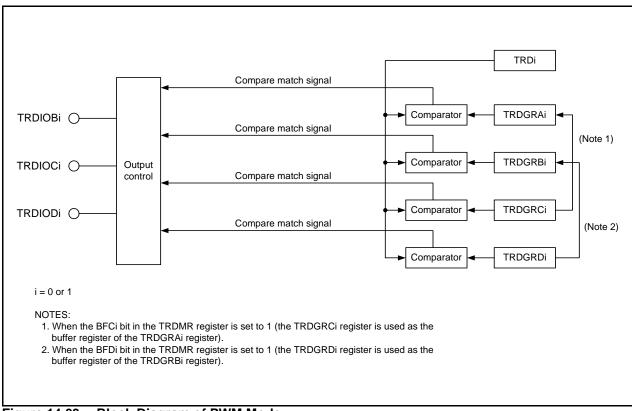

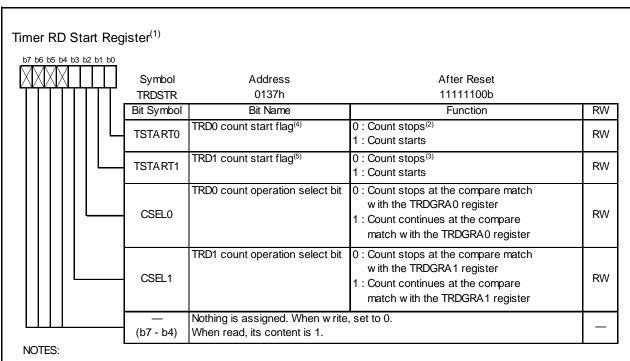

Figure 14.63 Block Diagram of PWM Mode

Table 14.27 PWM Mode Specifications

Item	Specification
Count Sources	f1, f2, f4, f8, f32, fOCO40M
	External signal input to the TRDCLK pin (valid edge selected by a
	program)
Count Operations	Increment
PWM Waveform	PWM period: 1/fk x (m+1)
	Active level width: 1/fk x (m-n)
	Inactive level width: 1/fk x (n+1)
	fk: Frequency of count source
	m: Setting value in the TRDGRAi register
	n: Setting value in the TRDGRji register
	m + 1
	n + 1 m - n (When "L" is selected for the active level)
Count Start Condition	Write 1 (count starts) to the TSTARTi bit in the TRDSTR register.
Count Stop Conditions	Write 0 (count stops) to the TSTARTi bit in the TRDSTR register
·	when the CSELi bit in the TRDSTR register is set to 1.
	The PWM output pin holds output level before the count stops.
	• When the CSELi bit in the TRDSTR register is set to 0, the count
	stops at the compare match in the TRDGRAi register.
	The PWM output pin holds level after output change by the compare
Interment Degrees Constitution	match.
Interrupt Request Generation	Compare match (the content in the TRDi register matches with the content in the TRDGRhi register.)
Timing	• TRDi register overflows
TRDIOA0 Pin Function	Programmable I/O port or TRDCLK (external clock) input
TRDIOA1 Pin Function	Programmable I/O port
TRDIOB0, TRDIOC0, TRDIOD0,	Programmable I/O port or pulse output (select every pin)
TRDIOB1, TRDIOC1, TRDIOD1	Togrammable #6 port of pales output (solest every pin)
Pin Functions	
INTO Pin Function	Programmable I/O port, pulse output forced cutoff signal input or INTO
INTO FILL UNGUOII	interrupt input
Read from Timer	The count value can be read by reading the TRDi register.
Write to Timer	The value can be written to the TRDi register.
Selection Functions	• 1 to 3 PWM output pins selected per 1 channel
	Either 1 pin or multiple pins of the TRDIOBi, TRDIOCi or TRDIODi
	pin.
	• The active level selected every pin.
	Initial output level selected every pin.
	• Synchronous operation (refer to 14.3.3 Synchronous Operation.)
	Buffer operation (refer to 14.3.2 Buffer Operation.) Bulge output ferred input (refer to 14.3.4 Bulge Output
	 Pulse output forced cutoff signal input (refer to 14.3.4 Pulse Output Forced Cutoff.)
	i ordea datoir.)

i = 0 or 1, j = either B, C or D,h = either A, B, C or D

- 1. Set the TRDSTR register using the MOV instruction (do not use the bit handling instruction). Refer to 14.3.12.1 TRDSTR Register of Notes on Timer RD.
- 2. When the CSEL0 bit is set to 1, write 0 to the TSTART0 bit.
- 3. When the CSEL1 bit is set to 1, write 0 to the TSTART1 bit.
- 4. When the CSEL0 bit is set to 0 and generating the compare match signal (TRDIOA0), this bit is set to 0 (count stops).
- 5. When the CSEL1 bit is set to 0 and generating the compare match signal (TRDIOA1), this bit is set to 0 (count stops).

14.3.8 Reset Synchronous PWM Mode

Output 3 normal-phases and 3 counter-phases of the PWM waveform with the same period (no three-phase, sawtooth wave modulation and dead time).

Figure 14.76 shows the Block Diagram of Reset Synchronous PWM Mode, Table 14.29 lists the Reset Synchronous PWM Mode Specifications. Figures 14.77 to 14.84 show the Registers Associated with Reset Synchronous PWM Mode and Figure 14.85 shows the Operating Example of Reset Synchronous PWM Mode. Refer to **Figure 14.75 Operating Example of PWM Mode (Duty 0%, Duty 100%)** for the operation example in PWM Mode of duty 0% and duty 100%.

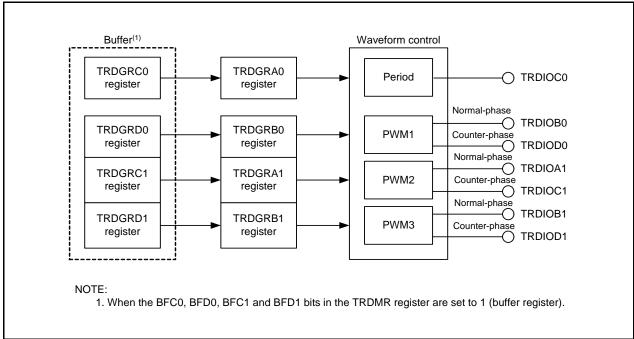

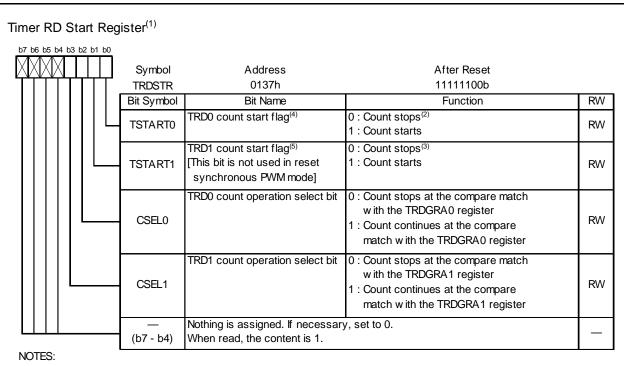

Figure 14.76 Block Diagram of Reset Synchronous PWM Mode

Table 14.29 Reset Synchronous PWM Mode Specifications

Item	Specification	
Count Sources	f1, f2, f4, f8, f32, fOCO40M	
	External signal input to the TRDCLK pin (valid edge selected by a	
	program)	
Count Operations	The TRD0 register is incremented (The TRD1 register is not used.)	
PWM Waveform	PWM period: $1/fk \times (m + 1)$	
	Active level width of normal-phase: 1/fk × (m - n)	
	Active level width of counter-phase:1/fk × (n + 1)	
	fk: Frequency of count source	
	m: Setting value in the TRDGRA0 register	
	n: Setting value in the TRDGRB0 register (PWM output 1),	
	Setting value in the TRDGRA1 register (PWM output 2), Setting value in the TRDGRB1 register (PWM output 3)	
	Setting value in the TNDGNBT register (F vvivi output 3)	
	m + 1	
	Normal-phase	
	→	
	m-n	
	Counter-phase	
	n + 1 (When "L" is selected for the active level)	
Count Start Condition	Write 1 (count starts) to the TSTART0 bit in the TRDSTR register.	
Count Stop Conditions	Write 0 (count stops) to the TSTART0 bit in the TRDSTR register	
	when the CSEL0 bit in the TRDSTR register is set to 1.	
	The PWM output pin holds output level before the count stops	
	 When the CSEL0 bit in the TRDSTR register is set to 0, the count stops at the compare match in the TRDGRA0 register. 	
	The PWM output pin holds level after output change by the compare	
	match.	
• Compare match (the content in the TRD0 register matches w		
Timing	content in the TRDGRj0, TRDGRA1 and TRDGRB1 registers.)	
	The TRD0 register overflows	
TRDIOA0 Pin Function	Programmable I/O port or TRDCLK (external clock) input	
TRDIOB0 Pin Function	PWM output 1 normal-phase output	
TRDIOD0 Pin Function	PWM output 1 counter-phase output	
TRDIOA1 Pin Function	PWM output 2 normal-phase output	
TRDIOC1 Pin Function	PWM output 2 counter-phase output	
TRDIOB1 Pin Function	PWM output 3 normal-phase output	
TRDIOD1 Pin Function	PWM output 3 counter-phase output	
TRDIOC0 Pin Function	Output inverted every period of PWM	
INT0 Pin Function	Programmable I/O port, pulse output forced cutoff signal input or INTO	
	interrupt input	
Read from Timer	The count value can be read by reading the TRD0 register.	
Write to Timer	The value can be written to the TRD0 register.	
Selection Functions	The active level of normal-phase and counter-phase and initial	
	output level selected individually.	

j = either A, B, C or D

- 1. Set the TRDSTR register using the MOV instruction (do not use the bit handling instruction). Refer to 14.3.12.1 TRDSTR Register of Notes on Timer RD.
- 2. When the CSEL0 bit is set to 1, write 0 to the TSTART0 bit.
- 3. When the CSEL1 bit is set to 1, write 0 to the TSTART1 bit.
- 4. When the CSEL0 bit is set to 0 and generating the compare match signal(TRDIOA0), this bit is set to 0 (count stops).
- 5. When the CSEL1 bit is set to 0 and generating the compare match signal (TRDIOA1), this bit is set to 0 (count stops).

Figures 14.87 to 14.95 show the Registers Associated with Complementary PWM Mode, Figure 14.96 shows the Output Model of Complementary PWM Mode and Figure 14.97 shows the Operating Example of Complementary PWM Mode.

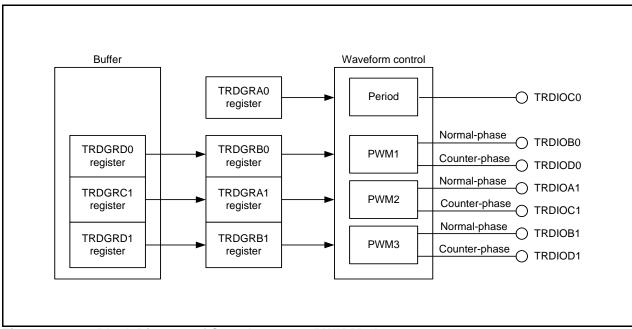

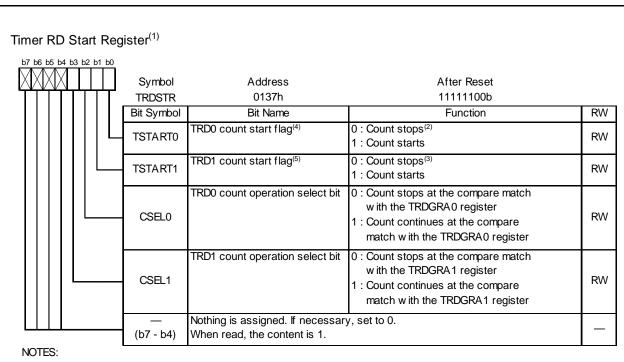

Figure 14.86 Block Diagram of Complementary PWM Mode

Table 14.31 Complementary PWM Mode Specifications

Item	Specification	
Count Sources	f1, f2, f4, f8, f32, fOCO40M External signal input to the TRDCLK pin (valid edge selected by a program) Set the TCK2 to TCK0 bits in the TRDCR1 register to the same value (same count	
Count Operations	source) as the TCK2 to TCK0 bits in the TRDCR0 register. Increment or decrement The TRD0 and TRD1 registers are decremented with the compare match in the TRD0 and TRDGRA0 registers during increment. The TRD1 register is set from 0000h to FFFFh during decrement, the TRD0 and TRD1 registers are incremented.	
PWM Operations	PWM period: 1/fk × (m + 2 - p) × 2 ⁽¹⁾ Dead time: p Active level width of normal-phase: 1/fk × (m - n - p + 1) × 2 Active level width of counter-phase: 1/fk × (n + 1 - p) × 2 fk: Frequency of count source m: Setting value in the TRDGRA0 register n: Setting value in the TRDGRB0 register (PWM output 1) Setting value in the TRDGRB1 register (PWM output 2) Setting value in the TRDGRB1 register (PWM output 3) p: Setting value in the TRD0 register	
Count Start Condition	Write 1 (count starts) to the TSTART0 and TSTART1 bits in the TRDSTR register.	
Count Stop Conditions	Write 0 (count stops) to the TSTART0 and TSTART1 bits in the TRDSTR register when the CSEL0 bit in the TRDSTR register is set to 1. (The PWM output pin holds output level before the count stops.)	
Interrupt Request Generation Timing	 Compare match (the content in the TRDi register matches with the content in the TRDGRji register.) The TRD1 register undeflows 	
TRDIOA0 Pin Function	Programmable I/O port or TRDCLK (external clock) input	
TRDIOBO Pin Function	PWM output 1 normal-phase output	
TRDIODO Pin Function	PWM output 1 counter-phase output	
TRDIOA1 PIn Function	PWM output 2 normal-phase output	
TRDIOC1 Pin Function	PWM output 2 counter-phase output	
TRDIOB1 Pin Function	PWM output 3 normal-phase output	
TRDIOD1 Pin Function	PWM output 3 counter-phase output	
TRDIOC0 Pin Function	Output inversed every 1/2 period of PWM	
INT0 Pin Function	Programmable I/O port, pulse output forced cutoff signal input or INTO interrupt input	
Read from Timer	The count value can be read by reading the TRDi register.	
Write to Timer	The value can be written to the TRDi register.	
Selection Functions	 Pulse output forced cutoff signal input (refer to 14.3.4 Pulse Output Forced Cutoff) The active level of normal-phase and counter-phase and initial output level selected individually. Transfer timing from the buffer register selected A/D trigger generated 	

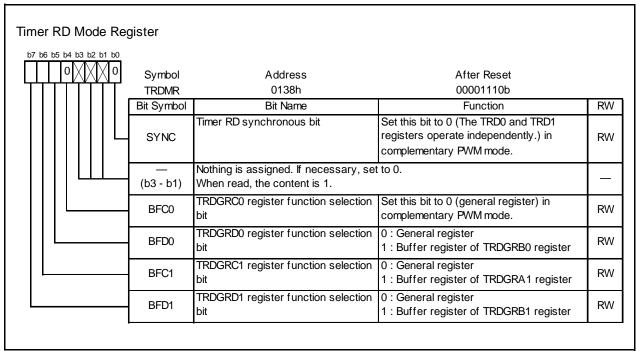

i = 0 or 1, j = either A, B, C or DNOTE:

1. After a count starts, the PWM period is stable.

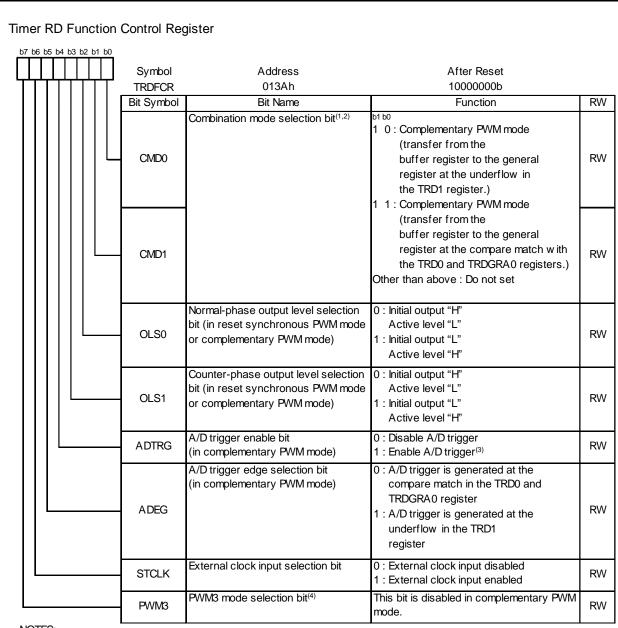

- 1. Set the TRDSTR register using the MOV instruction (do not use the bit handling instruction). Refer to 14.3.12.1 TRDSTR Register of Notes on Timer RD.
- 2. When the CSEL0 bit is set to 1, write 0 to the TSTART0 bit.
- 3. When the CSEL1 bit is set to 1, write 0 to the TSTART1 bit.
- 4. When the CSEL0 bit is set to 0 and generating the compare match signal (TRDIOA0), this bit is set to 0 (count stops).
- 5. When the CSEL1 bit is set to 0 and generating the compare match signal(TRDIOA1), this bit is set to 0 (count stops).

TRDSTR Register in Complementary PWM Mode **Figure 14.87**

TRDMR Register in Complementary PWM Mode **Figure 14.88**

NOTES:

- 1. When setting bits CMD1 to CMD0 to 10b or 11b, the MCU enters complementary PWM mode in spite of the setting of the TRDPMR register.
- 2. Set bits CMD1 to CMD0 when both the TSTART0 and TSTART1 bits in the TRDSTR register are set to 0 (count stops).
- 3. Set the ADCAP bit in the ADC0N0 register to 1 (starts by timer RD).
- 4. When bits CMD1 to CMD0 are set to 00b (timer mode, PWM mode, or PWM3 mode), the setting of the PWM3 bit is enabled.

Figure 14.89 TRDFCR Register in Complementary PWM Mode

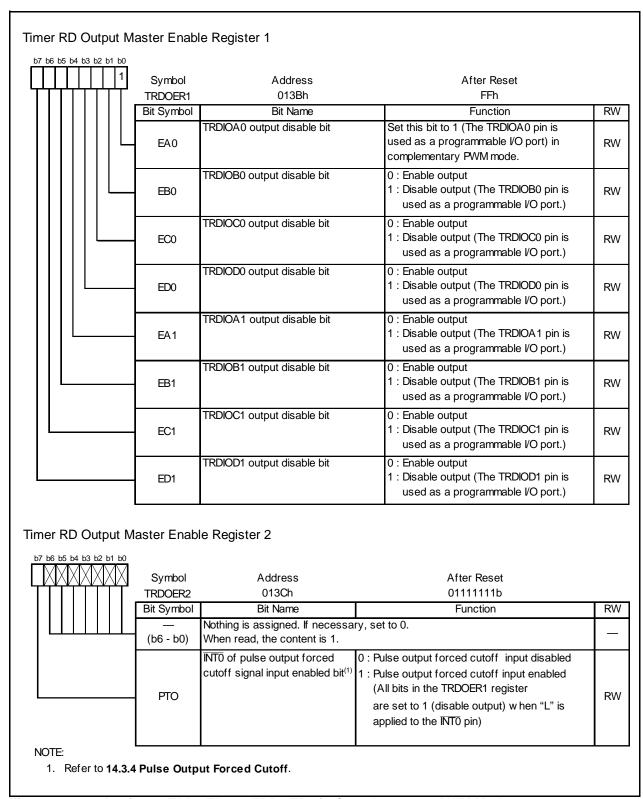

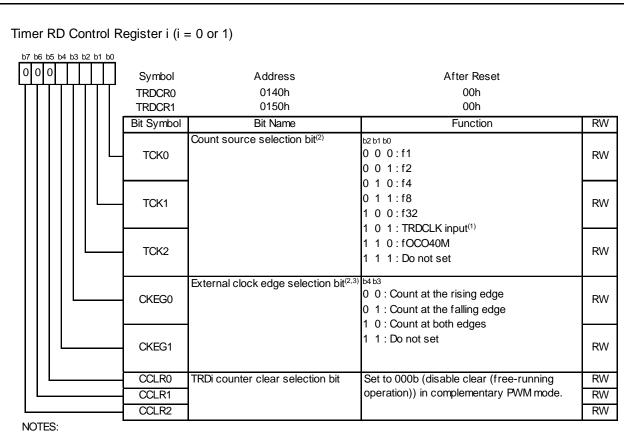

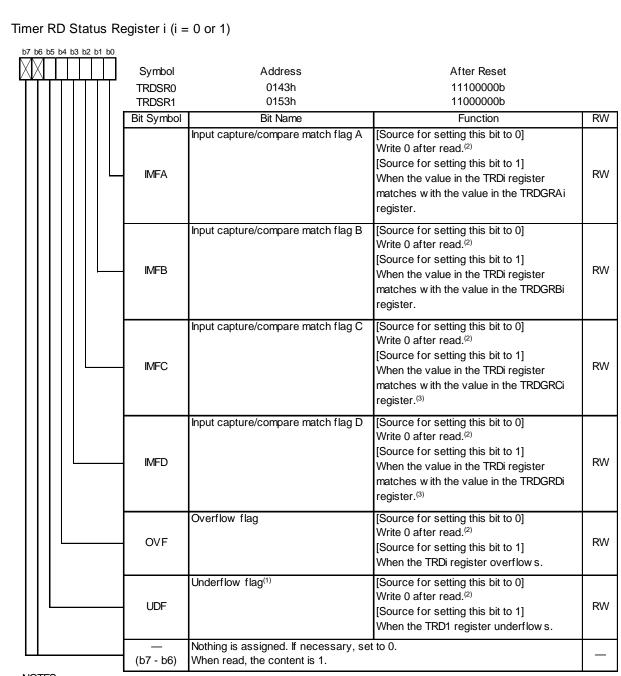

Figure 14.90 Registers TRDOER1 to TRDOER2 in Complementary PWM Mode

- - 1. This bit is enabled when the STCLK bit in the TRDFCR register is set to 1 (external clock input enabled).
 - 2. Set the TCK2 to TCK0 bits and CKEG1 to CKEG0 bits in the TRDCR0 and TRDCR1 registers to the same values.
 - 3. This bit is enabled when the TCK2 to TCK0 bits are set to 101b (TRDCLK input) and the STCLK bit in the TRDFCR register is set to 1 (external clock input enabled).

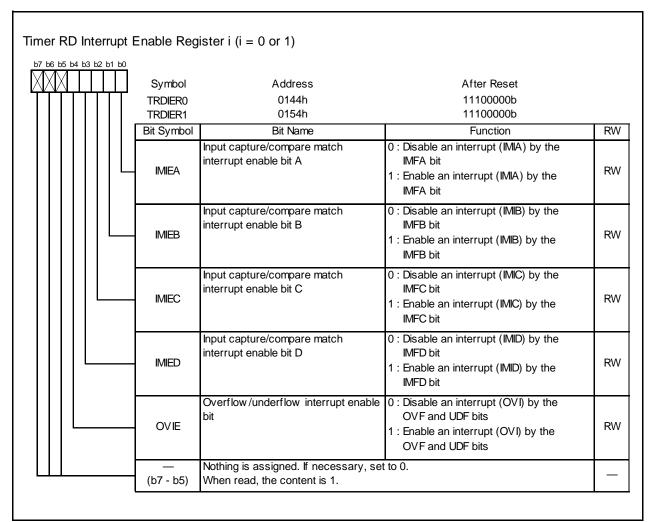

Figure 14.91 Registers TRDCR0 to TRDCR1 in Complementary PWM Mode

NOTES:

- 1. Nothing is assigned to the bit 5 in the TRDSR0 register. When writing to the bit 5, write 0. When reading, its content is
- 2. The writing results are as follows:
 - This bit is set to 0 when the read result is 1 and writing 0 to the same bit.
 - This bit remains unchanged even if the read result is 0 and writing 0 to the same bit. (This bit remains 1 even if this bit is set to 1 from 0 after reading, and writing 0.)
 - This bit remains unchanged when writing 1.
- 3. Including when the BFji (j = C or D) bit in the TRDMR register is set to 1 (TRDGRji is used as the buffer register).

The following registers are disabled in the complementary PWM mode: TRDPMR, TRDOCR, TRDDF0, TRDDF1, TRDIORA0, TRDIORC0, TRDPOCR0, TRDIORA1, TRDIORC1 and TRDPOCR1

Table 14.32 TRDGRji Register Functions in Complementary PWM Mode

Register	Setting	Register Function	PWM Output Pin
TRDGRA0	_	General register. Set the PWM period at initialization. Setting range: Setting value or above in TRD0 register FFFFh - TRD0 register setting value or below	(Output inversed every half period of TRDIOC0 pin)
		Do not write when the TSTART0 and TSTART1 bits in the TRDSTR register are set to 1 (count starts).	
TRDGRB0	_	General register. Set the changing point of PWM1 output at initialization. Setting range: Setting value or above in TRD0 register TRDGRA0 register - TRD0 register setting value or below Do not write when the TSTART0 and TSTART1 bits in the TRDSTR register are set to 1 (count starts).	TRDIOB0 TRDIOD0
TRDGRA1	-	General register. Set the changing point of PWM2 output at initialization. Setting range: Setting value or above in TRD0 register TRDGRA0 register - TRD0 register setting value or below Do not write when the TSTART0 and TSTART1 bits in the TRDSTR register are set to 1 (count starts).	TRDIOA1 TRDIOC1
TRDGRB1	-	General register. Set the changing point of PWM3 output at initialization. Setting range: Setting value or above in TRD0 register TRDGRA0 register - TRD0 register setting value or below Do not write when the TSTART0 and TSTART1 bits in the TRDSTR register are set to 1 (count starts).	TRDIOB1 TRDIOD1
TRDGRC0	_	These registers not used in complementary PWM mode.	_
TRDGRD0	BFD0 = 1	Buffer register. Set the changing point of next PWM1 output. (Refer to 14.3.2 Buffer Operation) Setting range: Setting value or above in TRD0 register TRDGRA0 register - TRD0 register setting value or below Set this register to the same value as the TRDGRB0 register for the initialization.	TRDIOB0 TRDIOD0
TRDGRC1	BFC1 = 1	Buffer register. Set the changing point of next PWM2 output. (Refer to 14.3.2 Buffer Operation) Setting range: Setting value or above in TRD0 register TRDGRA0 register - TRD0 register setting value or below Set this register to the same value as the TRDGRA1 register for the initialization.	TRDIOA1 TRDIOC1
TRDGRD1	BFD1 = 1	Buffer register. Set the changing point of next PWM3 output. (Refer to 14.3.2 Buffer Operation) Setting range: Setting value or above in TRD0 register TRDGRA0 register - TRD0 register setting value or below Set this register to the same value as the TRDGRB1 register for the initialization.	TRDIOB1 TRDIOD1

BFC0, BFD0, BFC1, BFD1: Bits in TRDMR register

Since values cannot be written to the TRDGRB0, TRDGRA1, or TRDGRB1 register directly after count operation starts (prohibited item), use the TRDGRD0, TRDGRC1, or TRDGRD1 register as a buffer register. However, to write data to the TRDGRD0, TRDGRC1, or TRDGRD1 register, set bits BFD0, BFC1, and BFD1 to 0 (general register). After this, bits BFD0, BFC1, and BFD1 may be set to 1 (buffer register).

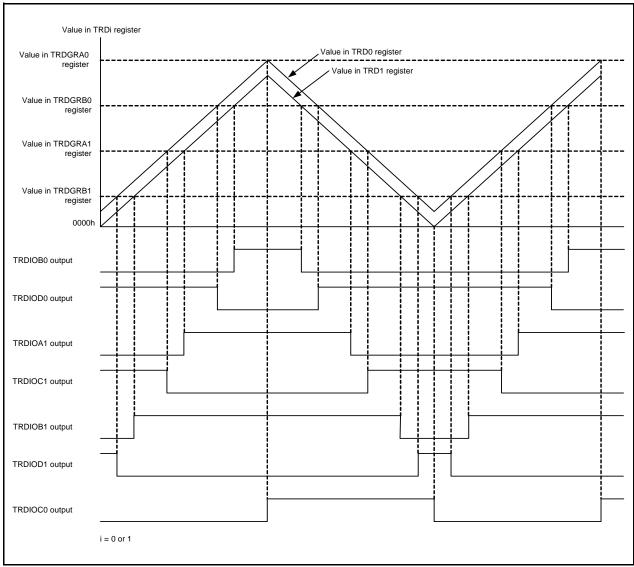

Figure 14.96 Output Model of Complementary PWM Mode

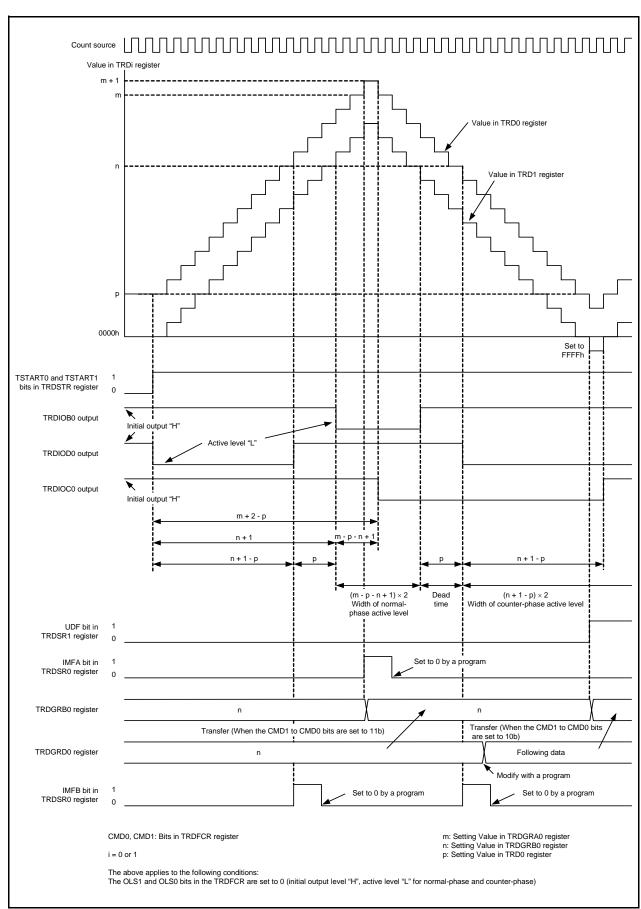

Figure 14.97 Operating Example of Complementary PWM Mode

14.3.9.1 Transfer Timing from Buffer Register

• Transfer from the TRDGRD0, TRDGRC1 and TRDGRD1 registers to the TRDGRB0, TRDGRA1 and TRDGRB1 registers

When the CMD1 to CMD0 bits in the TRDFCR register are set to 10b, the content is transferred when the TRD1 register underflows.

When the CMD1 to CMD0 bits are set to 11b, the content is transferred at the compare match in the TRD0 and TRDGRA0 registers.

14.3.9.2 A/D Trigger Generation

The compare match in the TRD0 and TRDGRA0 registers and the TRD1 underflow can be used as a conversion start trigger of the A/D converter. It can be selected by the ADEG and ADTRG bits in the TRDFCR register.

Also, set the ADCAP bit in the ADCON0 register to 1 (starts in Timer RD).

14.3.10 PWM3 Mode

Output 2 PWM waveforms with the same period.

Figure 14.98 shows the Block Diagram of PWM3 Mode, Table 14.33 lists the PWM3 Mode Specifications. Figures 14.99 to 14.107 show the Registers Associated with PWM3 Mode and Figure 14.108 shows the Operating Example of PWM3 Mode.

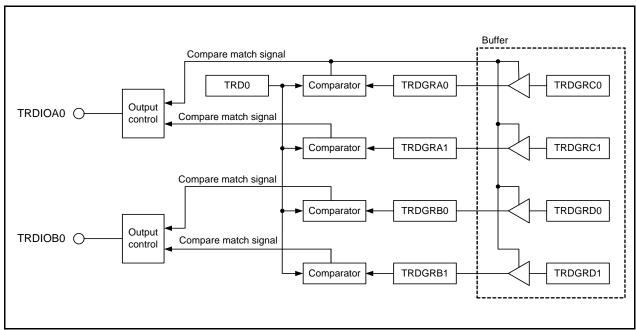

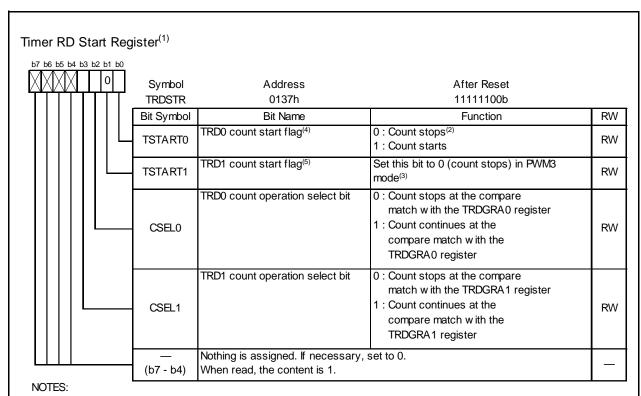

Figure 14.98 Block Diagram of PWM3 Mode

Table 14.33 PWM3 Mode Specifications

Item	Specification	
Count Sources	f1, f2, f4, f8, f32, fOCO40M	
Count Operations	The TRD0 register is incremented. (The TRD1 is not used.)	
PWM Waveform	PWM period: 1/fk × (m + 1) Active level width of TRDIOA0 output: 1/fk × (m - n)	
	Active level width of TRDIOB0 output: 1/fk × (p - q)	
	fk: Frequency of count source	
	m: Setting value in the TRDGRA0 register	
	n: Setting value in the TRDGRA1 register	
	p: Setting value in the TRDGRB0 register	
	q: Setting value in the TRDGRB1 register	
	<u> </u>	
	n + 1 p + 1 q + 1 TRDIOA0 output	
	TRDIOB0 output	
	p - q (When "H" is selected for the active level)	
Count Start Condition	Write 1 (count starts) to the TSTART0 bit in the TRDSTR register.	
Count Stop Conditions	Write 0 (count stops) to the TSTART0 bit in the TRDSTR register when the CSEL0 bit in the TRDSTR register is set to 1. The PWM output pin holds output level before the count stops When the CSEL0 bit in the TRDSTR register is set to 0, the count stops at the compare match in the TRDGRA0 register. The PWM output pin holds level after output change by the compare match.	
Interrupt Request Generation Timing	Compare match (the content in the TRDi register matches with the content in the TRDGRji register.) The TRD0 register overflows	
TRDIOA0, TRDIOB0 Pin	PWM output	
Functions	·	
TRDIOC0, TRDIOD0, TRDIOA1 to TRDIOD1 Pin Functions	DA1 Programmable I/O port	
	Programmable I/O port, pulse output forced outoff cignal input or	
INT0 Pin Function	Programmable I/O port, pulse output forced cutoff signal input or INTO interrupt input	
Read from Timer	The count value can be read by reading the TRD0 register.	
Write to Timer		
Selection Functions	 Pulse output forced cutoff signal input (refer to 14.3.4 Pulse Output Forced Cutoff) Select the active level every pin. 	
	Buffer operation (refer to 14.3.2 Buffer Operation)	

i = 0 or 1, j = either A, B, C or D

- 1. Set the TRDSTR register using the MOV instruction (do not use the bit handling instruction). Refer to 14.3.12.1 TRDSTR Register of Notes on Timer RD.
- 2. When the CSEL0 bit is set to 1, write 0 to the TSTART0 bit.
- 3. When the CSEL1 bit is set to 1, write 0 to the TSTART1 bit.
- 4. When the CSEL0 bit is set to 0 and generating the compare match signal(TRDIOA0), this bit is set to 0 (count stops).
- 5. When the CSEL1 bit is set to 0 and generating the compare match signal(TRDIOA1), this bit is set to 0 (count stops).

		Setting range: Value set in TRDGRD0 register or below	

BFC0, BFD0, BFC1, BFD1: Bits in TRDMR Register

Registers TRDGRC0, TRDGRC1, TRDGRD0, and TRDGRD1 are not used in PWM3 mode. To use them as buffer registers, set bits BFC0, BFC1, BFD0, and BFD1 to 0 (general register) and write a value to the TRDGRC0, TRDGRC1, TRDGRD0, or TRDGRD1 register. After this, bits BFC0, BFC1, BFD0, and BFD1 may be set to 1 (buffer register).

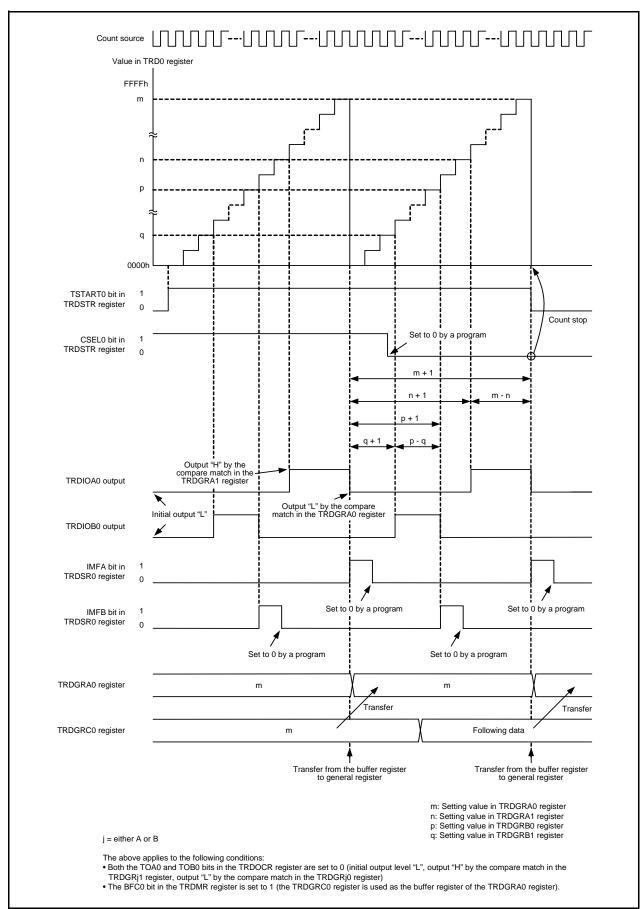

Figure 14.108 Operating Example of PWM3 Mode

14.3.11 Timer RD Interrupt

Timer RD generates the Timer RD interrupt request based on 6 sources every channel. The Timer RD interrupt has 1 TRDiIC register (IR bit, ILVL0 to ILVL2 bits) every channel, and 1 vector.

Table 14.35 lists the Registers Associated with Timer RD Interrupt and Figure 14.109 shows the Block Diagram of Timer RD Interrupt.

Table 14.35 Registers Associated with Timer RD Interrupt

	Timer RD	Timer RD	Timer RD
	Status Register	Interrupt Enable Register	Interrupt Control Register
Channel 0	TRDSR0	TRDIER0	TRD0IC
Channel 1	TRDSR1	TRDIER1	TRD1IC

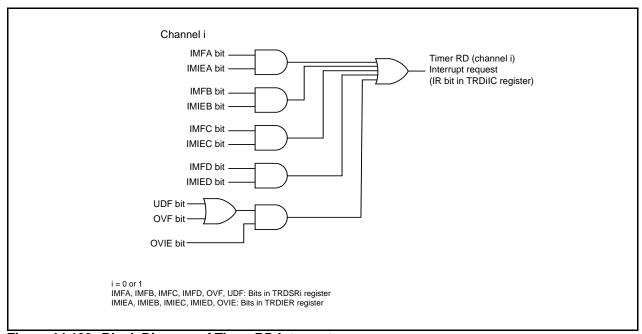

Figure 14.109 Block Diagram of Timer RD Interrupt

As with other maskable interrupts, the timer RD interrupt is controlled by the combination of the I flag, IR bit, bits ILVL0 to ILVL2, and IPL. However, since the interrupt source (timer RD interrupt) is generated by a combination of multiple interrupt request sources, the following differences from other maskable interrupts apply:

- When bits in the TRDSRi register corresponding to bits set to 1 in the TRDIERi register are set to 1 (enable interrupt), the IR bit in the TRDiIC register is set to 1 (interrupt requested).
- · When either bits in the TRDSRi register or bits in the TRDIERi register corresponding to bits in the TRDSRi register, or both of them, are set to 0, the IR bit is set to 0 (interrupt not requested). Therefore, even though the interrupt is not acknowledged after the IR bit is set to 1, the interrupt request will not be maintained.
- When the conditions of other request sources are met, the IR bit remains 1.
- When multiple bits in the TRDIERi register are set to 1, which request source causes an interrupt is determined by the TRDSRi register.
- Since each bit in the TRDSRi register is not automatically set to 0 even if the interrupt is acknowledged, set each bit to 0 in the interrupt routine. For information on how to set these bits to 0, refer to the descriptions of the registers used in the different modes (Figures 14.41, 14.56, 14.69, 14.81, 14.92 and 14.104).

Refer to Registers TRDSR0 to TRDSR1 in each mode (Figures 14.41, 14.56, 14.69, 14.81, 14.92 and 14.104) for the TRDSRi register. Refer to Registers TRDIER0 to TRDIER1 in each mode (Figures 14.42, 14.57, 14.70, 14.82, 14.93 and 14.105) for the TRDIERi register.

Refer to 12.1.6 Interrupt Control for the TRDiIC register and 12.1.5.2 Relocatable Vector Tables for the interrupt vector.

14.3.12 Notes on Timer RD

14.3.12.1 TRDSTR Register

- Set the TRDSTR register using the MOV instruction.
- When the CSELi (i = 0 or 1) is set to 0 (the count stops at compare match of registers TRDi and TRDGRAi), the count does not stop and the TSTARTi bit remains unchanged even if 0 (count stops) is written to the TSTARTi bit.

Therefore, set the TSTARTi bit to 0 to change other bits without changing the TSTARTi bit when the CSELi bit is set to 0.

To stop counting by a program, set the TSTARTi bit to 0 after setting the CSELi bit to 1. Although the CSELi bit is set to 1 and the TSTARTi bit is set to 0 at the same time (with 1 instruction), the count cannot be stopped.

• Table 14.36 lists the TRDIOji (j = A, B, C, or D) Pin Output Level when Count Stops to use the TRDIOji pin with the timer RD output.

Table 14.36 TRDIOji (j = A, B, C, or D) Pin Output Level when Count Stops

Count Stop	TRDIOji Pin Output when Count Stops
When the CSELi bit is set to 1, set the TSTARTi bit to 0 and the count	Hold the output level immediately before the
stops.	count stops.
When the CSELi bit is set to 0, the count stops at compare match of	Hold the output level after output changes by
registers TRDi and TRDGRAi.	compare match.

14.3.12.2 TRDi Register (i = 0 or 1)

• When writing the value to the TRDi register by a program while the TSTARTi bit in the TRDSTR register is set to 1 (count starts), avoid to overlap with the timing to set the TRDi register to 0000h, and then write. When the timing to set the TRDi register to 0000h overlaps with the timing to write the value to the TRDi register, the value is not written and the TRDi register is set to 0000h.

These precautions are applicable when selecting the following by the CCLR2 to CCLR0 bits in the TRDCRi register.

- 001b (clear by the TRDi register at the compare match with the TRDGRAi register)
- 010b (clear by the TRDi register at the compare match with the TRDGRBi register.)
- 011b (synchronous clear)
- 101b (clear by the TRDi register at the compare match with the TRDGRCi register.)
- 110b (clear by the TRDi register at the compare match with the TRDGRDi register.)
- When writing the value to the TRDi register and continuously reading the same register, the value before writing may be read. In this case, execute the JMP.B instruction between the writing and reading.

Program Example MOV.W #XXXXh, TRD0 ;Writing JMP.B L1 ;JMP.B L1: MOV.W TRD0,DATA ;Reading

14.3.12.3 TRDSRi Register (i = 0 or 1)

When writing the value to the TRDSRi register and continuously reading the same register, the value before writing may be read. In this case, execute the JMP.B instruction between the writing and reading.

Program Example MOV.B #XXh, TRDSR0 ;Writing JMP.B L1 ;JMP.B L1: MOV.B TRDSR0,DATA ;Reading

14.3.12.4 Count Source Switch

• When switching the count source, switch it after the count stops.

Change procedure

- (1) Set the TSTARTi (i = 0 or 1) bit in the TRDSTR register to 0 (count stops).
- (2) Change the TCK2 to TCK0 bits in the TRDCRi register.
- When changing the count source from fOCO40M to the other and stopping fOCO40M, wait 2 cycles or more of f1 after setting the clock switch, and then stop fOCO40M.

Change procedure

- (1) Set the TSTARTi (i = 0 or 1) bit in the TRDSTR register to 0 (count stops).
- (2) Change the TCK2 to TCK0 bits in the TRDCRi register.
- (3) Wait 2 cycles or more of f1.
- (4) Set the FRA00 bit in the FRA0 register to 0 (high-speed on-chip oscillator stops).

14.3.12.5 Input Capture Function

- Set the pulse width of input capture signal to 3 cycles or more of the Timer RD operation clock. (Refer to **Table 14.11 Timer RD Operation Clocks**.)
- The value in the TRDi register is transferred to the TRDGRji register after 2 to 3 cycles of the Timer RD operation clock since the input capture signal is applied to the TRDIOji pin (i = 0 or 1, j = either A, B, C or D) (no digital filter).

14.3.12.6 Reset Synchronous PWM Mode

- When reset synchronous PWM mode is used for motor control, use it with OLS0 = OLS1.
- Set to reset synchronous PWM mode in the following procedure:

Change procedure

- (1) Set the TSTART0 bit in the TRDSTR register to 0 (count stops).
- (2) Set the CMD1 to CMD0 bits in the TRDFCR register to 00b (timer mode, PWM mode, and PWM3 mode).
- (3) Set the CMD1 to CMD0 bits to 01b (reset synchronous PWM mode).
- (4) Set the registers associated with other Timer RD again.

14.3.12.7 Complementary PWM Mode

- When complementary PWM mode is used for motor control, use it with OLS0 = OLS1.
- Change the CMD1 to CMD0 bits in the TRDFCR register in the following procedure.

Change procedure: When setting to complementary PWM mode (including re-set), or changing the transfer timing from the buffer register to the general register in complementary PWM mode.

- (1) Set both the TSTART0 and TSTART1 bits in the TRDSTR register to 0 (count stops).
- (2) Set the CMD1 to CMD0 bits in the TRDFCR register to 00b (timer mode, PWM mode, and PWM3 mode)
- (3) Set the DMD1 to CMD0 bits to 10b or 11b (complementary PWM mode).
- (4) Set the registers associated with other Timer RD again.

Change procedure: When stopping complementary PWM mode

- (1) Set both the TSTART0 and CSEL1 bits in the TRDSTR register to 0 (count stops).
- (2) Set the CMD1 to CMD bits to 00b (other than reset synchronous PWM mode, complementary PWM mode)
- Do not write to the TRDGRA0, TRDGRB0, TRDGRA1 and TRDGRB1 registers during operation. When changing the PWM waveform, transfer the value written to the TRDGRD0, TRDGRC1 and TRDGRD1 registers to the TRDGRB0, TRDGRA1 and TRDGRB1 registers using the buffer operation. However, to write data to the TRDGRD0, TRDGRC1, or TRDGRD1 register, set bits BFD0, BFC1, and BFD1 to 0 (general register). After this, bits BFD0, BFC1, and BFD1 may be set to 1 (buffer register). The PWM period cannot be changed.

• When the value in the TRDGRA0 register is assumed as m, the TRD0 register counts order of m - 1, m, m + 1, m, m - 1 when changing from increment to decrement.

When changing from m to m + 1, the IMFA bit is set to 1. Also, the CMD1 to CMD0 bits in the TRDFCR register are set to 11b (complementary PWM mode, buffer data transferred by the compare match in the TRD0 and TRDGRA0 registers), the content in the buffer register (TRDGRD0, TRDGRC1, TRDGRD1) is transferred to the general register (TRDGRB0, TRDGRA1, TRDGRB1).

For the order of m + 1, m, m - 1 operation, the IMFA bit remains unchanged and data are not transferred to the register such as the TRDGRA0 register.

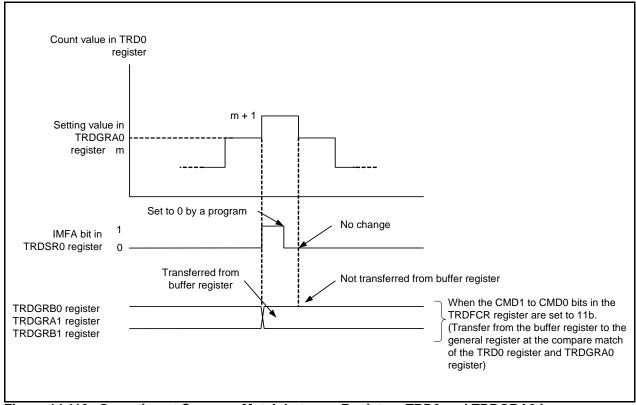

Figure 14.110 Operation at Compare Match between Registers TRD0 and TRDGRA0 in Complementary PWM Mode

• The TRD1 register counts the order of 1, 0, FFFFh, 0, 1 when changing from decrement to increment. The UDF bit is set to 1 by the order of 1, 0, FFFFh operation. Also, when the CMD1 to CMD0 bits in the TRDFCR register are set to 10b (complementary PWM mode, buffer data transferred by the underflow in the TRD1 register), the content in the buffer register (TRDGRD0, TRDGRC1, TRDGRD1) is transferred to the general register (TRDGRB0, TRDGRA1, TRDGRB1). For the order of FFFFh, 0, 1 operation, data are not transferred to the register such as the TRDGRB0 register. Also, at this time, the OVF bit remains unchanged.

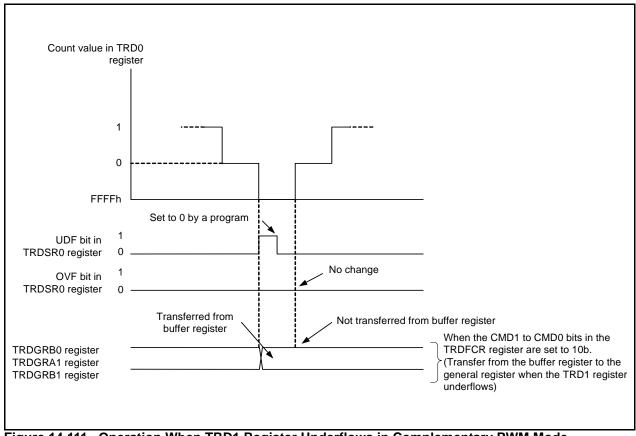

Figure 14.111 Operation When TRD1 Register Underflows in Complementary PWM Mode

• Select with the CMD1 to CMD0 bits for the data transfer timing from the buffer register to the general register. However, transfer with the following timing in spite of the value of the CMD1 to CMD0 bits for the following cases:

Value in buffer register ≥ Value in TRDGRA0 register:

Transfer at the underflow in the TRD1 register.

And then, when setting the buffer register to 0001h or above and the smaller value than the one in the TRDGRA0 register, and the TRD1 register underflows in the fist time after setting, the value is transferred to the general register. After that, transfer the value with the timing selected by the CMD1 to CMD0 bits.

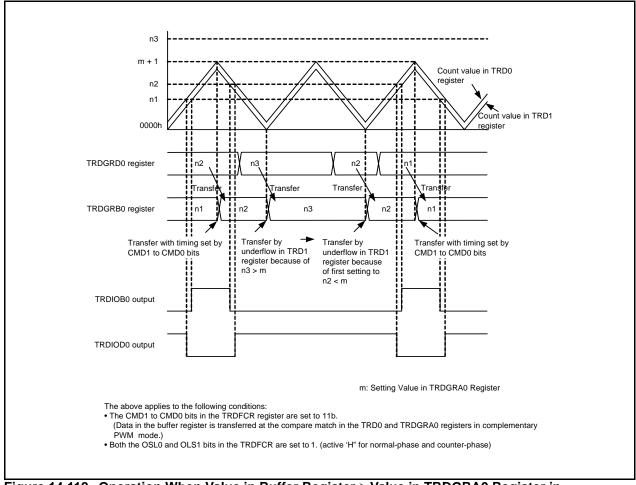

Figure 14.112 Operation When Value in Buffer Register ≥ Value in TRDGRA0 Register in **Complementary PWM Mode**

When the value in the buffer register is set to 0000h:

Transfer by the compare match in the TRD0 and TRDGRA0 registers.

And then, when setting the buffer register to 0001h or above and the smaller value than the one in the TRDGRA0 register, and the compare match in the TRD0 and TRDGRA0 registers in the fist time after setting, the value is transferred to the general register. After that, transfer the value with the timing selected by the CMD1 to CMD0 bits.

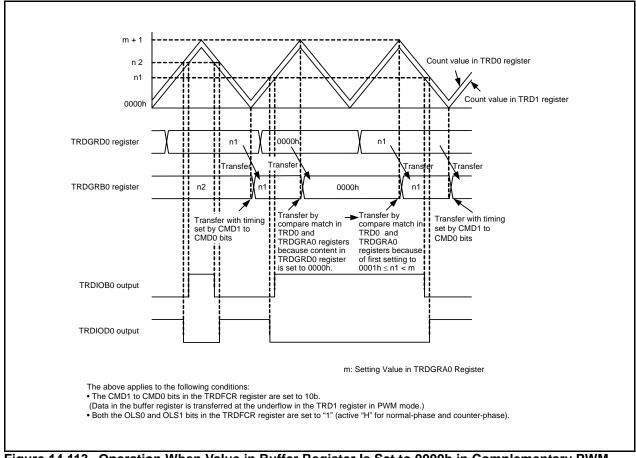

Figure 14.113 Operation When Value in Buffer Register Is Set to 0000h in Complementary PWM

14.3.12.8 Count Source fOCO40M

The count source fOCO40M can be used with supply voltage VCC = 3.0 to 5.5 V. For supply voltage other than that, do not set bits TCK2 to TCK0 in registers TRDCR0 and TRDCR to 110b (select fOCO40M as the count source).

14.4 Timer RE

Timer RE has the 4-bit counter and 8-bit counter. Timer RE has the following mode:

• Output compare mode Count a count source and detect the compare match

The count source for timer RE is the operating clock that regulates the timing of timer operations.

14.4.1 Output Compare Mode

The output compare mode is to count the internal count source divided-by-2 using the 4-bit or 8-bit counter and detect the compare value match with the 8-bit counter.

Figure 14.114 shows the Block Diagram of Output Compare Mode and Table 14.37 lists the Output Compare Mode Specifications. Figures 14.115 to 14.119 show the Registers Associated with Output Compare Mode and Figure 14.120 shows the Operation in Output Compare Mode.

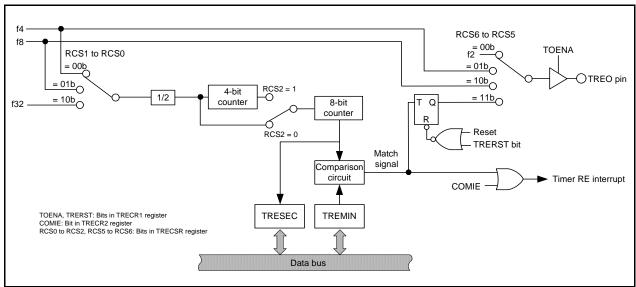

Figure 14.114 Block Diagram of Output Compare Mode

Page 268 of 501

Table 14.37 Output Compare Mode Specifications

Item	Specification		
Count Source	f4, f8, f32		
Count Operation	• Increment		
	When the 8-bit counter content matches with the TREMIN register		
	content, the value returns to 00h and count continues.		
	The count value is held while count stops.		
Count Period	• When RCS2 = 0 (4-bit counter is not used)		
	1/fi x 2 x (n + 1)		
	• When RCS2 = 1 (4-bit counter is used)		
	1/fi x 32 x (n + 1)		
	fi: Frequency of count source		
	n: Setting value of TREMIN register		
Count Start Condition	Write 1 (count starts) to the TSTART bit in the TRECR1 register		
Count Stop Condition	Write 0 (count stops) to the TSTART bit in the TRECR1 register		
Interrupt Request Generation	When the 8-bit counter content matches with the TREMIN register		
Timing	content		
TREO Pin Function	Select any one of the followings:		
	Programmable I/O ports		
	Output any one of f2, f4 and f8		
	Compare output		
Read from Timer	When reading the TRESEC register, the 8-bit counter value can be		
	read.		
	When reading the TREMIN register, the compare value can be read.		
Write to Timer	Writing to the TRESEC register is disabled.		
	When the TSTART and TCSTF bits in the TRECR1 register are set to		
	0 (timer stops), writing to the TREMIN register is enabled.		
Select Functions	Select use of 4-bit counter		
	Compare output function		
	Every time the 8-bit counter value matches with the TREMIN register		
	value, TREO output polarity is reversed. The TREO pin outputs "L"		
	after reset is deasserted and the Timer RE reset by the TRERST bit		
	in the TRECR1 register. Output level is held by setting the TSTART		
	bit to 0 (count stops).

14.4.2 Notes on Timer RE

14.4.2.1 Starting and Stopping Count

Timer RE has the TSTART bit for instructing count start or stop, and the TCSTF bit which indicates count start or stop. The TSTART and TCSTF bits are in the TRECR1 register.

Timer RE starts counting when setting the TSTART bit to 1 (count starts) and the TCSTF bit is set to 1 (count starts). It takes the time for up to 2 cycles of the count source until the TCSTF bit is set to 1 after setting the TSTART bit to 1. During this time, do not access registers associated with Timer $RE^{(1)}$ other than the TCSTF bit.

Also, timer RE stops counting when setting the TSTART bit to 0 (count stops) and the TCSTF bit is set to 0 (count stops). It takes the time for up to 2 cycles of the count source until the TCSTF bit is set to 0 after setting the TSTART bit to 0. During this time, do not access registers associated with timer RE other than the TCSTF bit.

NOTE:

1. Registers associated with Timer RE: TRESEC, TREMIN, TRECR1, TRECR2, TRECSR

14.4.2.2 Register Setting

Write to the following registers or bits while timer RE stops.

- TRESEC and TRECR2 registers
- The INT bit in TRECR1 register
- RCS0 to RCS2 bits in TRECSR register

The state while Timer RE stops is indicated as the state where the TSTART and TCSTF bits in the TRECR1 register are set to 0 (timer RE stops).

Also, set all above-mentioned registers and bits (immediately before timer RE count starts) before setting the TRECR2 register.

15. Serial Interface

Serial Interface is configured with two channels: UART0 and UART1. Each UART0 and Uart1 has an exclusive timer to generate a transfer clock and they operate independently.

Figure 15.1 shows the UARTi (i = 0 or 1) Block Diagram. Figure 15.2 shows the UARTi (i = 0 or 1) Transmit/Receive Unit.

UART0 has two modes: clock synchronous serial I/O mode, and clock asynchronous serial I/O mode (UART mode). UART1 has only one mode: clock asynchronous serial interface mode (UART mode).

Figures 15.3 to 15.6 show the Registers Associated with UARTi.

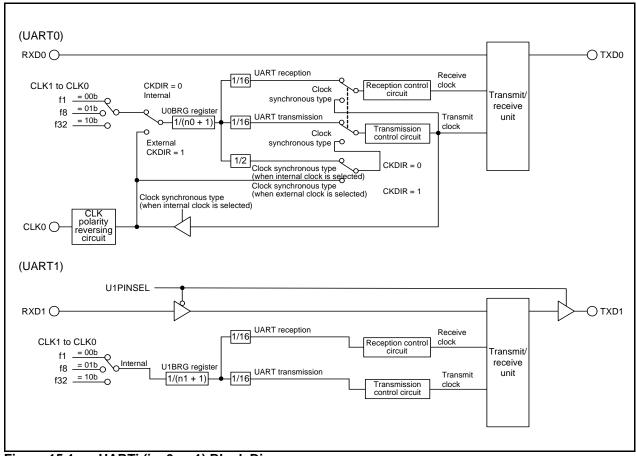

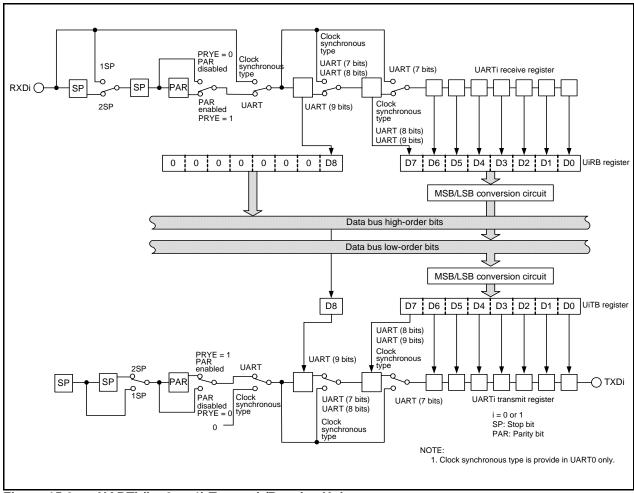

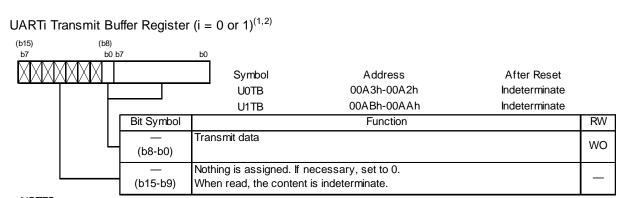

Figure 15.1 UARTi (i = 0 or 1) Block Diagram

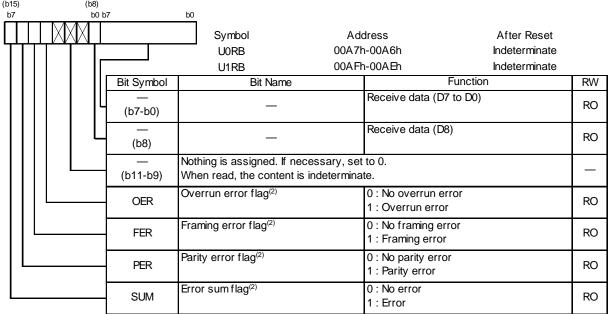

UARTi (i = 0 or 1) Transmit/Receive Unit Figure 15.2

- 1. When the transfer data length is 9-bit long, write to high-byte data first then low-byte data.
- 2. Use the MOV instruction to write to this register.

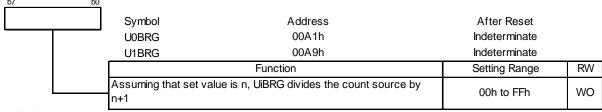

UARTi Receive Buffer Register (i = 0 or 1)⁽¹⁾

NOTES:

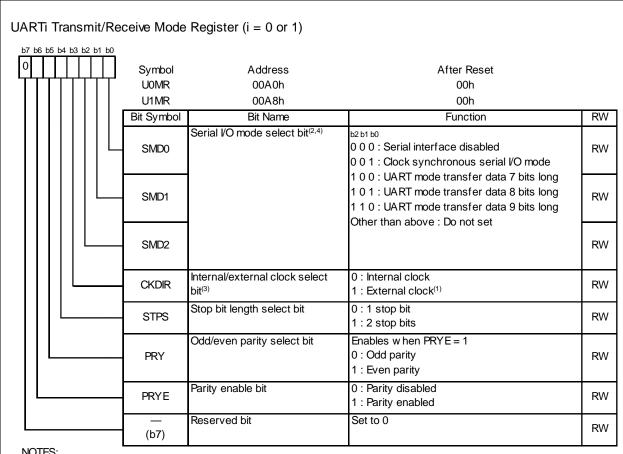

- 1. Read out the UiRB register in 16-bit unit.
- The SUM, PER, FER and OER bits are set to 0 (no error) when the SMD2 to SMD0 bits in the UiMR register are set to 000b (serial interface disabled) or the RE bit in the U0C1 register is set to 0 (receive disable). The SUM bit is set to 0 (no error) when the PER, FER and OER bits are set to 0 (no error). Also, the PER and FER bits are set to 0 when the higher byte of the UiRB register is read out.

UARTi Bit Rate Register (i = 0 or 1) $^{(1,2,3)}$

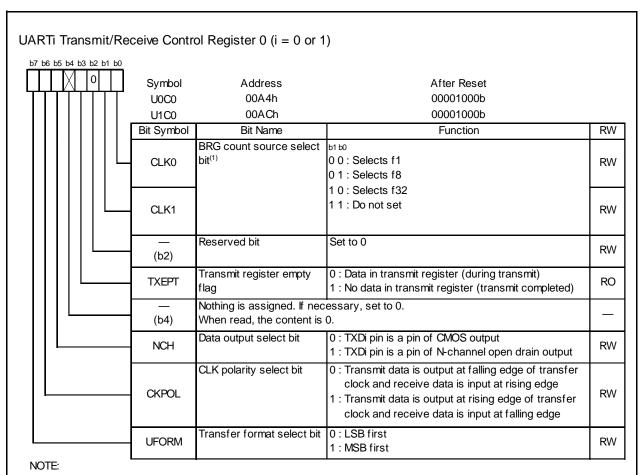

- 1. Write to this register while the serial interface is neither transmitting nor receiving.
- 2. Use the MOV instruction to write to this register.
- 3. After setting the CLK0 to CLK1 bits in the UiC0 register, write to the UiBRG register.

Registers UiTB, UiRB, and UiBRG (i = 0 or 1) Figure 15.3

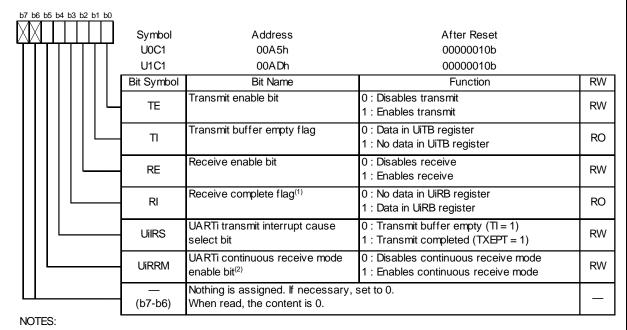

- 1. Set the PD1_6 bit in the PD1 register to 0 (input).
- 2. Do not set bits SMD2 to SMD0 in the U1MR register to any values other than 000b, 100b, 101b and 110b.
- 3. Set the CKDIR bit to 0 (internal clock) in UART1.
- 4. The SMD2 to SMD1 bits can not select clock synchronous serial I/O mode in UART1.

Figure 15.4 UiMR Register (i = 0 or 1)

1. If the BRG count source is switched, set the UiBRG register again.

UARTi Transmit/Receive Control Register 1 (i = 0 or 1)

- 1. The RI bit is set to 0 when the higher byte of the UiRB register is read out.
- 2. Set the UiRRM bit to 0 (disables continuous receive mode) in UART mode.

Figure 15.5 Registers UiC0 and UiC1 (i = 0 or 1)

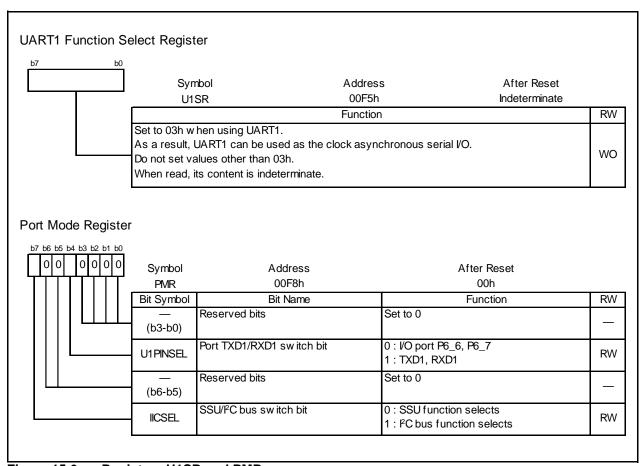

Figure 15.6 Registers U1SR and PMR

15.1 Clock Synchronous Serial I/O Mode

The clock synchronous serial I/O mode is mode to transmit and receive data using a transfer clock. This mode is selected in UART0 only.

Table 15.1 lists the Clock Synchronous Serial I/O Mode Specifications. Table 15.2 lists the Registers Used and Settings in Clock Synchronous Serial I/O Mode⁽¹⁾.

Table 15.1 Clock Synchronous Serial I/O Mode Specifications

Item	Specification
Transfer Data Format	Transfer data length: 8 bits
Transfer Clocks	 CKDIR bit in U0MR register is set to 0 (internal clock): fi/(2(n + 1)) fi = f1, f8, f32 n = setting value in U0BRG register: 00h to FFh The CKDIR bit is set to 1 (external clock): input from CLK0 pin
Transmit Start Conditions	 Before transmit starts, the following requirements are required⁽¹⁾ The TE bit in the U0C1 register is set to 1 (transmit enabled) The TI bit in the U0C1 register is set to 0 (data in the U0TB register)
Receive Start Conditions	Before receive starts, the following requirements are required ⁽¹⁾ The RE bit in the U0C1 register is set to 1 (receive enabled) The TE bit in the U0C1 register is set to 1 (transmit enabled) The TI bit in the U0C1 register is set to 0 (data in the U0TB register)
Interrupt Request	When transmit, one of the following conditions can be selected
Generation Timing	 The U0IRS bit is set to 0 (transmit buffer empty): when transferring data from the U0TB register to UART0 transmit register (when transmit starts) The U0IRS bit is set to 1 (transmit completes): when completing transmit data from UARTi transmit register When receive When transferring data from the UART0 receive register to the U0RB register (when receive completes)
Error Detection	Overrun error ⁽²⁾ This error occurs if serial interface starts receiving the following data before reading the U0RB register and receives the 7th bit of the following data
Select Functions	 CLK polarity selection Transfer data input/output can be selected to occur synchronously with the rising or the falling edge of the transfer clock LSB first, MSB first selection Whether transmitting or receiving data beginning with the bit 0 or beginning with the bit 7 can be selected Continuous receive mode selection Receive is enabled immediately by reading the U0RB register

- 1. When an external clock is selected, meet the conditions while the CKPOL bit in the U0C0 register is set to 0 (transmit data output at the falling edge and the receive data input at the rising edge of the transfer clock), the external clock is held "H"; if the CKPOL bit in the U0C0 register is set to 1 (transmit data output at the rising edge and the receive data input at the falling edge of the transfer clock), the external clock is held "L".
- 2. If an overrun error occurs, the receive data (b0 to b8) of the U0RB register will be undefined. The IR bit in the S0RIC register remains unchanged.

Table 15.2 Registers Used and Settings in Clock Synchronous Serial I/O Mode(1)

Register	Bit	Function		
U0TB	0 to 7	Set transmit data		
U0RB	0 to 7	Receive data can be read		
	OER	Overrun error flag		
U0BRG	0 to 7	Set bit rate		
U0MR	SMD2 to SMD0	Set to 001b		
	CKDIR	Select the internal clock or external clock		
U0C0	CLK1 to CLK0	Select the count source in the U0BRG register		
	TXEPT	Transmit register empty flag		
	NCH	Select TXD0 pin output mode		
	CKPOL	Select the transfer clock polarity		
	UFORM	Select the LSB first or MSB first		
U0C1	TE	Set this bit to 1 to enable transmit/receive		
	TI	Transmit buffer empty flag		
	RE	Set this bit to 1 to enable reception		
	RI	Reception complete flag		
	U0IRS	Select the UART0 transmit interrupt source		
	U0RRM	Set this bit to 1 to use continuous receive mode		

1. Set bits which are not in this table to 0 when writing to the registers in clock synchronous serial I/O mode.

Table 15.3 lists the I/O Pin Functions in Clock Synchronous Serial I/O Mode. The TXD0 pin outputs "H" level between the operating mode selection of UART0 and transfer start, an "H" (If the NCH bit is set to 1 (the Nchannel open-drain output), this pin is in a high-impedance state.)

Table 15.3 I/O Pin Functions in Clock Synchronous Serial I/O Mode

Pin Name	Function	Selection Method
TXD0(P1_4)	Output serial data	(Outputs dummy data when performing receive only)
RXD0(P1_5)	Input serial data	The PD1_5 bit in the PD1 register = 0
		(P1_5 can be used as an input port when performing transmit
		only)
CLK0(P1_6)	Output transfer clock	The CKDIR bit in the U0MR register = 0
	Input transfer clock	The CKDIR bit in the U0MR register = 1
		PD1_6 bit in PD1 register = 0

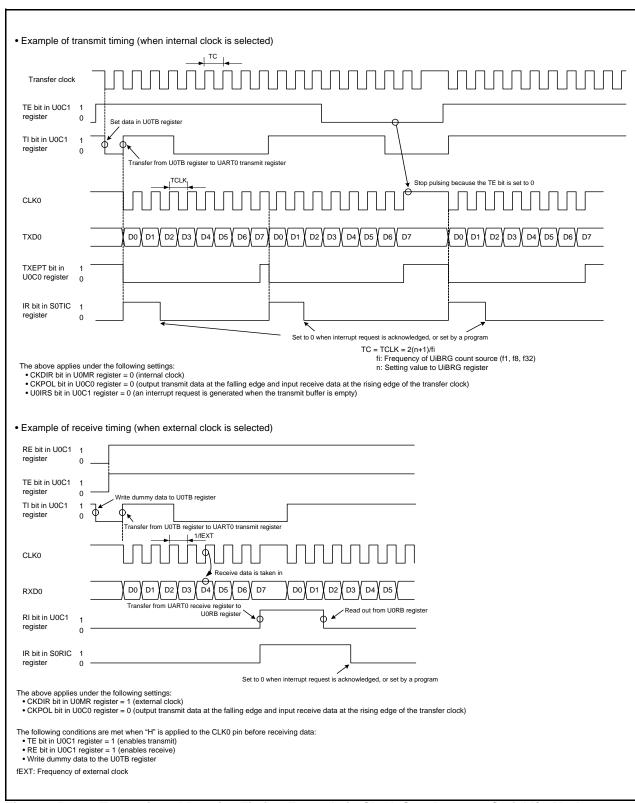

Figure 15.7 Transmit and Receive Timing Example in Clock Synchronous Serial I/O Mode

15.1.1 Polarity Select Function

Figure 15.8 shows the Transfer Clock Polarity. Use the CKPOL bit in the U0C0 register to select the transfer clock polarity.

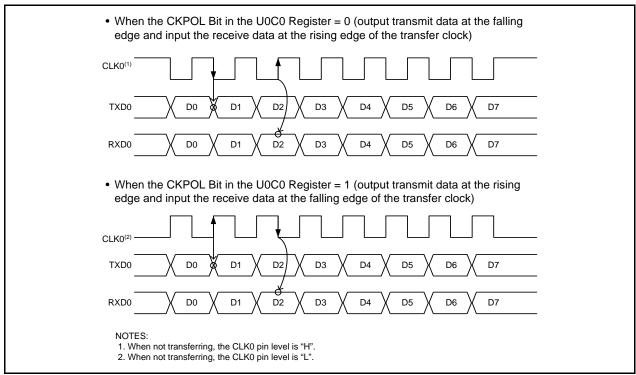

Figure 15.8 Transfer Clock Polarity

15.1.2 LSB First/MSB First Select Function

Figure 15.9 shows the Transfer Format. Use the UFORM bit in the U0C0 register to select the transfer format.

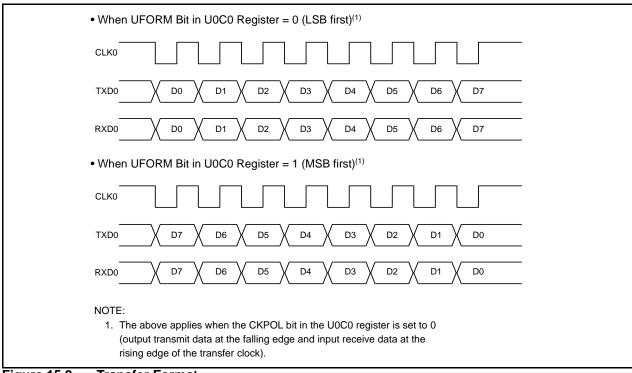

Figure 15.9 Transfer Format

15.1.3 Continuous Receive Mode

Continuous receive mode is held by setting the U0RRM bit in the U0C1 register to 1 (enables continuous receive mode). In this mode, reading U0RB register sets the TI bit in the U0C1 register to 0 (data in the U0TB register). When the U0RRM bit is set to 1, do not write dummy data to the U0TB register in a program.

15.2 Clock Asynchronous Serial I/O (UART) Mode

The UART mode allows transmit and receive data after setting the desired bit rate and transfer data format. Table 15.4 lists the UART Mode Specifications. Table 15.5 lists the Registers Used and Settings for UART Mode.

Table 15.4 UART Mode Specifications

Item	Specification
Transfer Data Formats	 Character bit (transfer data): selectable from 7, 8 or 9 bits Start bit: 1 bit Parity bit: selectable from odd, even, or none Stop bit: selectable from 1 or 2 bits
Transfer Clocks	 CKDIR bit in UiMR register is set to 0 (internal clock): fj/(16(n + 1)) fj = f1, f8, f32 n = setting value in U0BRG register: 00h to FFh CKDIR bit is set to 1 (external clock): fEXT/(16(n + 1)) fEXT: Input from CLK0 pin n = setting value in UiBRG register: 00h to FFh
Transmit Start Conditions	 Before transmit starts, the following are required TE bit in UiC1 register is set to 1 (transmit enabled) TI bit in UiC1 register is set to 0 (data in UiTB register)
Receive Start Conditions	Before receive starts, the following are required RE bit in UiC1 register is set to 1 (receive enabled) Detects start bit
Interrupt Request Generation Timing	When transmitting, one of the following conditions can be selected - UilRS bit is set to 0 (transmit buffer empty): when transferring data from the UiTB register to UARTi transmit register (when transmit starts) - UilRS bit is set to 1 (transfer ends): when serial interface completes transmitting data from the UARTi transmit register When receiving When transferring data from the UARTi receive register to UiRB register (when receive ends)
Error Detection	 Overrun error⁽¹⁾ This error occurs if serial interface starts receiving the following data before reading the UiRB register and receiving the bit one before the last stop bit of the following data Framing error This error occurs when the number of stop bits set are not detected Parity error This error occurs when parity is enabled, the number of 1's in parity and character bits do not match the number of 1's set Error sum flag This flag is set is set to 1 when any of the overrun, framing, and parity errors is generated

i = 0 or 1

NOTE:

1. If an overrun error occurs, the receive data (b0 to b8) of the U0RB register will be undefined. The IR bit in the S0RIC register remains unchanged.

Table 15.5 Registers Used and Settings for UART Mode

Register	Bit	Function		
UiTB	0 to 8	Set transmit data ⁽¹⁾		
UiRB	0 to 8	Receive data can be read ^(1, 2)		
	OER,FER,PER,SUM	Error flag		
UiBRG	0 to 7	Set a bit rate		
UiMR	SMD2 to SMD0	Set to 100b when transfer data is 7-bit long		
		Set to 101b when transfer data is 8-bit long		
		Set to 110b when transfer data is 9-bit long		
	CKDIR	Select the internal clock or external clock ⁽³⁾		
	STPS	Select the stop bit		
	PRY, PRYE	Select whether parity is included and odd or even		
UiC0	CLK0, CLK1	Select the count source for the UiBRG register		
	TXEPT	Transmit register empty flag		
	NCH	Select TXDi pin output mode		
	CKPOL	Set to 0		
	UFORM	LSB first or MSB first can be selected when transfer data is 8-bit		
		long. Set to 0 when transfer data is 7- or 9-bit long.		
UiC1	TE	Set to 1 to enable transmit		
	TI	Transmit buffer empty flag		
	RE	Set to 1 to enable receive		
	RI	Receive complete flag		
	UilRS	Select the UARTi transmit interrupt source		
	UiRRM	Set to 0		

i = 0 or 1 NOTES:

- 1. The bits used for transmit/receive data are as follows: Bits 0 to 6 when transfer data is 7-bit long; bits 0 to 7 when transfer data is 8-bit long; bits 0 to 8 when transfer data is 9-bit long.
- 2. The following bits are undefined: Bits 7 and 8 when transfer data is 7 bits long; bit 8 when transfer data is 8 bits long.
- 3. External clock can be selected in UART0 only.

Table 15.6 lists the I/O Pin Functions in UART Mode. After the UARTi (i = 0 or 1) operating mode is selected, the TXDi pin outputs "H" level (if the NCH bit is set to 1 (N-channel open-drain outputs), this pin is in a highimpedance state) until transfer starts.

Table 15.6 I/O Pin Functions in UART Mode

Pin name	Function	Selection Method
TXD0(P1_4)	Output serial data	(Cannot be used as a port when performing receive only)
RXD0(P1_5)	Input serial data	The PD1_5 bit in the PD1 register = 0
		(P1_5 can be used as an input port when performing transmit only)
CLK0(P1_6)	Programmable I/O port	The CKDIR bit in the U0MR register = 0
	Input transfer clock	The CKDIR bit in the U0MR register = 1
		The PD1_6 bit in the PD1 register = 0
TXD1(P6_6)	Output serial data	U1PINSEL bit in PMR register = 1
		(Cannot be used as a port when performing receive only)
RXD1(P6_7)	Input serial data	U1PINSEL bit in PMR register = 1
		The PD6_7bit in the PD6 register = 0
		(P6_7 can be used as an input port when performing transmit
		only)

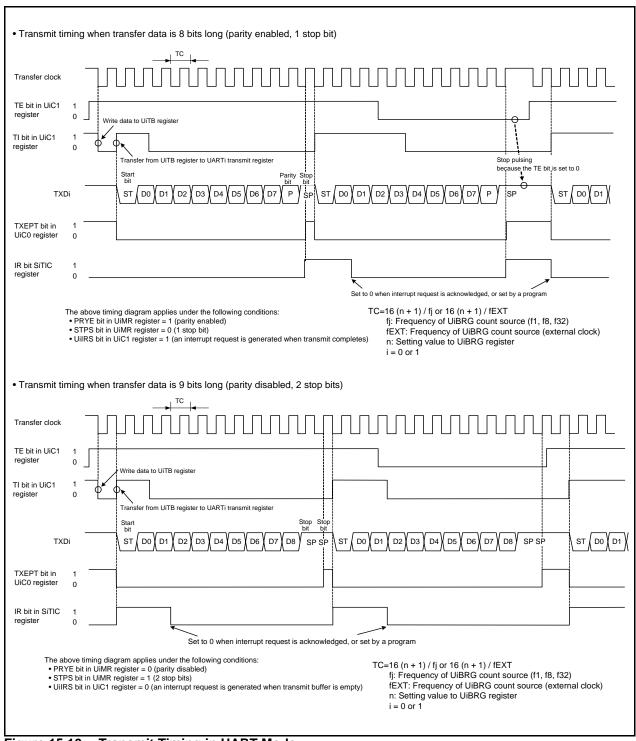

Figure 15.10 Transmit Timing in UART Mode

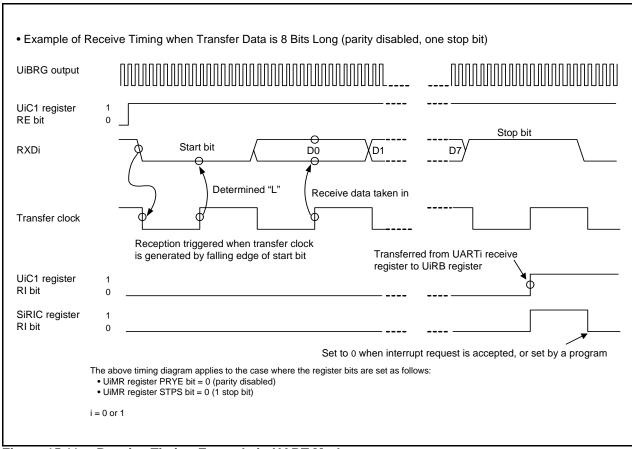

Figure 15.11 Receive Timing Example in UART Mode

15.2.1 **Bit Rate**

Divided-by-16 of frequency by the UiBRG (i = 0 or 1) register in UART mode is a bit rate.

<UART Mode> • When selecting internal clock Setting value to the UiBRG register = $\frac{fj}{Bit Rate \times 16}$ - 1 fj: Count source frequency of the UiBRG register (f1, f8 and f32) • When selecting external clock Setting value to the UiBRG register = fEXT: Count source frequency of the UiBRG register (external clock) i = 0 or 1

Figure 15.12 Calculation Formula of UiBRG (i = 0 or 1) Register Setting Value

Table 15.7 Bit Rate Setting Example in UART Mode (Internal Clock Selected)

Bit Data	Bit Rate UiBRG		System Clock = 20 MHz			System Clock = 8 MHz		
(bps)	Count	UiBRG	Actual Time	Setting	UiBRG	Actual Time	Setting	
(bps)	Source	Setting Value	(bps)	Error(%)	Setting Value	(bps)	Error(%)	
1200	f8	129 (81h)	1201.92	0.16	51 (33h)	1201.92	0.16	
2400	f8	64 (40h)	2403.85	0.16	25 (19h)	2403.85	0.16	
4800	f8	32 (20h)	4734.85	-1.36	12 (0Ch)	4807.69	0.16	
9600	f1	129 (81h)	9615.38	0.16	51 (33h)	9615.38	0.16	
14400	f1	86 (56h)	14367.82	-0.22	34 (22h)	14285.71	-0.79	
19200	f1	64 (40h)	19230.77	0.16	25 (19h)	19230.77	0.16	
28800	f1	42 (2Ah)	29069.77	0.94	16 (10h)	29411.76	2.12

38400	f1	32 (20h)	37878.79	-1.36	12 (0Ch)	38461.54	0.16	
51200	f1	23 (17h)	52083.33	1.73	9 (09h)	50000.00	-2.34	

i = 0 or 1

15.3 Notes on Serial Interface

• When reading data from the UiRB (i = 0 or 1) register even in the clock asynchronous serial I/O mode or in the clock synchronous serial I/O mode. Ensure to read data in 16-bit unit. When the high-order byte of the UiRB register is read, the PER and FER bits in the UiRB register and the RI bit in the UiC1 register are set to 0. To check receive errors, read the UiRB register and then use the read data.

Example (when reading receive buffer register):

MOV.W 00A6H,R0 ; Read the U0RB register

• When writing data to the UiTB register in the clock asynchronous serial I/O mode with 9-bit transfer data length, write data high-order byte first, then low-order byte in 8-bit units.

Example (when reading transmit buffer register):

MOV.B #XXH,00A3H ; Write the high-order byte of U0TB register MOV.B #XXH,00A2H ; Write the low-order byte of U0TB register

16. Clock Synchronous Serial Interface

The clock synchronous serial interface is configured as follows.

Clock Synchronous Serial Interface

Clock synchronous serial I/O with chip select (SSU)	Clock synchronous communication mode
	4-wire bus communication mode
I ² C bus interface	I ² C bus interface mode
	Clock synchronous serial mode

The clock synchronous serial interface uses the registers of addresses 00B8h to 00BFh. Registers, bits, symbols and functions vary even in the same addresses depending on the modes. Refer to registers of each function for details. Also, the differences between clock synchronous communication mode and clock synchronous serial mode are the options of the transfer clock, clock output format and data output format.

16.1 **Mode Selection**

The clock synchronous serial interface contains 4 modes.

Table 16.1 lists the Mode Selections. Refer to 16.2 Clock Synchronous Serial I/O with Chip Select (SSU) or after for details of each mode.

Table 16.1 Mode Selections

IICSEL Bit in PMR Register	Bit 7 in 00B8h (ICE Bit in ICCR1 Register)	Bit 0 in 00BDh (SSUMS Bit in SSMR2 Register, FS Bit in SAR Register)	Function	Mode
0	0	0	Clock synchronous serial I/O with chip	Clock synchronous communication mode
0	0	1	select	4-wire bus communication mode
1	1	0	I ² C bus interface	I ² C bus interface mode
1	1	1		Clock synchronous serial mode

16.2 Clock Synchronous Serial I/O with Chip Select (SSU)

The serial data of the clock synchronous can communicate for the clock synchronous serial I/O with chip select. Table 16.2 lists the Clock Synchronous Serial I/O with Chip Select Specifications and Figure 16.1 shows a Block Diagram of Clock Synchronous Serial I/O with Chip Select.

Figures 16.2 to 16.9 show Clock Synchronous Serial I/O with Chip Select Associated Registers.

Table 16.2 Clock Synchronous Serial I/O with Chip Select Specifications

Item	Specification		
Transfer Data Format	Transfer-data length 8 bits		
	Continuous transmit and receive of serial data are enabled since both		
	transmitter and receiver have buffer structure.		
Operating Mode	Clock synchronous communication mode		
	• 4-wire bus communication mode (including bidirectional communication)		
Master / Slave Device	Selectable		
I/O Pin	SSCK (I/O): Clock I/O pin		
	SSI (I/O): Data I/O pin		
	SSO (I/O): Data I/O pin		
	SCS (I/O): Chip-select I/O pin		
Transfer Clock	• When the MSS bit in the SSCRH register is set to 0 (operates as slave		
	device), external clock can be selected.		
	• When the MSS bit in the SSCRH register is set to 1 (operates as master		
	device), internal clock (selects from f1/256, f1/128, f1/64, f1/32, f1/16, f1/8 and		
	f1/4 and outputs from SSCK pin) can be selected.		
	Clock polarity and phase of SSCK can be selected.		
Receive Error Detection	Overrun error		
	Overrun error occurs during receive and completes by error. While the RDRF		
	bit in the SSSR register is set to 1 (data in the SSRDR register) and		
	completing the next serial data receive, the ORER bit is set to 1.		
Multimaster Error	Conflict error		
Detection	While the SSUMS bit in the SSMR2 register is set to 1 (4-wire bus		
	communication mode) and the MSS bit in the SSCRH register is set to 1		
	(operates as master device) and when starting a serial communication, the		
	CE bit in the SSSR register is set to 1 if "L" applies to the SCS pin input.		
	When the SSUMS bit in the SSMR2 register is set to 1 (4-wire bus		
	communication mode), the MSS bit in the SSCRH register is set to 0		
	(operates as slave device) and the SCS pin input changes state from "L" to		
	"H", the CE bit in the SSSR register is set to 1.		
Interrupt Request	5 interrupt requests (transmit-end, transmit-data-empty, receive-data-full,		
	overrun error and conflict error). ⁽¹⁾		
Select Function	Data transfer direction		
	Selects MSB-first or LSB-first		
	• SSCK clock polarity		
	Selects "L" or "H" level when clock stops		
	• SSCK clock phase		
	Selects edge of data change and data download		

NOTE:

1. The interrupt vector table is one of the clock synchronous serial I/O with chip select specification.

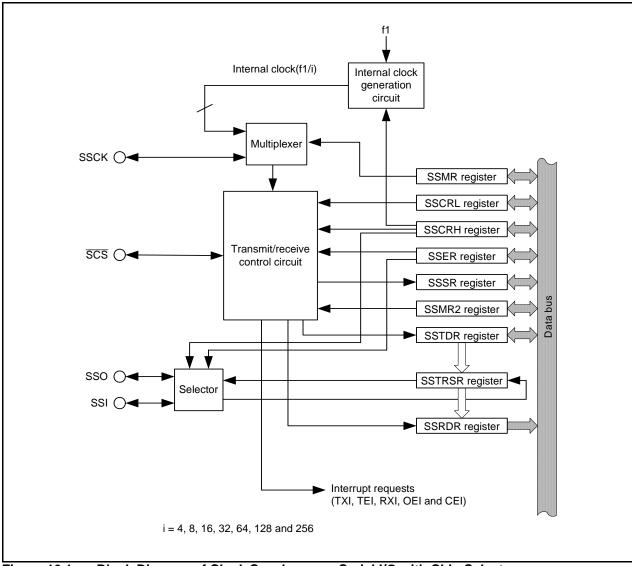

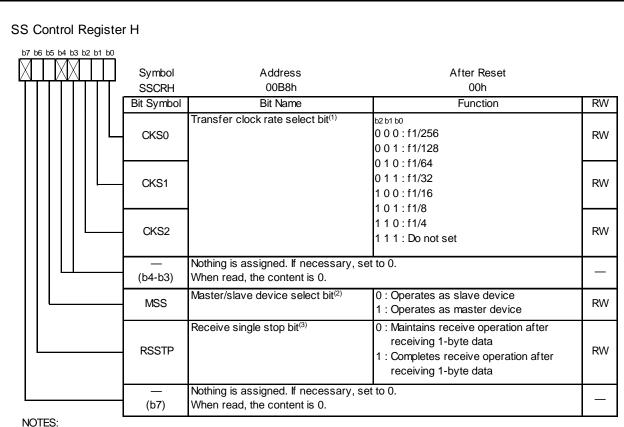

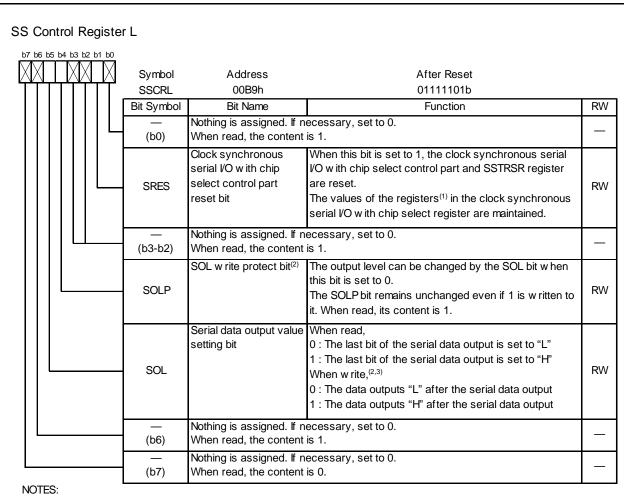

Figure 16.1 Block Diagram of Clock Synchronous Serial I/O with Chip Select

- - 1. The set clock is used when the internal clock is selected.
 - 2. The SSCK pin functions as the transfer clock output pin w hen the MSS bit is set to 1 (operates as master device). The MSS bit is set to 0 (operates as slave device) when the CE bit in the SSSR register is set to 1 (conflict error occurs).
 - 3. The RSSTP bit is disabled when the MSS bit is set to 0 (operates as slave device).

Figure 16.2 **SSCRH Register**

- 1. SSCRH, SSCRL, SSMR, SSER, SSSR, SSMR2, SSTDR and SSRDR registers.
- 2. The data output after the serial data is output can be changed when writing to the SOL bit before or after transfer. When writing to the SOL bit, set the SOLP bit to 0 and then write to bits SOLP and SOL by the MOV instruction.
- 3. Do not write to the SOL bit during the data transfer.

Figure 16.3 **SSCRL** Register

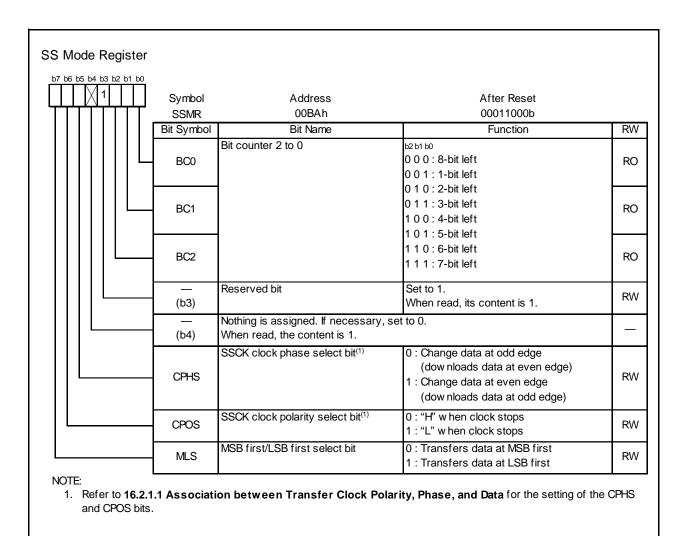

Figure 16.4 SSMR Register

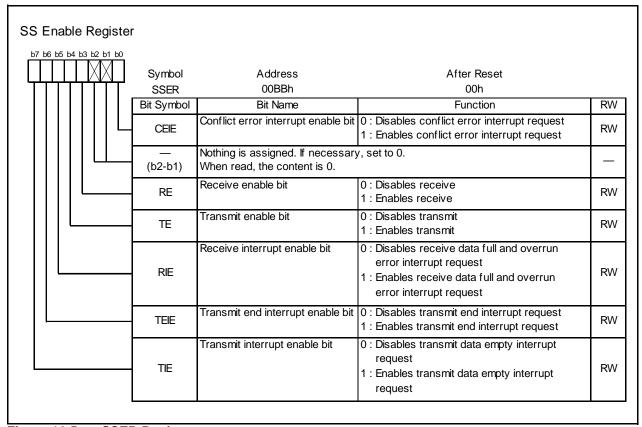

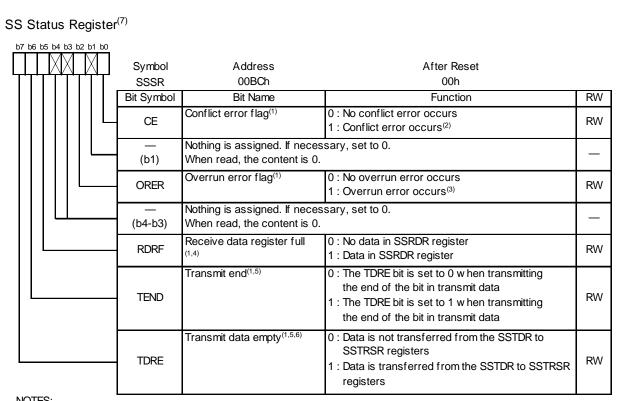

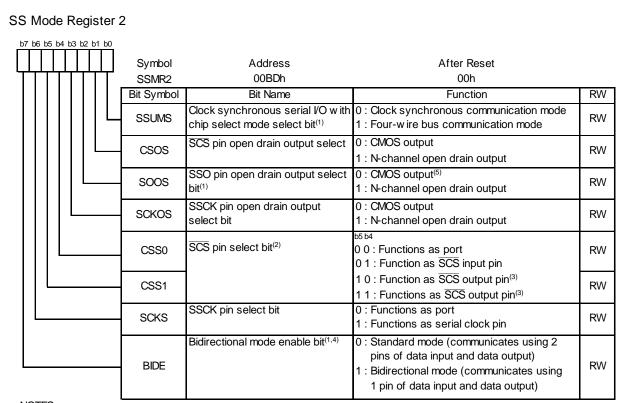

Figure 16.5 SSER Register

- 1. When reading 1 and writing 0, the CE, ORER, RDRF, TEND and TDRE bits are set to 0.
- 2. When the serial communication is started while the SSUMS bit in the SSMR2 register is set to 1 (four-wire bus communication mode) and the MSS bit in the SSCRH register is set to 1 (operates as master device), the CE bit is set to 1 if "L" is applied to the SCS pin input. Refer to 16.2.7 SCS Pin Control and Arbitration for more information. When the SSUMS bit in the SSMR2 register is set to 1 (four-wire bus communication mode), the MSS bit in the SSCRH register is set to 0 (operates as slave device) is set to 0 (operates as slave device) and the SCS pin input changes the level from "L" to "H" during transfer, the CE bit is set to 1.
- 3. Indicates overrun error occurs and receive completes by error when receive. When the next serial data receive is completed while the RDRF bit is set to 1 (data in the SSRDR register), the ORER bit is set to 1. After the ORER bit is set to 1 (overrun error occurs), do not transmit or receive while the ORER bit is set to 1.
- 4. The RDRF bit is set to 0 when reading out the data from the SSRDR register.
- 5. The TEND and TDRE bits are set to "0" when writing the data to the SSTDR register.
- 6. The TDRE bit is set to 1 when setting the TE bit in the SSER register to 0 (disables transmit).
- 7. When accessing the SSSR register continuously, insert one or more NOP instructions between the instructions to access it.

Figure 16.6 SSSR Register

- 1. Refer to 16.2.2.1 Association between Data I/O Pins and SS Shift Register for the combination of the data I/O
- 2. The SCS pin functions as a port, regardless of the contents of the CSS0 and CSS1 bits when the SSUMS bit is set to 0 (clock synchronous communication mode).
- 3. This bit functions as the SCS input pin before starting transfer.
- 4. The BIDE bit is disabled when the SSUMS bit is set to 0 (clock synchronous communication mode).
- The SSI pin and SSO pin corresponding port direction bits are set to 0 (input mode) when the SOOS bit is set to 0 (CMOS output).

Figure 16.7 SSMR2 Register

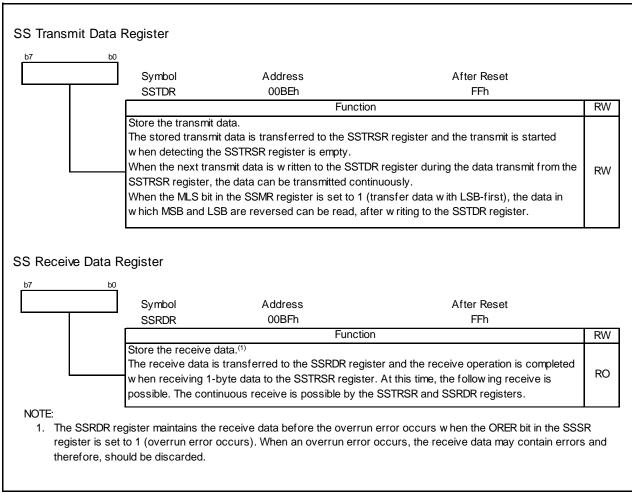

Figure 16.8 Registers SSTDR and SSRDR

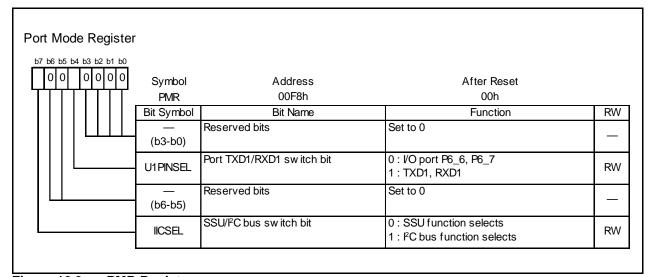

Figure 16.9 **PMR Register**

16.2.1 Transfer Clock

A transfer clock can be selected from 7 internal clocks (f1/256, f1/128, f1/64, f1/32, f1/16, f1/8 and f1/4) and an external clock.

When using the clock synchronous serial I/O with chip select, set the SCKS bit in the SSMR2 register to 1 and select the SSCK pin as the serial clock pin.

When the MSS bit in the SSCRH register is set to 1 (operates as master device), an internal clock can be selected and the SSCK pin functions as output. When transfer is started, the SSCK pin outputs clocks of the transfer rate selected in the CKS0 to CKS2 bits in the SSCRH register.

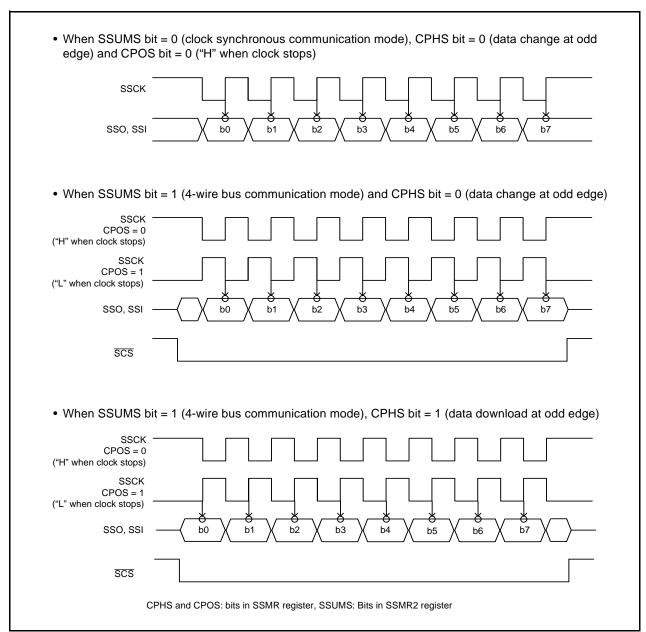

When the MSS bit in the SSCRH register is set to 0 (operates as slave device), an external clock can be selected and the SSCK pin functions as input.

16.2.1.1 Association between Transfer Clock Polarity, Phase, and Data

Association between transfer clock polarity, phase and data changes according to a combination of the SSUMS bit in the SSMR2 register and the CPHS and CPOS bits in the SSMR register.

Figure 16.10 shows the Association between Transfer Clock Polarity, Phase, and Transfer Data.

Also, the MSB-first transfer or LSB-first transfer can be selected by setting the MLS bit in the SSMR register. When the MLS bit is set to 1, transfer is started from the LSB to MSB. When the MLS bit is set to 0, transfer is started from the MSB to LSB.

Association between Transfer Clock Polarity, Phase, and Transfer Data **Figure 16.10**

16.2.2 SS Shift Register (SSTRSR)

The SSTRSR register is the shift register to transmit and receive the serial data.

When the transmit data is transferred from the SSTDR register to the SSTRSR register and the MLS bit in the SSMR register is set to 0 (MSB-first), the bit 0 in the SSTDR register is transferred to the bit 0 in the SSTRSR register. When the MLS bit is set to 1 (LSB-first), the bit 7 in the SSTDR register is transferred to the bit 0 in the SSTRSR register.

16.2.2.1 Association between Data I/O Pins and SS Shift Register

Connecting association between the data I/O pin and SSTRSR register (SS shift register) changes according to a combination of the MSS bit in the SSCRH register and the SSUMS bit in the SSMR2 register. Also, connecting association changes according to the BIDE bit in the SSMR2 register.

Figure 16.11 shows an Association between Data I/O Pins and SSTRSR Register.

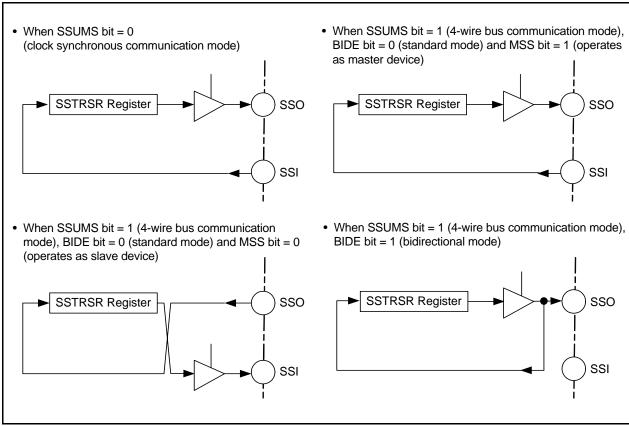

Figure 16.11 Association between Data I/O Pins and SSTRSR Register

16.2.3 Interrupt Requests

Clock synchronous serial I/O with chip select has five interrupt requests: transmit data empty, transmit end, receive data full, overrun error and conflict error. Since these interrupt requests are assigned to the clock synchronous serial I/O with chip select interrupt vector table, determining interrupt sources by flags is required. Table 16.3 shows the Clock Synchronous Serial I/O with Chip Select Interrupt Requests.

Table 16.3 Clock Synchronous Serial I/O with Chip Select Interrupt Requests

Interrupt Request	Abbreviation	Generation Condition
Transmit Data Empty	TXI	TIE = 1, TDRE = 1
Transmit End	TEI	TEIE = 1, TEND = 1
Receive Data Full	RXI	RIE = 1, RDRF = 1
Overrun Error	OEI	RIE = 1, ORER = 1
Conflict Error	CEI	CEIE = 1, CE = 1

CEIE, RIE, TEIE and TIE: Bits in SSER register ORER, RDRF, TEND and TDRE: Bits in SSSR register

Generation conditions of Table 16.3 are met, a clock synchronous serial I/O with chip select interrupt request is generated. Set the each interrupt source to 0 by a clock synchronous serial I/O with chip select interrupt routine.

However, the TDRE and TEND bits are automatically set to 0 by writing the transmit data to the SSTDR register and the RDRF bit is automatically set to 0 by reading the SSRDR register. When writing the transmit data to the SSTDR register, at the same time the TDRE bit is set to 1 (data is transmitted from the SSTDR to SSTRSR registers) again and when setting the TDRE bit to 0 (data is not transmitted from the SSTDR to SSTRSR registers), additional 1-byte data may be transmitted.

16.2.4 Communication Modes and Pin Functions

Clock synchronous serial I/O with chip select switches functions of the I/O pin in each communication mode according to the setting of the MSS bit in the SSCRH register and the RE and TE bits in the SSER register. Table 16.4 shows the Association between Communication Modes and I/O Pins.

Table 16.4 Association between Communication Modes and I/O Pins

Communication Mode		Е	Pin State					
Communication wode	SSUMS	BIDE	MSS	TE	RE	SSI	SSO	SSCK
Clock Synchronous	0	Disabled	0	0	1	Input	_(1)	Input
Communication Mode				1	0	_(1)	Output	Input
					1	Input	Output	Input
			1	0	1	Input	_(1)	Output
				1	0	_(1)	Output	Output
					1	Input	Output	Output
4-Wire Bus	1	0	0	0	1	_(1)	Input	Input
Communication Mode				1	0	Output	_(1)	Input
					1	Output	Input	Input
			1	0	1	Input	_(1)	Output
				1	0	_(1)	Output	Output
					1	Input	Output	Output
4-Wire Bus	1	1	0	0	1	_(1)	Input	Input
(Bidirectional)				1	0	_(1)	Output	Input
Communication Mode ⁽²⁾			1	0	1	_(1)	Input	Output
				1	0	_(1)	Output	Output

NOTES:

- 1. This pin can be used as programmable I/O port.
- 2. Do not set both the TE and RE bits to 1 in 4-wire bus (bidirectional) communication mode.

SSUMS and BIDE: Bits in SSMR2 register

MSS: Bit in SSCRH register TE and RE: Bits in SSER register

Clock Synchronous Communication Mode 16.2.5

16.2.5.1 **Initialization in Clock Synchronous Communication Mode**

Figure 16.12 shows an Initialization in Clock Synchronous Communication Mode. Set the TE bit in the SSER register to 0 (disables transmit) and the RE bit to 0 (disables receive) before data transmit / receive as an initialization.

When communication mode and format are changed, set the TE bit to 0 and the RE bit to 0 before changing. Setting the RE bit to 0 does not change the contents of the RDRF and ORER flags, and the contents of the SSRDR register.

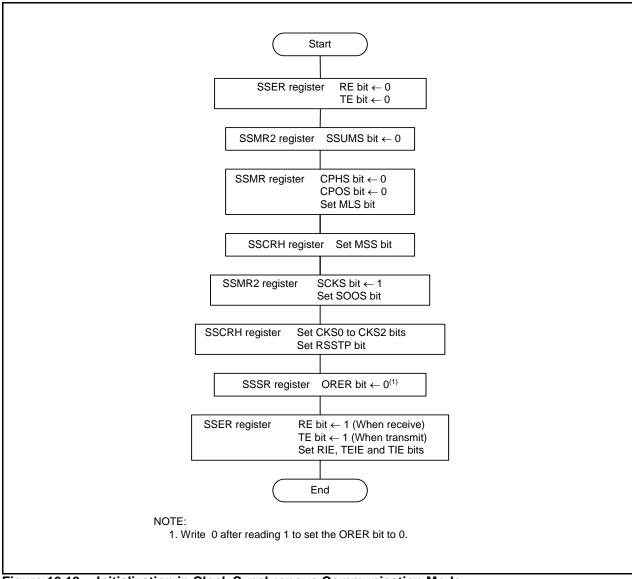

Figure 16.12 Initialization in Clock Synchronous Communication Mode

16.2.5.2 Data Transmission

Figure 16.13 shows an Example of Clock Synchronous Serial I/O with Chip Select Operation for Data Transmission (Clock Synchronous Communication Mode). During the data transmit, the clock synchronous serial I/O with chip select operates as described below.

When the clock synchronous serial I/O with chip select is set as a master device, it outputs a synchronous clock and data.

When the clock synchronous serial I/O with chip select is set as a slave device, it outputs data synchronized with the input clock. When setting the TE bit to 1 (enables transmit) before writing the transmit data to the SSTDR register, the TDRE bit is automatically set to 0 (data is not transferred from the SSTDR to SSTRSR registers) and the data is transferred from the SSTDR to SSTRSR registers.

After the TDRE bit is set to 1 (data is transferred from the SSTDR to SSTRSR registers), a transmit is started. When the TIE bit in the SSER register is set to 1, the TXI interrupt request is generated. When one frame of data is transferred while the TDRE bit is set to 0, data is transferred from the SSTDR to SSTRSR registers and a transmit of the next frame is started. If the 8th bit is transmitted while the TDRE bit is set to 1, the TEND bit in the SSSR register is set to 1 (the TDRE bit is set to 1 when the last bit of the transmit data is transmitted) and the state is retained. The TEI interrupt request is generated when the TEIE bit in the SSER register is set to 1 (enables transmit-end interrupt request). The SSCK pin is retained "H" after transmit-end.

Transmit can not be performed while the ORER bit in the SSSR register is set to 1 (overrun error occurs). Confirm that the ORER bit is set to 0 before transmit.

Figure 16.14 shows a Sample Flowchart of Data Transmission (Clock Synchronous Communication Mode).

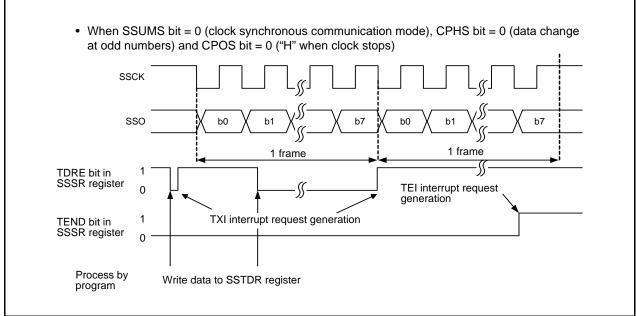

Figure 16.13 Example of Clock Synchronous Serial I/O with Chip Select Operation for Data Transmission (Clock Synchronous Communication Mode)

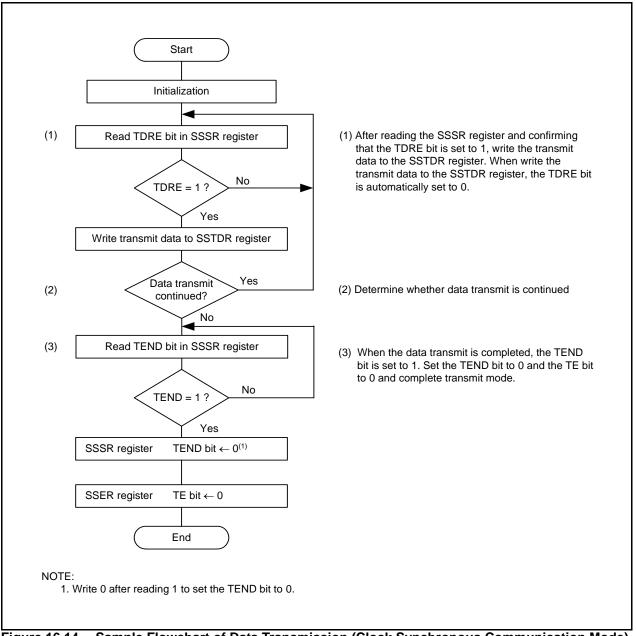

Figure 16.14 Sample Flowchart of Data Transmission (Clock Synchronous Communication Mode)

16.2.5.3 **Data Reception**

Figure 16.15 shows an Example of Clock Synchronous Serial I/O with Chip Select Operation for Data Reception (Clock Synchronous Communication Mode).

During the data receive, the clock synchronous serial I/O with chip select operates as described below. When the clock synchronous serial I/O with chip select is set as a master device, it outputs a synchronous clock and inputs data.

When the clock synchronous serial I/O with chip select is set as a salve device, it outputs data synchronized with the input clock. When the clock synchronous serial I/O with chip select is set as a master device, it outputs a receive clock and starts receiving by performing dummy read on the SSRDR register.

After the 8-bit data is received, the RDRF bit in the SSSR register is set to 1 (data in the SSRDR register) and receive data is stored in the SSRDR register. When the RIE bit in the SSER register is set to 1 (enables RXI and OEI interrupt request), the RXI interrupt request is generated. If the SSDR register is read, the RDRF bit is automatically set to 0 (no data in the SSRDR register).

Read the receive data after setting the RSSTP bit in the SSCRH register to 1 (after receiving 1-byte data, the receive operation is completed). The clock synchronous serial I/O with chip select outputs a clock for receiving 8-bit data and stops. After that, set the RE bit in the SSER register to 0 (disables receive) and the RSSTP bit to 0 (receive operation is continued after receiving the 1-byte data) and read the receive data. If the SSRDR register is read while the RE bit is set to 1 (enables receive), a receive clock is output again.

When the 8th clock rises while the RDRF bit is set to 1, the ORER bit in the SSSR register is set to 1 (overrun error occurs: OEI) and the operation is stopped. When the ORER bit is set to 1, receive can not be performed. Confirm that the ORER bit is set to 0 before restarting receive.

Figure 16.16 shows a Sample Flowchart of Data Reception (MSS = 1) (Clock Synchronous Communication Mode).

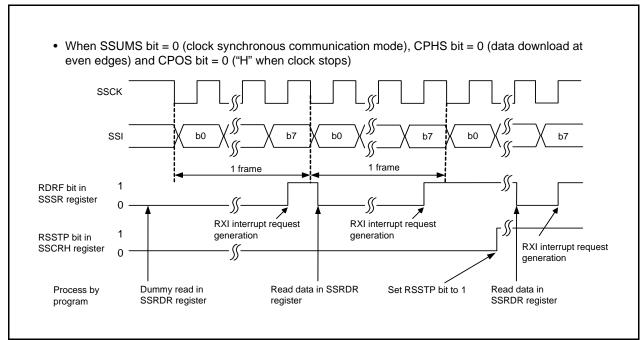

Figure 16.15 Example of Clock Synchronous Serial I/O with Chip Select Operation for Data Reception (Clock Synchronous Communication Mode)

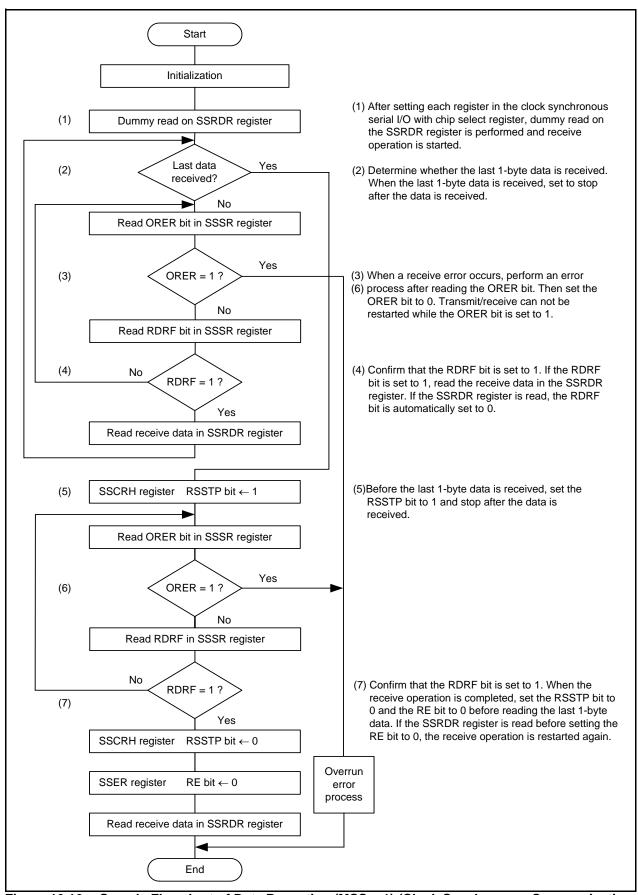

Figure 16.16 Sample Flowchart of Data Reception (MSS = 1) (Clock Synchronous Communication Mode)

16.2.5.4 Data Transmission/Reception

Data transmit/receive is a combined operation of data transmit and receive which are described before. Transmit/receive is started by writing data in the SSTDR register.

When the 8th clock rises or the ORER bit is set to 1 (overrun error occurs) while the TDRE bit is set to 1 (data is transferred from the SSTDR to SSTRSR registers), the transmit/receive operation is stopped.

When switching from transmit mode (TE = 1) or receive mode (RE = 1) to transmit/receive mode (Te = RE = 1), set the TE bit to 0 and RE bit to 0 before switching. After confirming that the TEND bit is set to 0 (the TDRE bit is set to 0 when the last bit of the transmit data is transmitted), the RERF bit is set to 0 (no data in the SSRDR register) and the ORER bit is set to 0 (no overrun error), set the TE and RE bits to 1.

Figure 16.17 shows a Sample Flowchart of Data Transmission/Reception (Clock Synchronous Communication Mode).

When exiting transmit/receive mode after this mode is used (TE = RE = 1), a clock may be output if transmit/receive mode is exited after reading the SSRDR register. To avoid any clock outputs, perform either of the following:

- First set the RE bit to 0, and then set the TE bit to 0.
- Set bits TE and RE at the same time.

When subsequently switching to receive mode (TE = 0 and RE = 1), first set the SRES bit to 1, and set this bit to 0 to reset the clock synchronous serial interface control unit and the SSTRSR register. Then, set the RE bit to 1.

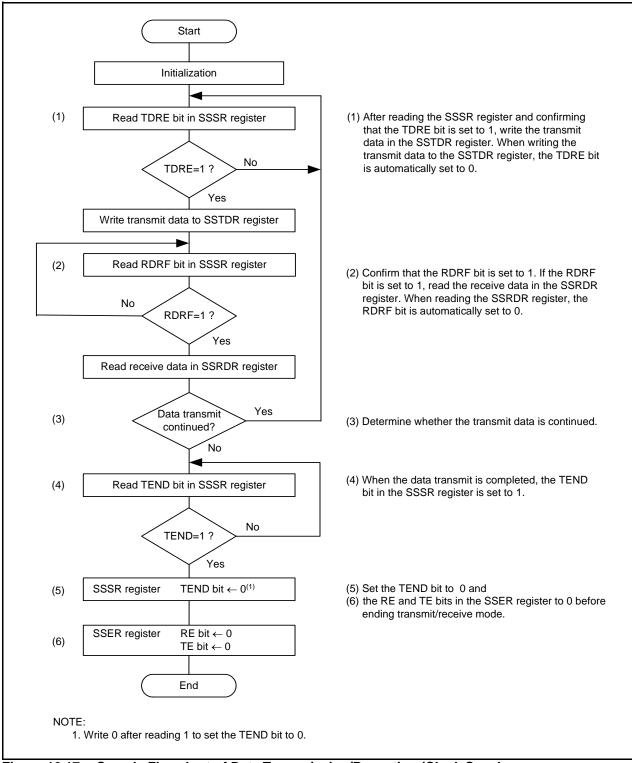

Figure 16.17 Sample Flowchart of Data Transmission/Reception (Clock Synchronous **Communication Mode)**

16.2.6 Operation in 4-Wire Bus Communication Mode

4-wire bus communication mode is a mode which communicates with the 4-wire bus; a clock line, data input line, data output line and chip select line. This mode includes bidirectional mode in which the data input line and data output line function as a single pin.

The data input line and output line are changed according to the setting of the MSS bit in the SSCRH register and the BIDE bit in the SSMR2 register. For details, refer to 16.2.2.1 Association between Data I/O Pins and SS Shift Register. In this mode, association between the clock polarity, phase and data can be set by the CPOS and CPHS bits in the SSMR register. For details, refer to 16.2.1.1 Association between Transfer Clock Polarity, Phase, and Data.

When the clock synchronous serial I/O with chip select is set as a master device, the chip select line controls output. When the clock synchronous serial I/O with chip select is set as a slave device, the chip select line controls input. When the clock synchronous serial I/O with chip select is set as master device, the chip select line controls output of the \overline{SCS} pin or controls output of a general port by setting the CSS1 bit in the SSMR2 register. When the clock synchronous serial I/O with chip select is set as a slave device, the chip select line set the \overline{SCS} pin as an input pin by setting the CSS1 and CSS0 bits in the SSMR2 register to 01b.

In 4-wire bus communication mode, the MLS bit in the SSMR register is set to 0 and communication is performed using the MSB-first.

16.2.6.1 Initialization in 4-Wire Bus Communication Mode

Figure 16.18 shows an Initialization in 4-Wire Bus Communication Mode. Before the data transit/receive, set the TE bit in the SSER register to 0 (disables transmit) and the RE bit in the SSER register to 0 (disables receive) and initialize the clock synchronous serial I/O with chip select.

When communication mode and format are changed, set the TE bit to 0 and the RE bit to 0 before changing. Setting the RE bit to 0 does not change the contents of the RDRF and ORER flags, and the contents of the SSRDR register.

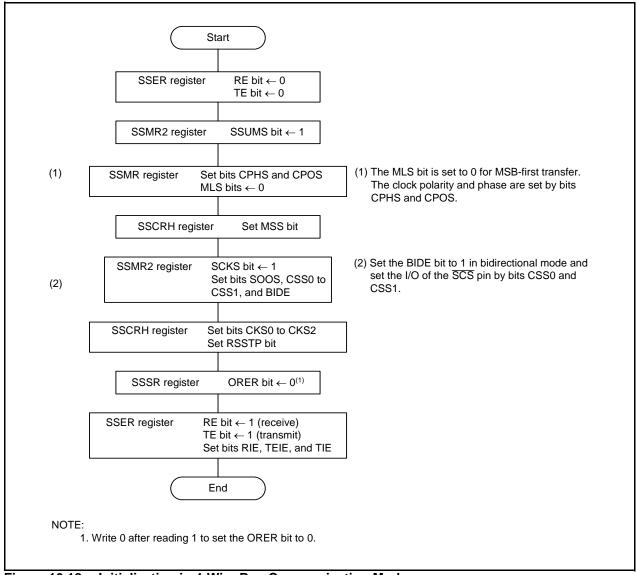

Figure 16.18 Initialization in 4-Wire Bus Communication Mode

16.2.6.2 Data Transmission

Figure 16.19 shows an Example of Clock Synchronous Serial I/O with Chip Select Operation during Data Transmission (4-Wire Bus Communication Mode). During the data transmit, the clock synchronous serial I/O with chip select operates as described below.

When the clock synchronous serial I/O with chip select is set as a master device, it outputs a synchronous clock and data. When the UUSA is set as a slave device, it outputs data in synchronized with the input clock while "L" applies to the \overline{SCS} pin.

When writing the transmit data to the SSTDR register after setting the TE bit to 1 (enables transmit), the TDRE bit is automatically set to 0 (data is not transferred from the SSTDR to SSTRSR registers) and the data is transferred from the SSTDR to SSTRSR registers. After the TDRE bit is set to 1 (data is transferred from the SSTDR to SSTRSR registers), a transmit is started. When the TIE bit in the SSER register is set to 1, the TXI interrupt request is generated.

When the 1-frame data is transferred while the TDRE bit is set to 0, the data is transferred from the SSTDR to SSTRSR registers and the next frame transmit is started. If the 8th bit is transmitted while the TDRE is set to 1, the TEND in the SSSR register is set to 1 (when the last bit of the transmit data is transmitted, the TDRE bit is set to 1) and the state is retained. If the TEIE bit in the SSER register is set to 1 (enables transmit-end interrupt request), the TEI interrupt request is generated. The SSCK pin is retained "H" after transmit-end and the \overline{SCS} pin is held "H". When the \overline{SCS} pin is transmitted When transmitting continuously while the \overline{SCS} pin is held "L", write the next transmit data to the SSTDR register before transmitting the 8th bit.

Transmit can not be performed while the ORER bit in the SSSR register is set to 1 (overrun error occurs). Confirm that the ORER bit is set to 0 before transmit.

The difference from the clock synchronous communication mode is that the SSO pin is placed in high-impedance state while the \overline{SCS} pin is placed in high-impedance state when operating as a master device and the SSI pin is placed in high-impedance state while the \overline{SCS} pin is placed in "H" input state when operating as a slave device.

A sample flowchart is the same as the clock synchronous communication mode (refer to **Figure 16.14 Sample Flowchart of Data Transmission (Clock Synchronous Communication Mode)**).

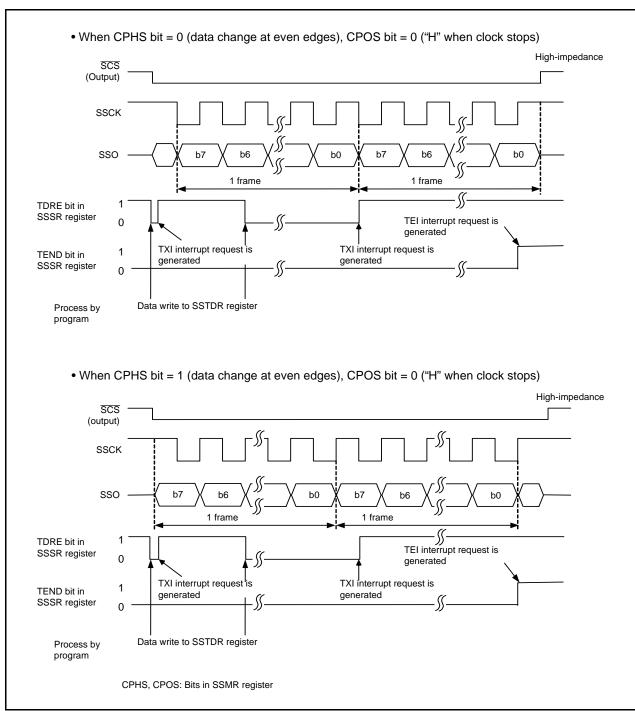

Figure 16.19 Example of Clock Synchronous Serial I/O with Chip Select Operation during Data **Transmission (4-Wire Bus Communication Mode)**

16.2.6.3 Data Reception

Figure 16.20 shows an Example of Clock Synchronous Serial I/O with Chip Select Operation during Data Reception (4-Wire Bus Communication Mode). During the data receive, the clock synchronous serial I/O with chip select operates as described below.

When the clock synchronous serial I/O with chip select is set as a master device, it outputs a synchronous clock and inputs data. When the clock synchronous serial I/O with chip select is set as a salve device, it outputs data synchronized with the input clock while the \overline{SCS} pin is held "L" input. When the clock synchronous serial I/O with chip select is set as a master device, it outputs a receive clock and starts receiving by performing dummy read on the SSRDR register.

After the 8-bit data is received, the RDRF bit in the SSSR register is set to 1 (data in the SSRDR register) and receive data is stored in the SSRDR register. When the RIE bit in the SSER register is set to 1 (enables RXI and OEI interrupt request), the RXI interrupt request is generated. If the SSRDR register is read, the RDRF bit is automatically set to 0 (no data in the SSRDR register).

Read the receive data after setting the RSSTP bit in the SSCRH register to 1 (after receiving 1-byte data, the receive operation is completed). The clock synchronous serial I/O with chip select outputs a clock for receiving 8-bit data and stops. After that, set the RE bit in the SSER register to 0 (disables receive) and the RSSTP bit to 0 (receive operation is continued after receiving 1-byte data) and read the receive data. If the SSRDR register is read while the RE bit is set to 1 (enables receive), a receive clock is output again.

When the 8th clock rises while the RDRF bit is set to 1, the ORER bit in the SSSR register is set to 1 (overrun error occurs: OEI) and the operation is stopped. When the ORER bit is set to 1, receive can not be performed. Confirm that the ORER bit is set to 0 before restarting receive.

When the RDRF and ORER bits are set to 1, it varies depending on setting the CPHS bit in the SSMR register. Figure 16.20 shows when the RDRF and ORER bits are set to 1.

When the CPHS bit is set to 1 (data download at the odd edges), the RDRF and ORER bits are set to 1 at one point of a frame.

A sample flowchart is the same as the clock synchronous communication mode (refer to **Figure 16.16 Sample Flowchart of Data Reception (MSS = 1) (Clock Synchronous Communication Mode)**).

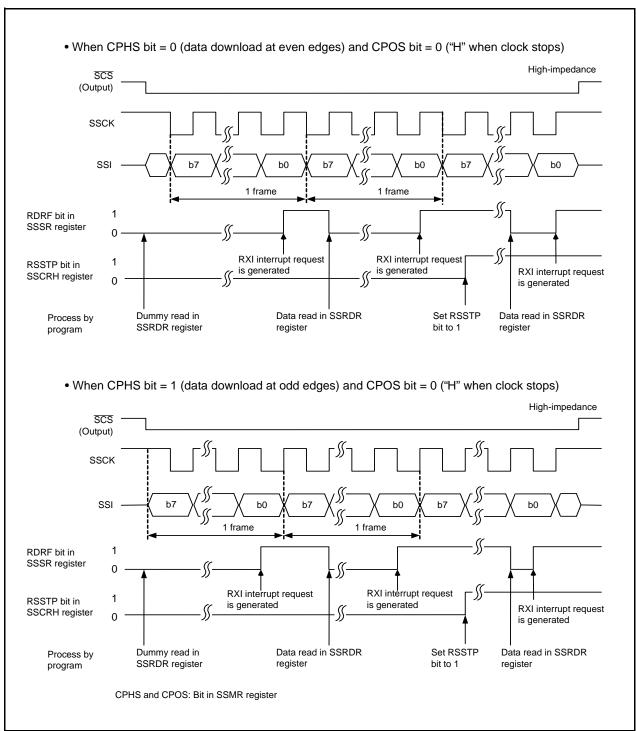

Figure 16.20 Example of Clock Synchronous Serial I/O with Chip Select Operation during Data **Reception (4-Wire Bus Communication Mode)**

16.2.7 **SCS Pin Control and Arbitration**

When setting the SSUMS bit in the SSMR2 register to 1 (4-wire bus communication mode), and the CSS1 bit in the SSMR2 register to 1 (functions as SCS output pin), Set the MSS bit in the SSCRH register to 1 (operates as a master device) and check the arbitration of the \overline{SCS} pin before starting serial transfer. If the clock synchronous serial I/O with chip select detects that the synchronized internal SCS signal is held "L" in this period, the CE bit in the SSSR register to 1 (a conflict error occurs) and the MSS bit is automatically set to 0 (operates as a slave device).

Figure 16.21 shows an Arbitration Check Timing.

A future transmit operation is not performed while the CE bit is set to 1. Set the CE bit to 0 (a conflict error does not occur) before a transmit is started.

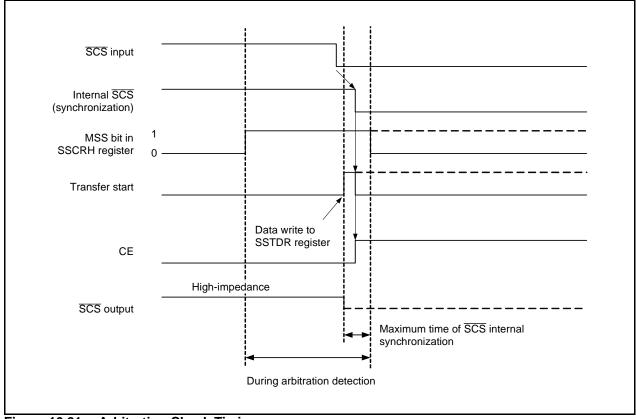

Figure 16.21 Arbitration Check Timing

16.2.8 Notes on Clock Synchronous Serial I/O with Chip Select

Set the IICSEL bit in the PMR register to 0 (select clock synchronous serial I/O with chip select function) to use the clock synchronous serial I/O with chip select.

16.3 I²C Bus Interface

The I²C bus interface is the circuit which is used for a serial communication based on the data transfer format of the Philips I²C bus.

Table 16.5 lists a I²C Bus Interface Specifications, Figure 16.22 shows a Block Diagram of I²C bus Interface and Figure 16.23 shows the External Circuit Connection Example of Pins SCL and SDA. Figures 16.24 to 16.31 show the registers associated with the I²C bus interface.

Table 16.5 I²C Bus Interface Specifications

Item	Specification					
Communication	• I ² C bus format					
Formats	- Selectable for master / slave device					
	- Continuous transmit / receive (since the shift register, transmit data register					
	and receive data register are independent)					
	- Start / stop conditions are automatically generated in master mode					
	- Automatic loading of acknowledge bit when transmit					
	- Bit synchronization / wait function (in master mode, the state of the SCL					
	signal is monitored per bit and the timing is synchronized automatically. If					
	the transfer is not possible yet, stand by to set the SCL signal to "L".					
	- Direct drive of the SCL and SDA pins (N-channel open drain output) is					
	enabled					
	Clock synchronous serial format					
	- Continuous transmit / receive (since the shift register, transmit data register					
	and receive data register are independent)					
I/O Pins	SCL (I/O): Serial clock I/O pin					
	SDA (I/O): Serial data I/O pin					
Transfer Clocks	When the MST bit in the ICCR1 register is set to 0					
	The external clock (input from the SCL pin)					
	When the MST bit in the ICCR1 register is set to 1					
	The internal clock selected by the CKS0 to CKS3 bits in the ICCR1 register					
	(output from the SCL pin)					
Receive Error Detection	Detects overrun error (clock synchronous serial format)					
	An overrun error occurs during receive. When the last bit of the following data					
	is received while the RDRF bit in the ICSR register is set to 1 (data in the					
	ICDRR register), the AL bit is set to 1.					
Interrupt Sources	• I ² C bus format 6 types ⁽¹⁾					
	Transmit data empty (including when slave address matches), transmit ends,					
	receive data full (including when slave address matches), arbitration lost,					
	NACK detection and stop condition detection.					
	• Clock synchronous serial format 4 types ⁽¹⁾					
	Transmit data empty, transmit ends, receive data full and overrun error					
Select Functions	• I ² C bus format					
	- Selectable for the output level of the acknowledge signal when receive					
	Clock synchronous serial format Cole stable for the MOD first and CD first to the data together direction.					
	- Selectable for the MSB-first or LSB-first to the data transfer direction					

NOTE:

1. The interrupt sources can use the only I²C bus interface interrupt vector table.

^{*} I²C bus is a trademark of Koninklijke Philips Electronics N. V.

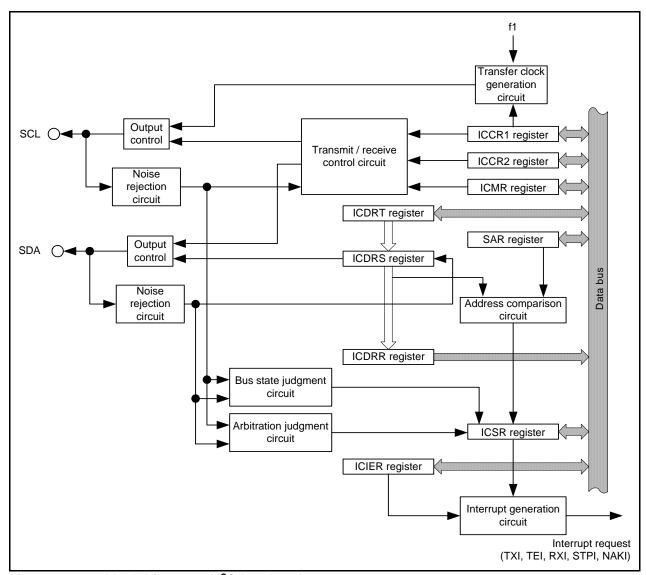

Figure 16.22 Block Diagram of I²C Bus Interface

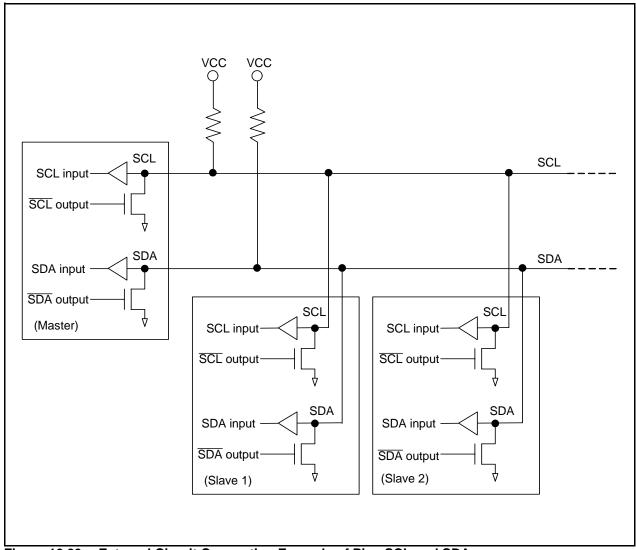

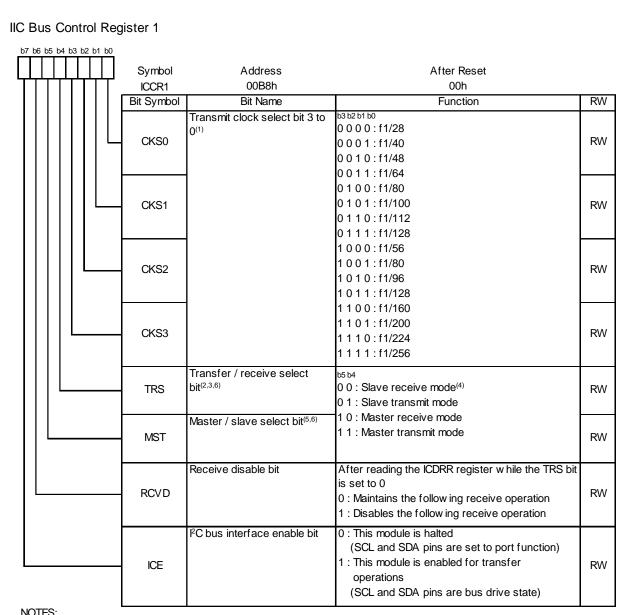

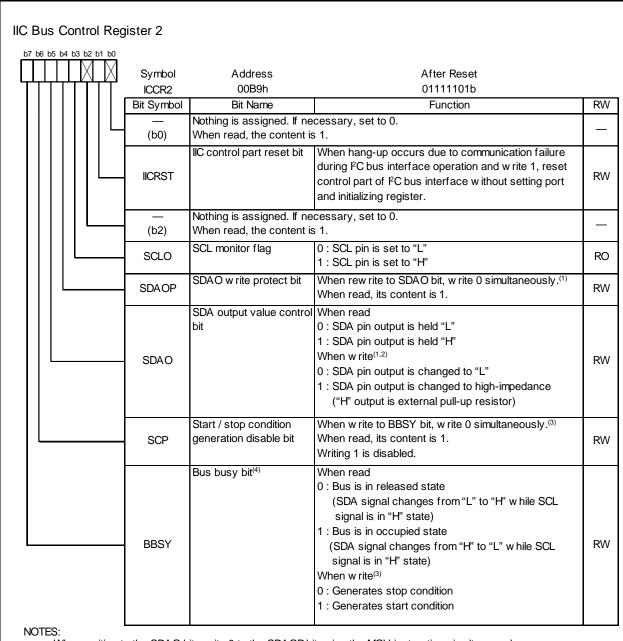

Figure 16.23 External Circuit Connection Example of Pins SCL and SDA

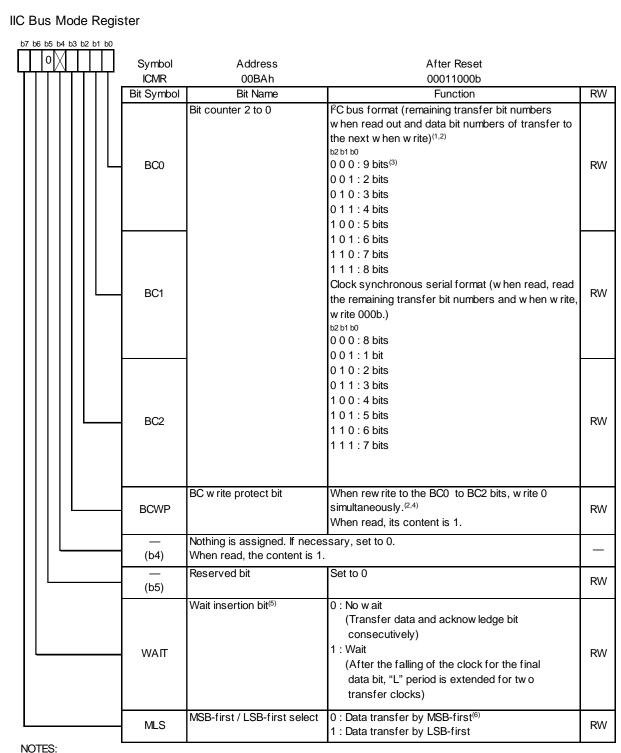

- 1. Set according to the necessary transfer rate in master mode. Refer to Table 16.6 Transfer Rate Examples for the transfer rate. This bit is used for maintaining of the setup time in transmit mode. The time is 10Tcyc when the CKS3 bit is set to 0 and 20Tcyc when the CKS3 bit is set to 1. (1Tcyc = 1/f1(s))
- 2. Rew rite the TRS bit between the transfer frame.
- 3. When the first 7 bits, after the start condition in slave receive mode, match with the slave address set in the SAR register and the 8th bit is set to 1, the TRS bit is set to 1.
- 4. In master mode with the PC bus format, when arbitration is lost, the MST and TRS bits are set to 0 and the IIC enters slave receive mode.
- 5. When an overrun error occurs in master receive mode of the clock synchronous serial format, the MST bit is set to 0 and the IIC enters slave receive mode.
- 6. In multimaster operation use the MOV instruction to set bits TRS and MST.

Figure 16.24 ICCR1 Register

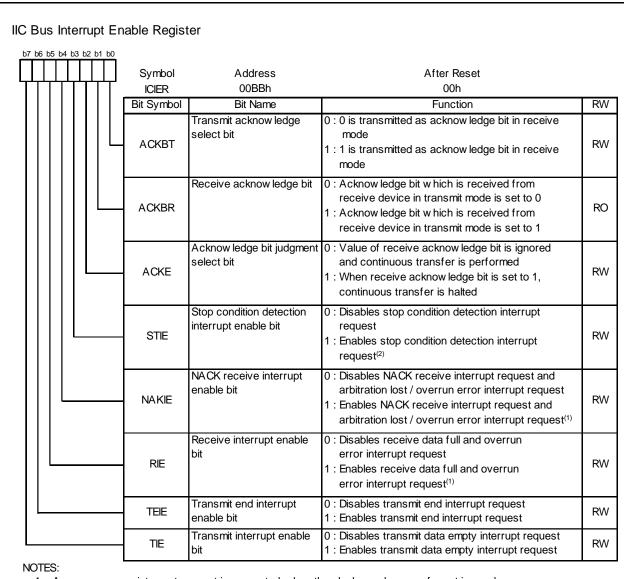

- 1. When writing to the SDAO bit, write 0 to the SDAOP bit using the MOV instruction simultaneously.
- 2. Do not write during transfer operation.
- This bit is enabled in master mode. When write to the BBSY bit, write 0 to the SCP bit using the MOV instruction simultaneously. Execute the same way when the start condition is regenerating.
- This bit is disabled when the clock synchronous serial format is used.

Figure 16.25 ICCR2 Register

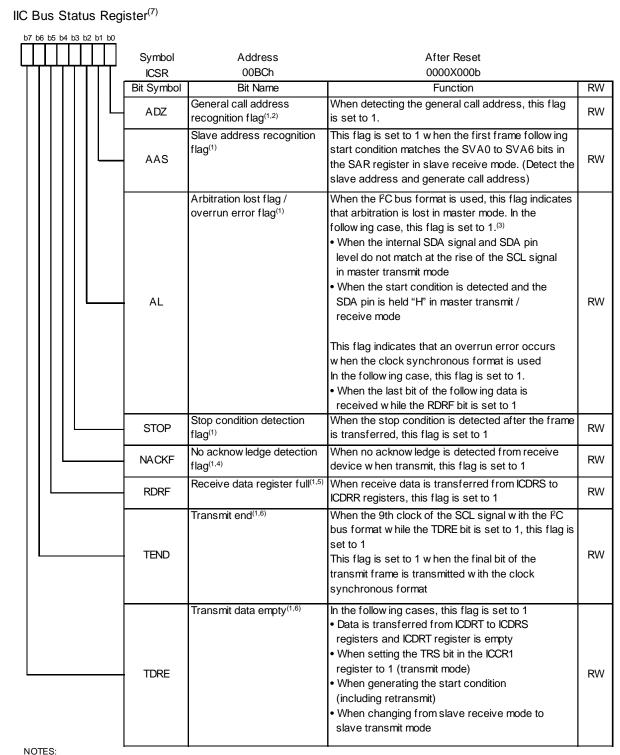

- 1. Rew rite betw een transfer frames. When w rite values other than 000b, w rite w hen the SCL signal is "L".
- 2. When write to the BC0 to BC2 bits, write 0 to the BCWP bit using the MOV instruction.
- 3. After data including the acknowledge bit is transferred, bits b2 to b0 are automatically set to 000b. When the start condition is detected, these bits are automatically set to 000b.
- 4. Do not rew rite when the clock synchronous serial format is used.
- 5. The setting value is enabled in master mode of the PC bus format. It is disabled in slave mode of the PC bus format or when the clock synchronous serial format is used.
- 6. Set to 0 when the PC bus format is used.

Figure 16.26 ICMR Register

- 1. An overrun error interrupt request is generated when the clock synchronous format is used.
- 2. Set the STIE bit to 1 (enable stop condition detection interrupt request) when the STOP bit in the ICSR register is set

Figure 16.27 **ICIER Register**

- 1. Each bit is set to 0 when reading 1 before writing 0.
- 2. This flag is enabled in slave receive mode of the I2C bus format.
- 3. When two or more master devices attempt to occupy the bus at nearly the same time, if the I2C bus Interface monitors the SDA pin and the data which the IIC transmits is different, the AL flag is set to 1 and the bus is occupied by the other masters.
- 4. The NACKF bit is enabled when the ACKE bit in the ICIER register is set to 1 (when the receive acknowledge bit is set to 1, transfer is
- 5. The RDRF bit is set to 0 when reading data from the ICDRR register.
- 6. The TEND and TDRE bits are set to 0 when writing data to the ICDRT register.
- 7. When accessing the ICSR register continuously, insert one or more NOP instructions between the instructions to access it.

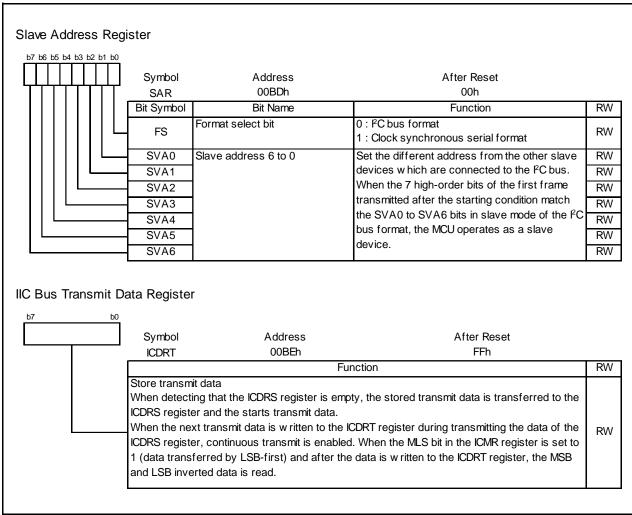

Figure 16.29 Registers SAR and ICDRT

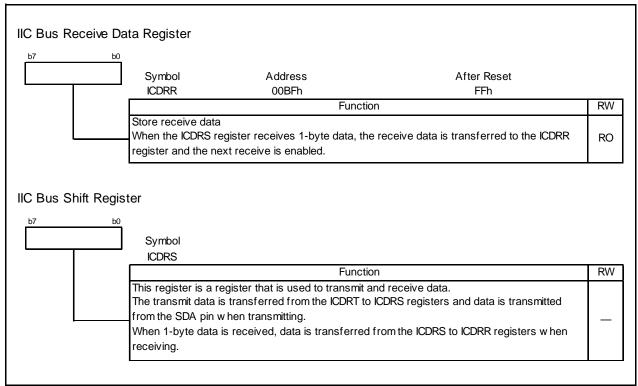

Figure 16.30 Registers ICDRR and ICDRS

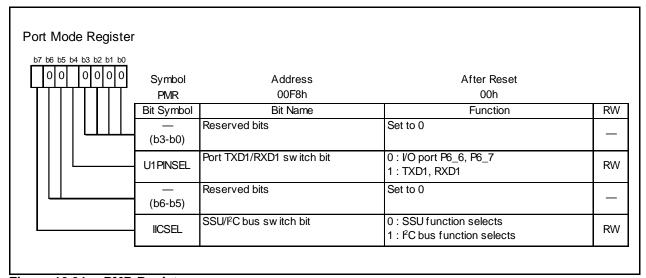

Figure 16.31 PMR Register

16.3.1 **Transfer Clock**

When the MST bit in the ICCR1 register is set to 0, the transfer clock is the external clock input from the SCL pin. When the MST bit in the ICCR1 register is set to 1, the transfer clock is the internal clock selected by the CKS0 to CKS3 bits in the ICCR1 register and the transfer clock is output from the SCL pin. Table 16.6 lists the Transfer Rate Examples.

Table 16.6 Transfer Rate Examples

ICCR1 Register				Transfer	Transfer Rate					
CKS3	CKS2	CKS1	CKS0	Clock	f1 = 5 MHz	f1 = 8 MHz	f1 = 10 MHz	f1 = 16 MHz	f1 = 20 MHz	
0	0	0	0	f1/28	179 kHz	286 kHz	357 kHz	571 kHz	714 kHz	
			1	f1/40	125 kHz	200 kHz	250 kHz	400 kHz	500 kHz	
		1	0	f1/48	104 kHz	167 kHz	208 kHz	333 kHz	417 kHz	
			1	f1/64	78.1 kHz	125 kHz	156 kHz	250 kHz	313 kHz	
	1	0	0	f1/80	62.5 kHz	100 kHz	125 kHz	200 kHz	250 kHz	
			1	f1/100	50.0 kHz	80.0 kHz	100 kHz	160 kHz	200 kHz	
		1	0	f1/112	44.6 kHz	71.4 kHz	89.3 kHz	143 kHz	179 kHz	
			1	f1/128	39.1 kHz	62.5 kHz	78.1 kHz	125 kHz	156 kHz	
1	0	0	0	f1/56	89.3 kHz	143 kHz	179 kHz	286 kHz	357 kHz	
			1	f1/80	62.5 kHz	100 kHz	125 kHz	200 kHz	250 kHz	
		1	0	f1/96	52.1 kHz	83.3 kHz	104 kHz	167 kHz	208 kHz	
			1	f1/128	39.1 kHz	62.5 kHz	78.1 kHz	125 kHz	156 kHz	
	1	0	0	f1/160	31.3 kHz	50.0 kHz	62.5 kHz	100 kHz	125 kHz	
			1	f1/200	25.0 kHz	40.0 kHz	50.0 kHz	80.0 kHz	100 kHz	
		1	0	f1/224	22.3 kHz	35.7 kHz	44.6 kHz	71.4 kHz	89.3 kHz	
			1	f1/256	19.5 kHz	31.3 kHz	39.1 kHz	62.5 kHz	78.1 kHz	

16.3.2 Interrupt Requests

The interrupt request of the I²C bus interface contains 6 types when the I²C bus format is used and 4 types when the clock synchronous serial format is used.

Table 16.7 lists the Interrupt Requests of I²C Bus Interface.

Since these interrupt requests are allocated at the I²C bus interface interrupt vector table, determining the source by each bit is necessary.

Table 16.7 Interrupt Requests of I²C Bus Interface

			Format		
Interrupt Request		Generation Condition	I ² C bus	Clock	
interrupt Nequest		Generation Condition		Synchronous	
				Serial	
Transmit Data Empty	TXI	TIE = 1 and TDRE = 1	Enabled	Enabled	
Transmit Ends	TEI	TEIE = 1 and TEND = 1	Enabled	Enabled	
Receive Data Full	RXI	RIE = 1 and RDRF = 1	Enabled	Enabled	
Stop Condition Detection	STPI	STIE = 1 and STOP = 1	Enabled	Disabled	
NACK Detection	NAKI	NAKIE = 1 and AL = 1 (or	Enabled	Disabled	
Arbitration Lost / Overrun Error		NAKIE = 1 and NACKF = 1)	Enabled	Enabled	

STIE, NAKIE, RIE, TEIE, TIE: Bits in ICIER register

AL, STOP, NACKF, RDRF, TEND, TDRE: Bits in ICSR register

When the generation conditions on the Table 16.7 are met, the I²C bus interface interrupt request is generated. Set the interrupt generation conditions to 0 by the I²C bus interface interrupt routine. However, the TDRE and TEND bits are automatically set to 0 by writing transmit data to the ICDRT register and the RDRF bit is automatically set to 0 by reading the ICDRR register. When writing transmit data to the ICDRT register, the TDRE bit is set to 0. When data is transferred from the ICDRT to ICDRS registers, the TDRE bit is set to 1 and when further setting the TDRE bit to 0, extra 1 byte may be transmitted.

Also, set the STIE bit to 1 (enable stop condition detection interrupt request) when the STOP bit is set to 0.

16.3.3 I²C Bus Interface Mode

I²C Bus Format 16.3.3.1

Setting the FS bit in the SAR register to 0 communicates in I²C bus format.

Figure 16.32 shows the I²C Bus Format and Bus Timing. The 1st frame following start condition consists of 8 bits.

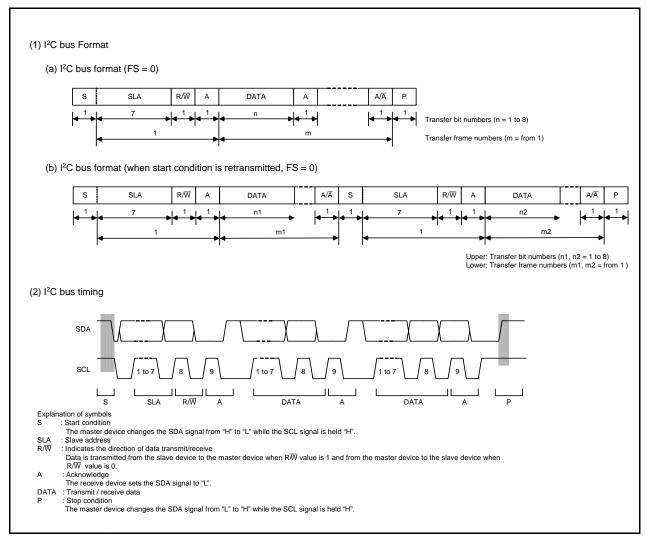

Figure 16.32 I²C Bus Format and Bus Timing

16.3.3.2 **Master Transmit Operation**

In master transmit mode, the master device outputs the transmit clock and data, and the slave device returns an acknowledge signal.

Figure 16.33 and Figure 16.34 show the Operation Timing in Master Transmit Mode (I²C Bus Interface Mode).

The transmit procedure and operation in master transmit mode are shown below.

- (1) Set the STOP bit in the ICSR register to 0 to reset it. And then set the ICE bit in the ICCR1 register to 1 (transfer operation enabled). Set the WAIT and MLS bits in the ICMR register and set the CKS0 to CKS3 bits in the ICCR1 register (initial setting).
- (2) Read the BBSY bit in the ICCR2 register to confirm that the bus is free. Set the TRS and MST bits in the ICCR1 register to master transmit mode. The start condition is generated by writing 1 to the BBSY bit and 0 to the SCP bit by the MOV instruction.
- After confirming that the TDRE bit in the ICSR register is set to 1 (data is transferred from the ICDRT to ICDRS registers), write transmit data to the ICDRT register (data in which a slave address and R/\overline{W} are shown at the 1st byte). At this time, the TDRE bit is automatically set to 0 and data is transferred from the ICDRT to ICDRS registers, the TDRE bit is set to 1 again.
- When the transmit of 1-byte data is completed while the TDRE bit is set to 1, the TEND bit in the ICSR register is set to 1 at the rise of the 9th transmit clock pulse. Read the ACKBR bit in the ICIER register, and confirm that the slave is selected. Write the 2nd-byte data to the ICDRT register. Since the slave device is not acknowledged when the ACKBR bit is set to 1, generate the stop condition. The stop condition is generated by the writing 0 to the BBSY bit and 0 to the SCP bit by the MOV instruction. The SCL signal is held "L" until data is available and the stop condition is generated.
- (5) Write the transmit data after the 2nd byte to the ICDRT register every time the TDRE bit is set to 1.
- (6) When writing the number of bytes to be transmitted to the ICDRT register, wait until the TEND bit is set to 1 while the TDRE bit is set to 1. Or wait for NACK (the NACKF bit in the ICSR register is set to 1) from the receive device while the ACKE bit in the ICIER register is set to 1 (when the receive acknowledge bit is set to 1, transfer is halted). And generate the stop condition before setting the TEND and NACKF bits to 0.
- (7) When the STOP bit in the ICSR register is set to 1, return to slave receive mode.

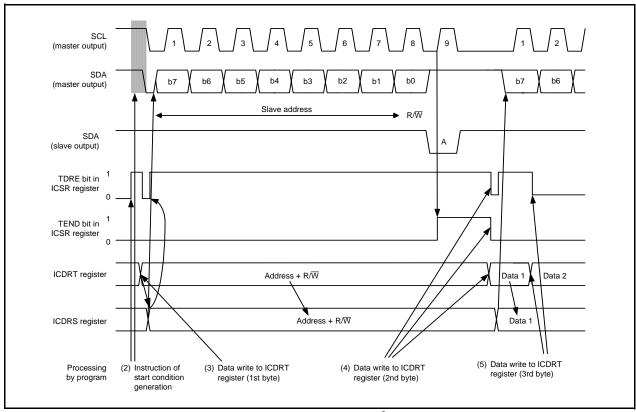

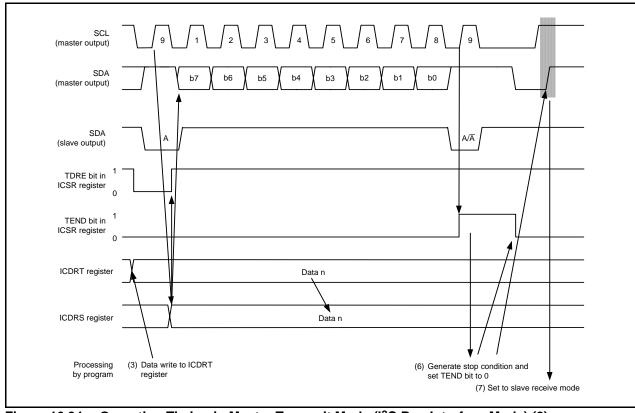

Figure 16.33 Operating Timing in Master Transmit Mode (I²C Bus Interface Mode) (1)

Operating Timing in Master Transmit Mode (I²C Bus Interface Mode) (2) **Figure 16.34**

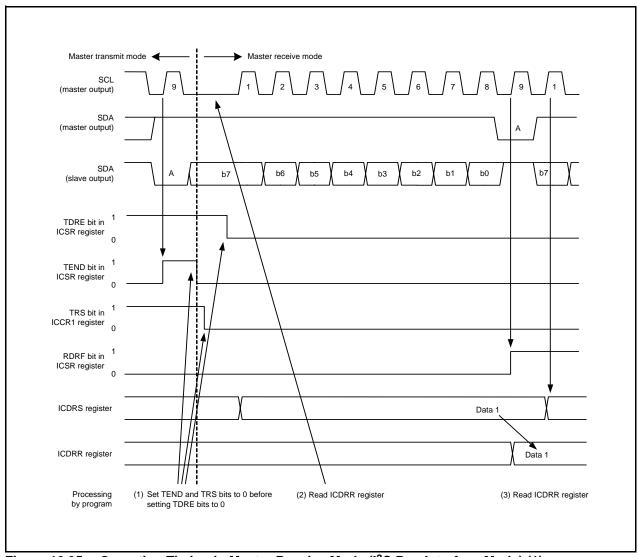

16.3.3.3 **Master Receive Operation**

In master receive mode, the master device outputs the receive clock, receives data from the slave device, and returns an acknowledge signal.

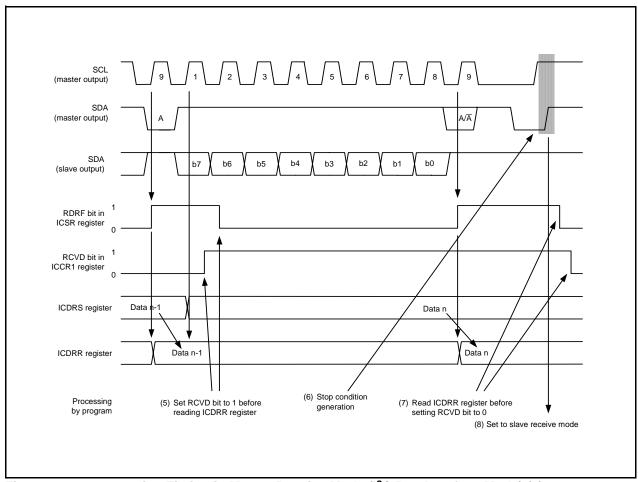

Figure 16.35 and Figure 16.36 show the Operation Timing in Master Receive Mode (I²C Bus Interface Mode).

The receive procedure and operation in master receive mode are shown below.

- (1) After setting the TEND bit in the ICSR register to 0, switch from master transmit mode to master receive mode by setting the TRS bit in the ICCR1 register. And set the TDRE bit in the ICSR register to
- (2) When performing the dummy-read of the ICDRR register and starting receive, output the receive clock synchronizing with the internal clock and receive data. The master device outputs the level set by the ACKBT bit in the ICIER register to the SDA pin at the 9th clock of the receive clock.
- (3) The 1-frame data receive is completed and the RDRF bit in the ICSR register is set to 1 at the rise of the 9th clock. At this time, when reading the ICDRR register, the received data can be read and the RDRF bit is set to 0 simultaneously.
- (4) The continuous receive is enabled by reading the ICDRR register every time the RDRF bit is set to 1. If the 8th clock falls after reading the ICDRR register by the other processes while the RDRF bit is set to 1, the SCL signal is fixed "L" until the ICDRR register is read.
- (5) If the following frame is the last receive frame and the RCVD bit in the ICCR1 register is set to 1 (disables the next receive operation) before reading the ICDRR register, the stop condition generation is enabled after the following receive.
- (6) When the RDRF bit is set to 1 at the rise of the 9th clock of the receive clock, generate the stop condition.
- (7) When the STOP bit in the ICSR register is set to 1, read the ICDRR register. And set the RCVD bit to 0 (maintain the following receive operation).
- (8) Return to slave receive mode.

Operating Timing in Master Receive Mode (I²C Bus Interface Mode) (1) **Figure 16.35**

Operating Timing in Master Receive Mode (I²C Bus Interface Mode) (2) **Figure 16.36**

16.3.3.4 Slave Transmit Operation

In slave transmit mode, the slave device outputs the transmit data while the master device outputs the receive clock and returns an acknowledge signal.

Figure 16.37 and Figure 16.38 show the Operation Timing in Slave Transmit Mode (I²C Bus Interface Mode).

The transmit procedure and operation in slave transmit mode are shown below.

- (1) Set the ICE bit in the ICCR1 register to 1 (transfer operation enabled). Set the WAIT and MLS bits in the ICMR register and CKS0 to CKS3 bits in the ICCR1 register (initial setting). Set the TRS and MST bits in the ICCR1 register to 0 and wait until the slave address matches in slave receive mode.
- (2) When the slave address matches at the 1st frame after detecting the start condition, the slave device outputs the level set by the ACKBT bit in the ICIER register to the SDA pin at the rise of the 9th clock. At this time, if the 8-bit data (R/W) is set to 1, the TRS and TDRE bit in the ICSR register are set to 1, the mode is switched to slave transmit mode automatically. When writing transmit data to the ICDRT register every time the TDRE bit is set to 1, the continuous transmit is enabled.
- (3) When the TDRE bit in the ICDRT register is set to 1 after writing the last transmit data to the ICDRT register, wait until the TEND bit in the ICSR register is set to 1 while the TDRE bit is set to 1. When the TEND bit is set to 1, set the TEND bit to 0.
- (4) The SCL signal is released by setting the TRS bit to 0 and performing the dummy-read of the ICDRR register for the end process.
- (5) Set the TDRE bit to 0.

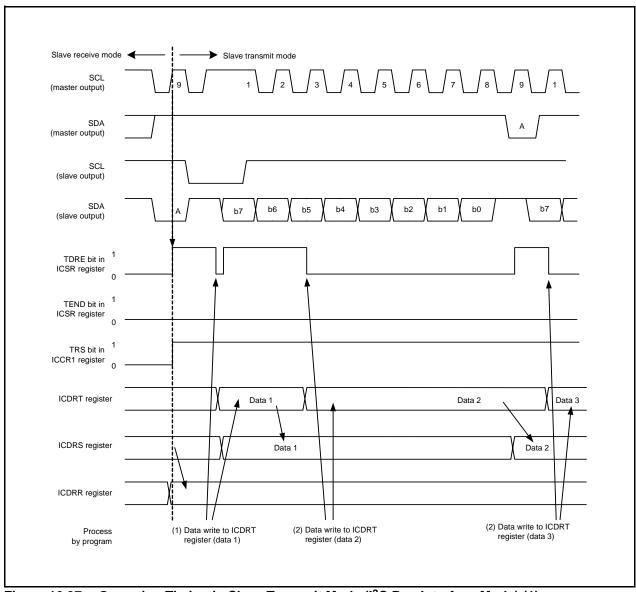

Figure 16.37 Operating Timing in Slave Transmit Mode (I²C Bus Interface Mode) (1)

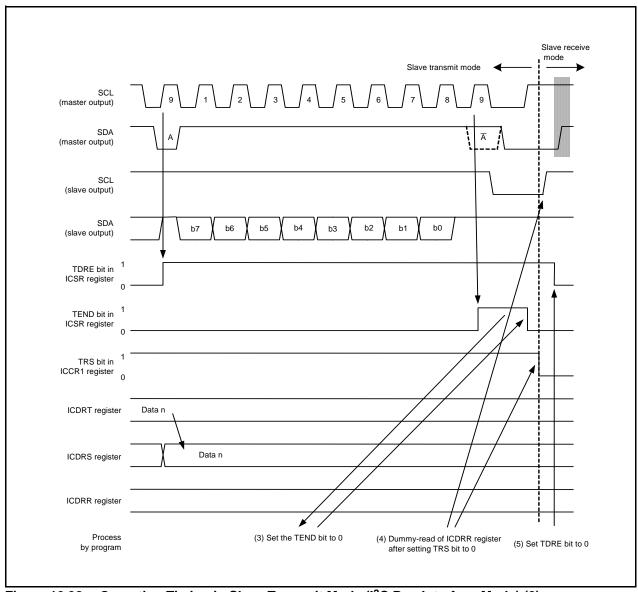

Figure 16.38 Operating Timing in Slave Transmit Mode (I²C Bus Interface Mode) (2)

16.3.3.5 Slave Receive Operation

In slave receive mode, the master device outputs the transmit clock and data, and the slave device returns an acknowledge signal.

Figure 16.39 and Figure 16.40 show the Operation Timing in Slave Receive Mode (I²C Bus Interface Mode).

The receive procedure and operation in slave receive mode are shown below.

- (1) Set the ICE bit in the ICCR1 register to 1 (transfer operation enabled). Set the WAIT and MLS bits in the ICMR register and CKS0 to CKS3 bits in the ICCR1 register (initial setting). Set the TRS and MST bits in the ICCR1 register to 0 and wait until the slave address matches in slave receive mode.
- (2) When the slave address matches at the 1st frame after detecting the start condition, the slave device outputs the level set in the ACKBT bit in the ICIER register to the SDA pin at the rise of the 9th clock. Since the RDRF bit in the ICSR register is set to 1 simultaneously, perform the dummy-read (the read data is unnecessary because of showing slave address and R/W).
- (3) Read the ICDRR register every time the RDRF bit is set to 1. If the 8th clock falls while the RDRF bit is set to 1, the SCL signal is fixed "L" until the ICDRR register is read. The setting change of the acknowledge signal which returns to master device before reading the ICDRR register reflects the following transfer frame.
- (4) Reading the last byte is performed by reading the ICDRR register as well.

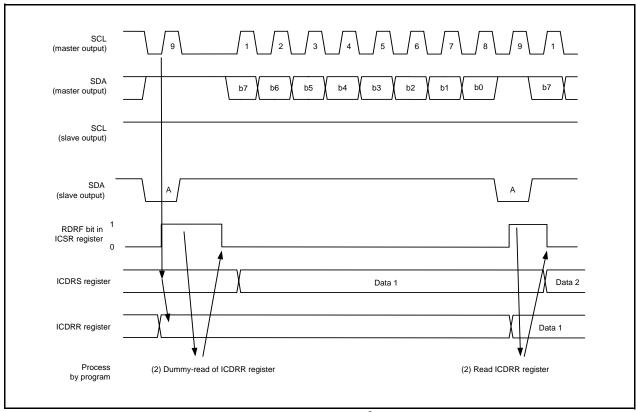

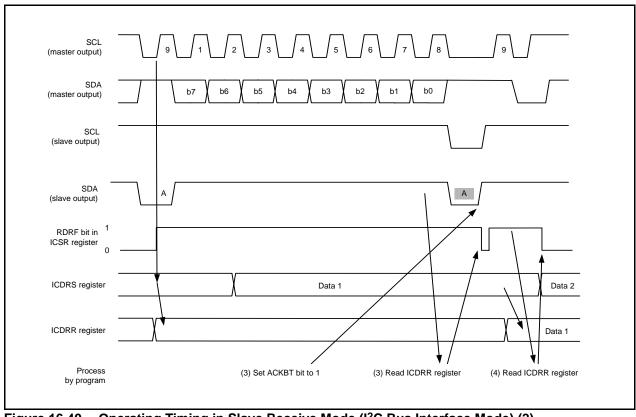

Figure 16.39 Operating Timing in Slave Receive Mode (I²C Bus Interface Mode) (1)

Operating Timing in Slave Receive Mode (I²C Bus Interface Mode) (2) **Figure 16.40**

16.3.4 **Clock Synchronous Serial Mode**

16.3.4.1 **Clock Synchronous Serial Format**

When setting the FS bit in the SAR register to 1, the clock synchronous serial format is used to communicate. Figure 16.41 shows the Transfer Format of Clock Synchronous Serial Format.

When the MST bit in the ICCR1 register is set to 1, the transfer clock is output from the SCL pin and when the MST bit is set to 0, the external clock is input.

The transfer data is output between the fall and the following fall of the SCL clock, and data is determined by the rise of the SCL clock. The MSB-first or LSB-first can be selected for the order of the data transfer by setting the MLS bit in the ICMR register. The SDA output level can be changed by the SDAO bit in the ICCR2 register during the transfer standby.

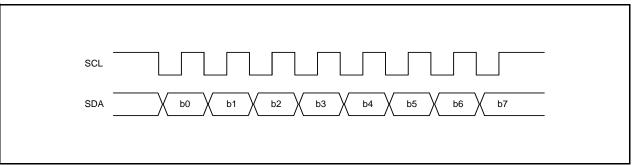

Figure 16.41 Transfer Format of Clock Synchronous Serial Format

16.3.4.2 Transmit Operation

In transmit mode, transmit data is output from the SDA pin synchronizing with the fall of the transfer clock. The transfer clock is output when the MST bit in the ICCR1 register is set to 1 and input when the MST bit is set to 0.

Figure 16.42 shows the Operating Timing in Transmit Mode (Clock Synchronous Serial Mode).

The transmit procedure and operation in transmit mode are shown below.

- (1) Set the ICE bit in the ICCR1 register to 1 (transfer operation enabled). Set the CKS0 to CKS3 bits in the ICCR1 register and set the MST bit (initial setting).
- (2) The TDRE bit in the ICSR register is set to 1 by selecting transmit mode after setting the TRS bit in the ICCR1 register to 1.
- (3) Data is transferred from the ICDRT to ICDRS registers and the TDRE bit is automatically set to 1 by writing transmit data to the ICDRT register after confirming that the TDRE bit is set to 1. When writing data to the ICDRT register every time the TDRE bit is set to 1, the continuous transmit is enabled. When switching from transmit to receive modes, set the TRS bit to 0 while the TDRE bit is set to 1.

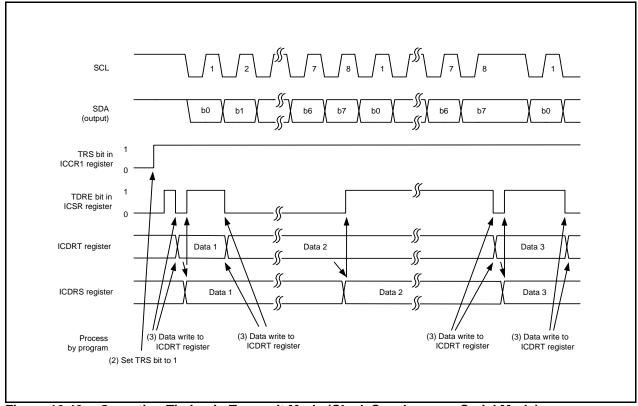

Figure 16.42 Operating Timing in Transmit Mode (Clock Synchronous Serial Mode)

16.3.4.3 **Receive Operation**

In receive mode, data is latched at the rise of the transfer clock. The transfer clock is output when the MST bit in the ICCR1 register is set to 1 and input when the MST bit is set to 0.

Figure 16.43 shows the Operating Timing in Receive Mode (Clock Synchronous Serial Mode).

The receive procedure and operation in receive mode are shown below.

- (1) Set the ICE bit in the ICCR1 register to 1 (transfer operation enabled). Set the CKS0 to CKS3 bits in the ICCR1 register and set the MST bit (initial setting).
- (2) The output of the receive clock stars by setting the MST bit to 1 when the transfer clock is output.
- (3) Data is transferred from the ICDRS to ICDRR registers and the RDRF bit in the ICSR register is set to 1, when the receive is completed. Since the following-byte data is enabled to receive when the MST bit is set to 1, the continuous clock is output. The continuous receive is enabled by reading the ICDRR register every time the RDRF bit is set to 1. An overrun is detected at the rise of the 8th clock while the RDRF bit is set to 1, the AL bit in the ICSR register is set to 1. At this time, the former receive data is retained in the ICDRR register.
- (4) When the MST bit is set to 1, set the RCVD bit in the ICCR1 register to 1 (disables the following receive operation) and read the ICDRR register. The SCL signal is fixed "H" after the receive of the following-byte data is completed.

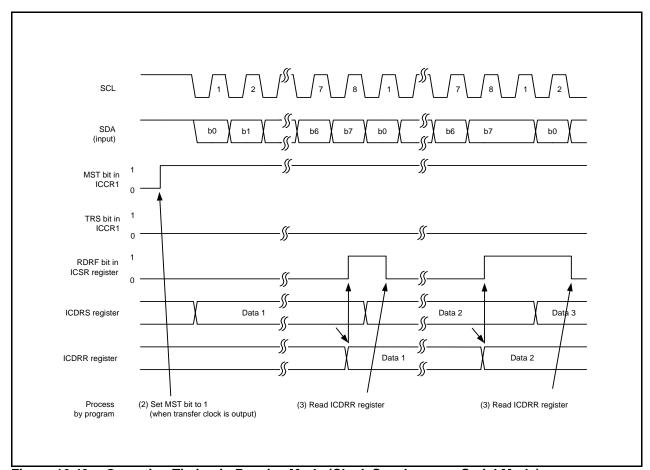

Figure 16.43 Operating Timing in Receive Mode (Clock Synchronous Serial Mode)

16.3.5 Noise Canceller

The state of the SCL and SDA pins are routed through the noise rejection circuit before being latched internally. Figure 16.44 shows the Block Diagram of Noise Canceller.

The noise rejection circuit consists of two cascaded latch and match detector circuits. When the SCL pin input signal (or SDA pin input signal) is sampled on f1 and 2 latch outputs match, the level is passed forward to the next circuit. When they do not match, the former value is retained.

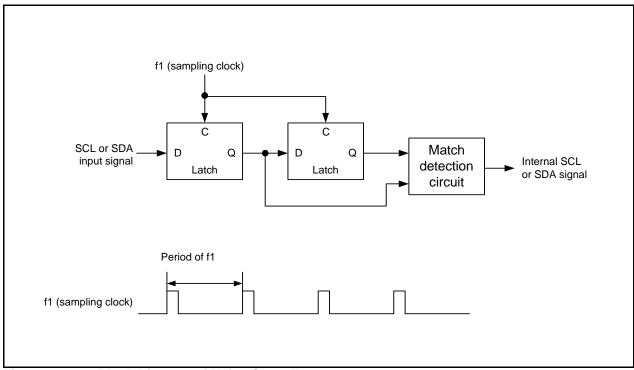

Figure 16.44 Block Diagram of Noise Canceller

16.3.6 **Bit Synchronization Circuit**

When setting the I²C bus interface in master mode.

- When the SCL signal is driven to "L" by the slave device.
- Since the "H" period may become shorter while the SCL signal is driven to "L" by the slave device and the rising speed of the SCL signal is lowered by the load (load capacity and pull-up resistor) of the SCL line, the SCL signal is monitored and the communication synchronizes per bit.

Figure 16.45 shows the Timing of Bit Synchronous Circuit and Table 16.8 lists the Time between Changing SCL Signal from "L" Output to High-Impedance and Monitoring of SCL Signal.

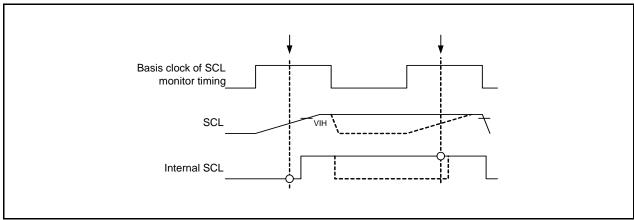

Figure 16.45 Timing of Bit Synchronous Circuit

Time between Changing SCL Signal from "L" Output to High-Impedance and **Table 16.8** Monitoring of SCL Signal

ICCR1 Register		Time for Monitoring SCL	
CKS3	CKS2	Time for Monitoring SCL	
0	0	7.5 Tcyc	
	1	19.5 Tcyc	
1	0	17.5 Tcyc	
	1	41.5 Tcyc	

 $^{1 \}text{ Tcyc} = 1/f1(s)$

16.3.7 Examples of Register Setting

Figure 16.46 to Figure 16.49 show the Examples of Register Setting When Using I²C Bus Interface.

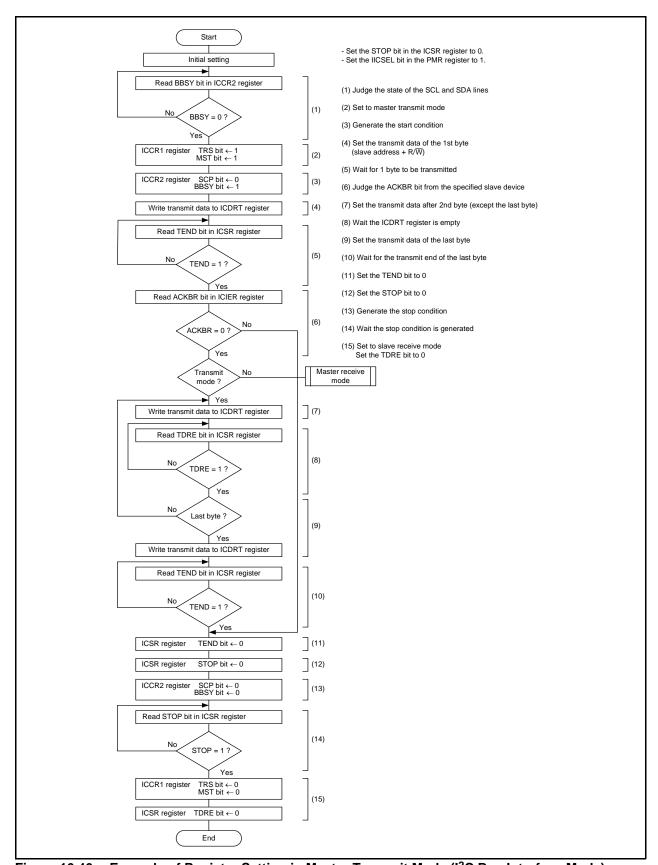

Figure 16.46 Example of Register Setting in Master Transmit Mode (I²C Bus Interface Mode)

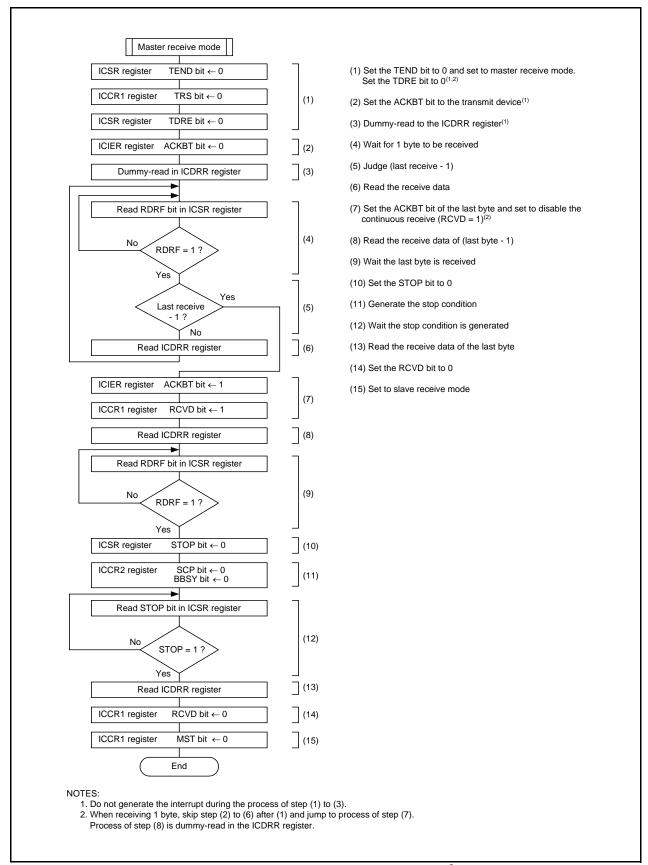

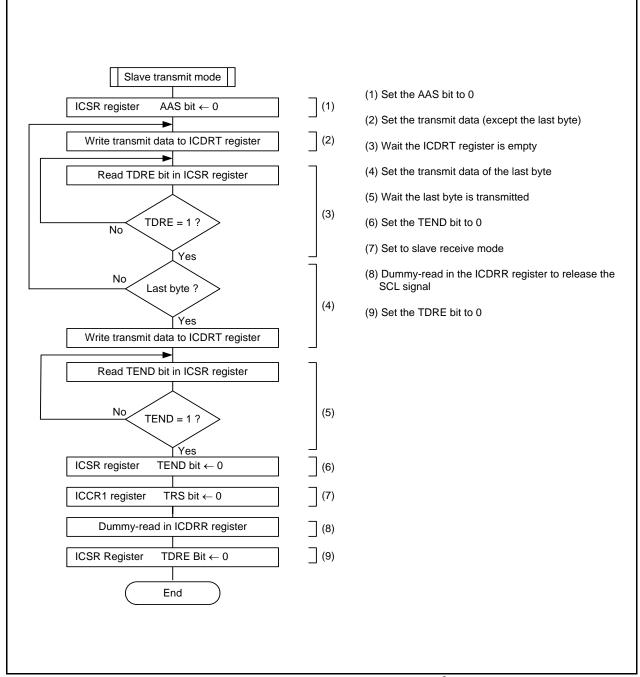

Figure 16.47 Example of Register Setting in Master Receive Mode (I²C Bus Interface Mode)

Example of Register Setting in Slave Transmit Mode (I²C Bus Interface Mode) **Figure 16.48**

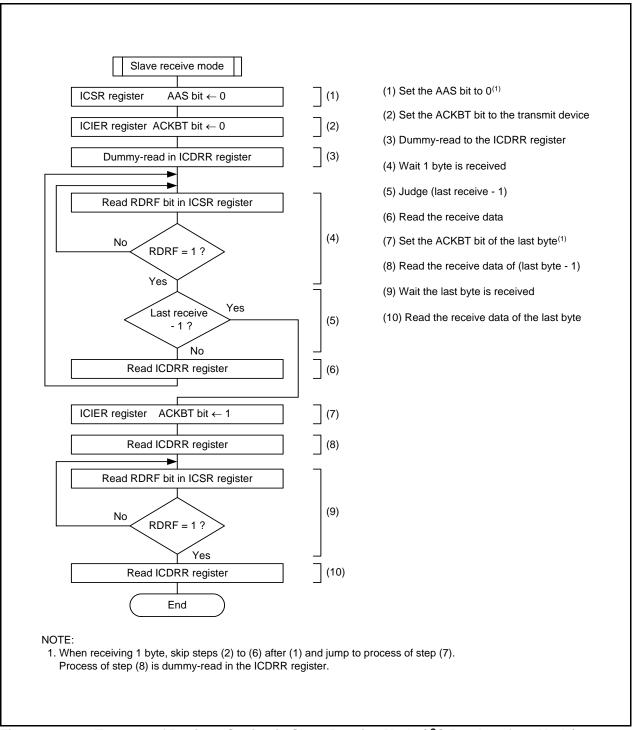

Figure 16.49 Example of Register Setting in Slave Receive Mode (I²C Bus Interface Mode)

16.3.8 Notes on I²C Bus Interface

Set the IICSEL bit in the PMR register to 1 (select I²C bus interface function) to use I²C bus interface.

Multimaster Operation

The following actions must be performed to use the I²C bus interface in multimaster operation.

Set the transfer rate by 1/1.8 or faster than the fastest rate of the other masters. For example, if the fastest transfer rate of the other masters is set to 400 kbps, the I²C-bus transfer rate in this MCU should be set to 223 kbps (= 400/1.18) or more.

- Bits MST and TRS in the ICCR1 register setting
- (a) Use the MOV instruction to set bits MST and TRS.
- (b) When arbitration is lost, confirm the contents of bits MST and TRS. If the contents are other than the MST bit set to 0 and the TRS bit set to 0 (slave receive mode), set the MST bit to 0 and the TRS bit to 0 again.

16.3.8.2 **Master Receive Mode**

Either of the following actions must be performed to use the I²C bus interface in master receive mode.

- (a) In master receive mode while the RDRF bit in the ICSR register is set to 1, read the ICDRR register before the rising edge of the 8th clock.
- (b) In master receive mode, set the RCVD bit in the ICCR1 register to 1 (disables the next receive operation) to perform 1-byte communications.

17. Hardware LIN

The hardware LIN performs LIN communication in cooperation with timer RA and UARTO.

17.1 Features

The hardware LIN has the following features.

Figure 17.1 shows a Block Diagram of Hardware LIN.

[Master mode]

- Generates Synch Break
- Detects bus collision

[Slave mode]

- Detects Synch Break
- Measures Synch Field
- Controls Synch Break and Synch Field signal inputs to UARTO
- Detects bus collision

NOTE:

1. The WakeUp function is detected by INT1.

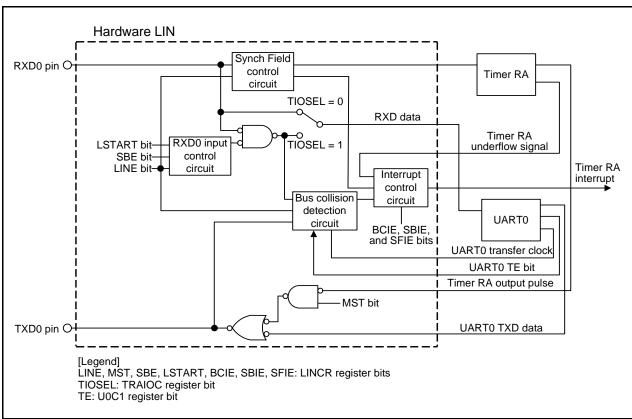

Figure 17.1 Block Diagram of Hardware LIN

Input/Output Pins 17.2

Table 17.1 lists the Pin Configuration of the hardware LIN.

Pin Configuration Table 17.1

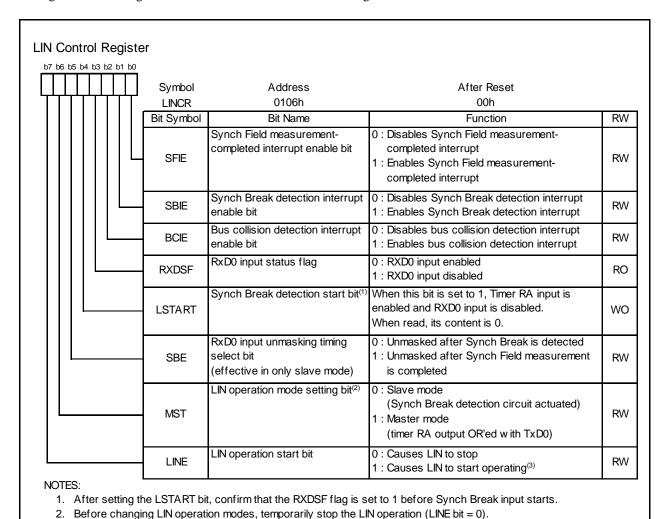

Name	Abbreviation	Input/Output	Function	
Receive Data Input	RXD0	On Input Receive data input pin of the hard		
Transmit Data Output TXD0 Output		Output	Transmit data output pin of the hardware LIN	

17.3 **Register Configuration**

The hardware LIN contains the following registers.

- LIN Control Register (LINCR)
- LIN Status Register (LINST)

Figure 17.2 and Figure 17.3 show the LINCR and LINST Registers.

3. Input to timer RA and UART0 are prohibited immediately after the LINE bit is set to 1(Causes LIN to start operating). Refer to Figure 17.5 Example of Header Field Transmission Flowchart (1) and Figure 17.9 Example of

Figure 17.2 LINCR Register

Header Field Reception Flowchart (2).

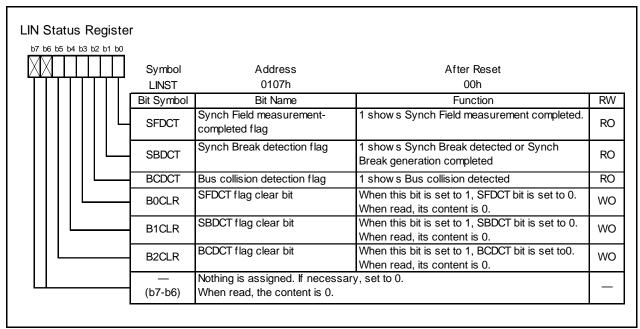

Figure 17.3 LINST Register

17.4 Functional Description

17.4.1 Master Mode

Figure 17.4 shows a Typical Operation when Sending a Header Field. Figure 17.5 and Figure 17.6 show an Example of Header Field Transmission Flowchart.

When transmitting a header field, the hardware LIN operates as described below.

- (1) When the TSTART bit in the TRACR register for timer RA is set by writing 1 in a program, the hardware LIN outputs a low-level signal from the TXD0 pin for the period that is set in the TRAPRE and TRA registers for timer RA.
- (2) When timer RA underflows upon reaching the terminal count, the hardware LIN reverses the output of the TXD0 pin and sets the SBDCT flag in the LINST register to 1. Furthermore, if the SBIE bit in the LINCR register is set to 1, it generates a timer RA interrupt.
- (3) The hardware LIN transmits 55h via UART0.
- (4) The hardware LIN transmits an ID field via UART0 after it finished sending 55h.
- (5) The hardware LIN performs communication for a response field after it finished sending the ID field.

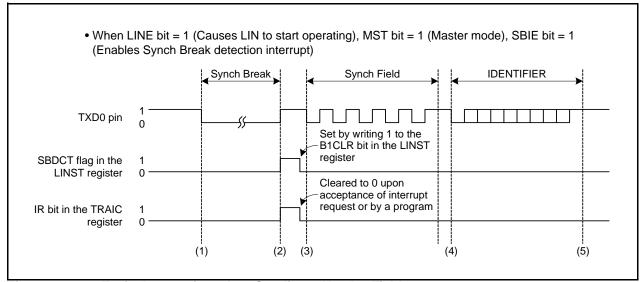

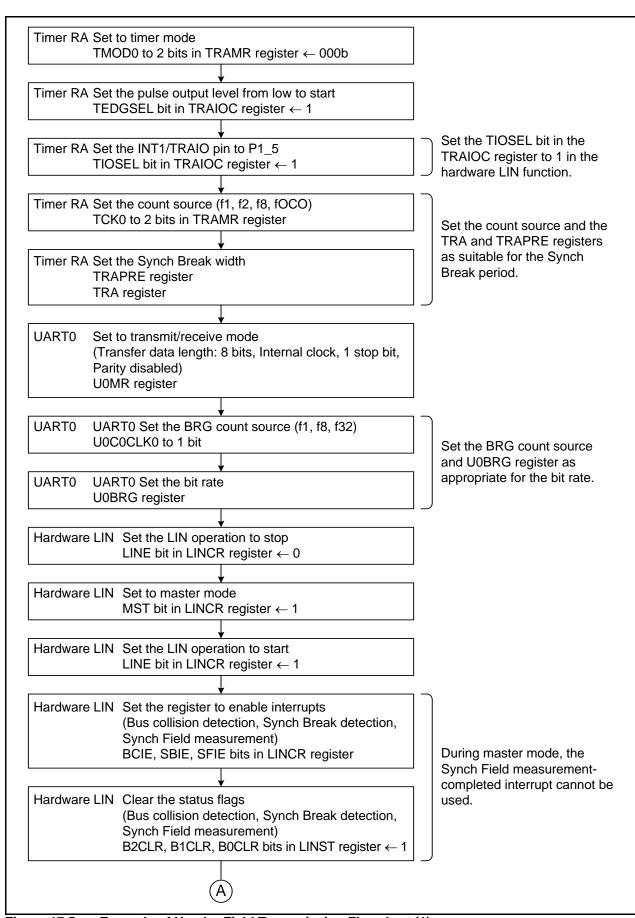

Figure 17.4 Typical Operation when Sending a Header Field

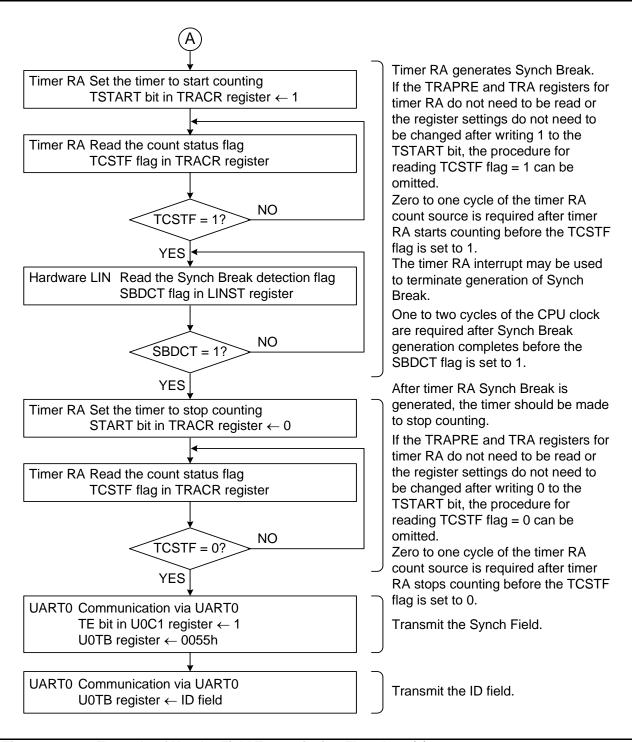

Figure 17.6 **Example of Header Field Transmission Flowchart (2)**

17.4.2 Slave Mode

Figure 17.7 shows a Typical Operation when Receiving a Header Field. Figure 17.8 through Figure 17.10 show an Example of Header Field Reception Flowchart.

When receiving a header field, the hardware LIN operates as described below.

- (1) Synch Break detection is enabled by writing 1 to the LSTART bit in the LINCR register of the hardware LIN.
- (2) When a low-level signal is input for a duration equal to or greater than the period set in timer RA, the hardware LIN detects it as Synch Break. At this time, the SBDCT flag in the LINST register is set to 1. Furthermore, if the SBIE bit in the LINCR register is set to 1, the hardware LIN generates a timer RA interrupt. Then it goes to Synch Field measurement.
- (3) The hardware LIN receives a Synch Field (55h). At this time, it measures the period of the start bit and bits 0 to 6 by using timer RA. In this case, it is possible to select whether to input the Synch Field signal to RxD0 of UART0 by setting the SBE bit in the LINCR register accordingly.
- (4) The hardware LIN sets the SFDCT flag in the LINST register to 1 when it finished measuring the Synch Field. Furthermore, if the SFIE bit in the LINCR register is set to 1, it generates a timer RA interrupt.
- (5) After it finished measuring the Synch Field, the hardware LIN calculates a transfer rate from the count value of timer RA and sets the result in UART0 and sets the TRAPRE and TRA registers of the timer RA back again. Then it receives an ID field via UART0.
- (6) The hardware LIN performs communication for a response field after it finished receiving the ID field.

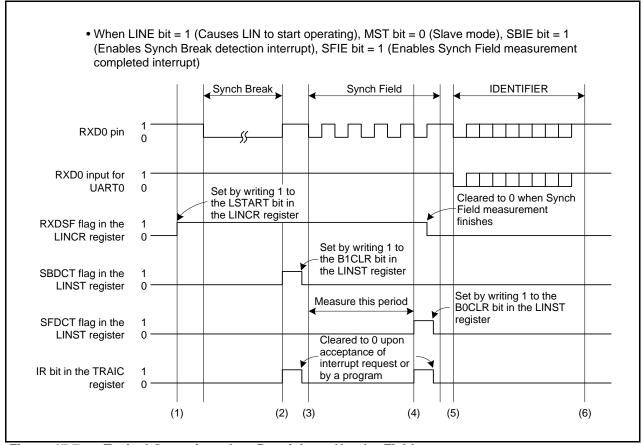

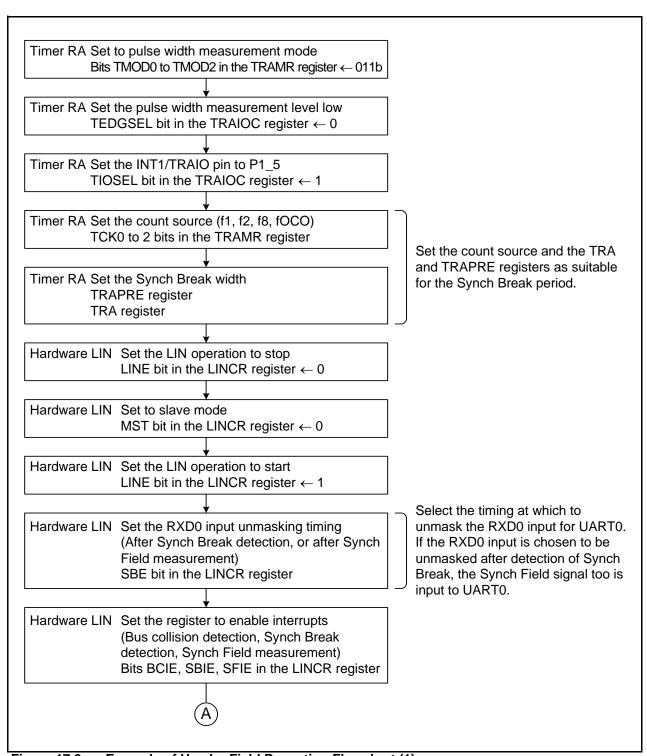

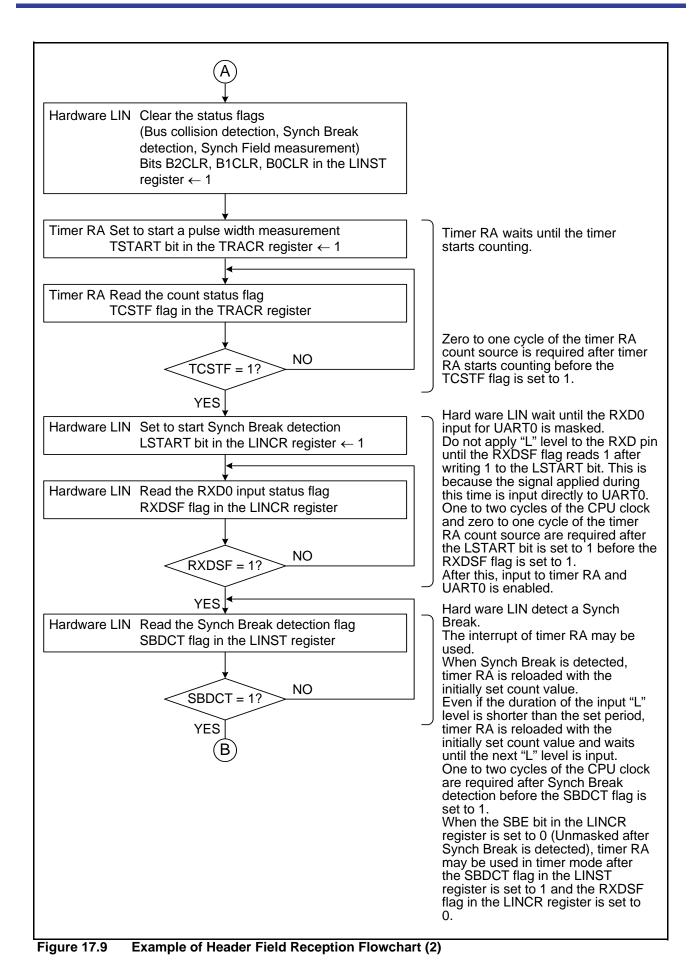

Figure 17.7 Typical Operation when Receiving a Header Field

Example of Header Field Reception Flowchart (1) Figure 17.8

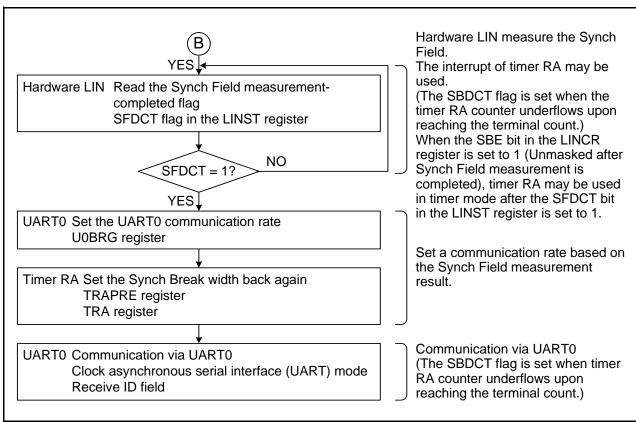

Figure 17.10 Example of Header Field Reception Flowchart (3)

17.4.3 Bus Collision Detection Function

The bus collision detection function can be used when UART0 is enabled for transmission (TE bit in the U0C1 register = 1).

Figure 17.11 shows a Typical Operation when a Bus Collision is Detected.

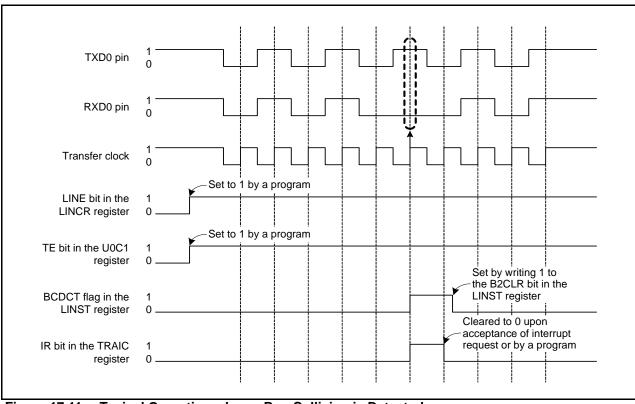

Figure 17.11 Typical Operation when a Bus Collision is Detected

17.4.4 **Hardware LIN End Processing**

Figure 17.12 shows an Example of Hardware LIN Communication Completion Flowchart. Use the following timing for hardware LIN end processing:

- If the hardware bus collision detection function is used Perform hardware LIN end processing after checksum transmission completes.
- If the bus collision detection function is not used Perform hardware LIN end processing after header field transmission and reception complete.

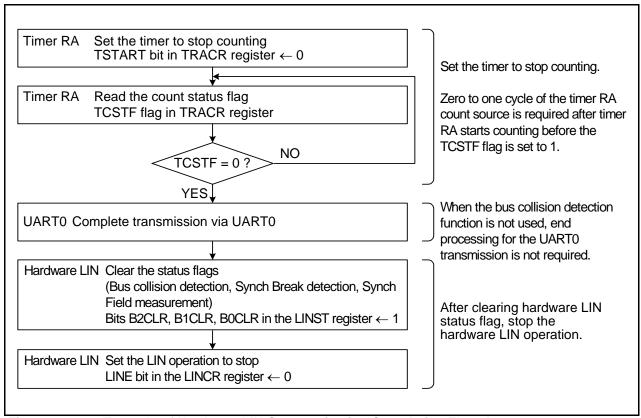

Figure 17.12 Example of Hardware LIN Communication Completion Flowchart

17.5 Interrupt Requests

There are four interrupt requests that are generated by the hardware LIN: Synch Break detection, Synch Break generation completed, Synch Field measurement, and bus collision detection. These interrupts are shared with the timer RA interrupt.

Table 17.2 lists the Interrupt Requests of Hardware LIN.

Table 17.2 Interrupt Requests of Hardware LIN

Interrupt Request	Status Flag	Cause of Interrupt	
Synch Break Detection	SBDCT	Generated when timer RA has underflowed after measuring the low level duration of RXD0 input, or when a low-level signal is input for a duration longer than the Synch Break period during communication.	
Synch Break Generation Completed		Generated when timer RA has completed outputting a low-level signal to TXD0 for set period.	
Synch Field Measurement	SFDCT	Generated when measurement for 8 bits of the Synch Field by timer RA is completed.	
Bus Collision Detection	BCDCT	Generated when the RXD0 input and TXD0 output values differed at data latch timing while UART0 is enabled for transmission.	

17.6 Notes on Hardware LIN

For the time-out processing of the header and response fields, use another timer to measure the duration of time with respect to a Synch Break detection interrupt as the starting point.

18. CAN Module

The CAN (Controller Area Network) module for the R8C/22 Group, R8C/23 Group of MCUs is a communication controller implementing the CAN 2.0B protocol. The R8C/22 Group, R8C/23 Group contains one Full CAN module which can transmit and receive messages in both standard (11-bit) ID and extended (29-bit) ID formats.

Figure 18.1 shows a Block Diagram of CAN Module.

External CAN bus driver and receiver are required.

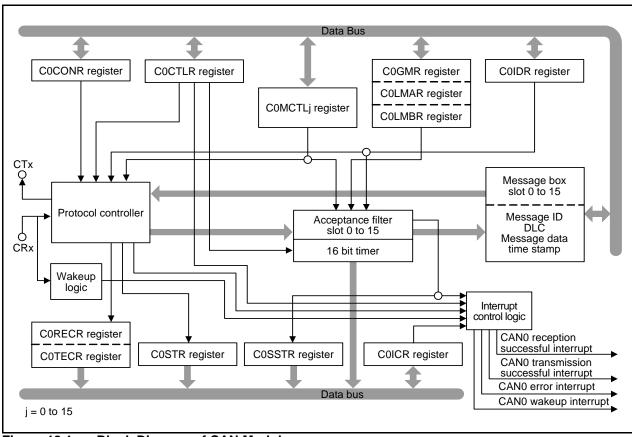

Figure 18.1 **Block Diagram of CAN Module**

CTx/CRx : CAN I/O pins.

: This controller handles the bus arbitration and the CAN protocol services, i.e. bit Protocol controller

timing, stuffing, error status etc.

Message box : This memory block consists of 16 slots that can be configured either as transmitter or

receiver. Each slot contains an individual ID, data length code, a data field (8 bytes)

and a time stamp.

: This block performs filtering operation for received messages. For the filtering Acceptance filter

operation, the C0GMR register, the C0LMAR register, or the C0LMBR register is

used.

16 bit timer : Used for the time stamp function. When the received message is stored in the message

memory, the timer value is stored as a time stamp.

: CANO wake up interrupt is generated by a message from the CAN bus. Wake up function

Interrupt generation function: The interrupt events are provided by the CAN module. CAN0 successful reception

interrupt, CANO successful transmission interrupt, CANO error interrupt, and CANO

wake up interrupt.

CAN Module-Related Registers 18.1

The CAN0 module has the following registers.

(1) CAN Message Box

A CAN module is equipped with 16 slots (16 bytes or 8 words each). Slots 14 and 15 can be used as Basic CAN.

- Priority of the slots: The smaller the number of the slot, the higher the priority, in both transmission and reception.
- A program can define whether a slot is defined as transmitter or receiver.

(2) Acceptance Mask Registers

A CAN module is equipped with 3 masks for the acceptance filter.

- CANO global mask register (COGMR register: 6 bytes) Configuration of the masking condition for acceptance filtering processing to slots 0 to 13
- CANO local mask A register (COLMAR register: 6 bytes) Configuration of the masking condition for acceptance filtering processing to slot 14
- CAN0 local mask B register (C0LMBR register: 6 bytes) Configuration of the masking condition for acceptance filtering processing to slot 15

(3) CAN SFR Registers

- CANO message control register i (COMCTLi register: 8 bits x 16) (i = 0 to 15) Control of transmission and reception of a corresponding slot
- CAN0 control register (C0CTLR register: 16 bits) Control of the CAN protocol
- CAN0 status register (C0STR register: 16 bits) Indication of the protocol status
- CANO slot status register (COSSTR register: 16 bits) Indication of the status of contents of each slot
- CAN0 interrupt control register (C0ICR register: 16 bits) Selection of interrupt enabled or disabled for each slot
- CAN0 extended ID register (C0IDR register: 16 bits) Selection of ID format (standard or extended) for each slot
- CANO configuration register (COCONR register: 16 bits) Configuration of the bus timing
- CAN0 receive error count register (C0RECR register: 8 bits) Indication of the error status of the CAN module in reception: the counter value is incremented or decremented according to the error occurrence.
- CAN0 transmit error count register (C0TECR register: 8 bits) Indication of the error status of the CAN module in transmission: the counter value is incremented or decremented according to the error occurrence.
- CANO acceptance filter support register (COAFS register: 16 bits) Decoding the received ID for use by the acceptance filter support unit

Explanation of each register is given below.

18.2 **CANO Message Box**

Table 18.1 shows the Memory Mapping of CANO Message Box.

It is possible to access to the message box in byte or word.

Mapping of the message contents differs from byte access to word access. Byte access or word access can be selected by the MsgOrder bit of the COCTLR register.

Table 18.1 Memory Mapping of CAN0 Message Box

Address	Message Content (Memory Mapping)	
CAN0	Byte access (8 bits)	Word access (16 bits)
1360h + n • 16 + 0	SID10 to SID6	SID5 to SID0
1360h + n • 16 + 1	SID5 to SID0	SID10 to SID6
1360h + n • 16 +2	EID17 to EID14	EID13 to EID6
1360h + n • 16 + 3	EID13 to EID6	EID17 to EID14
1360h + n • 16 + 4	EID5 to EID0	Data Length Code (DLC)
1360h + n • 16 + 5	Data Length Code (DLC)	EID5 to EID0
1360h + n • 16 + 6	Data byte 0	Data byte 1
1360h + n • 16 + 7	Data byte 1	Data byte 0
1360h + n • 16 + 13	Data byte 7	Data byte 6
1360h + n • 16 + 14	Time stamp high-order byte	Time stamp low-order byte
1360h + n • 16 + 15	Time stamp low-order byte	Time stamp high-order byte

n: Slot number, n = 0 to 15

Figure 18.2 shows the Bit Mapping in Byte Access and Figure 18.3 shows the Bit Mapping in Word Access. The content of each slot remains unchanged unless transmission or reception of a new message is performed.

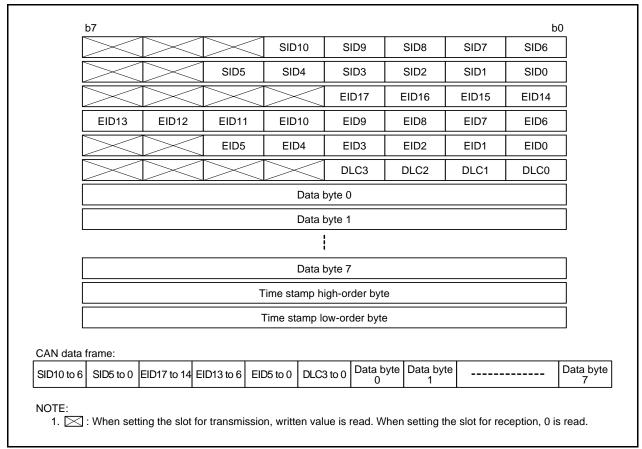

Figure 18.2 Bit Mapping in Byte Access

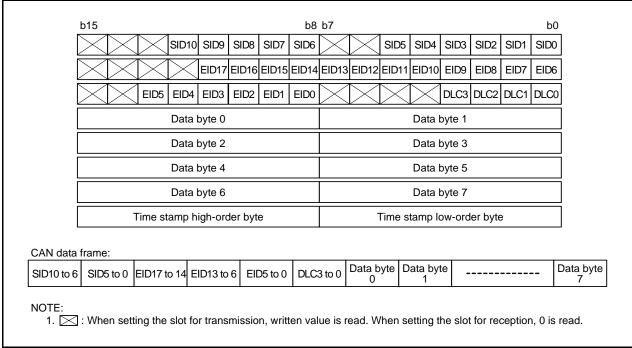

Figure 18.3 Bit Mapping in Word Access

18.3 Acceptance Mask Registers

Figure 18.4 and Figure 18.5 show the C0GMR register, the C0LMAR register, and the C0LMBR register, in which bit mapping in byte access and word access are shown.

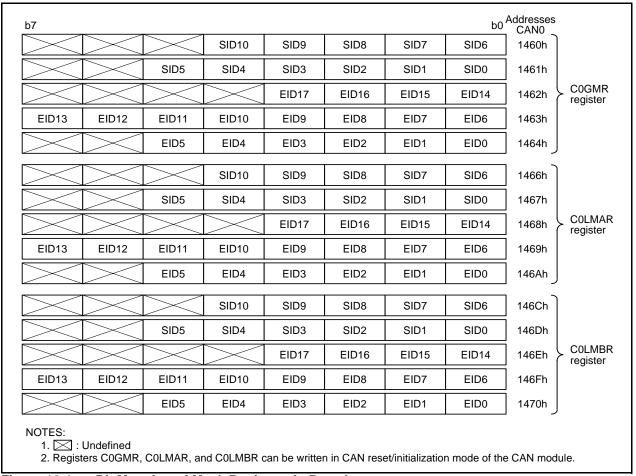

Figure 18.4 Bit Mapping of Mask Registers in Byte Access

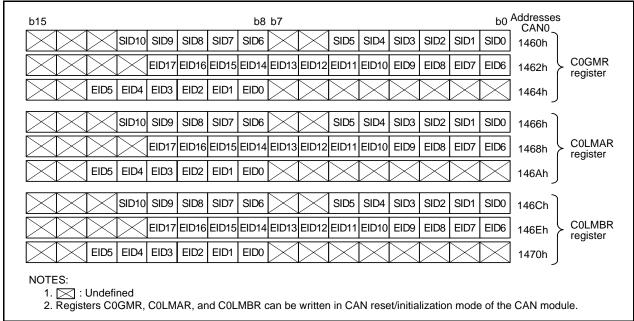

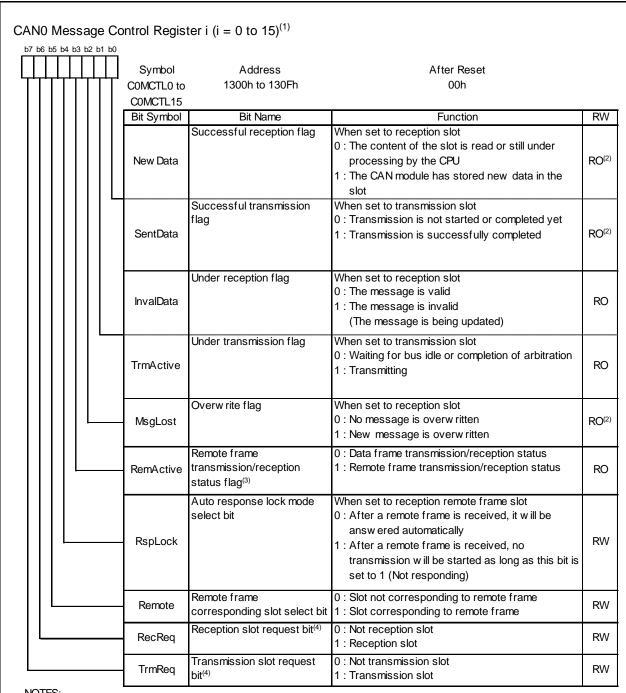

Figure 18.5 Bit Mapping of Mask Registers in Word Access

18.4 **CAN SFR Registers**

COMCTLi Register (i = 0 to 15) 18.4.1

Figure 18.6 shows the COMCTLi Register.

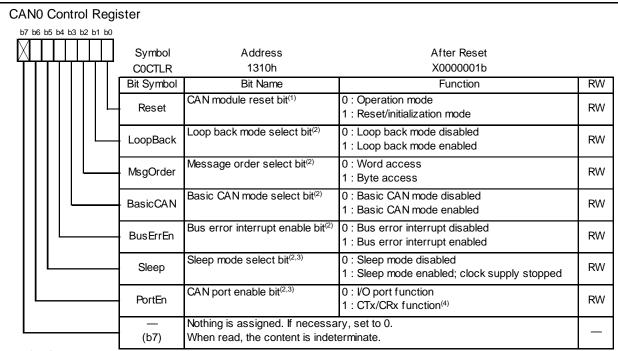

- 1. Set the COMCTLi register only when the CAN module is in CAN operation mode.
- 2. When write, set to 0. Each bit is set when the CAN module enters the respective state.
- 3. In Basic CAN mode, the RemActive bit serves as data format identification flag. When receiving a date frame, the RemActive bit is set to 0 and when receiving a remote frame, the RemActive bit is set to 1.
- 4. One slot can not be defined as reception slot and transmission slot at the same time.

Figure 18.6 C0MCTLi Register

18.4.2 **COCTLR Register**

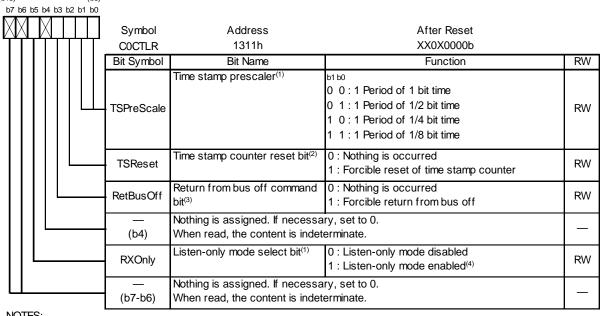

Figure 18.7 shows the COCTLR Register.

NOTES:

(b15)

- 1. When set the Reset bit to 1 (CAN reset/initialization mode), check that the State_Reset bit in the COSTR register is set to 1 (reset mode).
- 2. Set bits LoopBack, MsgOrder, BasicCAN, BusErrEn, Sleep, and PortEn only when the CAN module is in CAN reset/initialization mode.
- 3. To use CAN0 wake up interrupt, set bits Sleep and PorEn to 1.
- 4. Irrespective of setting the PD6 register, P6_1 and P6_2 function as CAN I/O pins.

NOTES:

- 1. Set bits TSPreScale and RXOnly only when the CAN module is in CAN operation mode.
- 2. When set the TSReset bit to 1 (forcible reset of time stamp counter), TSReset bit is automatically set to 0 (normal operation mode) after the COTSR register is set to 0000h.
- 3. When set the RetBusOff bit to 1 (Fforcible return from bus off), the RetBusOff bit is automatically set to 0 (normal operation mode) after registers CORECR and COTECR are set to 0000h.
- 4. When listen-only mode is selected, do not request a transmission.

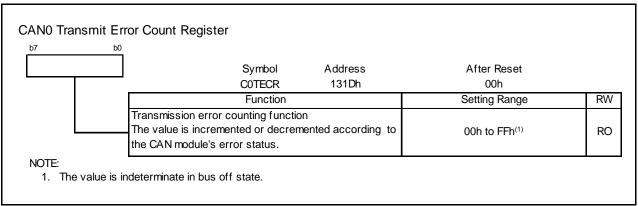

Figure 18.14 C0TECR Register

18.4.10 COAFS Register

Figure 18.15 shows the COAFS Register.

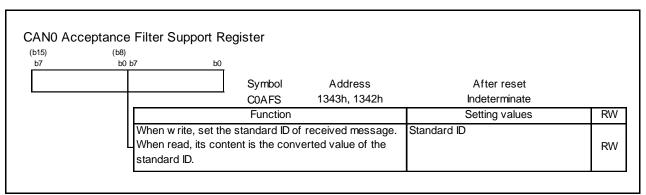

Figure 18.15 COAFS Register

18.5 **Operational Modes**

The CAN module contains the following four operational modes.

- CAN Reset/Initialization Mode
- CAN Sleep Mode
- CAN Operation Mode
- CAN Interface Sleep Mode

Figure 18.16 shows Transition between Operational Modes.

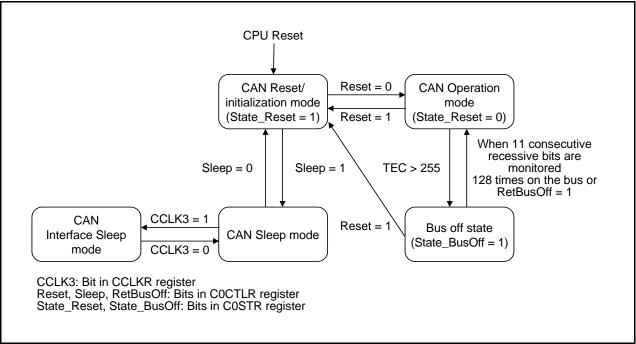

Figure 18.16 Transition between Operational Modes

18.5.1 **CAN Reset/Initialization Mode**

The CAN module can enter CAN reset/initialization mode by CPU reset or setting the Reset bit in the COCTLR register. When setting the Reset bit to 1, check that the State_Reset bit in the COSTR register is set to 1 during CAN reset/initialization mode. The CAN module performs the following functions:

- CAN communication is impossible.
- If the CAN module is set to CAN reset/initialization mode during transmitting a message, it is held CAN operation mode until the transmission is completed, it loses in arbitration or an error in it is detected and it enters CAN reset/initialization mode after the State_Reset bit in the COSTR register is set to 0.
- The COIDR, COMCTLi (i = 0 to 15), COICR, COSTR, CORECR and COTECR registers are initialized. All these registers are locked to prevent CPU modification.
- The COCTLR, COCONR, COGMR, COLMAR and COLMBR registers and the CANO message box retain their contents and are available for CPU access.

18.5.2 **CAN Operation Mode**

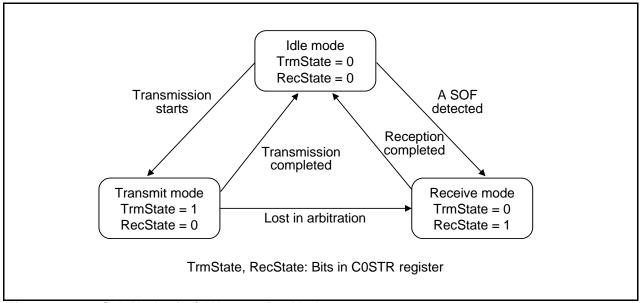

The CAN module can enter CAN operation mode when the Reset bit in the COCTLR register is set to 0. When set the Reset bit to 0, check that the State Reset bit in the COSTR register is set to 0. The CAN module performs the following functions after 11 consecutive bits are detected in CAN operation mode.

- The module can transmit and receive a message.
- The module controls the error status by counting transmission and reception errors. CAN communication depends on the error status.

The module is placed in one of three sub modes in CAN operation mode.

- Idle mode: Every nodes do nothing.
- Receive mode: The node can receive a message transmitted by another node.
- Transmit mode: The node can transmit a message. The node can receive own transmitting message simultaneously when the LoopBack bit in the COCTLR register is set to 1 (Loop back mode).

Figure 18.17 shows Sub Modes in CAN Operation Mode.

Sub Modes in CAN Operation Mode Figure 18.17

18.5.3 **CAN Sleep Mode**

The CAN module can enter CAN sleep mode when the Sleep bit in the COCTLR register is set to 1. Enter CAN sleep mode via CAN reset/initialization mode.

The power consumption can be reduced because the clock is not provided to the CAN module in CAN sleep mode.

18.5.4 **CAN Interface Sleep Mode**

The CAN module can enter CAN interface sleep mode when the CCLKR3 bit in the CCLKR register is set to 1. Enter CAN interface sleep mode via CAN sleep mode.

The power consumption can be reduced because the clock is not provided to CPU interface in the CAN module when entering CAN interface sleep mode.

18.5.5 Bus-Off State

When repeating communication error, the CAN module enters a bus-off state according to the fault confinement rule of CAN specification and cannot perform CAN communication. The CAN module can return to CAN operation mode from a bus-off state in the following conditions. At this time, the value of all CAN-associated registers except the COSTR, CORECR and COTECR registers are not changed.

- (1) When 11 consecutive recessive bits are monitored 128 times

 The module enters instantly in an error-active state and performs CAN communication.
- (2) When the RetBus Off bit in the COCTLR register = 1 (forcible return form bus off)

 The module enters instantly in an error-active state and performs CAN communication again after 11 consecutive recessive bits are detected.

18.6 Configuration of the CAN Module System Clock

The R8C/22 Group, R8C/23 Group contain a CAN module system clock selectable circuit. The CAN module system clock can be selected by setting the CCLKR register and the BRP bit in the COCINR register.

For the CCLKR register, refer to 10. Clock Generation Circuit.

Figure 18.18 shows a Block Diagram of CAN Module System Clock Generation Circuit.

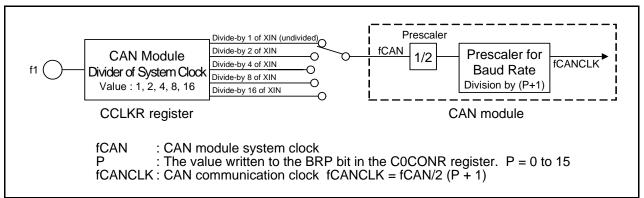

Figure 18.18 Block Diagram of CAN Module System Clock Generation Circuit

18.6.1 Bit Timing Configuration

The bit time consists of the following four segments:

- Synchronization segment (SS)
 - This serves for monitoring a falling edge for synchronization.
- Propagation time segment (PTS)
 - This segment absorbs physical delay on the CAN network which amounts to double the total sum of delay on the CAN bus, the input comparator delay, and the output driver delay.
- Phase buffer segment 1 (PBS1)
 - This serves for compensating the phase error. When the falling edge of the bit falls later than expected, the segment can become longer by the maximum of the value defined in SJW.
- Phase buffer segment 2 (PBS2)
 - This segment has the same function as the phase buffer segment 1. When the falling edge of the bit falls earlier than expected, the segment can become shorter by the maximum of the value defined in SJW.

Figure 18.19 shows the Bit Timing.

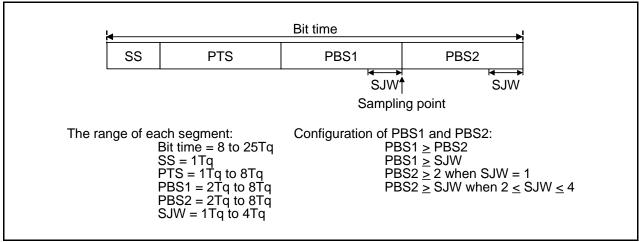

Figure 18.19 Bit Timing

18.6.2 **Baud Rate**

Baud rate depends on system clock, the division value of the CAN module system clock, the division value of the baud rate prescaler, and the number of Tq's in one bit.

Table 18.2 shows the Examples of Baud Rate.

Table 18.2 Examples of Baud Rate

Baud Rate	20 MHz	16 MHz	10 MHz	8 MHz
1 Mbps	10Tq (1)	8Tq (1)	_	_
500 kbps	10Tq (2) 20Tq (1)	8Tq (2) 16Tq (1)	10Tq (1) —	8Tq (1) —
125 kbps	8Tq (10) 10Tq (8) 16Tq (5) 20Tq (4)	8Tq (8) 16Tq (4) —	8Tq (5) 10Tq (4) 20Tq (2) —	8Tq (4) 16Tq (2) —
83.3 kbps	8Tq (15) 10Tq (12) 20Tq (6)	8Tq (12) 16Tq (6) —	10Tq (6) 20Tq (3) —	8Tq (6) 16Tq (3) —
33.3 kbps	10Tq (30) 20Tq (15) —	8Tq (30) 10Tq (24) 16Tq (15) 20Tq (12)	10Tq (15) —	8Tq (15) 10Tq (12) 20Tq (6) —

NOTE:

1. The number in () indicates a value of fCAN division value multiplied by division value of the baud rate prescaler.

Calculation of Baud Rate

XIN

2 x fCAN division value⁽¹⁾ x division value of baud rate prescaler⁽²⁾ x number of Tq's in one bit

NOTES:

- 1. fCAN division value = 1, 2, 4, 8, 16 fCAN division value: a value selected in the CCLKR register
- 2. Division value of prescaler for baud rate = P + 1 (P: 0 to 15) P: a value selected by the BRP bit in the C0CONR register

18.7 Acceptance Filtering Function and Masking Function

These functions serve the users to select and receive a facultative message. The C0GMR, C0LMAR, and C0LMBR registers can perform masking to the standard or extended ID. The C0GMR register corresponds to slots 0 to 13, the C0LMAR register corresponds to slot 14, and the C0LMBR register corresponds to slot 15. When acceptance filtering, the masking function is valid to a received 11 or 29 bit ID by the value set to the slot in the C0IDR register. This function is used for receiving a certain range of IDs.

Figure 18.20 shows Correspondence of Mask Registers to Slots and Figure 18.21 shows the Acceptance Function.

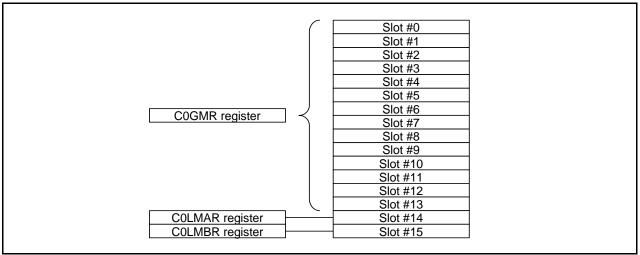

Figure 18.20 Correspondence of Mask Registers to Slots

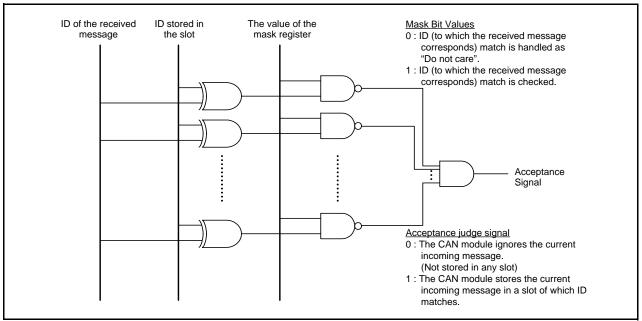

Figure 18.21 Acceptance Function

When using the acceptance function, note the following points.

- (1) If two or more slots are set the same ID and received a same message, the smallest slot number is valid.
- (2) If slots 14 and 15 are set to receive all IDs in Basic mode, slots 14 and 15 can receive IDs which are not received by slots 0 to 13.

18.8 Acceptance Filter Support Unit (ASU)

The ASU is a function to determine whether the receive ID is valid or not by means of a table search. To use this function, first register the ID to receive in the data table. Next, store the received ID in the C0AFS register, read out the decoded received ID from the C0AFS register and check it by searching the table. The ASU can only be used for the IDs of standard frames.

The ASU will prove effective in the following cases.

- When the IDs to receive cannot be masked by the acceptance filter. (Example) IDs to receive: 078h, 087h, 111h
- When there are too many IDs to receive and filtering in software requires an excessive amount of time.

Figure 18.22 shows the Content of COAFS Register When Written to and Read out (For Word Access).

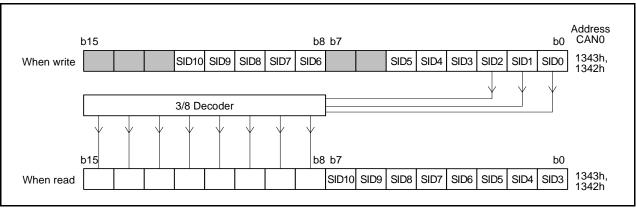

Figure 18.22 Content of COAFS Register When Written to and Read out (For Word Access)

18.9 Basic CAN Mode

When the Basic CAN bit in the C0CTLR register is set to 1, (Basic CAN mode) slots 14 and 15 correspond to Basic CAN mode. In normal operation mode, each slot can handle only one type message at a time, either a data frame or a remote frame by setting the C0MCTLi register (i = 0 to 15). However, in Basic CAN mode, slots 14 and 15 can receive both types of message at the same time.

When slots 14 and 15 are defined as reception slots in Basic CAN mode, received messages are stored in slots 14 and 15 alternately.

Which type of message has been received can be checked by the RemActive bit in the COMCTLi register. Figure 18.23 shows the Operation of Slots 14 and 15 in Basic CAN Mode.

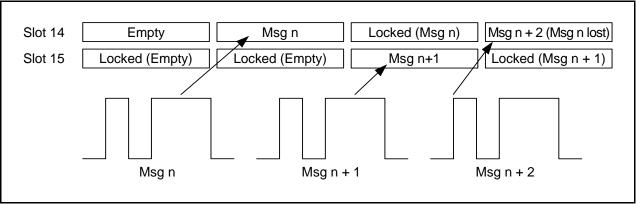

Figure 18.23 Operation of Slots 14 and 15 in Basic CAN Mode

When using Basic CAN mode, note the following points.

- (1) Basic CAN mode can only be set in CAN reset/initialization mode.
- (2) Slots 14 and 15 must be set the same ID. Also, the C0LMAR and C0LMBR registers for slots 14 and 15 must be set in the same way.
- (3) Slots 14 and 15 must be set as reception slot.
- (4) No protection against overwritten message. If any slot receives a new message while it is receiving another message, the slot may be overwritten by the new message received.
- (5) Slots 0 to 13 operate in normal operation mode.

18.10 Return from Bus off Function

The CAN module can forcibly return from bus off state by setting the RetBusOff bit in the COCTLR register to 1 (Forcible return from bus off). At the time, an error state in the CAN module transits from a bus-off state to an error-active state. When return from bus-off is executed, the COTECR and CORECR registers are initialized and the State_BusOff bit in the COSTR register is set to 0 (No bus off state). However, CAN related registers such as the COCONR register and contents of slots are not initialized.

18.11 Listen-Only Mode

When the RXOnly bit in the COCTLR register is set to 1, the CAN module enters listen-only mode. Listen-only mode is not allowed to transmit any frames such as error and overload frames and acknowledge. When setting the CAN module to Listen-only mode, do not request a transmission.

18.12 Reception and Transmission

Configuration of CAN Reception and Transmission Mode Table 18.3 shows Configuration of CAN Reception and Transmission Mode.

Table 18.3 Configuration of CAN Reception and Transmission Mode

TrmReq	RecReq	Remote	RspLock	Communication Mode of the Slot
0	0			Communication environment configuration mode: configure the communication mode of the slot.
0	1	0	0	Configured as a reception slot for a data frame.
1	0	1	0	Configured as a transmission slot for a remote frame. (At this time the RemActive bit is 1.) After completion of transmission, this functions as a reception slot for a data frame. (At this time the RemActive bit is 0.) However, when an ID that matches on the CAN bus is detected before remote frame transmission, this immediately functions as a reception slot for a data frame.
1	0	0	0	Configured as a transmission slot for a data frame.
0	1	1	1/0	Configured as a reception slot for a remote frame. (At this time the RemActive bit is 1.) After completion of reception, this functions as a transmission slot for a data frame. (At this time the RemActive bit is 0.) However, transmission does not start as long as RspLock bit remains 1; thus no automatic remote frame response. Response (transmission) starts when RspLock bit is set to 0.

TrmReq, RecReq, Remote, RspLock, RemActive, RspLock: C0MCTLi register's (i = 0 to 15) bit

When configuring a slot as a reception slot, note the following points.

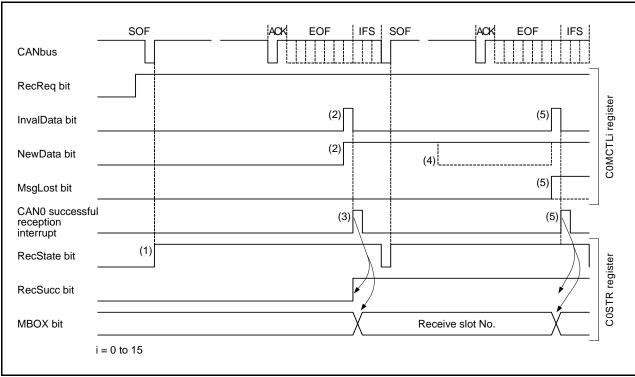

- (1) Before configuring a slot as a reception slot, be sure to set the COMCTLi registers (i = 0 to 15) to 00h.
- (2) A received message is stored in a slot that matches the condition first according to the result of reception mode configuration and acceptance filtering operation. Upon deciding in which slot to store, the smaller the number of the slot is, the higher priority it has.
- (3) In normal CAN operation mode, when a CAN module transmits a message of which ID matches, the CAN module never receives the transmitted data. In loop back mode, however, the CAN module receives back the transmitted data. In this case, the module does not return an ACK.

When configuring a slot as a transmission slot, note the following points.

- (1) Before configuring a slot as a transmission slot, be sure to set the COMCTLi registers to 00h.
- (2) Set the TrmReq bit to 0 (not transmission slot) before rewriting a transmission slot.
- (3) A transmission slot should not be rewritten when the TrmActive bit is 1 (transmitting). If it is rewritten, an indeterminate data will be transmitted.

18.12.1 Reception

Figure 18.24 shows the Timing of Receive Data Frame Sequence. This is an operation example when consecutive messages are received.

Timing of Receive Data Frame Sequence Figure 18.24

- (1) If a SOF is detected on the CAN bus, the RecState bit in the COSTR register is set to 1 (During reception) immediately and the slot starts receiving a message.
- (2) The message successfully is received and the NewData bit in the C0MCTLi register of the reception slot is set to 1 (stored new data in slot). The InvalData bit in the C0MCTLi register is set to 1 (the message is being updated) at the same time and set to 0 (the message is valid) after the message completely is stored to
- (3) If the interrupt enable bit in the COICR register of the slot is set to 1 (interrupt enabled), the CANO successful reception interrupt request is generated and the MBOX and RecSucc bits in the COSTR register change.
- (4) Set the NewData bit to 0 (the content of the slot is read out or still under processing by the CPU) by a program and read the message from the slot.
- (5) When next CAN message is received before the NewData bit is set to 0 by a program or a receive request to a slot is canceled, the MsgLost bit in the C0MCTLj register is set to 1 (this slot already contained a message) and new message is stored in a slot. CAN0 successful reception interrupt and the COSTR register change the same as (3).

18.12.2 Transmission

Figure 18.25 shows the Timing of Transmit Sequence.

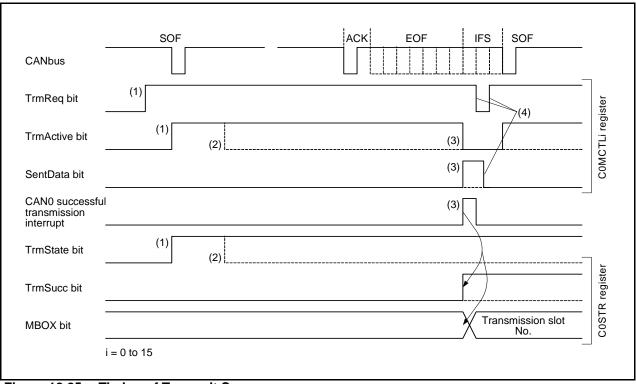

Figure 18.25 Timing of Transmit Sequence

- (1) If the TrmReq bit in the COMCTLi register (i = 0 to 15) is set to 1 (Transmission slot) in bus idle state, the TrmActive bit in the COMCTLi register and the TrmState bit in the COSTR register are set to 1 (During transmission), and the CAN module starts transmitting a message.
- (2) If the arbitration is lost after starting transmitting, the TrmActive and TrmState bits are set to 0.
- (3) If the transmission is successful without lost arbitration, the SentData bit in the C0MCTLi register is set to 1 (Transmission is successfully completed) and TrmActive bit in the C0MCTLi register is set to 0 (Waiting for bus idle or completion of arbitration). When the interrupt enable bits in the C0ICR register are set to 1 (Interrupt enabled), CAN0 successful transmission interrupt request is generated and the MBOX and TrmSucc bits in the C0STR register change.
- (4) When next transmission is performed, set the SentData and TrmReq bits to 0 and check that they are set to 0. Then, set the TrmReq bit to 1 by a program.

18.13 CAN Interrupts

The CAN module provides the following CAN interrupts.

- CANO Successful Reception Interrupt
- CANO Successful Transmission Interrupt
- CAN0 Error Interrupt

Error Passive State

Error BusOff State

Bus Error (this feature can be disabled separately)

• CAN0 Wake Up Interrupt

When the CPU detects a successful reception/transmission interrupt, the COSTR register must be read to determine which slot has issued the interrupt.

18.14 Notes on CAN Module

18.14.1 Reading COSTR Register

The CAN module updates the status of the COSTR register in a certain period. When the CPU and the CAN module access to the COSTR register at the same time, the CPU has the access priority; the access from the CAN module is disabled. Consequently, when the updating period of the CAN module matches the access period from the CPU, the status of the CAN module cannot be updated. (See Figure 18.26)

Accordingly, be careful about the following points so that the access period from the CPU should not match the updating period of the CAN module:

- There should be a wait time of 3fCAN or longer (see Table 18.4) before the CPU reads the COSTR register. (See Figure 18.27)
- When the CPU polls the COSTR register, the polling period must be 3fCAN or longer. (See Figure 18.28)

Table 18.4 CAN Module Status Updating Period

3 fCAN Period = 3 x XIN (Original Oscillation Period) x Division Value of CAN Clock (CCLK)			
(Example 1) Condition XIN 16 MHz CCLK: Divided by 1	·		
(Example 2) Condition XIN 16 MHz CCLK: Divided by 2	·		
(Example 3) Condition XIN 16 MHz CCLK: Divided by 4	·		
(Example 4) Condition XIN 16 MHz CCLK: Divided by 8	· · · · · · · · · · · · · · · · · · ·		
(Example 5) Condition XIN 16 MHz CCLK: Divided by 16	3 fCAN period = 3 x 62.5 ns x 16 = 3 μs

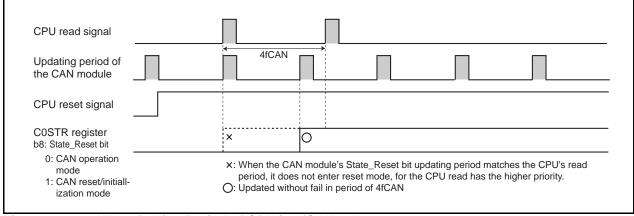

Figure 18.28 When Polling Period of CPU is 3fCAN or Longer

18.14.2 Performing CAN Configuration

If the Reset bit in the COCTLR register is changed from 0 (operation mode) to 1 (reset/initialization mode) in order to place the CAN module from CAN operation mode into CAN reset/initialization mode, always be sure to check that the State_Reset bit in the COSTR register is set to 1 (reset mode).

Similarly, if the Reset bit is changed from 1 to 0 in order to place the CAN module from CAN reset/initialization mode into CAN operation mode, always be sure to check that the State_Reset bit is set to 0 (operation mode).

The procedure is described below.

To place CAN Module from CAN Operation Mode into CAN Reset/Initialization Mode

- Change the Reset bit from 0 to 1.
- Check that the State_Reset bit is set to 1.

To place CAN Module from CAN Reset/Initialization Mode into CAN Operation Mode

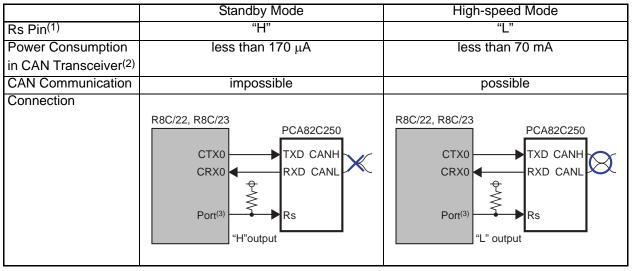

- Change the Reset bit from 1 to 0.
- Check that the State_Reset bit is set to 0.

18.14.3 Suggestions to Reduce Power Consumption

When not performing CAN communication, the operation mode of CAN transceiver should be set to "standby mode" or "sleep mode".

When performing CAN communication, the power consumption in CAN transceiver in not performing CAN communication can be substantially reduced by controlling the operation mode pins of CAN transceiver. Table 18.5 and Table 18.6 show Recommended Pin Connections.

Table 18.5 Recommended Pin Connections (In Case of PCA82C250: Philips Product)

NOTES:

- 1. The pin which controls the operation mode of CAN transceiver.
- 2. In case of Topr = 25°C
- 3. Connect to enabled port to control CAN transceiver.

Table 18.6 Recommended Pin Connections (In Case of PCA82C252: Philips Product)

	Sleep Mode	Normal Operation Mode
STB Pin ⁽¹⁾	" <u>L</u> "	"H"
EN Pin ⁽¹⁾	"L"	"H"
Power Consumption	less than 50 μA	less than 35 mA
in CAN Transceiver ⁽²⁾		
CAN Communication	impossible	possible
Connection	R8C/22, R8C/23 CTX0 CRX0 Port(3) Port(3) "L" output	PCA82C252 TXD CANH RXD CANL Port(3) Port(3) "H" output

NOTES:

- 1. The pin which controls the operation mode of CAN transceiver.
- 2. In case of Topr = 25°C
- 3. Connect to enabled port to control CAN transceiver.

19. A/D Converter

The A/D converter consists of one 10-bit successive approximation A/D converter circuit with a capacitive coupling amplifier. The analog input shares the pins with P0_0 to P0_7, P1_0 to P1_3. Therefore, when using these pins, ensure the corresponding port direction bits are set to 0 (input mode).

When not using the A/D converter, set the VCUT bit in the ADCON1 register to 0 (Vref unconnected), so that no current will flow from the VREF pin into the resistor ladder, helping to reduce the power consumption of the chip. The result of A/D conversion is stored in the AD register.

Table 19.1 lists the Performance of A/D Converter. Figure 19.1 shows the Block Diagram of A/D Converter. Figure 19.2 and Figure 19.3 show the A/D converter-related registers.

Table 19.1 Performance of A/D Converter

Item	Performance	
A/D Conversion Method	Successive approximation (with capacitive coupling amplifier)	
Analog Input Voltage ⁽¹⁾	0 V to AVCC	
Operating Clock $\phi AD^{(2)}$	4.2 V ≤ AVCC ≤ 5.5 V f1, f2, f4, fOCO-F	
	2.7 V ≤ AVCC < 4.2 V f2, f4, fOCO-F	
Resolution	8 bit or 10 bit is selectable	
Absolute Accuracy	AVCC = Vref = 5 V, ϕ AD = 10MHz	
	• 8-bit resolution ±2 LSB	
	• 10-bit resolution ±3 LSB	
	AVCC = Vref = 3.3 V, φAD = 10MHz	
	• 8-bit resolution ±2 LSB	
	• 10-bit resolution ±5 LSB	
Operating Mode	One-shot and repeat modes ⁽³⁾	
Analog Input Pin	12 pins (AN0 to AN11)	
A/D Conversion Start Condition	Software trigger	
	Set the ADST bit in the ADCON0 register to 1 (A/D conversion starts)	
	Capture	
	Timer RD interrupt request is generated while the ADST bit is set to 1	
Conversion Rate Per Pin	Without sample and hold function	
	8-bit resolution: 49φAD cycles, 10-bit resolution: 59φAD cycles	
	With sample and hold function	
	8-bit resolution: 28φAD cycles, 10-bit resolution: 33φAD cycles	

NOTES:

- 1. Analog input voltage does not depend on use of sample and hold function. When analog input voltage exceeds reference voltage, A/D conversion result is 3FFh in 10-bit mode, FFh in 8-bit mode.
- 2. The frequency of ϕAD must be 10 MHz or below. Without sample and hold function, the \$\phi AD\$ frequency should be 250 kHz or above. With the sample and hold function, the ϕAD frequency should be 1 MHz or above.
- 3. In repeat mode, only 8-bit mode can be used.

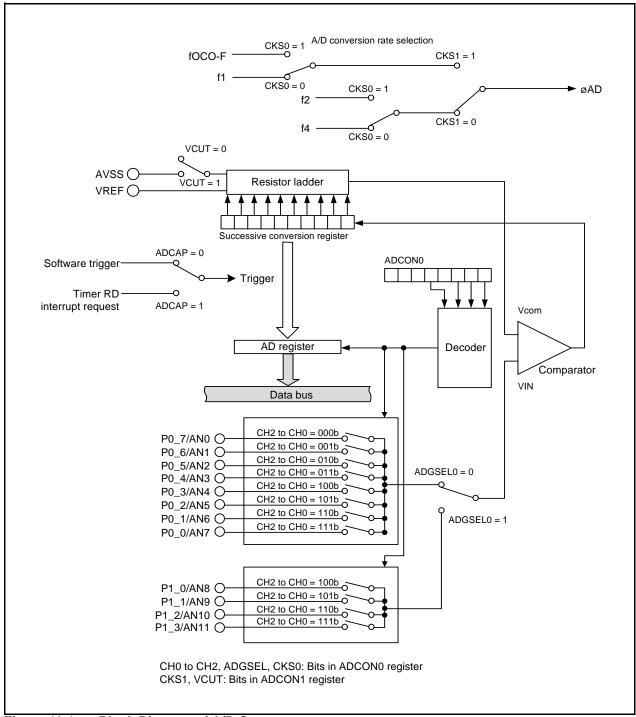

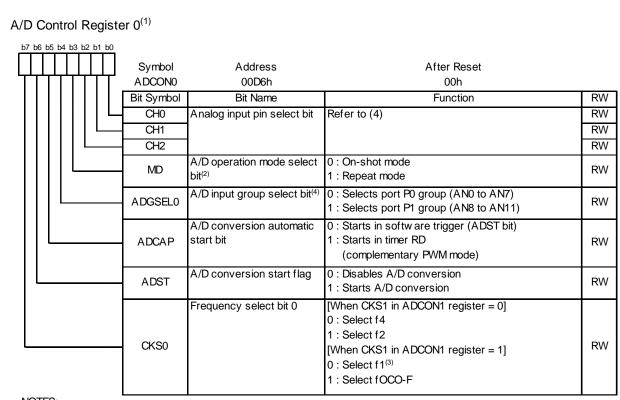

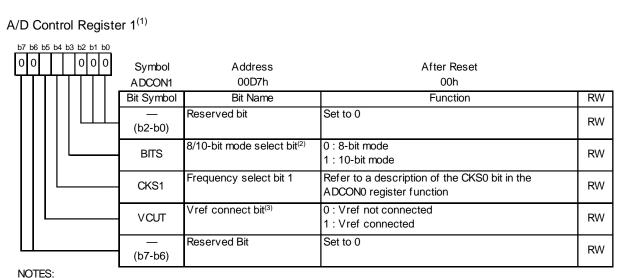

Figure 19.1 **Block Diagram of A/D Converter**

- NOTES:
 - 1. If the ADCON0 register is rewritten during A/D conversion, the conversion result is indeterminate.
 - 2. When changing A/D operation mode, set the analog input pin again.
 - 3. Set ØAD frequency to 10 MHz or below.
 - 4. The analog input pin can be select according to a combination of the CH0 to CH2 bits and the ADGSEL0 bit.

- 3. When the VCUT bit is set to 1 (connected) from 0 (not connected), w ait for 1 µs or more before starting A/D conversion.

Figure 19.7 **ADCON1 Register in Repeat Mode**

19.3 Sample and Hold

When the SMP bit in the ADCON2 register is set to 1 (with sample and hold function), A/D conversion rate per pin increases. The sample and hold function is available in all operating modes. Start the A/D conversion after selecting whether the sample and hold circuit is to be used or not.

Figure 19.8 shows the Timing Diagram of A/D Conversion.

19.4 A/D Conversion Cycles

Figure 19.9 shows the A/D Conversion Cycles.

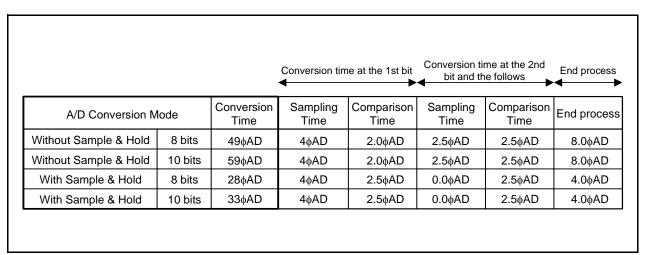

Figure 19.9 A/D Conversion Cycles

19.5 Internal Equivalent Circuit of Analog Input

Figure 19.10 shows the Internal Equivalent Circuit of Analog Input.

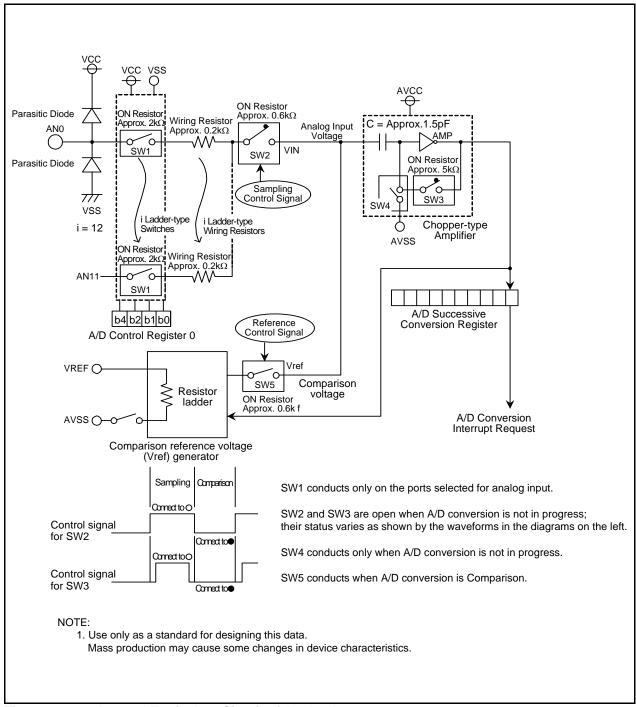

Figure 19.10 Internal Equivalent Circuit of Analog Input

19.6 Output Impedance of Sensor Under A/D Conversion

To carry out A/D conversion properly, charging the internal capacitor C shown in Figure 19.11 has to be completed within a specified period of time. T (sampling time) as the specified time. Let output impedance of sensor equivalent circuit be R0, internal resistance of microcomputer be R, precision (error) of the A/D converter be X, and the resolution of A/D converter be Y (Y is 1024 in the 10-bit mode, and 256 in the 8-bit mode).

$$\begin{split} \text{VC is generally} \quad \text{VC} &= \text{VIN} \bigg\{ 1 - e^{-\frac{1}{C(R0 + R)} t} \bigg\} \\ \text{And when } t &= \text{T}, \quad \text{VC} = \text{VIN} - \frac{X}{Y} \text{VIN} = \text{VIN} \bigg(1 - \frac{X}{Y} \bigg) \\ &= -\frac{1}{C(R0 + R)} T = \frac{X}{Y} \\ &- \frac{1}{C(R0 + R)} T = 1 n \frac{X}{Y} \end{split}$$
 Hence,
$$R0 = -\frac{T}{C \bullet 1 n \frac{X}{Y}} - R$$

Figure 19.11 shows Analog Input Pin and External Sensor Equivalent Circuit. When the difference between VIN and VC becomes 0.1LSB, we find impedance R0 when voltage between pins VC changes from 0 to VIN (0.1/1024) VIN in time T. (0.1/1024) means that A/D precision drop due to insufficient capacitor charge is held to 0.1LSB at time of A/D conversion in the 10-bit mode. Actual error however is the value of absolute precision added to 0.1LSB.

When f(XIN) = 10 MHz, T = 0.25 μ s in the A/D conversion mode without sample & hold. Output impedance R0 for sufficiently charging capacitor C within time T is determined as follows.

$$T = 0.25 \mu s$$
, $R = 2.8 k\Omega$, $C = 6.0 pF$, $X = 0.1$, and $Y = 1024$. Hence,

$$R0 = -\frac{0.25 \times 10^{-6}}{6.0 \times 10^{-12} \cdot 1n \frac{0.1}{1024}} - 2.8 \times 10^{3} \approx 1.7 \times 10^{3}$$

Thus, the allowable output impedance of the sensor equivalent circuit, making the precision (error) 0.1LSB or less, is approximately $1.7 \text{ k}\Omega$ maximum.

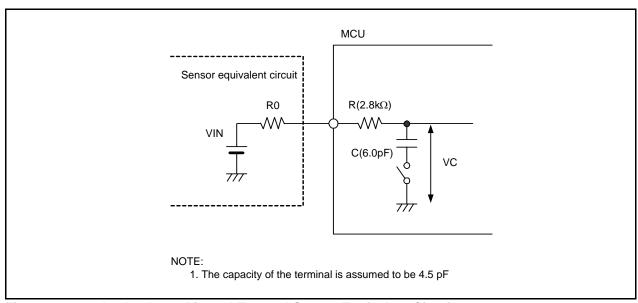

Figure 19.11 Analog Input Pin and External Sensor Equivalent Circuit

19.7 Notes on A/D Converter

- Write to each bit (other than bit 6) in the ADCON0 register, each bit in the ADCON1 register, or the SMP bit in the ADCON2 register when the A/D conversion stops (before a trigger occurs). When the VCUT bit in the ADCON1 register is changed from 0 (VREF not connected) to 1 (VREF connected), wait for at least 1 µs or longer before the A/D conversion starts.
- When changing A/D operating mode, select an analog input pin again.
- When using in one-shot mode. Ensure that the A/D conversion is completed and read the AD register. The IR bit in the ADIC register or the ADST bit in the ADCON0 register can determine whether the A/D conversion is completed.
- When using the repeat mode, select the frequency of the A/D converter operating clock φAD or more for the CPU clock during A/D conversion.
 Do not select the fOCO-F for the φAD.
- If setting the ADST bit in the ADCON0 register to 0 (A/D conversion stops) by a program and the A/D conversion is forcibly terminated during the A/D conversion operation, the conversion result of the A/D converter will be indeterminate. If the ADST bit is set to 0 by a program, do not use the value of AD register.
- Connect 0.1 µF capacitor between the P4_2/VREF pin and AVSS pin.
- Do not enter stop mode during A/D conversion.
- Do not enter wait mode when the CM02 bit in the CM0 register is set to 1 (peripheral function clock stops in wait mode) during A/D conversion.

20. Flash Memory

20.1 Overview

In the flash memory version, rewrite operations to the flash memory can be performed in three modes; CPU rewrite, standard serial I/O, parallel I/O modes.

Table 20.1 lists the Flash Memory Performance (see Table 1.1 and Table 1.2 Performance for the items not listed on Table 20.1).

Table 20.1 Flash Memory Performance

Item		Specification	
Flash Memory Operating Mode		3 modes (CPU rewrite, standard serial I/O, and parallel I/O mode)	
Division of Erase Block		See Figure 20.1 and Figure 20.2	
Program Metho	d	Byte unit	
Erase Method		Block erase	
Program, Erase	Control Method	Program and erase control by software command	
Rewrite Control	Method	Rewrite control for blocks 0 and 1 by FMR02 bit in FMR0 register	
		Rewrite control for block 0 by FMR16 bit and block 1 by FMR16 bit	
Number of Com	nmands	5 commands	
Programming	Blocks 0 and 1	R8C/22 Group: 100 times; R8C/23 Group: 1,000 times	
and erase	(Program ROM)		
endurance ⁽¹⁾	Blocks A and B	10,000 times	
(Data Flash) ⁽²⁾			
ID Code Check	Function	Standard serial I/O mode supported	
ROM Code Protect		For parallel I/O mode supported	

NOTES:

- 1. Definition of programming and erasure endurance
 - The programming and erasure endurance is defined on a per-block basis.
 - If the programming and erasure endurance is n (n = 100 or 10,000), each block can be erased n times. For example, if 1,024 1-byte writes are performed to different addresses in block A, a 1-Kbyte block, and then the block is erased, the programming/erasure endurance still stands at one. When performing 100 or more rewrites, the actual erasure endurance can be reduced by executing programming operations in such a way that all blank areas are used before performing an erase operation. Avoid rewriting only particular blocks and try to average out the programming and erasure endurance of the blocks. It is also advisable to retain data on the erasure endurance of each block and limit the number of erase operations to a certain number.
- 2. Blocks A and B are embedded only in the R8C/23 Group.

Flash Memory Rewrite Modes Table 20.2

Flash Memory Rewrite Mode	CPU Rewrite Mode	Standard Serial I/O Mode	Parallel I/O Mode
Function	User ROM area is rewritten by executing software commands from the CPU. EW0 mode: Rewritable in the RAM EW1 mode: Rewritable in flash memory	User ROM area is rewritten by using a dedicated serial programmer.	User ROM area is rewritten by using a dedicated parallel programmer.
Areas which can be rewritten	User ROM area	User ROM area	User ROM area
Operating mode	Single chip mode	Boot mode	Parallel I/O mode
ROM programmer	None	Serial programmer	Parallel programmer

20.2 Memory Map

The flash memory contains a user ROM area and a boot ROM area (reserved area).

Figure 20.1 shows the Flash Memory Block Diagram for R8C/22 Group. Figure 20.2 shows the Flash Memory Block Diagram for R8C/23 Group.

The user ROM area of R8C/23 Group contains an area which stores a MCU operating program (program ROM) and the 1-Kbyte block A and B (data flash).

The user ROM area is divided into several blocks. The user ROM area can be rewritten in CPU rewrite and standard serial I/O and parallel I/O modes.

When rewriting the block 0 and block 1 in CPU rewrite mode, set the FMR02 bit in the FMR0 register to 1 (rewrite enables), and when setting the FMR15 bit in the FMR1 register to 0 (rewrite enables), block 0 is rewritable. When setting the FMR16 bit to 0 (rewrite enables), block 1 is rewritable.

When rewriting the block 2 and block 3 in CPU rewrite mode, set the FMR02 bit in the FMR0 register to 1 (rewrite enables).

The rewrite control program for standard serial I/O mode is stored in boot ROM area before shipment. The boot ROM area and the user ROM area share the same address, but have an another memory.

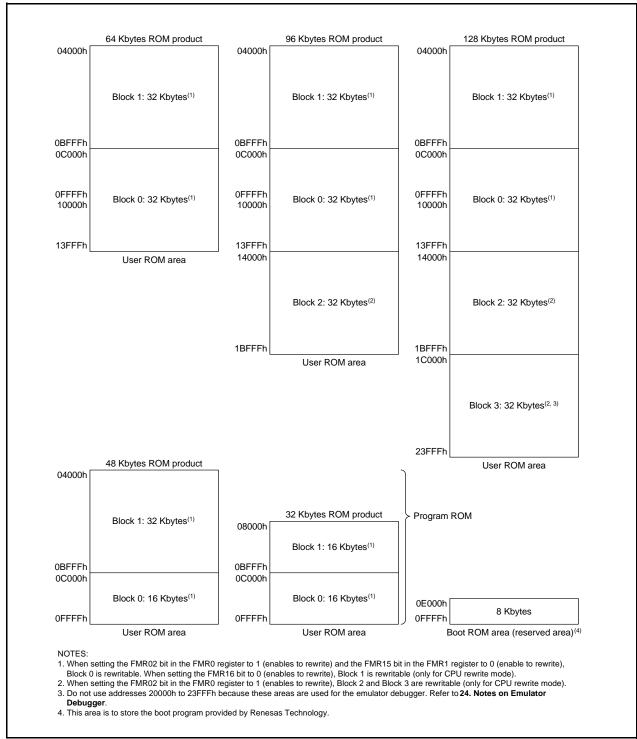

Figure 20.1 Flash Memory Block Diagram for R8C/22 Group

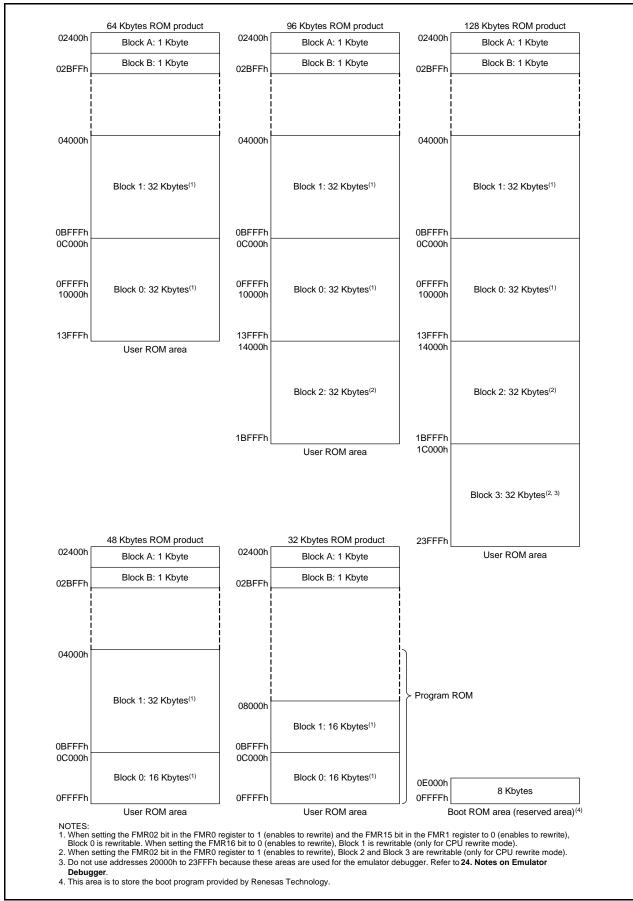

Figure 20.2 Flash Memory Block Diagram for R8C/23 Group

Functions to Prevent Rewriting of Flash Memory 20.3

Standard serial I/O mode contains an ID code check function, and the parallel I/O mode contains a ROM code protect function to prevent the flash memory from reading or rewriting easily.

20.3.1 **ID Code Check Function**

Use this function in standard serial I/O mode. Unless the flash memory is blank, the ID codes sent from the programmer and the ID codes written in the flash memory are determined whether they match. If the ID codes do not match, the commands sent from the programmer are not acknowledged. The ID code consists of 8-bit data, the areas of which, beginning with the first byte, are 00FFDFh, 00FFE3h, 00FFEBh, 00FFEFh, 00FFF3h, 00FFF7h, and 00FFFBh. Write a program in which the ID codes are set at these addresses and write them in the flash memory.

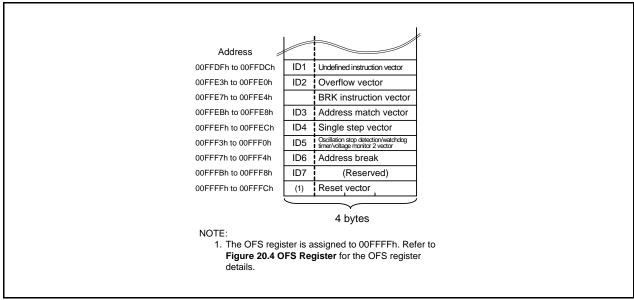

Figure 20.3 Address for Stored ID Code

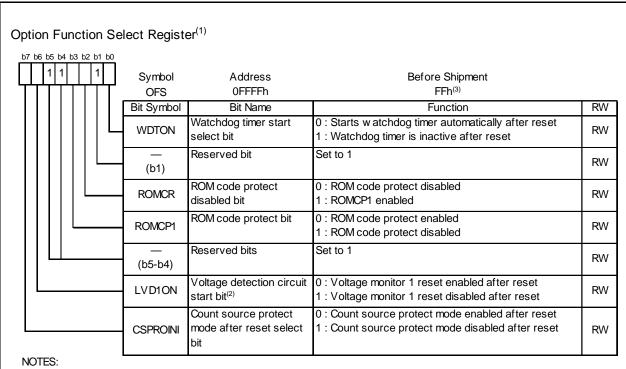

20.3.2 **ROM Code Protect Function**

The ROM code protect function disables to read and change the internal flash memory by the OFS register in parallel I/O mode.

Figure 20.4 shows the OFS Register.

The ROM code protect function is enabled by writing 0 to the ROMCP1 bit and 1 to the ROMCR bit and disables to read and change the internal flash memory.

Once the ROM code protect is enabled, the content in the internal flash memory cannot be rewritten in parallel I/O mode. When the ROM code protect is disabled, erase the block including the OFS register with CPU rewrite mode or standard serial I/O mode.

- 1. The OFS register is on the flash memory. Write to the OFS register with a program. After writing is completed, do not write additions to the OFS register.
- 2. To use the power-on reset, set the LVD1ON bit to 0 (voltage monitor 1 reset enabled after reset).
- 3. If the block including the OFS register is erased, FFh is set to the OFS register.

Figure 20.4 **OFS Register**

20.4 CPU Rewrite Mode

In CPU rewrite mode, user ROM area can be rewritten by executing software commands from the CPU. Therefore, the user ROM area can be rewritten directly while the MCU is mounted on a board without using such as a ROM programmer. Execute the program and block erase commands only to each block in user ROM area.

When an interrupt request is generated during an erase operation in CPU rewrite mode, the flash module contains an erase-suspend function which performs the interrupt process after the erase operation is halted temporarily. During the erase-suspend, user ROM area can be read by a program.

When an interrupt request is generated during the auto-program operation in CPU rewrite mode, the flash module contains a program-suspend function which performs the interrupt process after the auto-program operation suspends. During the program-suspend, user ROM area can be read by a program.

CPU rewrite mode contains erase write 0 mode (EW0 mode) and erase write 1 mode (EW1 mode).

Table 20.3 lists the Differences between EW0 Mode and EW1 Mode.

Table 20.3 Differences between EW0 Mode and EW1 Mode

Item	EW0 Mode	EW1 Mode
Operating Mode	Single chip mode	Single chip mode
Areas in which a Rewrite Control Program Can be Located	User ROM area	User ROM area
Areas in which a Rewrite Control Program can be Executed	Necessary to transfer to any areas other than the flash memory (e.g., RAM) before executing	Executing directly in user ROM or RAM area possible
Areas which can be Rewritten	User ROM area	User ROM area However, other than the blocks which contain a rewrite control program ⁽¹⁾
Software Command Restriction	None	 Program and block erase commands Cannot be run on any block which contains a rewrite control program Read status register command Cannot be executed
Modes After Program or Erase	Read status register mode	Read array mode
Modes After Read Status Register	Read status register mode	Do not execute this command
CPU Status During Auto- write and Auto-erase	Operating	Hold state (I/O ports hold state before the command is executed)
Flash Memory Status Detection	 Read the FMR00, FMR06, and FMR07 bits in the FMR0 register by a program Execute the read status register command and read the SR7, SR5, and SR4 bits in the status register. 	Read the FMR00, FMR06, and FMR07 bits in the FMR0 register by a program
Conditions for Transition to Erase-suspend	Set the FMR40 and FMR41 bits in the FMR4 register to 1 by a program.	The FMR40 bit in the FMR4 register is set to 1 and the interrupt request of the enabled maskable interrupt is generated
Conditions for Transitions to Program-suspend	Set the FMR40 and FMR42 bits in the FMR4 register to 1 by a program.	The FMR40 bit in the FMR4 register is set to 1 and the interrupt request of the enabled maskable interrupt is generated
CPU Clock	5 MHz or below	No restriction to the following (clock frequency to be used)

NOTE:

1. When setting the FMR02 bit in the FMR0 register to 1 (rewrite enables) and rewriting block 0 is enabled by setting the FMR15 bit in the FMR1 register to 0 (rewrite enables). Rewriting block 1 is enabled by setting the FMR16 bit to 0 (rewrite enables).

20.4.1 **EW0 Mode**

The MCU enters CPU rewrite mode and software commands can be acknowledged by setting the FMR01 bit in the FMR0 register to 1 (CPU rewrite mode enabled). In this case, since the FMR11 bit in the FMR1 register is set to 0. EW0 mode is selected.

Use software commands to control a program and erase operations. The FMR0 register or the status register can determine status when program and erase operation complete.

When entering an erase-suspend, set the FMR40 bit to 1 (enables suspend) and the FMR41 bit to 1 (requests erase-suspend). Wait for td(SR-SUS) and ensure that the FMR46 bit is set to 1 (enables reading) before accessing the user ROM area. The auto-erase operation restarts by setting the FMR41 bit to 0 (erase restarts). When entering a program-suspend during the auto-program, set the FMR40 bit to 1 (enables suspend) and the FMR42 bit to 1 (requests program-suspend). Wait for td(SR-SUS) and ensure that the FMR46 bit is set to 1 (enables reading) before accessing the user ROM area. The auto-program operation restarts by setting the

20.4.2 **EW1 Mode**

FMR42 bit to 0 (program restarts).

The MCU enters EW1 mode by setting the FMR11 bit to 1 (EW1 mode) after setting the FMR01 bit to 1 (CPU rewrite mode enabled).

The FMR0 register can determine status when program and erase operation complete. Do not execute commands of the read status register in EW1 mode.

To enable the erase-suspend function during the auto-erase, execute the block erase command after setting the FMR40 bit to 1 (enables suspend). The interrupt to enter an erase-suspend should be in interrupt enabled status. After passing td(SR-SUS) since the block erase command is executed, an interrupt request is acknowledged.

When an interrupt request is generated, the FMR41 bit is automatically set to 1 (requests erase-suspend) and the auto-erase operation is halted. If the auto-erase operation does not complete (FMR00 bit is 0) when the interrupt process completes, the auto-erase operation restarts by setting the FMR41 bit to 0 (erase restarts)

To enable the program-suspend function during the auto-program, execute the program command after setting the FMR40 bit to 1 (enables suspend). The interrupt to enter a program-suspend should be in interrupt enabled status. After waiting for td(SR-SUS) since the program command is executed, an interrupt request is acknowledged.

When an interrupt request is generated, the FMR42 bit is automatically set to 1 (requests program-suspend) and the auto-program operation suspends. When the auto-program operation does not complete (FMR00 bit is 0) after the interrupt process completes, the auto-program operation restarts by setting the FMR42 bit to 0 (program restarts).

Figure 20.5 shows the FMR0 Register, Figure 20.6 shows the FMR1 Register and Figure 20.7 shows the FMR4 Register.

20.4.2.1 FMR00 Bit

This bit indicates the operating status of the flash memory. The bit is 0 during programming, erasing (including suspend periods), or erase-suspend mode; otherwise, the bit is 1.

20.4.2.2 FMR01 Bit

The MCU is made ready to accept commands by setting the FMR01 bit to 1 (CPU rewrite mode).

20.4.2.3 FMR02 Bit

The block0, block1, block2 and block3 do not accept the program and block erase commands if the FMR02 bit is set to 0 (rewrite disabled).

The block0 and block1 are controlled rewriting in the FMR15 and FMR16 bits if the FMR02 bit is set to 1 (rewrite enabled).

20.4.2.4 FMSTP Bit

This bit is provided for initializing the flash memory control circuits, as well as for reducing the amount of current consumed in the flash memory. The flash memory is disabled against access by setting the FMSTP bit to 1. Therefore, the FMSTP bit must be written to by a program transferred to the RAM. In the following cases, set the FMSTP bit to 1:

- When flash memory access resulted in an error while erasing or programming in EW0 mode (FMR00 bit not reset to 1 (ready))
- When entering high-speed on-chip oscillator mode, low-speed on-chip oscillator mode (XIN clock stop) Figure 20.11 shows a Process to Reduce Power Consumption in High-Speed On-Chip Oscillator Mode, Low-Speed On-Chip Oscillator Mode (XIN Clock Stops) and Low-Speed Clock Mode (XIN Clock Stops). Note that when going to stop or wait mode while the CPU rewrite mode is disabled, the FMR0 register does not need to be set because the power for the flash memory is automatically turned off and is turned back on again after returning from stop or wait mode.

20.4.2.5 FMR06 Bit

This is a read-only bit indicating the status of auto program operation. The bit is set to 1 when a program error occurs; otherwise, it is cleared to 0. For details, refer to the description of the **20.4.5 Full Status Check**.

20.4.2.6 FMR07 Bit

This is a read-only bit indicating the status of auto erase operation. The bit is set to 1 when an erase error occurs; otherwise, it is set to 0. Refer to **20.4.5 Full Status Check** for the details.

20.4.2.7 FMR11 Bit

Setting this bit to 1 (EW1 mode) places the MCU in EW1 mode.

20.4.2.8 FMR15 Bit

When the FMR02 bit is set to 1 (rewrite enabled) and the FMR15 bit is set to 0 (rewrite enabled), the block0 accepts the program command and block erase command.

20.4.2.9 FMR16 Bit

When the FMR02 bit is set to 1 (rewrite enabled) and the FMR16 bit is set to 0 (rewrite enabled), the block1 accepts the program command and block erase command.

20.4.2.10 FMR40 Bit

The suspend function is enabled by setting the FMR40 bit to 1 (enable).

20.4.2.11 FMR41 Bit

In EW0 mode, the MCU enters erase-suspend mode when setting the FMR41 bit to 1 by a program. The FMR41 bit is automatically set to 1 (requests erase-suspend) when an interrupt request of an enabled interrupt is generated in EW1 mode, and then the MCU enters erase-suspend mode.

Set the FMR41 bit to 0 (erase restart) when the auto-erase operation restarts.

20.4.2.12 FMR42 Bit

In EW0 mode, the MCU enters program-suspend mode when setting the FMR42 bit to 1 by a program. The FMR42 bit is automatically set to 1 (requests program-suspend) when an interrupt request of an enabled interrupt is generated in EW1 mode, and then the MCU enters program-suspend mode.

Set the FMR42 bit to 0 (program restarts) when the auto-program operation restarts.

20.4.2.13 FMR43 Bit

When the auto-erase operation starts, the FMR43 bit is set to 1 (during erase execution). The FMR43 bit remains 1 (during erase execution) during erase-suspend operation.

When the auto-erase operation ends, the FMR43 bit is set to 0 (erase not executed).

20.4.2.14 FMR44 Bit

When the auto-program starts, the FMR44 bit is set to 1 (during program execution). The FMR44 bit remains 1 (during program execution) during program-suspend operation.

When the auto-program operation ends, the FMR44 bit is set to 0 (program not executed).

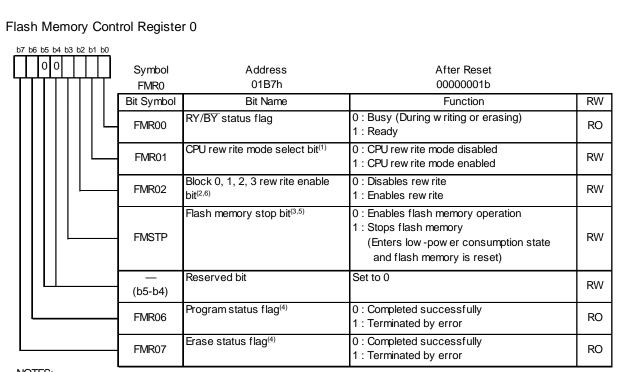

20.4.2.15 FMR46 Bit

The FMR46 bit is set to 0 (reading disabled) during auto-program or auto-erase execution and set to 1 (reading enabled) in suspend mode. Do not access the flash memory while this bit is set to 0.

20.4.2.16 FMR47 Bit

Power consumption when reading the flash memory can be reduced by setting the FMR47 bit to 1 (enabled) in low-speed on-chip oscillator mode (XIN clock stops).

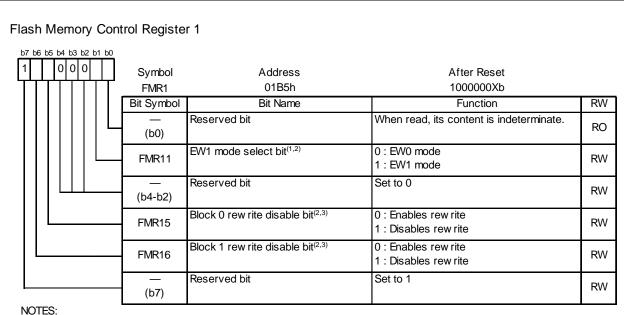

NOTES:

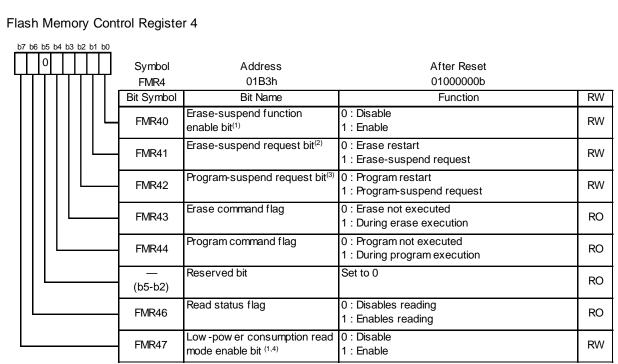

- 1. When setting this bit to 1, set to 1 immediately after setting it first to 0. Do not generate an interrupt between setting the bit to 0 and setting it to 1. Enter read array mode and set this bit to 0.
- 2. Set this bit to 1 immediately after setting this bit first to 0 w hile the FMR01 bit is set to 1. Do not generate an interrupt between setting the bit to 0 and setting it to 1.
- 3. Set this bit by a program transferred to the RAM.
- 4. This bit is set to 0 by executing the clear status command.
- 5. This bit is enabled when the FMR01 bit is set to 1 (CPU rewrite mode enabled). When the FMR01 bit is set to 0 and w riting 1 to the FMSTP bit, the FMSTP bit is set to 1. The flash memory does not enter low-power consumption stat
- 6. When setting the FMR01 bit to 0 (CPU rew rite mode disabled), the FMR02 bit is set to 0 (disables rew rite).

Figure 20.5 **FMR0** Register

- 1. When setting this bit to 1, set to 1 immediately after setting it first to 0 while the FMR01 bit is set to 1 (CPU rew rite mode enable) . Do not generate an interrupt betw een setting the bit to 0 and setting it to 1.
- 2. This bit is set to 0 by setting the FMR01 bit to 0 (CPU rew rite mode disabled).
- 3. When the FMR01 bit is set to 1 (CPU rew rite mode enabled), the FMR15 and FMR16 bits can be w ritten. When setting this bit to 0, set to 0 immediately after setting it first to 1. When setting this bit to 1, set it to 1.

Figure 20.6 FMR1 Register

NOTES:

- 1. When setting this bit to 1, set to 1 immediately after setting it first to 0. Do not generate an interrupt between setting the bit to 0 and setting it to 1.
- 2. This bit is enabled when the FMR40 bit is set to 1 (enable) and this bit can be written during the period between issuing an erase command and completing an erase (This bit is set to 0 during the periods other than above.) In EW0 mode, this can be set to 0 or 1 by a program.
 - In EW1 mode, this bit is automatically set to 1 if a maskable interrupt is generated during an erase operation while the FMR40 bit is set to 1. Do not set this bit to 1 by a program (0 can be written).
- 3. The FMR42 bit is enabled only when the FMR40 bit is set to 1 (enable) and programming to the FMR42 bit is enabled until the auto-program ends since the program command is generated. (This bit is set to 0 during periods other than
 - In EW0 mode, 0 or 1 can be programmed to the FMR42 bit by a program.
 - In EW1 mode, the FMR42 bit is automatically set to 1 by generating a maskable interrupt during the auto-program when the FMR40 bit is set to 1.1 cannot be programmed to the FMR42 bit by a program.
- 4. In high-speed clock mode and high-speed on-chip oscillator mode, set the FMR47 bit to 0 (disabled).
- 5. Set the FMR01 bit in the FMR0 register to 0 (CPU rew rite mode disabled) in low-pow er-consumption read mode.

Figure 20.9 shows the How to Set and Exit EW0 Mode. Figure 20.10 shows the How to Set and Exit EW1 Mode.

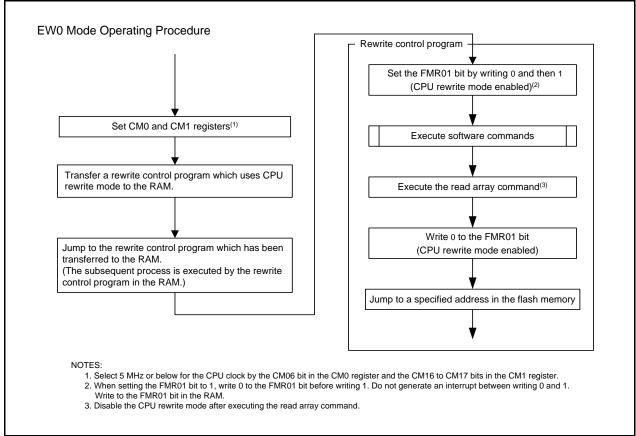

Figure 20.9 How to Set and Exit EW0 Mode

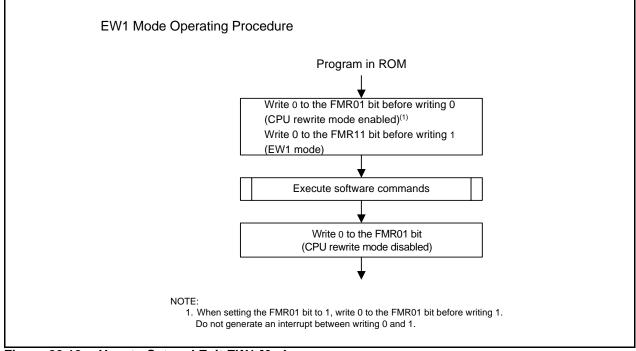

Figure 20.10 How to Set and Exit EW1 Mode

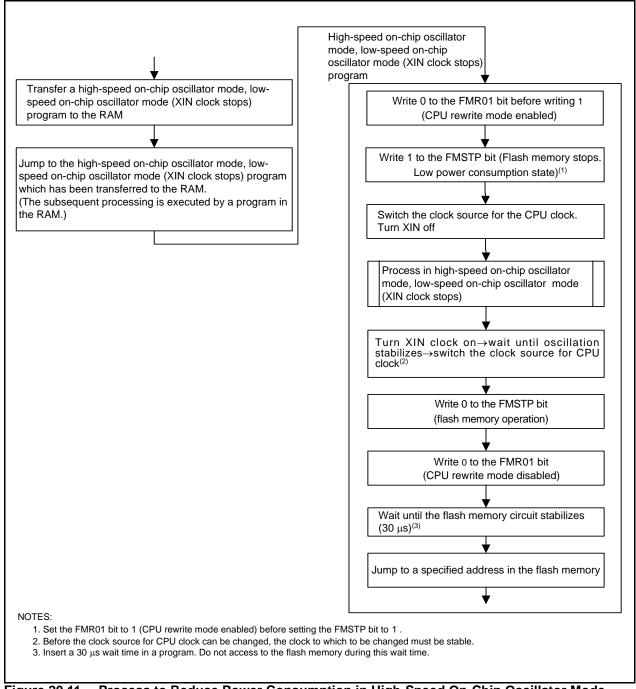

Figure 20.11 Process to Reduce Power Consumption in High-Speed On-Chip Oscillator Mode, Low-Speed On-Chip Oscillator Mode (XIN Clock Stops) and Low-Speed Clock Mode (XIN Clock Stops)

20.4.3 **Software Commands**

Software commands are described below. Read or write commands and data from or to in 8-bit units.

Table 20.4 Software Commands

	First Bus Cycle			Second Bus Cycle		
Command	Mode	Address	Data (D7 to D0)	Mode	Address	Data (D7 to D0)
Read Array	Write	×	FFh			
Read Status Register	Write	×	70h	Read	×	SRD
Clear Status Register	Write	×	50h			
Program	Write	WA	40h	Write	WA	WD
Block Erase	Write	×	20h	Write	BA	D0h

SRD: Status register data (D7 to D0)

WA: Write address (Ensure the address specified in the first bus cycle is the same address as the write address specified in the second bus cycle.)

WD: Write data (8 bits) BA: Given block address

Any specified address in the user ROM area

20.4.3.1 **Read Array Command**

The read array command reads the flash memory.

The MCU enters read array mode by writing FFh in the first bus cycle. If entering the read address after the following bus cycles, the content of the specified address can be read in 8-bit units.

Since the MCU remains in read array mode until another command is written, the contents of multiple addresses can be read continuously.

In addition, the MCU enters read array mode after a reset.

20.4.3.2 **Read Status Register Command**

The read status register command reads the status register.

If writing 70h in the first bus cycle, the status register can be read in the second bus cycle. (Refer to 20.4.4 Status Registers) When reading the status register, specify an address in the user ROM area.

Do not execute this command in EW1 mode.

The MCU remains in read status register mode until the next read array command is written.

20.4.3.3 **Clear Status Register Command**

The clear status register command sets the status register to 0.

If writing 50h in the first bus cycle, the FMR06 to FMR07 bits in the FMR0 register and SR4 to SR5 in the status register will be set to 0.

20.4.3.4 Program Command

The program command writes data to the flash memory in 1-byte units.

By writing 40h in the first bus cycle and data in the second bus cycle to the write address, and an auto program operation (data program and verify) will start. Make sure the address value specified in the first bus cycle is the same address as the write address specified in the second bus cycle.

The FMR00 bit in the FMR0 register can determine whether auto programming has completed.

When suspend function disabled, the FMR00 bit is set to 0 during auto-programming and set to 1 when auto-programming completes.

When suspend function enabled, the FMR44 bit is set to 1 during auto-programming and set to 0 when auto-programming completes.

The FMR06 bit in the FMR0 register can determine the result of auto programming after it has been finished. (Refer to **20.4.5 Full Status Check**)

When the FMR02 bit in the FMR0 register is set to 0 (disable rewriting), program commands targeting block 0 to 3 are not acknowledged. When the FMR02 bit is set to 1 (rewrite enables) and the FMR15 bit in the FMR1 register is set to 1 (disable rewriting), program commands targeting block 0 are not acknowledged. When the FMR16 bit is set to 1 (disable rewriting), program commands targeting block 1 are not acknowledged.

Figure 20.12 shows the Program Command (When Suspend Function Disabled). Figure 20.13 shows the Program Command (When Suspend Function Enabled).

In EW1 mode, do not execute this command on any address at which the rewrite control program is allocated. In EW0 mode, the MCU enters read status register mode at the same time auto programming starts and the status register can be read. The status register bit 7 (SR7) is set to 0 at the same time auto programming starts and set back to 1 when auto programming completes. In this case, the MCU remains in read status register mode until a read array command is written next. Reading the status register can determine the result of auto programming after auto programming has completed.

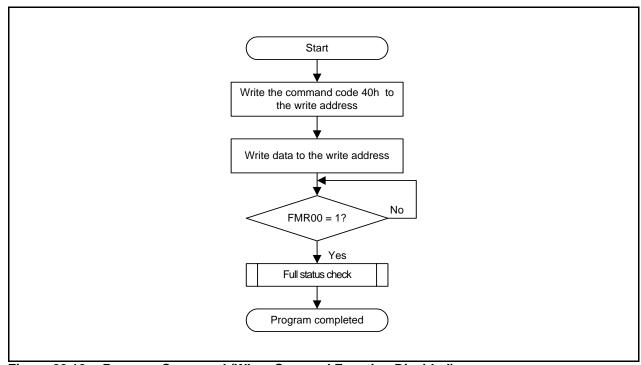

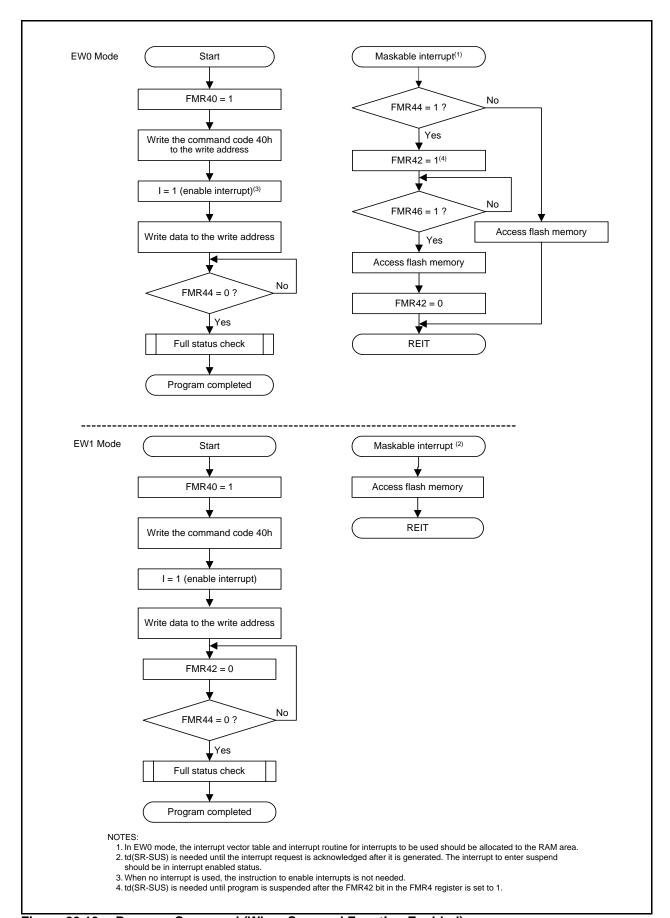

Figure 20.12 Program Command (When Suspend Function Disabled)

Program Command (When Suspend Function Enabled) Figure 20.13

20.4.3.5 **Block Erase**

If writing 20h in the first bus cycle and D0h to the given address of a block in the second bus cycle, and an auto erase operation (erase and verify) will start.

The FMR00 bit in the FMR0 register can determine whether auto erasing has completed.

The FMR00 bit is set to 0 during auto erasing and set to 1 when auto erasing completes.

The FMR07 bit in the FMR0 register can determine the result of auto erasing after auto erasing has completed. (Refer to 20.4.5 Full Status Check)

When the FMR02 bit in the FMR0 register is set to 0 (disable rewriting) or the FMR02 bit is set to 1 (rewrite enables) and the FMR15 bit in the FMR1 register is set to 1 (disable rewriting), the block erase command on block 0 is not acknowledged. When the FMR16 bit is set to 1 (disable rewriting), the block erase command on block 1 is not acknowledged.

Do not use the block erase command during program-suspend.

Figure 20.14 shows the Block Erase Command (When Erase-Suspend Function Disabled). Figure 20.15 shows the Block Erase Command (When Erase-Suspend Function Enabled).

In EW1 mode, do not execute this command on any address at which the rewrite control program is allocated. In EW0 mode, the MCU enters read status register mode at the same time auto erasing starts and the status register can be read. The status register bit 7 (SR7) is set to 0 at the same time auto erasing starts and set back to 1 when auto erasing completes. In this case, the MCU remains in read status register mode until the read array command is written next.

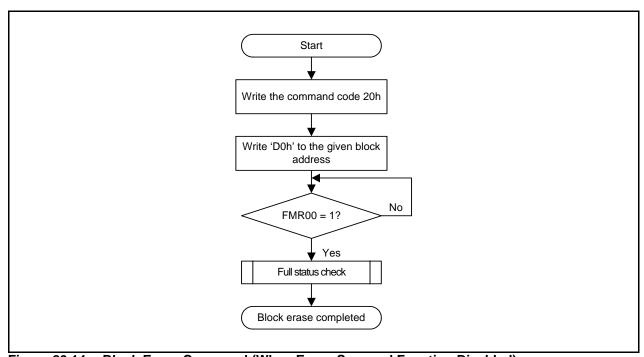

Figure 20.14 **Block Erase Command (When Erase-Suspend Function Disabled)**

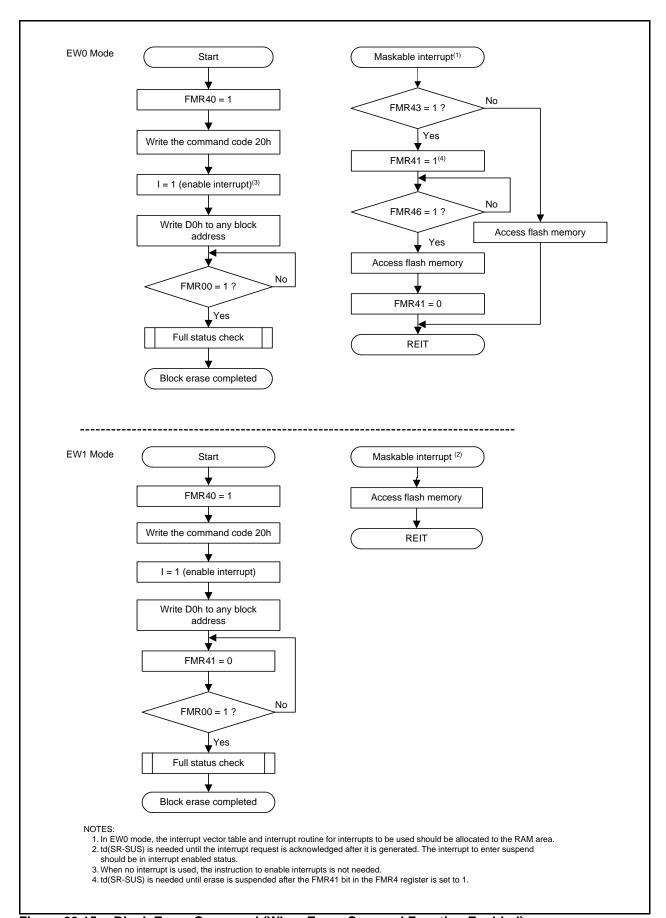

Figure 20.15 Block Erase Command (When Erase-Suspend Function Enabled)

20.4.4 Status Registers

The status register indicates the operating status of the flash memory and whether an erasing or programming operation completes normally or in error. Status of the status register can be read by the FMR00, FMR06, and FMR07 bits in the FMR0 register.

Table 20.5 lists the Status Register Bits.

In EW0 mode, the status register can be read in the following cases:

- When a given address in the user ROM area is read after writing the read status register command
- When a given address in the user ROM area is read after executing the program or block erase command but before executing the read array command.

20.4.4.1 Sequencer Status (Bits SR7 and FMR00)

The sequencer status indicates operating status of the flash memory. SR7 = 0 (busy) during auto programming and auto erasing, and is set to 1 (ready) at the same time the operation completes.

20.4.4.2 Erase Status (Bits SR5 and FMR07)

Refer to 20.4.5 Full Status Check.

20.4.4.3 Program Status (Bits SR4 and FMR06)

Refer to 20.4.5 Full Status Check.

Table 20.5 Status Register Bits

Status	FMR0		Desci	ription	Value
Register	Register	Status Name	0	1	after
Bit	Bit		ŏ	•	Reset
SR0 (D0)	_	Reserved	I	_	
SR1 (D1)	_	Reserved	1	_	_
SR2 (D2)	_	Reserved	_	_	_
SR3 (D3)	_	Reserved	1	_	_
SR4 (D4)	FMR06	Program status	Completed normally	Error	0
SR5 (D5)	FMR07	Erase status	Completed normally	Error	0
SR6 (D6)	_	Reserved	-	_	_
SR7 (D7)	FMR00	Sequencer status	Busy	Ready	1

- D0 to D7: Indicates the data bus which is read when the read status register command is executed.
- The FMR07 (SR5) to FMR06 bits (SR4) are set to 0 by executing the clear status register command.
- When the FMR07 bit (SR5) or FMR06 bit (SR4) is set to 1, the program and block erase command cannot be accepted.

20.4.5 Full Status Check

When an error occurs, the FMR06 to FMR07 bits in the FMR0 register are set to 1, indicating occurrence of each specific error. Therefore, checking these status bits (full status check) can determine the executed result. Table 20.6 lists the Errors and FMR0 Register Status. Figure 20.16 shows the Full Status Check and Handling Procedure for Individual Errors.

Table 20.6 Errors and FMR0 Register Status

FMR0 Register (Status				
Register) Status		Error	Error Occurrence Condition	
FMR07(SR5)	FMR06(SR4)			
1	1	Command sequence error	 When any command is not written correctly When invalid data other than those that can be written in the second bus cycle of the block erase command is written (i.e., other than D0h or FFh)(1) When executing the program command or block erase command while rewriting is disabled using the FMR02 bit in the FMR0 register, the FMR15 or FMR16 bit in the FMR1 register. When inputting and erasing the address in which the Flash memory is not allocated during the erase command input When executing to erase the block which disables rewriting during the erase command input. When inputting and writing the address in which the Flash memory is not allocated during the write command input. When executing to write the block which disables 	
1	0	Erase error	rewriting during the write command input. When the block erase command is executed but not automatically erased correctly	
0	1	Program error	When the program command is executed but not automatically programmed correctly.	

NOTE:

1. The MCU enters read array mode by writing FFh in the second bus cycle of these commands, at the same time the command code written in the first bus cycle will disabled.

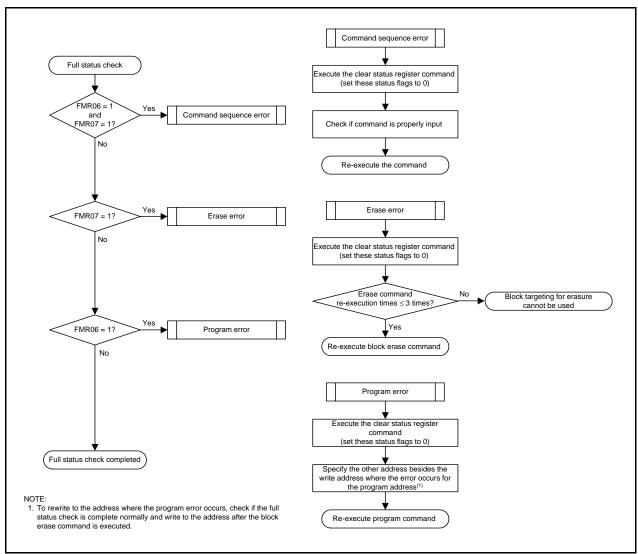

Figure 20.16 Full Status Check and Handling Procedure for Individual Errors

20.5 Standard Serial I/O Mode

In standard serial I/O mode, the user ROM area can be rewritten while the MCU is mounted on-board by using a serial programmer which is applicable for the MCU.

There are three types of Standard serial I/O modes:

- Standard serial I/O mode 1 Clock synchronous serial I/O used to connect with a serial programmer
- Standard serial I/O mode 2 Clock asynchronous serial I/O used to connect with a serial programmer
- Standard serial I/O mode 3 Special clock asynchronous serial I/O used to connect with a serial programmer This MCU uses Standard serial I/O mode 2 and Standard serial I/O mode 3.

Refer to **Appendix 2. Connection Examples between Serial Writer and On-Chip Debugging Emulator**. Contact the manufacturer of your serial programmer for serial programmer. Refer to the user's manual of your serial programmer for details on how to use it.

Table 20.7 lists the Pin Functions (Flash Memory Standard Serial I/O Mode 2), Table 20.8 lists the Pin Functions (Flash Memory Standard Serial I/O Mode 3), Figure 20.17 shows Pin Connections for Standard Serial I/O Mode 3. After processing the pins shown in Table 20.8 and rewriting a flash memory using a writer, apply "H" to the MODE pin and reset a hardware if a program is operated on the flash memory in single-chip mode.

20.5.1 ID Code Check Function

The ID code check function determines whether the ID codes sent from the serial programmer and those written in the flash memory match (refer to **20.3 Functions to Prevent Rewriting of Flash Memory**).

Table 20.7 Pin Functions (Flash Memory Standard Serial I/O Mode 2)

Pin	Name	I/O	Description
VCC,VSS	Power input		Apply the voltage guaranteed for programming and erasure to the VCC pin and 0 V to the VSS pin.
RESET	Reset input	ı	Reset input pin.
P4_6/XIN	P4_6 input/clock input	I	Connect a ceramic resonator or crystal oscillator between the XIN and XOUT pins.
P4_7/XOUT	P4_7 input/clock output	I/O	
P0_0 to P0_7	Input port P0	ı	Input "H" or "L" level signal or leave the pin open.
P1_0 to P1_7	Input port P1	ı	Input "H" or "L" level signal or leave the pin open.
P2_0 to P2_7	Input port P2	ı	Input "H" or "L" level signal or leave the pin open.
P3_0, P3_1, P3_3 to P3_5, P3_7	Input port P3	I	Input "H" or "L" level signal or leave the pin open.
P4_2, P4_5	Input port P4	ı	Input "H" or "L" level signal or leave the pin open.
P6_0 to P6_5	Input port P6	ı	Input "H" or "L" level signal or leave the pin open.
MODE	MODE	ı	Input "L".
P6_6	TXD output	0	Serial data input pin.
P6_7	RXD input	I	Serial data output pin.

Pin Functions (Flash Memory Standard Serial I/O Mode 3) **Table 20.8**

Pin	Name	I/O	Description
VCC,VSS	Power input		Apply the voltage guaranteed for programming and
			erasure to the VCC pin and 0 V to the VSS pin.
RESET	Reset input	I	Reset input pin.
P4_6/XIN	P4_6 input/clock input	I	Connect ceramic resonator or crystal oscillator between XIN and XOUT pins when connecting external
P4_7/XOUT	P4_7 input/clock output	I/O	oscillator. Apply "H" and "L" or leave the pin open when using as input port
P0_0 to P0_7	Input port P0	I	Input "H" or "L" level signal or leave the pin open.
P1_0 to P1_7	Input port P1	I	Input "H" or "L" level signal or leave the pin open.
P2_0 to P2_7	Input port P2	I	Input "H" or "L" level signal or leave the pin open.
P3_0, P3_1,	Input port P3	I	Input "H" or "L" level signal or leave the pin open.
P3_3 to P3_5,			
P3_7			
P4_2 to P4_5	Input port P4	I	Input "H" or "L" level signal or leave the pin open.
P6_0 to P6_7	Input port P6	I	Input "H" or "L" level signal or leave the pin open.
MODE	MODE	I/O	Serial data I/O pin. connect to the flash programmer.

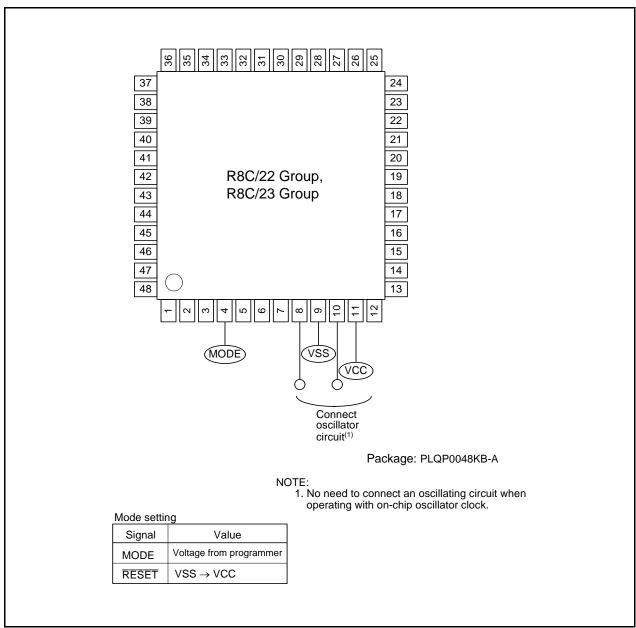

Figure 20.17 Pin Connections for Standard Serial I/O Mode 3

20.5.1.1 Example of Circuit Application in the Standard Serial I/O Mode

Figure 20.18 shows an example of Pin Processing in Standard Serial I/O Mode 2 and Figure 20.19 shows an example of Pin Processing in Standard Serial I/O Mode 3. Since the controlled pins vary depending on the programmer, refer to the manual of your serial programmer.

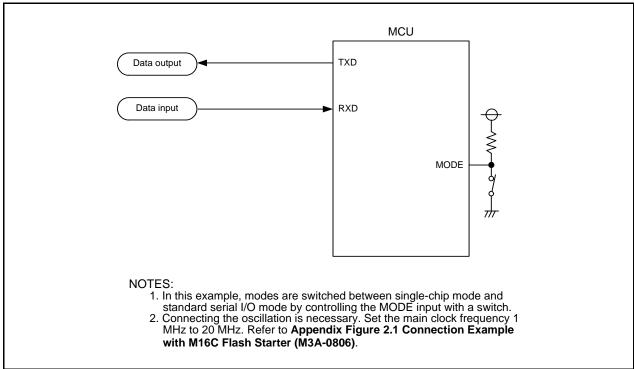

Figure 20.18 Pin Processing in Standard Serial I/O Mode 2

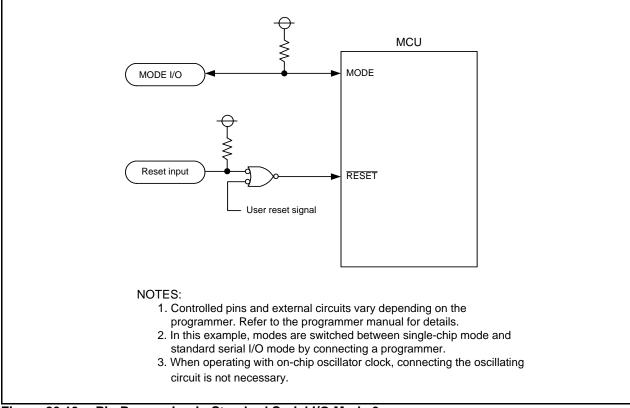

Figure 20.19 Pin Processing in Standard Serial I/O Mode 3

20.6 Parallel I/O Mode

Parallel I/O mode is used to input and output the required software command, address and data parallel to controls (read, program and erase) for internal flash memory. Use a parallel programmer which supports this MCU. Contact the manufacturer of your parallel programmer about the parallel programmer and refer to the user's manual of your parallel programmer for details on how to use it.

User ROM area can be rewritten shown in Figure 20.1 and Figure 20.2 in parallel I/O mode.

20.6.1 ROM Code Protect Function

The ROM code protect function disables to read and rewrite the flash memory. (Refer to **20.3 Functions to Prevent Rewriting of Flash Memory**.)

20.7 **Notes on Flash Memory**

20.7.1 **CPU Rewrite Mode**

20.7.1.1 **Operating Speed**

Before entering CPU rewrite mode (EW0 mode), select 5 MHz or below for the CPU clock using the CM06 bit in the CM0 register and the CM16 to CM17 bits in the CM1 register. This usage note is not needed for EW1 mode.

20.7.1.2 Prohibited Instructions

The following instructions cannot be used in EW0 mode because the flash memory internal data is referenced: UND, INTO, and BRK instructions.

20.7.1.3 Interrupts

Table 20.9 lists the EW0 Mode Interrupts and Table 20.10 lists the EW1 Mode Interrupts.

Table 20.9 EW0 Mode Interrupts

_			
		When Maskable Interrupt	When Watchdog Timer, Oscillation Stop
Mode	Status	Request is	Detection and Voltage Monitor 2 Interrupt
		Acknowledged	Request are Acknowledged
EW0	During automatic erasing	Any interrupt can be used	Once an interrupt request is acknowledged,
		by allocating a vector to	the auto-programming or auto-erasing is
		RAM	forcibly stopped immediately and resets the
			flash memory. An interrupt process starts
			after the fixed period and the flash memory
			restarts. Since the block during the auto-
			erasing or the address during the auto-
			programming is forcibly stopped, the
	Automatic writing		normal value may not be read. Execute the
	3		auto-erasing again and ensure the auto-
			erasing is completed normally.
			Since the watchdog timer does not stop
			during the command operation, the
			interrupt request may be generated. Reset
			the watchdog timer regularly.

NOTES:

- 1. Do not use the address match interrupt while the command is executed because the vector of the address match interrupt is allocated on ROM.
- 2. Do not use the non-maskable interrupt while block 0 is automatically erased because the fixed vector is allocated block 0.

Table 20.10 EW1 Mode Interrupts

Mode	Status	When Maskable Interrupt Request is Acknowledged	When Watchdog Timer, Oscillation Stop Detection and Voltage Monitor 2 Interrupt Request are Acknowledged
EW1	During automatic erasing (erase-suspend function is enabled) During automatic erasing (erase-suspend function is disabled) During automatic programming	The auto-erasing is suspended after td(SR-SUS) and the interrupt process is executed. The auto-erasing can be restarted by setting the FMR41 bit in the FMR4 register to 0 (erase restart) after the interrupt process completes. The auto-erasing has a priority and the interrupt request acknowledgement is waited. The interrupt process is executed after the auto-erasing completes. The auto-programming is suspended after td(SR-SUS)	Once an interrupt request is acknowledged, the auto-programming or auto-erasing is forcibly stopped immediately and resets the flash memory. An interrupt process starts after the fixed period and the flash memory restarts. Since the block during the auto-erasing or the address during the auto-programming is forcibly stopped, the normal value may not be read. Execute the auto-erasing again and ensure the auto-erasing is completed normally. Since the watchdog timer does not stop during the command operation,
	(program suspend function enabled) Auto programming (program suspend function disabled)	and the interrupt process is executed. The auto-programming can be restarted by setting the FMR42 bit in the FMR4 register to 0 (program restart) after the interrupt process completes. The auto-programming has a priority and the interrupt request acknowledgement is waited. The interrupt process is executed after the auto-programming completes.	the interrupt request may be generated. Reset the watchdog timer regularly using the erase-suspend function.

NOTES:

- 1. Do not use the address match interrupt while the command is executed because the vector of the address match interrupt is allocated on ROM.
- 2. Do not use the non-maskable interrupt while block 0 is automatically erased because the fixed vector is allocated block 0.

20.7.1.4 **How to Access**

Write 0 to the corresponding bits before writing 1 when setting the FMR01, FMR02, or FMR11 bit to 1. Do not generate an interrupt between writing 0 and 1.

Rewriting User ROM Area 20.7.1.5

In EW0 mode, if the power supply voltage drops while rewriting any block in which the rewrite control program is stored, the flash memory may not be able to be rewritten because the rewrite control program cannot be rewritten correctly. In this case, use standard serial I/O mode.

20.7.1.6 **Program**

Do not write additions to the already programmed address.

20.7.1.7 **Entering Stop Mode or Wait Mode**

Do not enter stop mode or wait mode during erase-suspend.

- 1. Vcc = 2.7 to 5.5 V at Topr = -40 to 85°C (D, J version) / -40 to 125°C (K version), unless otherwise specified.
- 2. Definition of programming/erasure endurance
 - The programming and erasure endurance is defined on a per-block basis.
 - If the programming and erasure endurance is n (n = 100 or 1,000), each block can be erased n times.
 - For example, if 1,024 1-byte writes are performed to different addresses in block A, a 1 Kbyte block, and then the block is erased, the programming/erasure endurance still stands at one. However, the same address must not be programmed more than once per erase operation (overwriting prohibited).
- 3. Endurance to guarantee all electrical characteristics after program and erase (1 to Min. value can be guaranteed).
- 4. In a system that executes multiple programming operations, the actual erasure endurance can be reduced by writing to sequential addresses in turn so that as much of the block as possible is used up before performing an erase operation. For example, when programming groups of 16 bytes, the effective number of rewrites can be minimized by programming up to 128 groups before erasing them all in one operation. It is also advisable to retain data on the erasure endurance of each block and limit the number of erase operations to a certain number.
- 5. If error occurs during block erase, attempt to execute the clear status register command, then the block erase command at least three times until the erase error does not occur.
- 6. Customers desiring program/erase failure rate information should contact their Renesas technical support representative.
- 7. The data hold time includes time that the power supply is off or the clock is not supplied.

Table 21.5 Flash Memory (Data Flash Block A, Block B) Electrical Characteristics⁽⁴⁾

-	Program, erase voltage		2.7	_	5.5	V
-	Read voltage		2.7	_	5.5	V
=	Program, erase temperature		-40	=	85(8)	°C
-	Data hold time ⁽⁹⁾	Ambient temperature = 55°C	20		-	year

- 1. Vcc = 2.7 to 5.5 V at Topr = -40 to 85°C (D, J version) / -40 to 125°C (K version), unless otherwise specified.
- 2. Definition of programming/erasure endurance
 - The programming and erasure endurance is defined on a per-block basis.
 - If the programming and erasure endurance is n (n = 10,000), each block can be erased n times.
 - For example, if 1,024 1-byte writes are performed to different addresses in block A, a 1 Kbyte block, and then the block is erased, the programming/erasure endurance still stands at one. However, the same address must not be programmed more than once per erase operation (overwriting prohibited).
- 3. Minimum endurance to guarantee all electrical characteristics after program and erase (1 to Min. value can be guaranteed).
- Standard of block A and block B when program and erase endurance exceeds 1,000 times. Byte program time to 1,000 times are the same as that in program ROM.
- 5. In a system that executes multiple programming operations, the actual erasure endurance can be reduced by writing to sequential addresses in turn so that as much of the block as possible is used up before performing an erase operation. For example, when programming groups of 16 bytes, the effective number of rewrites can be minimized by programming up to 128 groups before erasing them all in one operation. In addition, averaging the erasure endurance between blocks A and B can further reduce the actual erasure endurance. It is also advisable to retain data on the erasure endurance of each block and limit the number of erase operations to a certain number.
- 6. If error occurs during block erase, attempt to execute the clear status register command, then the block erase command at least three times until the erase error does not occur.
- 7. Customers desiring program/erase failure rate information should contact their Renesas technical support representative.
- 8. 125°C for K version.
- 9. The data hold time includes time that the power supply is off or the clock is not supplied.

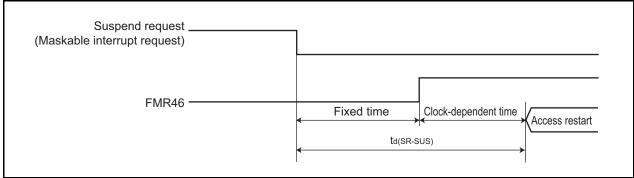

Figure 21.2 Time delay until Suspend

Table 21.6 Voltage Detection 1 Circuit Electrical Characteristics

Symbol	Parameter	Condition		Unit		
Syllibol	Falanetei	Condition	Min.	Тур.	Max.	Offic
Vdet1	Voltage detection level ^(3, 4)		2.70	2.85	3.00	V

td(E-A)	Waiting time until voltage detection circuit operation starts ⁽²⁾		=	=	100	μS
Vccmin	MCU operating voltage minimum value		2.70	=	=	V

- 1. The measurement condition is Vcc = 2.7 V to 5.5 V and Topr = -40°C to 85°C (D, J version) / -40°C to 125°C (K version).
- 2. Necessary time until the voltage detection circuit operates when setting to 1 again after setting the VCA26 bit in the VCA2 register to 0.
- 3. Hold Vdet2 > Vdet1.
- 4. This parameter shows the voltage detection level when the power supply drops. The voltage detection level when the power supply rises is higher than the voltage detection level when the power supply drops by approximately 0.1 V.
- Time until the voltage monitor 1 reset is generated after the voltage passes Vdet1 when Vcc falls. When using the digital filter, its sampling time is added to td(Vdet1-A). When using the voltage monitor 1 reset, maintain this time until Vcc = 2.0 V after the voltage passes Vdet1 when the power supply falls.

Table 21.7 Voltage Detection 2 Circuit Electrical Characteristics

Symbol	Parameter	Condition		Unit		
Symbol	Farameter	Condition	Min.	Тур.	Max.	Offic
Vdet2	Voltage detection level ⁽⁴⁾		3.3	3.6	3.9	V
td(Vdet2-A)	Voltage monitor 2 reset/interrupt request generation time ^(2, 5)		=	40	200	μS
=	Voltage detection circuit self power consumption	VCA27 = 1, Vcc = 5.0V	_	0.6	=	μΑ
td(E-A)	Waiting time until voltage detection circuit operation starts ⁽³⁾		=	=	100	μS

- 1. The measurement condition is Vcc = 2.7 V to 5.5 V and Topr = -40°C to 85°C (D, J version) / -40°C to 125°C (K version).
- 2. Time until the voltage monitor 2 reset/interrupt request is generated since the voltage passes Vdet2.
- 3. Necessary time until the voltage detection circuit operates when setting to 1 again after setting the VCA27 bit in the VCA2 register to 0.
- Hold Vdet2 > Vdet1.
- 5. When using the digital filter, its sampling time is added to td(Vdet2-A). When using the voltage monitor 2 reset, maintain this time until Vcc = 2.0 V after the voltage passes Vdet2 when the power supply falls.

Table 21.8 Power-on Reset Circuit, Voltage Monitor 1 Reset Circuit Electrical Characteristics(3)

Symbol	Parameter	Condition	Standard		Unit	
			Min.	Тур.	Max.	
Vpor1	Power-on reset valid voltage ⁽⁴⁾		_	_	0.1	V
Vpor2	Power-on reset or voltage monitor 1 valid voltage		0	=	Vdet1	V
trth	External power Vcc rise gradient	Vcc ≤ 3.6 V	20(2)	_	-	mV/msec
		Vcc > 3.6 V	20(2)	_	2,000	mV/msec

- 1. Topr = -40°C to 85°C (D, J version) / -40°C to 125°C (K version), unless otherwise specified.
- 2. This condition (the minimum value of external power Vcc rise gradient) does not apply if V_{por2} ≥ 1.0 V.
- 3. To use the power-on reset function, enable voltage monitor 1 reset by setting the LVD1ON bit in the OFS register to 0, the VW1C0 and VW1C6 bits in the VW1C register to 1 respectively, and the VCA26 bit in the VCA2 register to 1.
- 4. tw(por1) indicates the duration the external power Vcc must be held below the effective voltage (Vpor1) to enable a power on reset. When turning on the power for the first time, maintain tw(por1) for 30s or more if $-20^{\circ}C \le Topr \le 125^{\circ}C$, maintain tw(por1) for 30s or more if $-20^{\circ}C \le Topr \le 125^{\circ}C$, maintain tw(por1) for 30s or more if $-20^{\circ}C \le Topr \le 125^{\circ}C$, maintain tw(por1) for 30s or more if $-20^{\circ}C \le Topr \le 125^{\circ}C$, maintain tw(por1) for 30s or more if $-20^{\circ}C \le Topr \le 125^{\circ}C$, maintain tw(por1) for 30s or more if $-20^{\circ}C \le Topr \le 125^{\circ}C$, maintain tw(por1) for 30s or more if $-20^{\circ}C \le Topr \le 125^{\circ}C$, maintain tw(por1) for 30s or more if $-20^{\circ}C \le Topr \le 125^{\circ}C$, maintain tw(por1) for 30s or more if $-20^{\circ}C \le Topr \le 125^{\circ}C$, maintain tw(por1) for 30s or more if $-20^{\circ}C \le Topr \le 125^{\circ}C$, maintain tw(por1) for 30s or more if $-20^{\circ}C \le Topr \le 125^{\circ}C$, maintain tw(por1) for 30s or more if $-20^{\circ}C \le Topr \le 125^{\circ}C$, maintain tw(por1) for 30s or more if $-20^{\circ}C \le Topr \le 125^{\circ}C$, maintain tw(por1) for 30s or more if $-20^{\circ}C \le Topr \le 125^{\circ}C$, maintain tw(por1) for 30s or more if $-20^{\circ}C \le Topr \le 125^{\circ}C$, maintain tw(por1) for 30s or more if $-20^{\circ}C \le Topr \le 125^{\circ}C$, maintain tw(por1) for 30s or more if $-20^{\circ}C \le Topr \le 125^{\circ}C$, maintain tw(por1) for 30s or more if $-20^{\circ}C \le Topr \le 125^{\circ}C$, maintain tw(por1) for 30s or more if $-20^{\circ}C \le Topr \le 125^{\circ}C$, maintain tw(por1) for 30s or more if $-20^{\circ}C \le Topr \le 125^{\circ}C$, maintain tw(por1) for 30s or more if $-20^{\circ}C \le Topr \le 125^{\circ}C$, maintain tw(por1) for 30s or more if $-20^{\circ}C \le Topr \le 125^{\circ}C$, maintain tw(por1) for 30s or more if $-20^{\circ}C \le Topr \le 125^{\circ}C$, maintain tw(por1) for 30s or more if $-20^{\circ}C \le Topr \le 125^{\circ}C$, maintain tw(por1) for 30s or more if $-20^{\circ}C \le Topr \le 125^{\circ}C$, maintain tw(por1) for 30s or more if $-20^{\circ}C \le Topr \le 125^{\circ}C$, maintain tw(por1) for 30s or more if $-20^{\circ}C \le Topr \le 125^{\circ}C$, maintain tw(por1) for 30s or more if $-20^{\circ}C \le Topr \le 125^{\circ}C$, maintain tw(por1) for 30s or more if $-20^{\circ}C \le Topr \le 125^{\circ}C$, maintain tw(por1) for 30s or more if $-20^{\circ}C \le$ for 3,000s or more if $-40^{\circ}C \leq Topr < -20^{\circ}C$.

22. Usage Notes

22.1 Notes on Clock Generation Circuit

22.1.1 Stop Mode

When entering stop mode, set the FMR01 bit to "0" (CPU rewrite mode disabled) and the CM10 bit to "1" (stop mode). An instruction queue pre-reads 4 bytes from the instruction which sets the CM10 bit in the CM1 register to "1" (stop mode) and the program stops. Insert at least 4 NOP instructions following the JMP.B instruction after the instruction which sets the CM10 bit to "1".

• Example to enter stop mode

```
1.FMR0
                                   ; CPU rewrite mode disabled
      BCLR
      BSET
                   0,PRCR
                                    ; Protect disabled
                                    ; Enable interrupt
      FSET
                   I
                   0.CM1
                                   ; Stop mode
      BSET
                   LABEL_001
      JMP.B
LABEL 001:
      NOP
      NOP
      NOP
      NOP
```

22.1.2 Wait Mode

When entering wait mode, set the FMR01 bit to "0" (CPU rewrite mode disabled) and execute the WAIT instruction. An instruction queue pre-reads 4 bytes from the WAIT instruction and the program stops. Insert at least 4 NOP instructions after the WAIT instruction.

• Example to execute the WAIT instruction

```
BCLR 1,FMR0 ; CPU rewrite mode disabled
FSET I ; Enable interrupt
WAIT ; Wait mode
NOP
NOP
NOP
NOP
NOP
```

22.1.3 Oscillation Stop Detection Function

Since the oscillation stop detection function cannot be used if the XIN clock frequency is less than 2 MHz, set the OCD1 to OCD0 bits to 00b.

22.1.4 Oscillation Circuit Constants

Ask the maker of the oscillator to specify the beat oscillation circuit constants on your system.

22.2 Notes on Interrupts

22.2.1 Reading Address 00000h

Do not read the address 00000h by a program. When a maskable interrupt request is acknowledged, the CPU reads interrupt information (interrupt number and interrupt request level) from 00000h in the interrupt sequence. At this time, the acknowledged interrupt IR bit is set to 0.

If the address 00000h is read in a program, the IR bit for the interrupt which has the highest priority among the enabled interrupts is set to 0. This may cause a problem that the interrupt is canceled, or an unexpected interrupt is generated.

22.2.2 SP Setting

Set any value in the SP before an interrupt is acknowledged. The SP is set to 0000h after reset. Therefore, if an interrupt is acknowledged before setting any value in the SP, the program may run out of control.

22.2.3 External Interrupt and Key Input Interrupt

Either an "L" level or an "H" level of width shown in the Electrical Characteristics is necessary for the signal input to the $\overline{INT0}$ to $\overline{INT3}$ pins and $\overline{KI0}$ to $\overline{KI3}$ pins regardless of the CPU clocks. For details, refer to Table 21.19 External Interrupt INTi (i = 0 to 3) Input, Table 21.25 External Interrupt INTi (i = 0 to 3) Input.

22.2.4 Changing Interrupt Sources

The IR bit in the interrupt control register may be set to 1 (interrupt requested) when the interrupt source changes. When using an interrupt, set the IR bit to 0 (no interrupt requested) after changing the interrupt source. In addition, the changes of interrupt sources include all sources that change the interrupt sources assigned to individual software interrupt numbers, polarities, and timing. Therefore, when a mode change of the peripheral functions involves interrupt sources, edge polarities, and timing, Set the IR bit to 0 (no interrupt requested) after the change. Refer to each peripheral function for the interrupts caused by the peripheral functions.

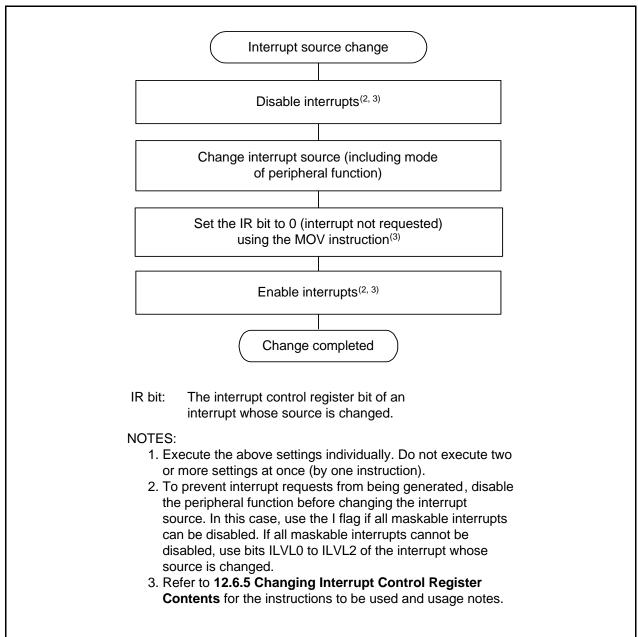

Figure 22.1 Example of Procedure for Changing Interrupt Sources

22.2.5 Changing Interrupt Control Register Contents

- (a) Each interrupt control register can only be changed while interrupt requests corresponding to that register are not generated. If interrupt requests may be generated, disable the interrupts before changing the interrupt control register.
- (b) When changing any interrupt control register after disabling interrupts, be careful with the instructions to be used.

When changing any bit other than IR bit

If an interrupt request corresponding to that register is generated while executing the instruction, the IR bit may not be set to 1 (interrupt requested), and the interrupt request may be ignored. If this causes a problem, use the following instructions to change the register.

Instructions to use: AND, OR, BCLR, BSET

When changing IR bit

If the IR bit is set to 0 (interrupt not requested), it may not be set to 0 depending on the instruction to be used. Therefore, use the MOV instruction to set the IR bit to 0.

(c) When disabling interrupts using the I flag, set the I flag according to the following sample programs. Refer to (b) for the change of interrupt control registers in the sample programs.

Sample programs 1 to 3 are preventing the I flag from being set to 1 (interrupt enables) before changing the interrupt control register for reasons of the internal bus or the instruction queue buffer.

Example 1: Use NOP instructions to prevent I flag being set to 1 before interrupt control register is changed

INT SWITCH1:

FCLR I ; Disable interrupts

AND.B #00H,0056H ; Set TRAIC register to 00h

NOP ;

NOP

FSET I ; Enable interrupts

Example 2: Use dummy read to have FSET instruction wait

INT_SWITCH2:

FCLR I ; Disable interrupts

AND.B #00H,0056H ; Set TRAIC register to 00h

MOV.W MEM,R0 ; <u>Dummy read</u> FSET I ; Enable interrupts

Example 3: Use POPC instruction to change I flag

INT SWITCH3:

PUSHC FLG

FCLR I ; Disable interrupts

AND.B #00H,0056H ; Set TRAIC register to 00h

POPC FLG ; Enable interrupts

22.3 **Notes on Timers**

22.3.1 **Notes on Timer RA**

- Timer RA stops counting after reset. Set the value to timer RA and timer RA prescaler before the count starts.
- Even if the prescaler and timer RA is read out in 16-bit units, these registers are read by 1 byte in the MCU. Consequently, the timer value may be updated during the period these two registers are being read.
- In pulse width measurement mode and pulse period measurement mode, the TEDGF and TUNDF bits in the TRACR register can be set to 0 by writing 0 to these bits by a program. However, these bits remain unchanged when 1 is written. When using the READ-MODIFY-WRITE instruction for the TRACR register, the TEDGF or TUNDF bit may be set to 0 although these bits are set to 1 while the instruction is executed. At the time, write 1 to the TEDGF or TUNDF bit which is not supposed to be set to 0 with the MOV instruction.
- When changing to pulse width measurement mode and pulse period measurement mode from other mode, the contents of the TEDGF and TUNDF bits are indeterminate. Write 0 to the TEDGF and TUNDF bits
- The TEDGF bit may be set to 1 by timer RA prescaler underflow which is generated for the first time since the count starts.
- When using the pulse period measurement mode, leave two periods or more of timer RA prescaler immediately after count starts, and set the TEDGF bit to 0.
- The TCSTF bit retains 0 (count stops) for 0 to 1 cycle of the count source after setting the TSTART bit to 1 (count starts) while the count stops.

During this time, do not access registers associated with timer RA⁽¹⁾ other than the TCSTF bit. Timer RA starts counting at the first valid edge of the count source after The TCSTF bit is set to 1 (during count). The TCSTF bit retains 1 for 0 to 1 cycle of the count source after setting the TSTART bit to 0 (count stops) while the count is performing. Timer RA counting is stopped when the TCSTF bit is set to 0. During this time, do not access registers associated with timer RA⁽¹⁾ other than the TCSTF bit.

- 1. Registers associated with timer RA: TRACR, TRAIOC, TRAMR, TRAPRE, TRA
- When the TRAPRE register is continuously written during count operation (TCSTF bit is set to 1), allow three or more cycles of the count source clock for each write interval.
- When the TRA register is continuously written during count operation (TCSTF bit is set to 1), allow three or more cycles of the prescaler underflow for each write interval.

22.3.2 **Notes on Timer RB**

- Timer RB stops counting after reset. Set the value to timer RB and timer RB prescaler before the count starts.
- Even if the prescaler and timer RB is read out in 16-bit units, these registers are read by 1 byte in the MCU. Consequently, the timer value may be updated during the period these two registers are being read.
- In programmable one-shot generation mode and programmable wait one-shot generation mode, when setting the TSTART bit in the TRBCR register to 0, 0 (stops counting) or setting the TOSSP bit in the TRBOCR register to 1 (stops one-shot), the timer reloads the value of reload register and stops. Therefore, read the timer count value in programmable one-shot generation mode and programmable wait one-shot generation mode before the timer stops.
- The TCSTF bit retains 0 (count stops) for 1 to 2 cycles of the count source after setting the TSTART bit to 1 (count starts) while the count stops.

During this time, do not access registers associated with timer RB⁽¹⁾ other than the TCSTF bit. The TCSTF bit retains 1 for 1 to 2 cycles of the count source after setting the TSTART bit to 0 (count stops) while the count is performing. Timer RB counting is stopped when the TCSTF bit is set to 0. During this time, do not access registers associated with timer RB⁽¹⁾ other than the TCSTF bit.

NOTE:

- 1. Registers associated with timer RB: TRBCR, TRBOCR, TRBIOC, TRBMR, TRBPRE, TRBSC, TRBPR
- If the TSTOP bit in the TRBCR register is set to 1 during timer operation, timer RB stops immediately.
- If 1 is written to the TOSST or TOSSP bit in the TRBOCR register, the value of the TOSSTF bit changes after one or two cycles of the count source have elapsed. If the TOSSP bit is written to 1 during the period between when the TOSST bit is written to 1 and when the TOSSTF bit is set to 1, the TOSSTF bit may be set to either 0 or 1 depending on the content state. Likewise, if the TOSST bit is written to 1 during the period between when the TOSSP bit is written to 1 and when the TOSSTF bit is set to 0, the TOSSTF bit may be set to either 0 or 1.

22.3.2.1 Timer mode

The following workaround should be performed in timer mode.

To write to registers TRBPRE and TRBPR during count operation (TCSTF bit is set to 1), note the following points:

- When the TRBPRE register is written continuously, allow three or more cycles of the count source for each write interval.
- When the TRBPR register is written continuously, allow three or more cycles of the prescaler underflow for each write interval.

22.3.2.2 Programmable waveform generation mode

The following three workarounds should be performed in programmable waveform generation mode.

- (1) To write to registers TRBPRE and TRBPR during count operation (TCSTF bit is set to 1), note the following points:
- When the TRBPRE register is written continuously, allow three or more cycles of the count source for each write interval.
- When the TRBPR register is written continuously, allow three or more cycles of the prescaler underflow for each write interval.
- (2) To change registers TRBPRE and TRBPR during count operation (TCSTF bit is set to 1), synchronize the TRBO output cycle using a timer RB interrupt, etc. This operation should be preformed only once in the same output cycle. Also, make sure that writing to the TRBPR register does not occur during period A shown in Figures 22.2 and 22.3.

The following shows the detailed workaround examples.

• Workaround example (a):

As shown in Figure 22.2, write to registers TRBSC and TRBPR in the timer RB interrupt routine. These write operations must be completed by the beginning of period A.

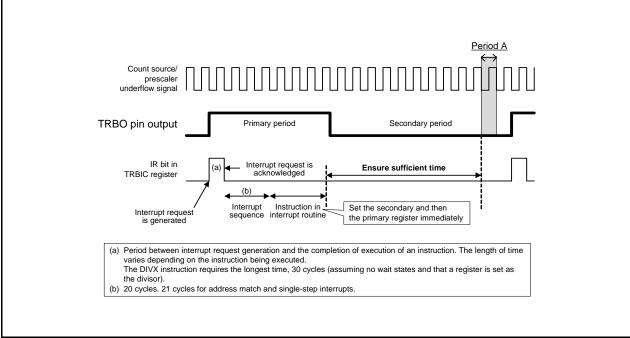

Figure 22.2 Workaround Example (a) When Timer RB Interrupt is Used

• Workaround example (b):

As shown in Figure 22.3 detect the start of the primary period by the TRBO pin output level and write to registers TRBSC and TRBPR. These write operations must be completed by the beginning of period A. If the port register's bit value is read after the port direction register's bit corresponding to the TRBO pin is set to 0 (input mode), the read value indicates the TRBO pin output value.

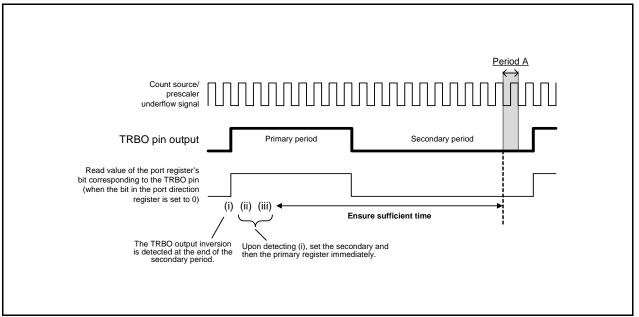

Figure 22.3 Workaround Example (b) When TRBO Pin Output Value is Read

(3) To stop the timer counting in the primary period, use the TSTOP bit in the TRBCR register. In this case, registers TRBPRE and TRBPR are initialized and their values are set to the values after reset.

22.3.2.3 Programmable one-shot generation mode

The following two workarounds should be performed in programmable one-shot generation mode.

- (1) To write to registers TRBPRE and TRBPR during count operation (TCSTF bit is set to 1), note the following points:
- When the TRBPRE register is written continuously during count operation (TCSTF bit is set to 1), allow three or more cycles of the count source for each write interval.
- When the TRBPR register is written continuously during count operation (TCSTF bit is set to 1), allow three or more cycles of the prescaler underflow for each write interval.
- (2) Do not set both the TRBPRE and TRBPR registers to 00h.

22.3.2.4 Programmable wait one-shot generation mode

The following three workarounds should be performed in programmable wait one-shot generation mode.

- (1) To write to registers TRBPRE and TRBPR during count operation (TCSTF bit is set to 1), note the following points:
- When the TRBPRE register is written continuously, allow three or more cycles of the count source for each write interval.
- When the TRBPR register is written continuously, allow three or more cycles of the prescaler underflow for each write interval.
- (2) Do not set both the TRBPRE and TRBPR registers to 00h.
- (3) Set registers TRBSC and TRBPR using the following procedure.
 - (a) To use "INTO pin one-shot trigger enabled" as the count start condition Set the TRBSC register and then the TRBPR register. At this time, after writing to the TRBPR register, allow an interval of 0.5 or more cycles of the count source before trigger input from the INTO pin.
 - (b) To use "writing 1 to TOSST bit" as the start condition Set the TRBSC register, the TRBPR register, and then TOSST bit. At this time, after writing to the TRBPR register, allow an interval of 0.5 or more cycles of the count source before writing to the TOSST bit.

22.3.3 Notes on Timer RD

22.3.3.1 TRDSTR Register

- Set the TRDSTR register using the MOV instruction.
- When the CSELi (i = 0 or 1) is set to 0 (the count stops at compare match of registers TRDi and TRDGRAi), the count does not stop and the TSTARTi bit remains unchanged even if 0 (count stops) is written to the TSTARTi bit.

Therefore, set the TSTARTi bit to 0 to change other bits without changing the TSTARTi bit when the CSELi bit is set to 0.

To stop counting by a program, set the TSTARTi bit to 0 after setting the CSELi bit to 1. Although the CSELi bit is set to 1 and the TSTARTi bit is set to 0 at the same time (with 1 instruction), the count cannot be stopped.

• Table 22.1 lists the TRDIOji (j = A, B, C, or D) Pin Output Level when Count Stops to use the TRDIOji pin with the timer RD output.

Table 22.1 TRDIOji (j = A, B, C, or D) Pin Output Level when Count Stops

Count Stop	TRDIOji Pin Output when Count Stops		
When the CSELi bit is set to 1, set the TSTARTi bit to 0 and the count	Hold the output level immediately before the		
stops.	count stops.		
When the CSELi bit is set to 0, the count stops at compare match of	Hold the output level after output changes by		
registers TRDi and TRDGRAi.	compare match.		

22.3.3.2 TRDi Register (i = 0 or 1)

• When writing the value to the TRDi register by a program while the TSTARTi bit in the TRDSTR register is set to 1 (count starts), avoid to overlap with the timing to set the TRDi register to 0000h, and then write. When the timing to set the TRDi register to 0000h overlaps with the timing to write the value to the TRDi register, the value is not written and the TRDi register is set to 0000h.

These precautions are applicable when selecting the following by the CCLR2 to CCLR0 bits in the TRDCRi register.

- 001b (clear by the TRDi register at the compare match with the TRDGRAi register)
- 010b (clear by the TRDi register at the compare match with the TRDGRBi register.)
- 011b (synchronous clear)
- 101b (clear by the TRDi register at the compare match with the TRDGRCi register.)
- 110b (clear by the TRDi register at the compare match with the TRDGRDi register.)
- When writing the value to the TRDi register and continuously reading the same register, the value before writing may be read. In this case, execute the JMP.B instruction between the writing and reading.

Program Example MOV.W #XXXXh, TRD0 ;Writing JMP.B L1 ;JMP.B L1: MOV.W TRD0,DATA ;Reading

22.3.3.3 TRDSRi Register (i = 0 or 1)

When writing the value to the TRDSRi register and continuously reading the same register, the value before writing may be read. In this case, execute the JMP.B instruction between the writing and reading.

Program Example MOV.B #XXh, TRDSR0 ;Writing JMP.B L1 ;JMP.B L1: MOV.B TRDSR0,DATA ;Reading

22.3.3.4 Count Source Switch

• When switching the count source, switch it after the count stops.

Change procedure

- (1) Set the TSTARTi (i = 0 or 1) bit in the TRDSTR register to 0 (count stops).
- (2) Change the TCK2 to TCK0 bits in the TRDCRi register.
- When changing the count source from fOCO40M to the other and stopping fOCO40M, wait 2 cycles or more of f1 after setting the clock switch, and then stop fOCO40M.

Change procedure

- (1) Set the TSTARTi (i = 0 or 1) bit in the TRDSTR register to 0 (count stops).
- (2) Change the TCK2 to TCK0 bits in the TRDCRi register.
- (3) Wait 2 cycles or more of f1.
- (4) Set the FRA00 bit in the FRA0 register to 0 (high-speed on-chip oscillator stops).

22.3.3.5 Input Capture Function

- Set the pulse width of input capture signal to 3 cycles or more of the Timer RD operation clock. (Refer to **Table 14.11 Timer RD Operation Clocks**.)
- The value in the TRDi register is transferred to the TRDGRji register after 2 to 3 cycles of the Timer RD operation clock since the input capture signal is applied to the TRDIOji pin (i = 0 or 1, j = either A, B, C or D) (no digital filter).

22.3.3.6 Reset Synchronous PWM Mode

- When reset synchronous PWM mode is used for motor control, use it with OLS0 = OLS1.
- Set to reset synchronous PWM mode in the following procedure:

Change procedure

- (1) Set the TSTART0 bit in the TRDSTR register to 0 (count stops).
- (2) Set the CMD1 to CMD0 bits in the TRDFCR register to 00b (timer mode, PWM mode, and PWM3 mode).
- (3) Set the CMD1 to CMD0 bits to 01b (reset synchronous PWM mode).
- (4) Set the registers associated with other Timer RD again.

22.3.3.7 Complementary PWM Mode

- When complementary PWM mode is used for motor control, use it with OLS0 = OLS1.
- Change the CMD1 to CMD0 bits in the TRDFCR register in the following procedure.

Change procedure: When setting to complementary PWM mode (including re-set), or changing the transfer timing from the buffer register to the general register in complementary PWM mode.

- (1) Set both the TSTART0 and TSTART1 bits in the TRDSTR register to 0 (count stops).
- (2) Set the CMD1 to CMD0 bits in the TRDFCR register to 00b (timer mode, PWM mode, and PWM3 mode)
- (3) Set the DMD1 to CMD0 bits to 10b or 11b (complementary PWM mode).
- (4) Set the registers associated with other Timer RD again.

Change procedure: When stopping complementary PWM mode

- (1) Set both the TSTART0 and CSEL1 bits in the TRDSTR register to 0 (count stops).
- (2) Set the CMD1 to CMD bits to 00b (other than reset synchronous PWM mode, complementary PWM mode)
- Do not write to the TRDGRA0, TRDGRB0, TRDGRA1 and TRDGRB1 registers during operation. When changing the PWM waveform, transfer the value written to the TRDGRD0, TRDGRC1 and TRDGRD1 registers to the TRDGRB0, TRDGRA1 and TRDGRB1 registers using the buffer operation. However, to write data to the TRDGRD0, TRDGRC1, or TRDGRD1 register, set bits BFD0, BFC1, and BFD1 to 0 (general register). After this, bits BFD0, BFC1, and BFD1 may be set to 1 (buffer register). The PWM period cannot be changed.

• When the value in the TRDGRA0 register is assumed as m, the TRD0 register counts order of m - 1, m, m + 1, m, m - 1 when changing from increment to decrement.

When changing from m to m + 1, the IMFA bit is set to 1. Also, the CMD1 to CMD0 bits in the TRDFCR register are set to 11b (complementary PWM mode, buffer data transferred by the compare match in the TRD0 and TRDGRA0 registers), the content in the buffer register (TRDGRD0, TRDGRC1, TRDGRD1) is transferred to the general register (TRDGRB0, TRDGRA1, TRDGRB1).

For the order of m + 1, m, m - 1 operation, the IMFA bit remains unchanged and data are not transferred to the register such as the TRDGRA0 register.

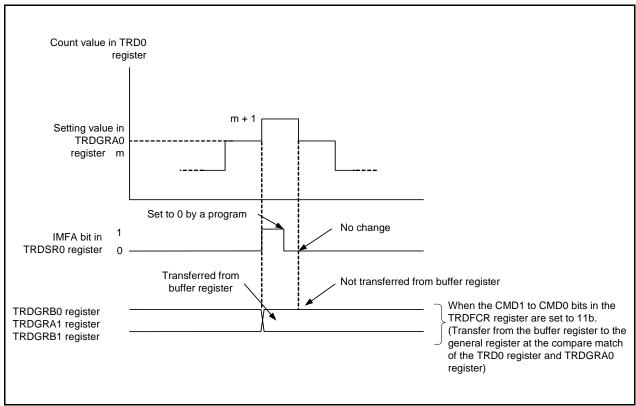

Figure 22.4 Operation at Compare Match between Registers TRD0 and TRDGRA0 in Complementary PWM Mode

• The TRD1 register counts the order of 1, 0, FFFFh, 0, 1 when changing from decrement to increment. The UDF bit is set to 1 by the order of 1, 0, FFFFh operation. Also, when the CMD1 to CMD0 bits in the TRDFCR register are set to 10b (complementary PWM mode, buffer data transferred by the underflow in the TRD1 register), the content in the buffer register (TRDGRD0, TRDGRC1, TRDGRD1) is transferred to the general register (TRDGRB0, TRDGRA1, TRDGRB1). For the order of FFFFh, 0, 1 operation, data are not transferred to the register such as the TRDGRB0 register. Also, at this time, the OVF bit remains unchanged.

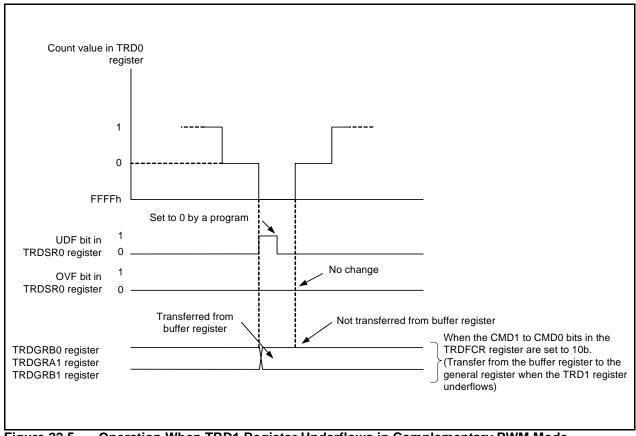

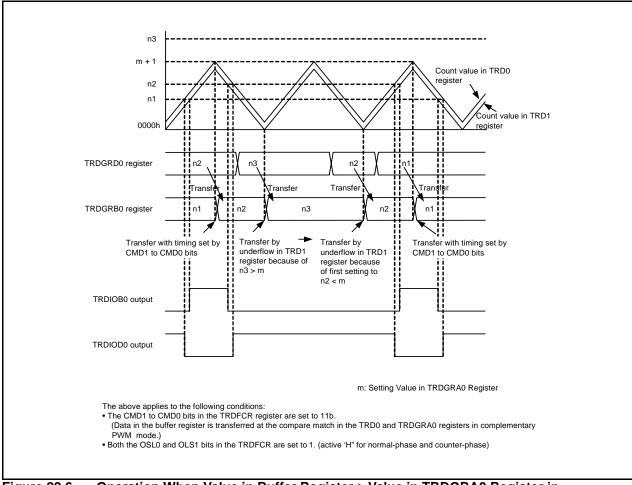

Figure 22.5 Operation When TRD1 Register Underflows in Complementary PWM Mode

• Select with the CMD1 to CMD0 bits for the data transfer timing from the buffer register to the general register. However, transfer with the following timing in spite of the value of the CMD1 to CMD0 bits for the following cases:

Value in buffer register ≥ Value in TRDGRA0 register:

Transfer at the underflow in the TRD1 register.

And then, when setting the buffer register to 0001h or above and the smaller value than the one in the TRDGRA0 register, and the TRD1 register underflows in the fist time after setting, the value is transferred to the general register. After that, transfer the value with the timing selected by the CMD1 to CMD0 bits.

Operation When Value in Buffer Register ≥ Value in TRDGRA0 Register in Figure 22.6 **Complementary PWM Mode**

When the value in the buffer register is set to 0000h:

Transfer by the compare match in the TRD0 and TRDGRA0 registers.

And then, when setting the buffer register to 0001h or above and the smaller value than the one in the TRDGRA0 register, and the compare match in the TRD0 and TRDGRA0 registers in the fist time after setting, the value is transferred to the general register. After that, transfer the value with the timing selected by the CMD1 to CMD0 bits.

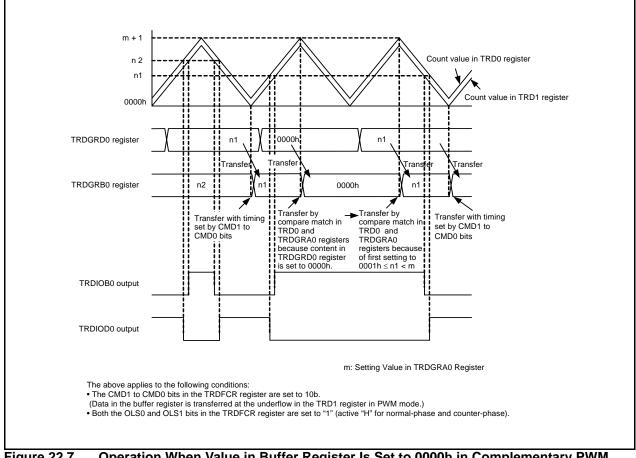

Figure 22.7 Operation When Value in Buffer Register Is Set to 0000h in Complementary PWM Mode

22.3.3.8 **Count Source fOCO40M**

The count source fOCO40M can be used with supply voltage VCC = 3.0 to 5.5 V. For supply voltage other than that, do not set bits TCK2 to TCK0 in registers TRDCR0 and TRDCR to 110b (select fOCO40M as the count source).

22.3.4 Notes on Timer RE

22.3.4.1 Starting and Stopping Count

Timer RE has the TSTART bit for instructing count start or stop, and the TCSTF bit which indicates count start or stop. The TSTART and TCSTF bits are in the TRECR1 register.

Timer RE starts counting when setting the TSTART bit to 1 (count starts) and the TCSTF bit is set to 1 (count starts). It takes the time for up to 2 cycles of the count source until the TCSTF bit is set to 1 after setting the TSTART bit to 1. During this time, do not access registers associated with Timer $RE^{(1)}$ other than the TCSTF bit.

Also, timer RE stops counting when setting the TSTART bit to 0 (count stops) and the TCSTF bit is set to 0 (count stops). It takes the time for up to 2 cycles of the count source until the TCSTF bit is set to 0 after setting the TSTART bit to 0. During this time, do not access registers associated with timer RE other than the TCSTF bit.

NOTE:

1. Registers associated with Timer RE: TRESEC, TREMIN, TRECR1, TRECR2, TRECSR

22.3.4.2 Register Setting

Write to the following registers or bits while timer RE stops.

- TRESEC and TRECR2 registers
- The INT bit in TRECR1 register
- RCS0 to RCS2 bits in TRECSR register

The state while Timer RE stops is indicated as the state where the TSTART and TCSTF bits in the TRECR1 register are set to 0 (timer RE stops).

Also, set all above-mentioned registers and bits (immediately before timer RE count starts) before setting the TRECR2 register.

22.4 Notes on Serial Interface

• When reading data from the UiRB (i = 0 or 1) register even in the clock asynchronous serial I/O mode or in the clock synchronous serial I/O mode. Ensure to read data in 16-bit unit. When the high-order byte of the UiRB register is read, the PER and FER bits in the UiRB register and the RI bit in the UiC1 register are set to 0. To check receive errors, read the UiRB register and then use the read data.

Example (when reading receive buffer register):

MOV.W 00A6H,R0 ; Read the U0RB register

• When writing data to the UiTB register in the clock asynchronous serial I/O mode with 9-bit transfer data length, write data high-order byte first, then low-order byte in 8-bit units.

Example (when reading transmit buffer register):

MOV.B #XXH,00A3H ; Write the high-order byte of U0TB register MOV.B #XXH,00A2H ; Write the low-order byte of U0TB register

Clock Synchronous Serial Interface 22.5

22.5.1 Notes on Clock Synchronous Serial I/O with Chip Select

Set the IICSEL bit in the PMR register to 0 (select clock synchronous serial I/O with chip select function) to use the clock synchronous serial I/O with chip select.

22.5.2 Notes on I²C Bus Interface

Set the IICSEL bit in the PMR register to 1 (select I²C bus interface function) to use I²C bus interface.

22.5.2.1 **Multimaster Operation**

The following actions must be performed to use the I²C bus interface in multimaster operation.

• Transfer rate

Set the transfer rate by 1/1.8 or faster than the fastest rate of the other masters. For example, if the fastest transfer rate of the other masters is set to 400 kbps, the I²C-bus transfer rate in this MCU should be set to 223 kbps (= 400/1.18) or more.

- Bits MST and TRS in the ICCR1 register setting
- (a) Use the MOV instruction to set bits MST and TRS.
- (b) When arbitration is lost, confirm the contents of bits MST and TRS. If the contents are other than the MST bit set to 0 and the TRS bit set to 0 (slave receive mode), set the MST bit to 0 and the TRS bit to 0 again.

22.5.2.2 **Master Receive Mode**

Either of the following actions must be performed to use the I²C bus interface in master receive mode.

- (a) In master receive mode while the RDRF bit in the ICSR register is set to 1, read the ICDRR register before the rising edge of the 8th clock.
- (b) In master receive mode, set the RCVD bit in the ICCR1 register to 1 (disables the next receive operation) to perform 1-byte communications.

22.6 Notes on Hardware LIN

For the time-out processing of the header and response fields, use another timer to measure the duration of time with respect to a Synch Break detection interrupt as the starting point.

22.7 Notes on CAN Module

22.7.1 Reading COSTR Register

The CAN module updates the status of the COSTR register in a certain period. When the CPU and the CAN module access to the COSTR register at the same time, the CPU has the access priority; the access from the CAN module is disabled. Consequently, when the updating period of the CAN module matches the access period from the CPU, the status of the CAN module cannot be updated. (See Figure 22.8)

Accordingly, be careful about the following points so that the access period from the CPU should not match the updating period of the CAN module:

- There should be a wait time of 3fCAN or longer (see Table 22.2) before the CPU reads the COSTR register. (See Figure 22.9)
- When the CPU polls the COSTR register, the polling period must be 3fCAN or longer. (See Figure 22.10)

Table 22.2 CAN Module Status Updating Period

3 fCAN Period = 3 x XIN (Original Oscillation Period) x Di	ivision Value of CAN Clock (CCLK)
(Example 1) Condition XIN 16 MHz CCLK: Divided by 1	· · · · · · · · · · · · · · · · · · ·
	3 fCAN period = 3 x 62.5 ns x 2 = 375 ns
(Example 3) Condition XIN 16 MHz CCLK: Divided by 4	·
(Example 4) Condition XIN 16 MHz CCLK: Divided by 8	· · · · · · · · · · · · · · · · · · ·

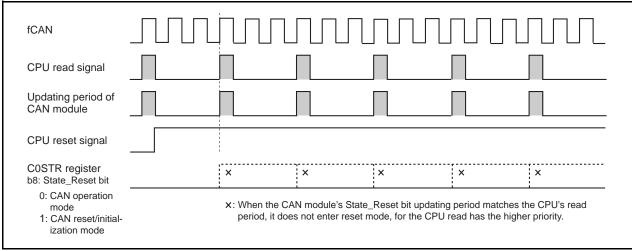

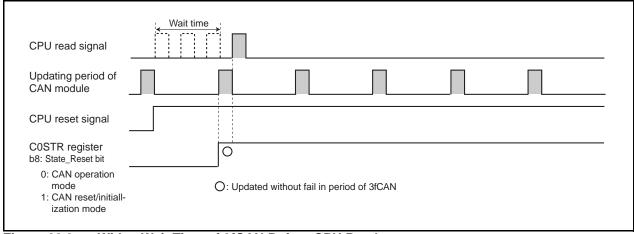

Figure 22.8 When Updating Period of CAN Module Matches Access Period from CPU

With a Wait Time of 3fCAN Before CPU Read Figure 22.9

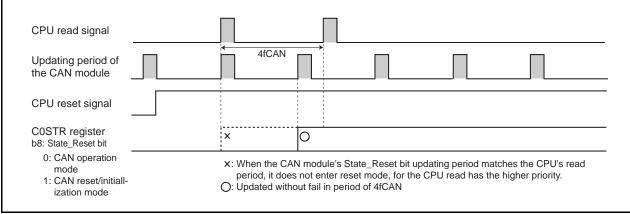

Figure 22.10 When Polling Period of CPU is 3fCAN or Longer

22.7.2 Performing CAN Configuration

If the Reset bit in the C0CTLR register is changed from 0 (operation mode) to 1 (reset/initialization mode) in order to place the CAN module from CAN operation mode into CAN reset/initialization mode, always be sure to check that the State_Reset bit in the C0STR register is set to 1 (reset mode).

Similarly, if the Reset bit is changed from 1 to 0 in order to place the CAN module from CAN reset/initialization mode into CAN operation mode, always be sure to check that the State_Reset bit is set to 0 (operation mode).

The procedure is described below.

To place CAN Module from CAN Operation Mode into CAN Reset/Initialization Mode

- Change the Reset bit from 0 to 1.
- Check that the State_Reset bit is set to 1.

To place CAN Module from CAN Reset/Initialization Mode into CAN Operation Mode

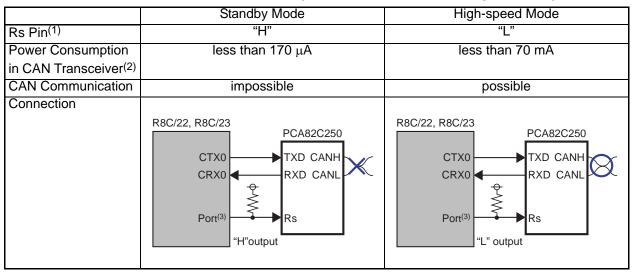

- Change the Reset bit from 1 to 0.
- Check that the State_Reset bit is set to 0.

22.7.3 Suggestions to Reduce Power Consumption

When not performing CAN communication, the operation mode of CAN transceiver should be set to "standby mode" or "sleep mode".

When performing CAN communication, the power consumption in CAN transceiver in not performing CAN communication can be substantially reduced by controlling the operation mode pins of CAN transceiver. Table 22.3 and Table 22.4 show Recommended Pin Connections.

Table 22.3 Recommended Pin Connections (In Case of PCA82C250: Philips Product)

NOTES:

- 1. The pin which controls the operation mode of CAN transceiver.
- 2. In case of Topr = 25°C
- 3. Connect to enabled port to control CAN transceiver.

Table 22.4 Recommended Pin Connections (In Case of PCA82C252: Philips Product)

	Sleep Mode	Normal Operation Mode		
STB Pin ⁽¹⁾	" <u>L</u> "	"H"		
EN Pin ⁽¹⁾	" <u>L</u> "	"H"		
Power Consumption	less than 50 μA	less than 35 mA		
in CAN Transceiver ⁽²⁾				
CAN Communication	impossible	possible		
Connection	PCA82C252 TXD CANH RXD CANL Port(3) Port(3) "L" output	R8C/22, R8C/23 CTX0 CRX0 Port(3) Port(3) WH" output		

NOTES:

- 1. The pin which controls the operation mode of CAN transceiver.
- 2. In case of Topr = 25°C
- 3. Connect to enabled port to control CAN transceiver.

22.8 Notes on A/D Converter

- Write to each bit (other than bit 6) in the ADCON0 register, each bit in the ADCON1 register, or the SMP bit in the ADCON2 register when the A/D conversion stops (before a trigger occurs). When the VCUT bit in the ADCON1 register is changed from 0 (VREF not connected) to 1 (VREF connected), wait for at least 1 µs or longer before the A/D conversion starts.
- When changing A/D operating mode, select an analog input pin again.
- When using in one-shot mode. Ensure that the A/D conversion is completed and read the AD register. The IR bit in the ADIC register or the ADST bit in the ADCON0 register can determine whether the A/D conversion is completed.
- When using the repeat mode, select the frequency of the A/D converter operating clock φAD or more for the CPU clock during A/D conversion.
 Do not select the fOCO F for the φAD.
 - Do not select the fOCO-F for the ϕ AD.
- If setting the ADST bit in the ADCON0 register to 0 (A/D conversion stops) by a program and the A/D conversion is forcibly terminated during the A/D conversion operation, the conversion result of the A/D converter will be indeterminate. If the ADST bit is set to 0 by a program, do not use the value of AD register.
- Connect 0.1 µF capacitor between the P4_2/VREF pin and AVSS pin.
- Do not enter stop mode during A/D conversion.
- Do not enter wait mode when the CM02 bit in the CM0 register is set to 1 (peripheral function clock stops in wait mode) during A/D conversion.

22.9 **Notes on Flash Memory**

22.9.1 **CPU Rewrite Mode**

22.9.1.1 **Operating Speed**

Before entering CPU rewrite mode (EW0 mode), select 5 MHz or below for the CPU clock using the CM06 bit in the CM0 register and the CM16 to CM17 bits in the CM1 register. This usage note is not needed for EW1 mode.

22.9.1.2 **Prohibited Instructions**

The following instructions cannot be used in EW0 mode because the flash memory internal data is referenced: UND, INTO, and BRK instructions.

22.9.1.3 Interrupts

Table 22.5 lists the EW0 Mode Interrupts and Table 22.6 lists the EW1 Mode Interrupts.

Table 22.5 EW0 Mode Interrupts

		When Maskable Interrupt	When Watchdog Timer, Oscillation Stop
Mode	Status	Request is	Detection and Voltage Monitor 2 Interrupt
		Acknowledged	Request are Acknowledged
EW0	During automatic erasing	Any interrupt can be used	Once an interrupt request is acknowledged,
		by allocating a vector to	the auto-programming or auto-erasing is
		RAM	forcibly stopped immediately and resets the
			flash memory. An interrupt process starts
			after the fixed period and the flash memory
			restarts. Since the block during the auto-
			erasing or the address during the auto-
			programming is forcibly stopped, the
	Automatic writing		normal value may not be read. Execute the
	ğ		auto-erasing again and ensure the auto-
			erasing is completed normally.
			Since the watchdog timer does not stop
			during the command operation, the
			interrupt request may be generated. Reset
			the watchdog timer regularly.

NOTES:

- 1. Do not use the address match interrupt while the command is executed because the vector of the address match interrupt is allocated on ROM.
- 2. Do not use the non-maskable interrupt while block 0 is automatically erased because the fixed vector is allocated block 0.

Table 22.6 EW1 Mode Interrupts

Mode	Status	When Maskable Interrupt Request is Acknowledged	When Watchdog Timer, Oscillation Stop Detection and Voltage Monitor 2 Interrupt Request are Acknowledged
EW1	During automatic erasing (erase-suspend function is enabled) During automatic erasing (erase-suspend function is disabled)	The auto-erasing is suspended after td(SR-SUS) and the interrupt process is executed. The auto-erasing can be restarted by setting the FMR41 bit in the FMR4 register to 0 (erase restart) after the interrupt process completes. The auto-erasing has a priority and the interrupt request acknowledgement is waited. The interrupt process is executed after the auto-erasing completes.	Once an interrupt request is acknowledged, the auto-programming or auto-erasing is forcibly stopped immediately and resets the flash memory. An interrupt process starts after the fixed period and the flash memory restarts. Since the block during the auto-erasing or the address during the auto-programming is forcibly stopped, the normal value may not be read. Execute the auto-erasing again and ensure the auto-erasing is completed normally.
	During automatic programming (program suspend function enabled)	The auto-programming is suspended after td(SR-SUS) and the interrupt process is executed. The auto-programming can be restarted by setting the FMR42 bit in the FMR4 register to 0 (program restart) after the interrupt process completes.	Since the watchdog timer does not stop during the command operation, the interrupt request may be generated. Reset the watchdog timer regularly using the erase-suspend function.
	Auto programming (program suspend function disabled)	The auto-programming has a priority and the interrupt request acknowledgement is waited. The interrupt process is executed after the auto-programming completes.	

NOTES:

- 1. Do not use the address match interrupt while the command is executed because the vector of the address match interrupt is allocated on ROM.
- 2. Do not use the non-maskable interrupt while block 0 is automatically erased because the fixed vector is allocated block 0.

22.9.1.4 **How to Access**

Write 0 to the corresponding bits before writing 1 when setting the FMR01, FMR02, or FMR11 bit to 1. Do not generate an interrupt between writing 0 and 1.

22.9.1.5 **Rewriting User ROM Area**

In EW0 mode, if the power supply voltage drops while rewriting any block in which the rewrite control program is stored, the flash memory may not be able to be rewritten because the rewrite control program cannot be rewritten correctly. In this case, use standard serial I/O mode.

22.9.1.6 **Program**

Do not write additions to the already programmed address.

22.9.1.7 **Entering Stop Mode or Wait Mode**

Do not enter stop mode or wait mode during erase-suspend.

22.10 Notes on Noise

22.10.1 Inserting a Bypass Capacitor between VCC and VSS Pins as a Countermeasure against Noise and Latch-up

Connect the bypass capacitor (at least $0.1~\mu F$) using the shortest and thickest as possible.

22.10.2 Countermeasures against Noise Error of Port Control Registers

During severe noise testing, mainly power supply system noise, and introduction of external noise, the data of port related registers may be changed.

As a firmware countermeasure, it is recommended to periodically reset the port registers, port direction registers and pull-up control registers. However, examine fully before introducing the reset routine as conflicts may be created between this reset routine and interrupt routines.

23. Notes on On-Chip Debugger

When using the on-chip debugger to develop the R8C/22 and R8C/23 Groups program and debug, pay the following attention.

- (1) Do not access the registers associated with UART1.
- (2) Some of the user flash memory and RAM areas are used by the on-ship debugger. These areas cannot be accessed by the user.
 - Refer to the on-chip debugger manual for which areas are used.
- (3) Do not set the address match interrupt (registers AIER, RMAD0, and RMAD1 and fixed vector tables) in a user system.
- (4) Do not use the BRK instruction in a user system.

Connecting and using the on-chip debugger has some peculiar restrictions. Refer to each on-chip debugger manual for on-chip debugger details.

24. Notes on Emulator Debugger

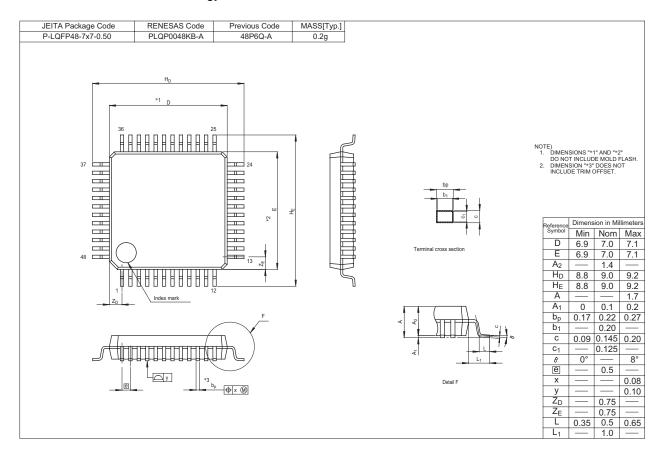

When using the emulator debugger to develop the R8C/22 and R8C/23 Groups program and debug, pay the following attention.

(1) Do not use the following flash memory areas because these areas are used for the emulator debugger. When debugging of these areas, intensive evaluation on the real chip is required. ROM 128 KB Product (R5F2122CJFP, R5F2122CKFP, R5F2123CJFP, R5F2123CKFP) addresses 20000h to 23FFFh

Connecting and using the emulator debugger has some peculiar restrictions. Refer to each emulator debugger manual for emulator debugger details.

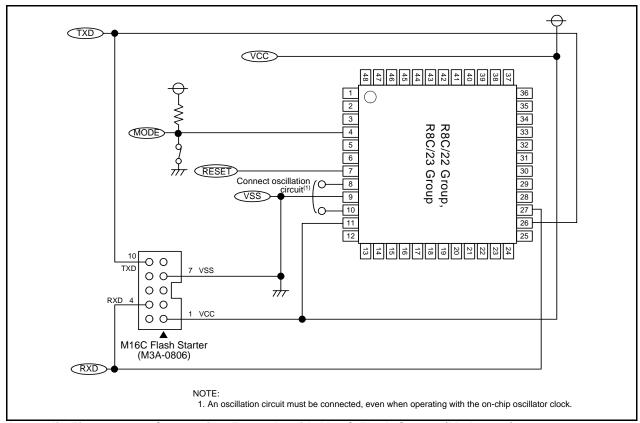

Appendix 1. Package Dimensions

Diagrams showing the latest package dimensions and mounting information are available in the "Packages" section of the Renesas Technology website.

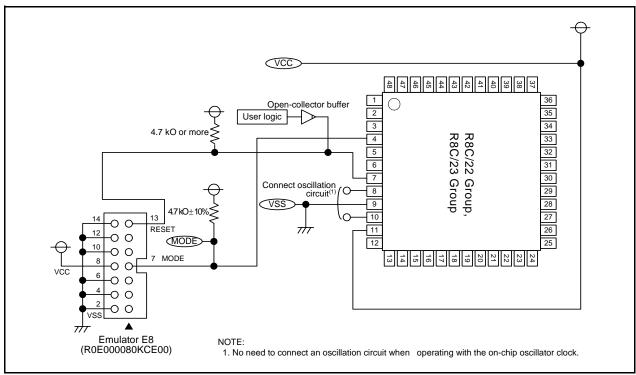

Appendix 2. Connection Examples between Serial Writer and On-Chip Debugging Emulator

Appendix Figure 2.1 shows the Connection Example with M16C Flash Starter (M3A-0806) and Appendix Figure 2.2 shows the Connection Example with E8 Emulator (R0E000080KCE00).

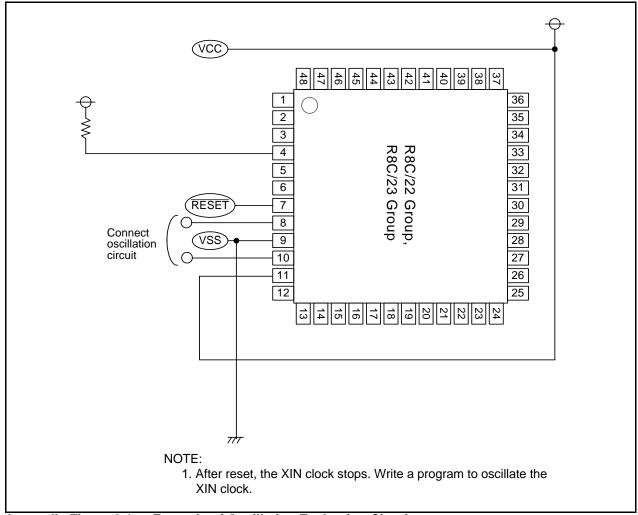

Appendix Figure 2.1 Connection Example with M16C Flash Starter (M3A-0806)

Appendix Figure 2.2 Connection Example with E8 Emulator (R0E000080KCE00)

Appendix 3. Example of Oscillation Evaluation Circuit

Appendix Figure 3.1 shows the Example of Oscillation Evaluation Circuit.

Appendix Figure 3.1 Example of Oscillation Evaluation Circuit

Davi	Data		Description
Rev.	Date	Page	Summary
0.20	Jun 28, 2006	254	Table 14.34 TRDGRji Register Functions in PWM3 Mode revised. On the 4th line from the bottom; "Registers TRDGRC0, ~ (buffer register)." added.
		255	Figure 14.109 Operating Example of PWM3 Mode revised.
		258	 14.3.12 Notes on Timer RD; "14.3.13 Precautions on Timer RD" → "14.3.12 Notes on Timer RD" revised. 14.3.12.1 TRDSTR Register (i = 0 or 1) added.
		259	14.3.12.6 Reset Synchronous PWM Mode revised. 14.3.12.7 Complementary PWM Mode revised.
		263	14.3.13.7 PWM3 mode deleted. 14.3.12.8 Count Source fOCO40M added.
		264	14.4 Timer RE, on the 3rd line; "The count source ~ timer operations." added.
		271	14.4.2 Notes on Timer RE; "14.4.2 Precautions on Timer RE" \rightarrow "14.4.2 Notes on Timer RE" revised.
		276	Figure 15.5 Registers UiC0 and UiC1 (i = 0 or 1); The UiC0 register (i=0 or 1) revised.
		284	Table 15.5 Registers Used and Settings for UART Mode revised. Table 15.6 I/O Pin Functions in UART Mode revised.
		285	Figure 15.10 Transmit Timing in UART Mode revised.
		286	Figure 15.11 Receive Timing Example in UART Mode revised.
		288	15.3 Notes on Serial Interface;"15.3 Precautions on Serial Interface" → "15.3 Notes on Serial Interface" revised.
		289	16. Clock Synchronous Serial Interface, on the 3rd line; "(SSU)" added.
		290	16.2 Clock Synchronous Serial I/O with Chip Select (SSU); "(SSU)" added. Table 16.2 Clock Synchronous Serial I/O with Chip Select Specifications; NOTE2 deleted.
		294	Figure 16.4 SSMR Register revised.
		297	Figure 16.7 SSMR2 Register revised.
		298	Figure 16.8 Registers SSTDR and SSRDR; NOTE in the SSTDR register revised.
		299	16.2.1 Transfer Clock; "∮" → "f1" revised.
		305	 16.2.5.2 Data Transmission; "16.2.5.2 Data Transmit" → "16.2.5.2 Data Transmission" revised. 16.2.5.2 Data Transmission, on the 4th line from the bottom; "When setting the ~ transmit is enabled." deleted.

Davi	Dete		Description
Rev.	Date	Page	Summary
0.20	Jun 28, 2006	306	Figure 16.14 Sample Flowchart of Data Transmission (Clock Synchronous Communication Mode); NOTE revised.
		307	16.2.5.3 Data Reception; "16.2.5.3 Data Receive" → "16.2.5.3 Data Reception" revised.
		309	 16.2.5.4 Data Transmission/Reception; "16.2.5.4 Data Transmit/Receive" → "16.2.5.4 Data Transmission/Reception" revised. 16.2.5.4 Data Transmission/Reception, on the 5th line from the bottom; "When setting the ~ transmit is enabled." deleted.
		310	Figure 16.17 Sample Flowchart of Data Transmission/Reception (Clock Synchronous Communication Mode) revised.
		313	16.2.6.2 Data Transmission; "16.2.6.2 Data Transmit" → "16.2.6.2 Data Transmission" revised. 16.2.6.2 Data Transmission, on the 9th line from the bottom; "When setting the ~ transmit is enabled." deleted.
		315	16.2.6.3 Data Reception; "16.2.6.3 Data Receive" → "16.2.6.3 Data Reception" revised.
		318	16.2.8 Notes on Clock Synchronous Serial I/O with Chip Select; "16.2.8 Precautions on Clock Synchronous Serial I/O with Chip Select" → "16.2.8 Notes on Clock Synchronous Serial I/O with Chip Select" revised.
		347	Figure 16.46 Example of Register Setting in Master Transmit Mode (I ² C Bus Interface Mode); "Figure 16.46 Example of Register Setting in Master Transmit Mode (Clock Synchronous Serial)" → "Figure 16.46 Example of Register Setting in Master Transmit Mode (I ² C Bus Interface Mode)" revised.
		348	Figure 16.47 Example of Register Setting in Master Receive Mode (I²C Bus Interface Mode); "Figure 16.47 Example of Register Setting in Master Receive Mode (Clock Synchronous Serial)" → "Figure 16.47 Example of Register Setting in Master Receive Mode (I²C Bus Interface Mode)" revised.
		349	Figure 16.48 Example of Register Setting in Slave Transmit Mode (I ² C Bus Interface Mode); "Figure 16.48 Example of Register Setting in Slave Transmit Mode (Clock Synchronous Serial)" → "Figure 16.48 Example of Register Setting in Slave Transmit Mode (I ² C Bus Interface Mode)" revised.
		350	Figure 16.49 Example of Register Setting in Slave Receive Mode (I²C Bus Interface Mode); "Figure 16.49 Example of Register Setting in Slave Receive Mode (Clock Synchronous Serial)" → "Figure 16.49 Example of Register Setting in Slave Receive Mode (I²C Bus Interface Mode)" revised.
		351	16.3.8 Notes on I ² O Bus Interface; "16.3.8 Precautions on I ² O Bus Interface" \rightarrow "16.3.8 Notes on I ² O Bus Interface" revised.

Dov	Doto		Description
Rev.	Date	Page	Summary
0.20	Jun 28, 2006	352 to 385	17. Hardware LIN; "Sync" → "Synch" revised.
		354	Figure 17.2 LINCR Register revised.
		355	Figure 17.3 LINST Register revised.
		356	Figure 17.4 Typical Operation when Sending a Header Field; "RAIC" \rightarrow "TRAIC" corrected.
		357	Figure 17.5 Example of Header Field Transmission Flowchart (1) revised.
		358	Figure 17.6 Example of Header Field Transmission Flowchart (2) revised.
		359	Figure 17.7 Typical Operation when Receiving a Header Field; "RAIC" \rightarrow "TRAIC" corrected.
		360	Figure 17.8 Example of Header Field Reception Flowchart (1) revised.
		361	Figure 17.9 Example of Header Field Reception Flowchart (2) revised.
		362	Figure 17.10 Example of Header Field Reception Flowchart (3) revised.
		363	Figure 17.11 Typical Operation when a Bus Collision is Detected; "RAIC" \rightarrow "TRAIC" corrected.
		364	17.5 Interrupt Requests, on the 2nd line; "Synch Break generation competed" added.
		374	Figure 18.9 C0SSTR Register, Setting values; "1: Reception slot, The message is read" → "1: Reception slot, The message is not read" corrected.
		379	Figure 18.16 Transition between Operational Modes revised.
		380	18.5.3 CAN Sleep Mode, on the 1st line; "and the Reset bit is set to 0" deleted.
		383	Table 18.2 Examples of Baud Rate revised.
		391	18.14 Notes on CAN Module;"18.14 Precautions on CAN Module" → "18.14 Notes on CAN Module" revised.
		394	Table 18.5 Recommended Pin Connections (In Case of PCA82C250: Philips Product) and Table 18.6 Recommended Pin Connections (In Case of PCA82C252: Philips Product); NOTES; "Ta" → "Topr" revised.
		395	Table 19.1 Performance of A/D converter revised.
		396	Figure 19.1 Block Diagram of A/D Converter; "ADGSEL" → "ADGSEL0" corrected.
		399	Table 19.2 One-Shot Mode Specifications, Input pin; "AN8" \rightarrow "AN0" corrected.
		405	19.3 Sample and Hold, on the 2nd and 5th lines; "to 28 φ AD cycles ~ 10-bit resolution." deleted. "When performing ~ the microcomputer." deleted.
		406	19.4 A/D Conversion Cycles added.
		407	19.5 Internal Equivalent Circuit of Analog Input added.
		408	19.6 Output Impedance of Sensor Under A/D Conversion added.

_	5.4		Description
Rev.	Date	Page	Summary
0.20	Jun 28, 2006	409	19.7 Notes on A/D Converter; "19.7 Precautions on A/D Converter" → "19.7 Notes on A/D Converter" revised.
		410	20. Flash Memory; "20. Flash Memory Version" → "20. Flash Memory" revised. Table 20.1 Flash Memory Performance, Program and Erase Endurance; "Program Area" → "Program ROM" "Data Area" → "Data ROM" revised.
		412	20.2 Memory Map, on the 4th and 5th lines; "(program ROM)" and "(data flash)" added. Figure 20.1 Flash Memory Block Diagram for R8C/22 Group revised.
		413	Figure 20.2 Flash Memory Block Diagram for R8C/23 Group revised.
		414	 20.3 Functions to Prevent Rewriting of Flash Memory; "20.3 Functions to prevent Flash Memory from Rewriting" → "20.3 Functions to Prevent Rewriting of Flash Memory" revised. 20.3.2 ROM Code Protect Function, on the 5th and 7th lines; "The ROM code ~ flash memory." deleted. "write 0 to the ROMCR bit" → "erase the block including the OFS register" revised.
		415	Figure 20.4 OFS Register revised.
		417	20.4.2 EW1 Mode, on the 3rd line; "Do not execute software command ~" → "Do not execute command ~" revised.
		418	20.4.2.1 FMR00 Bit, on the 1st line; "(including suspend periods)" added.
		419	20.4.2.16 FMR47 Bit revised.
		420	Figure 20.5 FMR0 Register; NOTE6 added.
		422	Figure 20.7 FMR4 Register; NOTES revised.
		423	Figure 20.8 Timing of Suspend Operation revised.
		427	20.4.3.4 Program Command, on the 5th line; "The FMR00 bit is ~ completes." → "When suspend function ~ autoprogramming completes." revised.
		428	Figure 20.13 Program Command (When Suspend Function Enabled) added.
		429	20.4.3.5 Block Erase, on the 11th line; "The block erase ~ program suspend." → "Do not use ~ program-suspend" revised.
		430	Figure 20.15 Block Erase Command (When Erase-Suspend Function Enabled) revised.
		431	Table 20.5 Status Register Bits, Value after Reset of SR7 (D7) "0" \rightarrow "1" corrected.

	Data		Description
Rev.	Date	Page	Summary
0.20	Jun 28, 2006	434	20.5 Standard Serial I/O Mode, on the 3rd line; "Standard serial I/O ~ interface" → "There are three ~ serial I/O mode 3." revised. Table 20.7 Pin Functions (Flash Memory Standard Serial I/O Mode 2) revised.
		436	Figure 20.17 Pin Connections for Standard Serial I/O Mode 3; "Figure 20.17 Pin Connections for Standard Serial I/O Mode" → "Figure 20.17 Pin Connections for Standard Serial I/O Mode 3" revised.
		437	Figure 20.18 Pin Processing in Standard Serial I/O Mode 2 added. Figure 20.19 Pin Processing in Standard Serial I/O Mode 3; "Figure 20.19 Pin Processing in Standard Serial I/O Mode" → "Figure 20.19 Pin Processing in Standard Serial I/O Mode 3" revised.
		439	20.7 Notes on Flash Memory; "20.7 Precautions on Flash Memory Version" → "20.7 Notes on Flash Memory" revised.
		442 to 461	21. Electrical Characteristics revised.
		462	 22. Usage Notes; "22. Precautions" → "22. Usage Notes" revised. 22.1.1 Stop Mode and Wait Mode revised. 22.1.3 Oscillation Circuit Constants revised.
		468	22.3.3.1 TRDSTR Register (i = 0 or 1) added.
		469	22.3.3.6 Reset Synchronous PWM Mode; (2) revised. 22.3.3.7 Complementary PWM Mode; (2) revised. On the 3rd line from the bottom; "However, to write data ~ to 1 (buffer register)." added.
		473	22.3.3.7 PWM3 Mode deleted. 22.3.3.8 Count Source fOCO40M added.
		487	 23. Notes on On-Chip Debugger; "23. Precaution for On-chip Debugger" → "23. Notes on On-Chip Debugger" revised. (2) and (3) added.
		488	Appendix 1. Package Dimensions; "Diagrams shows ~ website." added.
		489	Appendix Figure 2.1 Connection Example with M16C Flash Starter (M3A-0806); NOTES revised.
		490	Appendix Figure 3.1 Example of Oscillation Evaluation Circuit revised.
1.00	Oct 27, 2006	All pages	"Preliminary" and "Under development" deleted
		2	Table 1.1 Functions and Specifications for R8C/22 Group revised. NOTE1 deleted.
		3	Table 1.2 Functions and Specifications for R8C/23 Group revised. NOTE1 deleted.

		143	Table 14.6 Pulse Period Measurement Mode Specifications revised.
		144	Figure 14.14 Registers TRACR and TRAIOC in Pulse Period Measurement Mode → Figure 14.11 TRAIOC Register in Pulse Period Measurement Mode replaced.
			Timer RA Control Register (4) deleted. Figure 14.15 TRAMR Register in Pulse Period Measurement Mode deleted.

	D /		Description
Rev.	Date	Page	Summary
1.00	Oct 27, 2006	145	Figure 14.16 Operating Example of Pulse Period Measurement Mode → Figure 14.12 Operating Example of Pulse Period Measurement Mode replaced. NOTE6 revised.
		148	Figure 14.18 Registers TRBCR and TRBOCR → Figure 14.14 Registers TRBCR and TRBOCR replaced. Timer RB Control Register; NOTES revised. Timer RB One-Shot Control Register; Function and NOTES revised. NOTE deleted.
		149	Figure 14.19 Registers TRBIOC and TRBMR → Figure 14.15 Registers TRBIOC and TRBMR replaced. Timer RB Mode Register; TWRC bit and NOTES revised.
		150	Figure 14.20 Registers TRBPRE, TRBSC, and TRBPR → Figure 14.16 Registers TRBPRE, TRBSC, and TRBPR replaced. NOTES revised.
		151	Table 14.7 Timer Mode Specifications; "Write to Timer" revised. Figure 14.21 Regsiters TRBIOC and TRBMR in Timer Mode → Figure 14.17 TRBIOC Register in Timer Mode replaced. Timer RB Mode Register deleted.
		152	14.2.1.1 Timer Write Control during Count Operation added.
		153	Figure 14.18 TRBIOC Register in Timer Mode added.
		154	Table 14.8 Programmable Waveform Generation Mode Specifications revised. NOTE2 and NOTE3 revised.
		155	Figure 14.22 Registers TRBIOC and TRBMR in Programmable Waveform Generation Mode → Figure 14.19 TRBIOC Register in Programmable Waveform Generation Mode replaced. TOCNT bit revised. NOTE deleted. Timer RB Mode Register deleted.
		156	Figure 14.23 Operation Example of Timer RB in Programmable Waveform Generation Mode → Figure 14.20 Operation Example of Timer RB in Programmable Waveform Generation Mode replaced. Figure 14.20 revised.
		157	Table 14.9 Programmable One-Shot Generation Mode Specifications revised. NOTE added.
		158	Figure 14.24 Registers TRBIOC and TRBMR in Programmable One-Shot Generation Mode → Figure 14.21 TRBIOC Register in Programmable One-Shot Generation Mode replaced. NOTE revised. Timer RB Mode Register deleted.
		160	14.2.3.1 One-Shot Trigger Selection added.
		162	Table 14.10 Programmable Wait One-Shot Generation Mode Specifications revised. NOTE1 revised.

D	Dete		Description
Rev.	Date	Page	Summary
1.00	Oct 27, 2006	163	Figure 14.26 Registers TRBIOC and TRBMR in Programmable Wait One-Shot Generation Mode → Figure 14.23 TRBIOC Register in Programmable Wait One-Shot Generation Mode replaced. TOPL bit and NOTE revised. Timer RB Mode Register deleted.
		164	Figure 14.27 Operation Example of Programmable Wait One-Shot Generation Mode → Figure 14.24 Operation Example of Programmable Wait One-Shot Generation Mode replaced. Figure 14.24 revised.
		165	14.2.5 Notes on Timer RB revised.
		171	Table 14.21 Count Source Selection; NOTE1 added.
		179	Figure 14.35 Registers TRDSTR and TRDMR in Input Capture Function → Flgure 14.32 Registers TRDSTR and TRDMR in Input Capture Function replaced.
			Timer RD Start Register ⁽¹⁾ ; "TRD0 count start bit" → "TRD0 count start flag" revised.
		400	"TRD1 count start bit" → "TRD1 count start flag" revised.
		193	Figure 14.49 Registers TRDSTR and TRDMR in Output Compare Function → Figure 14.46 Registers TRDSTR and TRDMR in Output Compare Function replaced.
			Timer RD Start Register ⁽¹⁾ ; "TRD0 count start bit ⁽⁴⁾ " \rightarrow "TRD0 count start flag(4)" revised.
		400	"TRD1 count start bit(5)" → "TRD1 count start flag(5)" revised.
		196	Figure 14.52 Registers TRDOER1 to TRDOER2 in Output Compare Function → Figure 14.49 Registers TRDOER1 to TRDOER2 in Output Compare Function replaced. Timer RD Output Master Enable Register 1 revised.
		197	Figure 14.50 TRDOCR Register in Output Compare Function → Figure 14.50
		107	TRDOCR Register in Output Compare Function replaced. NOTE2 added.
		206	On the first line; "Figure 14.63 ~" → "Figure 14.60 lists ~" corrected.
		209	Figure 14.65 TRDSTR Register in PWM Mode → Figure 14.62 TRDSTR Register in PWM Mode replaced.
			Timer RD Star Register ⁽¹⁾ ; "TRD0 count start bit ⁽⁴⁾ " → "TRD0 count start flag ⁽⁴⁾ " corrected.
		0.10	"TRD1 count start bit(5)" \rightarrow "TRD1 count start flag(5)" corrected.
		212	Figure 14.68 Registers TRDOER1 to TRDOER2 in PWM Mode → Figure 14.65 Registers TRDOER1 to TRDOER2 in PWM Mode replaced.
		213	Figure 14.69 Registers TRDOCR and TRDCR0 to TRDCR1 in PWM Mode → Figure 14.66 Registers TRDOCR and TRDCR0 to TRDCR1 in PWM Mode replaced.
			Timer RD Output Control Register ⁽¹⁾ ; NOTE2 added.

Day	Doto		Description
Rev.	Date	Page	Summary
1.00	Oct 27, 2006	218	Figure 14.75 Operating Example of PWM Mode → Figure 14.72 Operating Example of PWM Mode replaced. Figure 14.72 revised.
		222	Figure 14.78 TRDSTR Register in Reset Synchronous PWM Mode → Figure 14.75 TRDSTR Register in Reset Synchronous PWM Mode replaced. Timer RD Start Register ⁽¹⁾ ; "TRD0 count start bit ⁽⁴⁾ " → "TRD0 count start flag ⁽⁴⁾ " corrected. "TRDi count start bit ⁽⁵⁾ " → "TRD1 count start flag ⁽⁵⁾ " corrected.
		228	Table 14.30 TRDGRji Register Functions in Reset Synchronous PWM Mode; TRDGRA0 register; "(Output inversed every half period of TRDIOC0 pin)" → "(Output inversed every period of TRDIOC0 and PWM pins)", TRDGRC0 register; "(Output inversed every half period of TRDIOC0 pin)" → "(Output inversed every period of TRDIOC0 and PWM pins)" revised.
		231	Table 14.31 Complementary PWM Mode Specifications, on the 3rd line from the bottom; " $i = 0$ to 2, $j = either A, B, C or D" \rightarrow "i = 0 or 1, j = either A, B, C or D" corrected.$
		232	Figure 14.85 TRDSTR Register in Complementary PWM Mode → Figure 14.85 TRDSTR Register in Complementary PWM Mode replaced. Timer RD Start Register ⁽¹⁾ ; TRD0 count start bit ⁽⁴⁾ → "TRD0 count start flag ⁽⁴⁾ " corrected. "TRD1 count start bit ⁽⁵⁾ " → "TRD1 count start flag ⁽⁵⁾ " corrected.
		242	Figure 14.98 Operating Example of Complementary PWM Mode → Figure 14.95 Operating Example of Complementary PWM Mode replaced.
		245	Table 14.33 PWM3 Mode Specifications, on the bottom line; "j = either A, B, C or D" \rightarrow "i = 0 or 1, j = either A, B, C or D" corrected.
		246	Figure 14.100 TRDSTR Register in PWM3 Mode → Figure 14.97 TRDSTR Register in PWM3 Mode replaced. Timer RD Start Register ⁽¹⁾ ; "TRD0 count start bit ⁽⁴⁾ " → "TRD0 count start flag ⁽⁴⁾ " corrected. "TRD1 count start bit ⁽⁵⁾ " → "TRD1 count start flag ⁽⁵⁾ " corrected.
		249	Figure 14.103 TRDOCR Register in PWM3 Mode → Figure 14.100 TRDOCR Register in PWM3 Mode replaced. NOTE2 added.
		259	 14.3.12.4 Count Source Switch; "count clock source" → "count source" corrected. 14.3.12.7 Complementary PWM Mode, on the bottom line; "Do not use the TRDGRC0 register in complementary PWM mode." deleted.
		275	Figure 15.4 UiMR Register (i = 0 or 1); "Serial Interface mode select bit $(2,4)$ " \rightarrow "Serial I/O mode select bit $(2,4)$ " corrected.
		276	Figure 15.5 Registers UiC0 and UiC1 (i = 0 or 1); UARTi Transmit/Receive Control Register 1 (i = 0 or 1) revised. NOTE2 added.
		289	Table 16.1 Mode Selections revised.

REVISION HISTORY

R8C/22 Group, R8C/23 Group Hardware Manual

Day	Date	Description		
Rev.		Page	Summary	
1.00	Oct 27, 2006	293	Figure 16.3 SSCRL Register; NOTE2 revised	
		321	Figure 16.23 External Circuit Connection Example of Pins SCL and SDA revised.	
		348	Figure 16.47 Example of Register Setting in Master Receive Mode (I²C Bus Interface Mode); (1) "Set the ~ master receive mode ~"→ "Set the ~ master transmit mode ~" corrected.	
		357	Figure 17.5 Example of Header Field Transmission Flowchart (1); Hard ware LIN Clear the status flags; "~ in LINST register" → "~ in LINST register: 0" corrected.	
		361	Figure 17.9 Example of Header Field Reception Flowchart (2); "When the SBE bit in the LINCR register is 0(Unmasked after Synch Break is detected), timer RA is usable in timer mode after the SBDCT flag in the LINST register is set to 1." added.	
		362	Figure 17.10 Example of Header Field Reception Flowchart (3); "When the SBE bit in the LINCR register is 1 (Unmasked after Synch Field measurement is completed), timer RA is usable in timer mode after the SFDCT flag in the LINST register is set to 1." added.	
		364	17.4.4 Hardware LIN End Processing and Figure 17.12 Example of Hardware LIN Communication Completion Flowchart added.	
		372	Figure 18.6 C0MCTLi Register; NOTE1 revised.	
		373	Figure 18.7 C0CTLR Register; NOTES revised.	
		374	Figure 18.8 C0STR Register; NOTE1 revised.	
		376	Figure 18.10 COICR Register; NOTE1 revised. Figure 18.11 COIDR Register; NOTE1 revised.	
		377	Figure 18.12 C0CONR Register; "CAN0 Configuration Register" → "CAN0 Configuration Register ⁽²⁾ " added. NOTE2 added.	
		404	Figure 19.6 ADCON0 Register in Repeat Mode, in the Function of Frequency select bit 0; "1: Select fOCO-F" → "Do not set" revised.	
		408	Figure 19.10 Internal Equivalent Circuit of Analog Input; "i = 4" → "i = 12" corrected.	
		410	19.7 Notes on A/D Converter, on the 5th line from the bottom; "Do not select the fOCO-F for the φAD." added.	
		413	20.2 Memory Map, on the 4th line from the bottom; "When rewriting the block 2 and block 3 in CPU rewrite mode, set the FMR02 bit in the FMR0 register to 1 (rewrite enables)." added.	
		414	Figure 20.1 Flash Memory Block Diagram for R8C/22 Group revised.	

REVISION HISTORY

R8C/22 Group, R8C/23 Group Hardware Manual

	5.4	Description		
Rev.	Date	Page	Summary	
1.00	Oct 27, 2006	415	Figure 20.2 Flash Memory Block Diagram for R8C/23 Group revised.	
		417	Figure 20.4 OFS Register; NOTE2; "LVD0ON" → "LVD1ON" and "(voltage monitor 0 reset enabled after reset)" → "voltage monitor 0 reset enabled after reset)".	
		418	Table 20.3 Differences between EW0 Mode and EW1 Mode; Modes After Read Status Register added.	
		420	20.4.2.3 FMR02 Bit; "The block 1 and block 0 do not ~" → "The block0 block1 block2, and block3 do not ~" corrected.	
		428	20.4.3.1 Read Array Command, on the bottom line; "In addition, the MCU enters read array mode after a reset." added. 20.4.3.2 Read Status Register Command, on the bottom line; "The MCU remains in read status register mode until the next read array command is written." added.	
		430	Figure 20.13 Program Command (When Suspend Function Enabled) revised. NOTE3 added.	
		432	Figure 20.15 Block Erase Command (When Erase-Suspend Function Enabled) revised. NOTE3 added.	
		435	Figure 20.16 Full Status Check and Handling Procedure for Individual Errors; "FMR07 = 0?" \rightarrow "FMR07 = 1?" and "FMR06 = 0?" \rightarrow "FMR06 = 1?" corrected.	
		437	Table 20.8 Pin Functions (Flash Memory Standard Serial I/O Mode 3); P4_2/VREF deleted. P4_3 or P4_5 → P4_2 to P4_5 corrected.	
		443	20.7.1.7 Reset Flash Memory deleted. 20.7.1.8 Entering Stop Mode or Wait Mode → 20.7.1.7 Entering Stop Mode or Wait Mode corrected.	
		444	Table 21.1 Absolute Maximum Ratings; Power dissipation revised. Table 21.2 Recommended Operating Conditions; System clock revised.	
		449	Table 21.8 Voltage Monitor 1 Reset Circuit Electrical Characteristics → Table 21.8 Power-on Reset Circuit, Voltage Monitor 1 Reset Circuit Electrical Characteristics ⁽¹⁾ replaced. Table 21.8 revised. NOTE3 added. Table 21.9 Power-on Reset Circuit Electrical Characteristics deleted.	
			Figure 21.3 Power-on Reset Circuit Electrical Characteristics revised.	
		450	Table 21.10 High-Speed On-Chip Oscillator Circuit Electrical Characteristics → Table 21.9 High-Speed On-Chip Oscillator Circuit Electrical Characteristics revised.	
		456	Table 21.15 Electrical Characteristics (1) [VCC = 5 V] \rightarrow Table 21.14 Electrical Characteristics (1) [VCC = 5 V] revised. RAM Hold Voltage, Min.; "1.8" \rightarrow "2.0" corrected.	

	5 /	Description	
Rev.	Date	Page	Summary
1.00	Oct 27, 2006	457	Table 21.16 Electrical Characteristics (2) [Vcc = 5 V] → Table 21.15 Electrical Characteristics (2) [Vcc = 5 V] revised. Wait mode revised.
		460	Table 21.21 Electrical Characteristics (3) [VCC = 3 V \rightarrow Table 21.20 Electrical Characteristics (3) [VCC = 3 V] revised. RAM hold voltage, Min.; "1.8" \rightarrow "2.0" corrected.
		461	Table 21.22 Electrical Characteristics (4) [Vcc = 3 V] \rightarrow Table 21.21 Electrical Characteristics (4) [Vcc = 3 V] revised. Wait mode revised.
		464	22.1.1 Stop Mode and Wait Mode \rightarrow 22.1.1 Stop Mode revised. 22.1.2 Wait Mode added.
		469	22.3.2 Notes on Timer RB; "Timer RB starts counting at the first valid edge of the count source after The TCSTF bit is set to 1 (during count)." deleted. On the 8th line from the bottom; "- If the TSTOP bit ~ stops immediately." added. On the 6th line from the bottom; "- If 1 is written to the TOSST or TOSSP bit ~ either 0 or 1." added.
		471	22.3.3.4 Count Source Switch; "count clock source" → "count source." corrected.
		485	22.8 Notes on A/D Converter; On the 6th line from the bottom; "Do not select the fOCO-F for the ϕ AD." added.
		488	22.9.1.7 Reset Flash Memory deleted.
		490	23. Notes on On-Chip Debugger, (2); ROM 128 KB Product (R5F2122CJFP, R5F2122CKFP, R5F2123CJFP, R5F2123CKFP) addresses 23800h to 23FFFh added. (3); ROM 128 KB Product (R5F2122CJFP, R5F2122CKFP, R5F2123CJFP, R5F2123CKFP) addresses 03B00h to 03BFFh added.
		491	24. Notes on Emulator Debugger added.
1.10	Oct 31, 2007	2	Table 1.1; D version added.
0	00.01, 2007	3	Table 1.2; D version added.
		5	Table 1.3; D version added and development status updated. Figure 1.2; D version added
		6	Table 1.4; D version added and development status updated. Figure 1.3; D version added
		7	Figure 1.4; NOTE 3 added.
		13	Figure 3.1; Part Number of D version added.
		14	Figure 3.2; Part Number of D version added.
		15	Table 4.1; • 000Ah: "00XXX000b" → "00h" • 000Fh: "00011111b" → "00X11111b"
		30	Figure 5.3 and Figure 5.4 NOTE1 revised.

Davi	Dete	Description		
Rev.	Date	Page	Summary	
1.10	Oct 31, 2007	31	5.1.1 (2) and 5.1.2 (4) revised.	
		32	Figure 5.5 and Figure 5.6 revised.	
		33	5.2 and Figure 5.7 revised.

2.00	Aug 20, 2008	_	"RENESAS TECHNICAL UPDATE" reflected: TN-16C-A172A/E	
		5, 6	Table 1.3, Table 1.4 revised Figure 1.2, Figure 1.3; ROM number "XXX" added	
		13, 14	Figure 3.1, Figure 3.2; "Expanding area" deleted	
		23	Table 4.9 135Fh Address "XXXX0000b" → "00h"	
		33	Figure 5.7 revised	
		130	Figure 14.1 "TSTART" → "TCSTF", "TCKCUT bit" revised	
		147	Figure 14.13 "TCSTF" → "TSTART" revised and added	
		157	Table 14.9 "TRBP pin function" → "TRBO pin function"	

Rev.	Date		Description
Rev.	Date	Page	Summary
2.00	Aug 20, 2008	182, 196, 235, 249	Figure 14.34, Figure 14.48, Figure 14.87, Figure 14.99; "0137Dh" → "0137h"
		209	Figure 14.62 revised
		211	Table 14.27 revised
		278	Figure 15.4; NOTE3: " 1 (internal clock)" → " 0 (internal clock)"
		296	Figure 16.3 revised
		312	16.2.5.4 added
		315	Figure 16.18 revised
		361	Figure 17.6 revised
		364	Figure 17.9 revised
		376	Figure 18.7; NOTE2: " operation mode." → " reset/initialization mode."
		414	Table 20.1; NOTE1 revised
		437	Table 20.6 "FRM0 Register" → "FMR0 Register"
		447	Table 21.2; NOTE2 revised
		449	Table 21.4; NOTE2 and NOTE4 revised
		450	Table 21.5; NOTE2 and NOTE5 revised
		451	Table 21.6; "td(Vdet1-A)" added, NOTE5 added
			Table 21.7; "td(Vdet2-A)" and NOTE2 revised, NOTE5 added
		452	Table 21.8; "trth" and NOTE2 revised
			Figure 21.3 revised
