MC100EP809

3.3V 2:1:9 Differential HSTL/PECL/LVDS to HSTL Clock Driver with LVTTL Clock Select and Enable

ON Semiconductor®

Description

The MC100EP809 is a low skew 2:1:9 differential clock driver, designed with clock distribution in mind, accepting two clock sources into an input multiplexer. The part is designed for use in low voltage applications which require a large number of outputs to drive precisely aligned low skew signals to their destination. The two clock inputs are one differential HSTL and one differential LVPECL. Both input pairs can accept LVDS levels. They are selected by the CLK_SEL pin which is LVTTL. To avoid generation of a runt clock pulse when the device is enabled/disabled, the Output Enable (OE), which is LVTTL, is synchronous ensuring the outputs will only be enabled/disabled when they are already in LOW state (Figure 9).

The MC100EP809 guarantees low output–to–output skew. The optimal design, layout, and processing minimize skew within a device and from lot to lot. The MC100EP809 output structure uses open emitter architecture and will be terminated with 50 Ω to ground instead of a standard HSTL configuration (Figure 7). To ensure the tight skew specification is realized, both sides of the differential output need to be terminated identically into 50 Ω even if only one output is being used. If an output pair is unused, both outputs may be left open (unterminated) without affecting skew.

Designers can take advantage of the EP809's performance to distribute low skew clocks across the backplane of the board. Both clock inputs may be single–end driven by biasing the non–driven pin in an input pair (Figure 8).

Features

- 100 ps Typical Device–to–Device Skew
- 15 ps Typical within Device Skew
- HSTL Compatible Outputs Drive 50 Ω to GND with no Offset Voltage
- Maximum Frequency > 750 MHz
- 850 ps Typical Propagation Delay
- Fully Compatible with Micrel SY89809L
- PECL and HSTL Mode Operating Range: V_{CCI} = 3 V to 3.6 V with GND = 0 V, V_{CCO} = 1.6 V to 2.0 V
- Open Input Default State
- These Devices are Pb–Free and are RoHS Compliant

ORDERING INFORMATION

See detailed ordering and shipping information in the package dimensions section on page 8 of this data sheet.

MC100EP809

All V_{CCI}, V_{CCO}, and GND pins must be externally connected to appropriate Power Supply to guarantee proper operation ($V_{CCI} \neq V_{CCO}$).

5. Measured with 750 mV (LVPECL) source or 1 V (HSTL) source, 50% duty cycle clock source. All outputs loaded with 50 Ω to GND (Figure 7).
6. Skew is measured between outputs under identical transitions and conditions on any one device.
7. Device–to–Device skew for identical transitions and conditions.
8. V_{PP} is the Differential Input Voltage swing required to maintain AC characteristics listed herein.
9. OE Set Up Time is defined with respect to the rising edge of the clock. OE High–to–Low transition ensures outputs remain disabled during the next clock cycle. OE Low–to–High transition enables normal operation of the next input clock (Figure 9).
