CRT-06

DIGITAL TEMPERATURE REGULATOR

5 9 0 8 3 1 2 1 5 9 2 7 1 6

www.fif.com.pl

F&F products are covered by a 24 months warranty from date of purchase

PURPOSE

The CRT-06 controller is multi-function, programmable electronic devices which enable control of heating or cooling devices in order to maintain a stable room temperature, as well as to control ambient and substance temperatures in industrial conditions, with the option of supervising technological processes.

In standard work mode on display are present values of temperature which are measure by sensors C1 and C2. If is connect only one sensors- C1, then at place on display for reprints from C2 anything is displayed.

Signs on the left side of display, signalize work mode of regulator in position of output relay. This sign present:

	Open joint - automatic work mode
	Close joint - automatic work mode
	Open joint - manual work mode
	Close joint - manual work mode

CRT-05 is equipped to:

- controlling panel use for programming and monitor to work of regulator
- possibility of connection two independent temperature probes PT-100
- two outputs of relay 1P which were attribute to sensors

CONTROLLERS FEATURES:

- control panel for programming and monitoring;
- 10 operation functions;
- 2 independent temperature sensors;
- two independent temperature values may be set;
- 2 x 1P contacts applied to the temperature sensors;
- 2 hysteresis set values, one for each sensor;
- AUTOMATIC mode - operation with one selected function;
- MANUAL mode permanent closing or opening of the contact without a temperature measurement. Separate temperature drops for the P1 and P2 contacts.
- memory feature for maximum and minimum temperature values registered, independent for the C1 and C2 sensors;
- CORRECTION related to the temperature read-out error against the model thermometer;
- WARNING - visual signalisation of the temperature sensor failure, range exceed and speed rising or falling temperature exceed
- limiting access to program menu using PIN code
- LIGHT selection of display illumination mode.
- LANGUAGE program menu in three languages: Polish, English or Russian

DESCRIPTION OF CONTROL PANEL:

To work and programming of regulator CRT-06 is use control panel. It include two line with eight sign on alfanumerical display and keyboard with five buttons, which is situated under the display.

BUTTONS FUNCTIONS:

	In programming mode button Return make possible to return main menu. If button will be push at edition mode, then program return to main menu without save all registry. Button Return enable to delete information about errors.
	At programming mode buttons UP and DOWN make to possibility to select position of menu and to increase or reduce value of edited parameter.
	In programming system mode button OK enable to pass to selected position from menu and enter the changes. In standard work button OK is use to change order temperature T1 and T2.
	Button Menu enable to pass to programming mode of regulator. In change order value mode use it cause reconnection between setting for first and secon sensor.

PROGRAMMING

Pass to programming mode is possible by push button MENU.

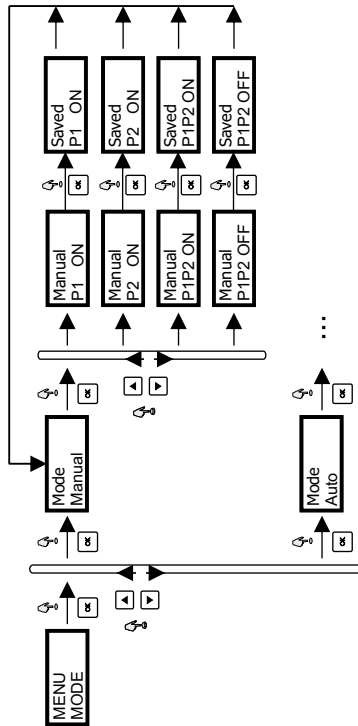

Structure of main menu:

To select position from menu we use buttons "UP" and "DOWN". If you want pass to selected position then you need push button OK. Pass to main menu is possible by push button return.

Menu -> MODE

This mode is use to set mode of work: automatic or handwork. In automatic work position of output relay is depend of reports from sensors which are connect to regulator and executed program. Hadwork mode make possibility set of output relays independent of reports from sensors.

Instruction to select work mode: :

1. By button MENU pass to main menu.
2. Press button OK, to entered pass to menu.
3. By buttons "UP" or "DOWN" select work mode: HADWORK or AUTO, enter by OK.
4. If will chosen hadnwork mode, wil displayed additional menu to set position outout of relay (open or close). Select by buttons "UP" or "DOWN" and enter by OK. Pass to main menu without save all settings is possible by push button return.

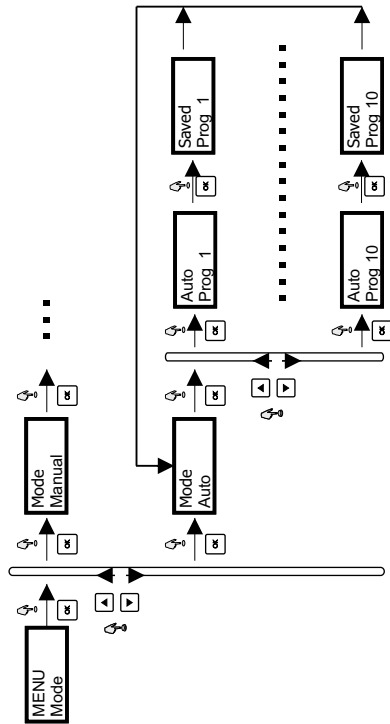

ATTENTION!:

Choose handwork mode is signalize by sign R near sings which present position of relays.

Handwork P1 ON	P1 ON - joint of relay P1 is close, but joint of relay P2 is open.
Handwork P1 OFF	P2 ON - joint of relay P1 is open, but joint of relay P2 is close.
Handwork P1P2 ON	P1P2 ON - joints of relays P1 and P2 are close.
Handwork P1P2 OFF	P1P2 OFF - joints of relays P1 and P2 are open.

5. In automatic work will dispalied menu to select program (one of tenth) saved in device memory.

By buttons "UP" or "DOWN" choose program (option to use are present under) and enter by button OK. Possible is return to main menu without save all changes by push button return.

PROG 1 HEATING mode

Regulator work with sensor C1 which have defined temperature T1 and hysteresis H1.

If temperature on output relay C1 fall under value (T1-H1), it cause close a joint P1 and P2 in the same time. Joints P1 and P2 will be open if temperature on input sensor C1 cross value (T1+H1).

PROG 2 COOLING mode

Regulator work with sensor C1 which have defined temperature T1 and hysteresis H1.

Relays P1 and P2 work in parallel connection and closing joints when temperature is higher than value(T1+H1). Joints of relays will be open when temperature fall under value (T1-H1).

PROG 3 HEATING/COOLING mode

Regulator work with sensor C1 which have defined temperature T1 and hysteresis threshold H1.

Relays P1 and P2 works alternately. P1 work in cooling mode, closing joint when teperature fall under value (T1 - H1) and opening it when cross value (T1 + H1). Realy P2 work in heating mode, closing joint when temperature fall under value (T1- H1) and returnly opening it when cross value (T1 + H1).

PROG 4 HEATING mode- two regulators

Regulator works with sensors C1 i C2 in function two independent thermostat which works in heating mode. For sensor C1 is defined temperature T1 and hysteresis threshold H1, but for sensor C2 is defined temperature T2 and hysteresis threshold H2.

If temperature of sensor C1 fall under value (T1-H1), it caue close a joint P1. When temperature increase higher than value (T1+H1), than joint P1 will be returnly open. Similary for sensor C2 when temperature will be smaller than (T2-H2) than joint P2 will be close, returnly opening will be possible than temperature cross value (T2+H2).

PROG 5 COOLING mode- two regulators

Regulator works with sensors C1 and C2 in function two independent thermostat which works in cooling mode. For sensor C1 is defined temperature T1 and hysteresis threshold H1, but for sensor C2 is defined temperature T2 and hysteresis threshold H2.

If temperature from sensor C1 increase higher than value (T1 + H1), then joint P1 will be closed. But when temperature fall under value (T1 - H1), than joint P1 will be returnly open. Similary for sensor C2, when temperature will be higher than value (T2 + H2) than joint P2 will be closed. It will be returnly open when temperature fall under value (T2 - H2).

PROG 6 HEATING mode- two regulators.
 Second regulator dependent from first regulator.

Regulator work with two sensors C1 and C2, which have defined temperature T1 and T2, and hysteresis thresholds H1 and H2

The first thermostat, is connect with sensor C1, it close when temperature from relay and output fall under value (T1-H1) and open it when cross value (T1+H1). Position of the second thermostat, which is connect with sensor C2 and output P2, depend from position of the first thermostat and temperature from sensor C2. Joint P2 will be closed when temperature from sensor C2 will be smaller than value (T2-H2) and joint P1 will be closed. Condition for open joint P2 is crossing by sensor C2 value (T2+H2) or open joint P1.

PROG 7 Differential regulator

Regulator work with two sensors C1 and C2. Ordered parameter is distinction of temperatures. If distinction between reports from the first and second sensors (C1 C2) cross ordered value then will be closed joint P1. If distinction of temperatures will be smaller than ordered value then joint P2 will be close.

ATTENTION: When will be set value T2 > T1 then regulator will be work correct.

PROG 10 Window mode - two regulators

Device works as two independent thermostats, which works in window mode. Sensor Czujnik C1 dependent from parameter s T1 and T2 and steer output of relay P1. Sensor C2 dependent from parameters T3 and T4, steer output of relay P2.

If temperature from sensor C1 will be included in range between values T1 and T2, then joint of relay P1 will be close. Similarly if temperature from sensor C2 will be included in range between values T3 and T4, then joint of relay P2 will be close.
ATTENTION: When temperature will T2 > T1, or T4 > T3, then regulator doesn't work correct

PROG 8 Window mode (one sensor)

Regulator work with sensor which is connect to joint C1. If temperature from sensor will be in range defined by values T1 and T2, then relays joints P1 and P2 will be closed.

ATTENTION: When will set value T2 > T1 then regulator will be work correct.

PROG 9 Window mode (two sensors)

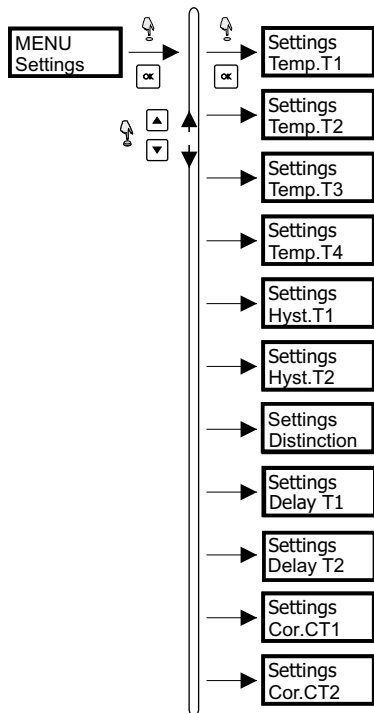

Regulator works with two sensors C1 and C2. If temperature from two sensors will be in range, which is defined by values T1 and T2, then relay joints P1 and P2 will be closed.

Menu -> SETTINGS

This menu is use to configuration parameters of regulator in automatic work.

If you need edit parameters follow with procedure:

1. By button Menu pass to main menu.
2. By buttons "UP" or "DOWN" select menu Menu-> Settings and enter OK..
3. By buttons "UP" or "DOWN" select parameter to edition and prees OK...
4. By buttons "UP" or "DOWN" set value of parameter and enter by OK..
5. Entered of change is signalize by raport: Saved with value of saving parameter.
6. Possible is out from edition mode to main menu without save all changes by button return.

Example of change parameter value.

ATTENTION: Edition of setting is possible for parameter which are use in a executigram. When need to change parameter which isn't use in program then option will not able.

ATTENTION: Settings which were able to program, are present under (numbers aren't cross out):

	1	2	3	4	5	6	7	8	9	10
Settings Temp.T1	<p>Ordered value of temperature T1 Temperature could be set in range: -100+400°C with precision 1°C. ATTENTION!!: Possible is quick change value of ordered temperature T1 and T2 without pass to menu-> settings. You need in standard work push button OK. It cause display actual value. Next by buttons "UP" or "DOWN" set new value and enter by OK. If need edit next temperature push button OK. Push a button return cause out from edition mode without save all changes.</p>									

	1	2	3	4	5	6	7	8	9	10
Settings Temp.T2	<p>Ordered value of temperature T2. Temperature could be set in range -100+400°C with precision 1°C.</p>									
	1	2	3	4	5	6	7	8	9	10
Settings Temp.T3	<p>Ordered value of temperature T3. Temperature could be set in range -100+400°C with precision 1°C.</p>									
	1	2	3	4	5	6	7	8	9	10
Settings Temp.T4	<p>Ordered value of temperature T4. Temperature could be set in range -100+400°C with precision 1°C.</p>									
	1	2	3	4	5	6	7	8	9	10
Settings Hyst.T1	<p>Value of hysteresis for temperature T1. Temperature could be set in range 1+100°C with precision 1°C.</p>									
	1	2	3	4	5	6	7	8	9	10
Settings Hyst.T2	<p>Value of hysteresis for temperature T2. Temperature could be set in range 1+100°C with precision 1°C.</p>									
	1	2	3	4	5	6	7	8	9	10
Settings Distinction	<p>Ordered distiction of temeratures which is use as parameter prog 7. Distiction of temperatures could be set in range 1+500°C with precision 1°C.</p>									

	1	2	3	4	5	6	7	8	9	10
Settings Delay T1	<p>Minimal time to execute one cycle of program (ON or OFF) Parameter DelayT1 is dependent from sensor C1. Example of work for prog 1 with delay . Delay is present on under picture..</p>									
	1	2	3	4	5	6	7	8	9	10
Settings Delay T2	<p>Minimal time to hold a one position (ON or OFF) of relay output Parameter DelayT2 is dependent from sensor C2. Example of work for prog 1 with delay . Delay was present in earlier point.</p>									
	1	2	3	4	5	6	7	8	9	10
Settings Cor.CT1	<p>Correction of sensor reports C1. Sensor repts could be corrected by ±20°C with precision 1°C.</p>									

	4	5	6	7	8	9	10
Settings Cor.CT2	Correction of sensor reports C2. Sensor reports could be corrected by $\pm 20^{\circ}\text{C}$ with precision 1°C .						

Menu -> System

This menu is used to set settings which were left, independent of work mode and executing program.

1. By button Menu pass to main menu.
2. By buttons "UP" or "DOWN" select menu Menu -> Settings and enter OK.
3. By buttons "UP" or "DOWN" select option (one of seven) and enter by OK.

6. **System-> Password.** This parameter is used to safe access for all user to menu. Password is a number from range 0 to 999, but save password to 0 unlock a menu. Set password another than 0, cause pass timer to safe mode. In case change of PIN need pass menu System -> Language and by buttons "UP" or "DOWN" set the first digit of PIN code. Push a button Menu cause pass to edit the next digit of PIN code. After set all PIN enter by button OK. Possible is out from edition PIN code mode without save changes by button return.

ATTENTION: Work in safe mode is signalized by displayed a sign . In this case pass to setting of regulator (press button MENU) is previous by key correct a pin code.

Example of key PIN code:

4. **System->Language.** This parameter makes possibility to choose one of three languages in which will be displayed reports. If you need change language you need pass to menu System -> Language by buttons "UP" or "DOWN" select language and enter by button OK. Return to main menu is possible by push button return.

5. **System->Light.** This parameter makes possibility to lighting a display of regulator. Possible is set lighting for all the time for display or lighting only for some second after push any button. If you need way of lighting you need to pass menu System -> Light and select by buttons "UP" or "DOWN" correct option and enter by button OK. Return to main menu is possible by push button return.

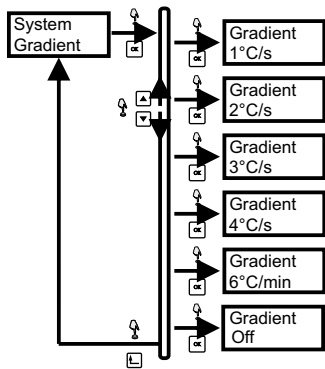

PIN code is entered only once for all time to edit parameters from edition mode. After out from edition mode regulator stay in unlock position about 10sec, (it is signalized by blinking key sign in display). At this time could return to edition mode (button MENU) without key PIN code.

ATTENTION: In safe mode possible is quick change ordered temperature T1 and T2 (press button OK in standard work).

7. **System -> Zero W-N.** This mode is used to delete min and max temperature (which could be read from Menu->Info) registered by sensor. In case to delete min and max value of temperature need pass to menu System -> Zero W-N and enter by OK. Next by buttons "UP" or "DOWN" select value YES and enter by OK.

8. **System -> Gradient.** This parameter makes possibility to set max value of change temperature speed. Cross this value will be signalized by ERROR of regulator. If want to change gradient pass to menu System -> Gradient and by buttons "UP" or "DOWN" set gradient value (option list is present under) and enter by OK. Possible is out to main menu without save changes by button return.

ATTENTION: Cross acceptable speed temperature change value cause error with code 02.

9. **System -> Samples.** This parameter is use to set frequency with will be update reports from temperature sensor. frequency could be change from range 1+120 samples for minute. To change sample frequency need to pass menu System -> Samples, by buttons "UP" or "DOWN" set frequency and enter by OK Return to main menu without save all changes is possible by button return.

10. **System-> Default settings.** Default settings make possibility to return all settings of regulator to target values. If you need restore default settings pass to menu System -> default settings and enter by button OK. Next by buttons "UP" or "DOWN" set value YES and push button OK.

ATTENTION! Return to default settings cause delete all earlier configurations with saved programs.

Rest of parameters of regulators are set with values:

Mode	Manual
T1	0,0°C
T2	0,0°C
T3	0,0°C
T4	0,0°C
H1	0,0°C
H2	0,0°C
Delay to C1	0min
Delay to C2	0min
Sensor correction C1	0,0°C
Sensor correction C2	0,0°C
Distinction	0,0°C
Password	Lack
Light	All time
Gradient	OFF
Sampling	30 samples/min
Language	polish

Error codes

Wrong work of regulator is signalize by blinkig display illumination and dispaly error number code. Delete information about error (if break will be fixe) possible is by push button return.

Explain of error codes.:

Error Code :01	Cross acceptable range for reports from sensor C1. Lack or break sensor C1.
Error Code :02	Cross acceptable speed change temperature value for sensor C1.
Error Code :03	Cross acceptable speed change temperature value for sensor C2.
Error Code :04	Cross acceptable range for reports from sensor C2. Lack or break sensor C2. (only for pprograms which use sensor C2 .

Menu -> Info

This Menu -> Info is use to display max and min values which were registered by temperature sensor.

TECHNICAL DATA

CRT-06

supply	230V AC
current load	2x(<16A)
joint	separated 1P
range of regulation temperature	-100+400°C
hysteresis setting range	0+100°C
precision	1°C
reconnection delay	0+45min
model correction	±20°C
gradient	4°C /sec+6°C/min.
sample frequency	1+120 samples/min.
power consumption	1,5W
working temperature	-20+40°C
terminal dimensions	screw terminals 2,5mm ² 3 modules (52,5mm)
fixing	on rail TH-35

PROBE RT56

sensor	PT100
dimensions of sensor	Ø4; h=85mm
sensor isolation	steel bush
cable	PC 3x0,34mm.; l=1,5m

ASSEMBLY:

1. Take OFF the power.
2. Regulator put on the rail in the switchgearbox.
3. Connect supply: L to joint 1; N to joint 2.
4. Out cable of probe of temperature C1 connect to joints 10-11-12.
5. Out cable of probe of temperature C2 connect to joints 7-8-9.
6. System which enclose receiver is dependent from sensor C1 connect in line to joints 3-4.
7. System which enclose receiver is dependent from sensor C2 connect in line to joints 5-6.
8. Set program to regulation temperature.

WIRING DIAGRAM

ATTENTION!

Do not any change in device. It impend break or wrong work of device, it will cause break contolled device or menace for user. In this cause producer is not responsible of arise accidents and could refuse given warranty for regulator in cause submit a claim.
