C _{IO}	I/O pin capacitance			5		pF

1. FT = Five-volt tolerant. In order to sustain a voltage higher than V_{DD}+0.3 the internal pull-up/pull-down resistors must be disabled.
2. Hysteresis voltage between Schmitt trigger switching levels. Based on characterization, not tested in production.
3. With a minimum of 100 mV.
4. Leakage could be higher than max. if negative current is injected on adjacent pins.
5. Pull-up and pull-down resistors are designed with a true resistance in series with aswitchable PMOS/NMOS. The MOS/NMOS contribution to the series resistance is minimum(~10% order).

8.1.1. Module Location Recommendation

To get better antenna performance, the following two module locations are advised.

- **Location 1:** Module is recommended to be on the upper right corner of main board.

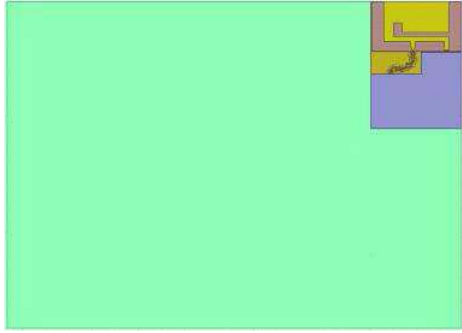

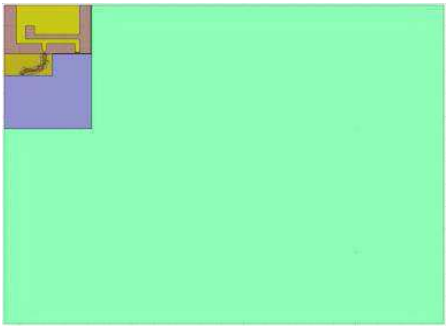

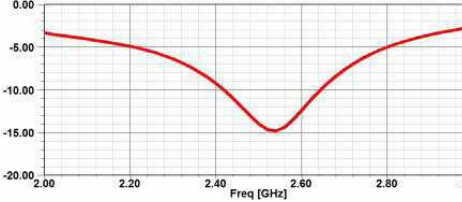

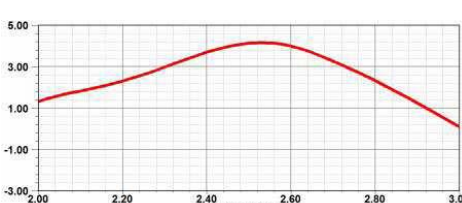

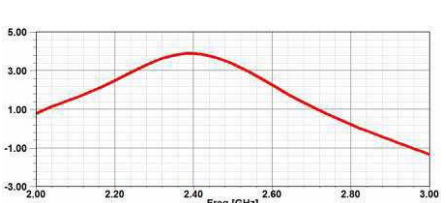

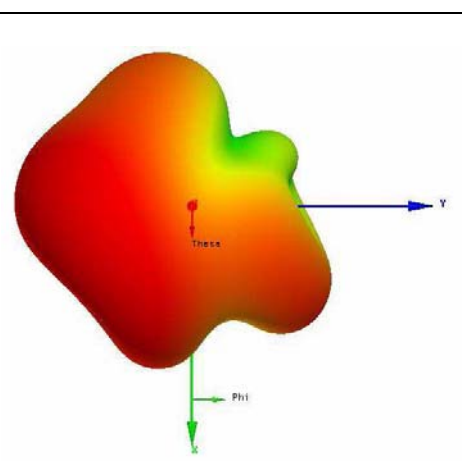

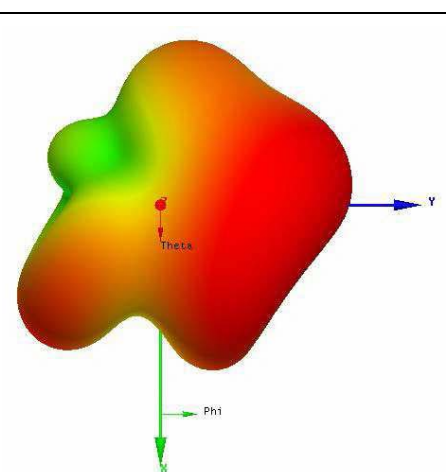

- **Location 2:** Module is recommended to be on the upper left corner of main board.

8.1.2. Module Layout Guideline

- Main board antenna area under module printed antenna should be clear or empty.
- No signals, GND or power traces can be routed in antenna area for each layers of the main board.
- Any metal lids, power traces or metal components should be placed far away from the antenna area on the main board.
- Keep GND plane as large as you can on main board.

8.2. Firmware Update– Circuit Guide

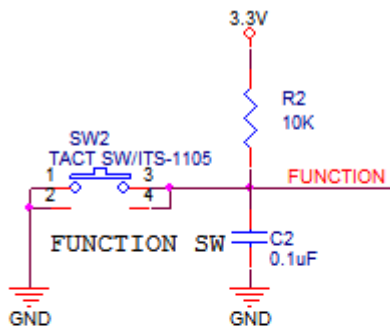

WizFi250 provides some specific functions according to its firmware. Until now, there is a standard firmware and some customized firmware to specific customers available. It is possible to perform firmware updates.

WizFi250 decides its operating mode according to the input value of the BOOT signal. WizFi250 operates in boot mode when the BOOT input value is “LOW”, otherwise it operates in the standard run mode. WizFi250 communicates with a PC via UART in order to upload another firmware, so you have to connect UART1_RXD and UART1_TXD to the external interface for communicating with PC. Two different schematics for that connection are listed below.

8.2.1. Case 1

A simple circuit for updating firmware. If your application MCU has UART communication with WizFi250, there is a possibility that the firmware update with an external PC will fail because of dual use of the one UART interface. In that case WIZnet cannot guarantee a completely successful update.

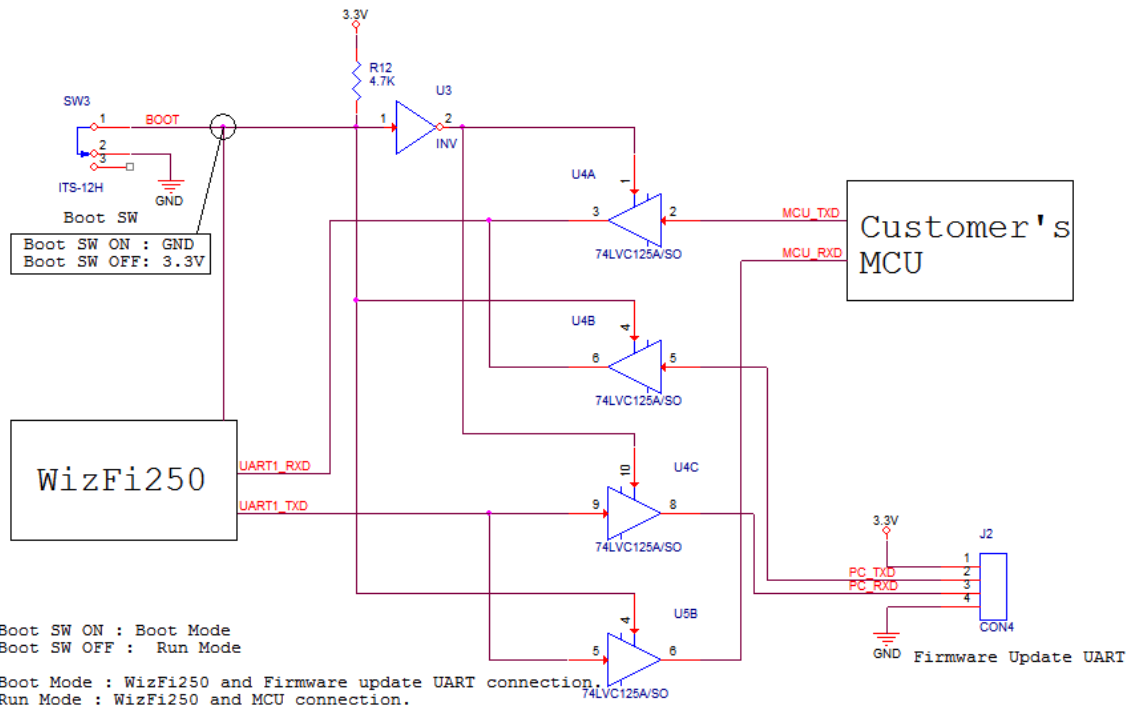

Therefore, please monitor the signal of BOOT of your MCU. Please stop the UART communication between your MCU and the WizFi250 when BOOT input value is “LOW”. After the detection of a “LOW” BOOT signal you can succeed firmware update.

8.2.2. Case 2

This circuit selects the UART communication using some extra hardware. If the BOOT SW is ON(GND), it is the BOOT Mode, and if the BOOT SW is OFF(3.3V), it is RUN Mode. The UART signal of the WizFi250 is connected on the firmware update UART(PC) when it becomes BOOT Mode, so firmware updates are made possible. The UART signal of the WizFi250 is only connected on your MCU if the BOOT signal is “High” and WizFi250 goes into the RUN mode.

9. Recommend reflow profile

The following paragraphs provide the requirements for the size, weight and mounting of the WizFi250.

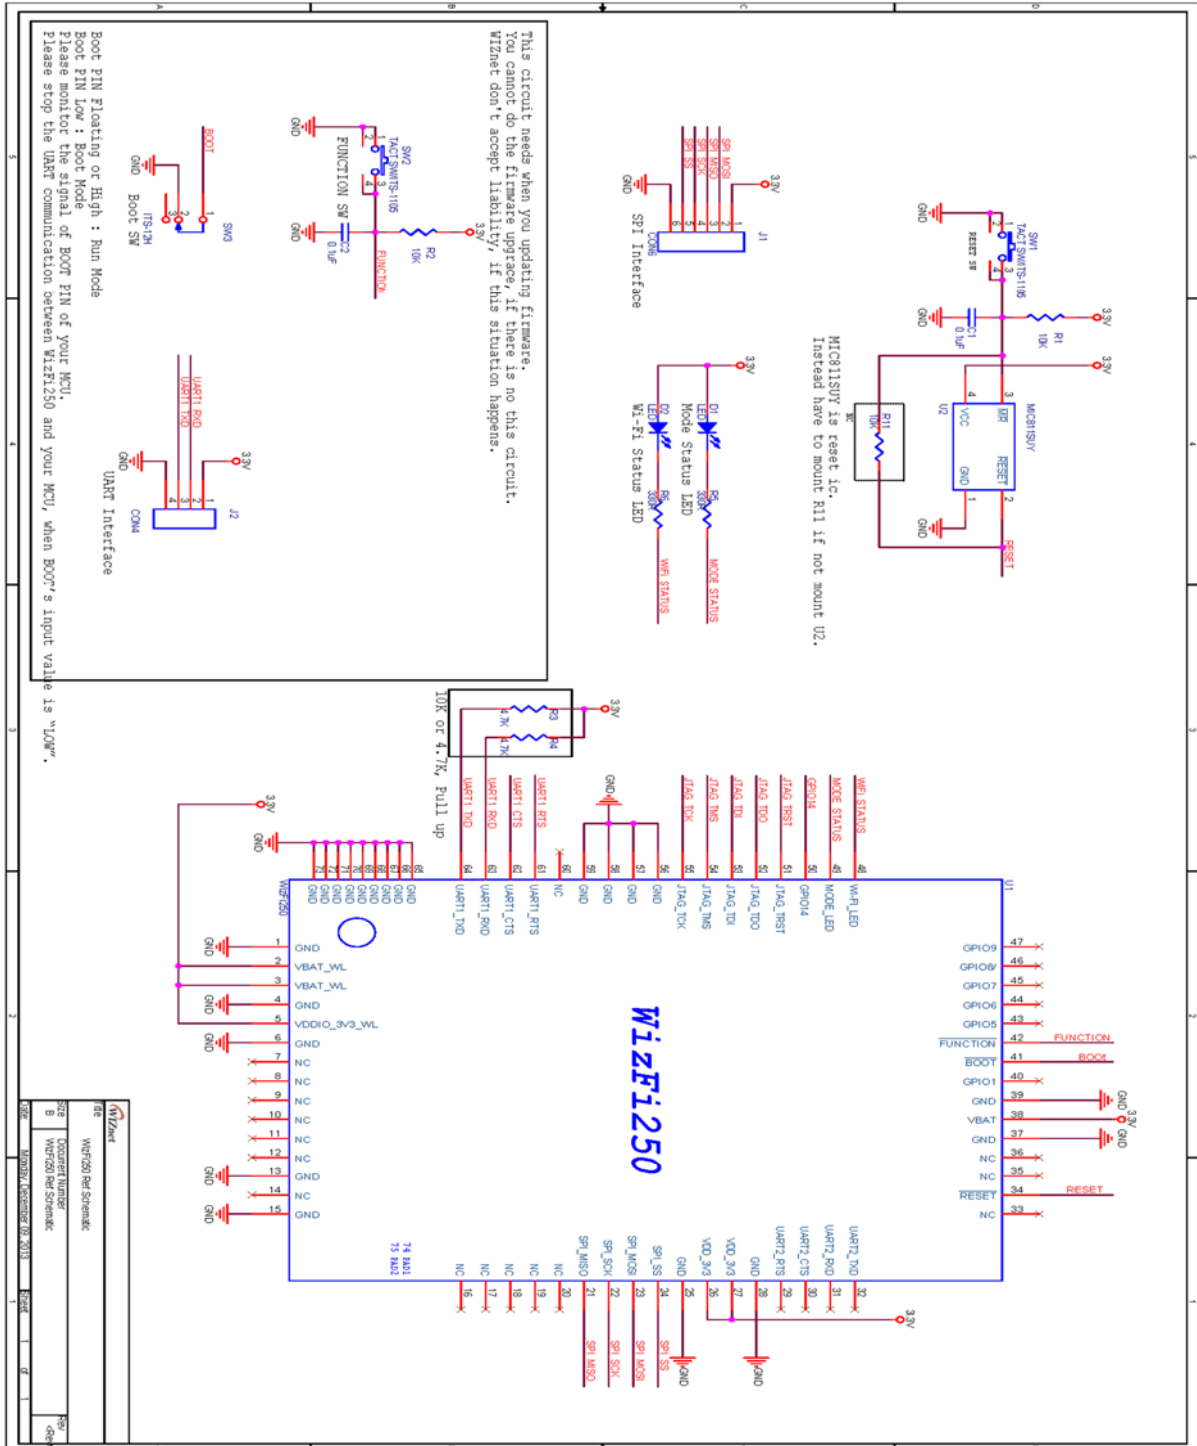

A-B. Temp.: 150~200 °C; soak time:60~120sec.

C. Peak temp: 235~245 °C

D. Time above 220 °C: 40~90sec.

Suggestion: Optimal cooling rate is $< 1 \text{ °C/sec.}$ from peak to 220 °C.
