## General Description

The MIC6211 Itty $B^{\text {itty }}{ }^{\text {TM }}$ op amp is a general-purpose, highperformance, single- or split-supply, operational amplifier in a space-saving, surface-mount package.
The MIC6211 operates from 4V to 32V, single or differential (split)supply. The input common-mode range includes ground. The device features a 2.5 MHz unity gain bandwidth, $6 \mathrm{~V} / \mu \mathrm{s}$ slew rate, and is internally unity-gain compensated.
Inputs are protected against reverse polarity (input voltage less than $\mathrm{V}-$ ) and ESD (electrostatic discharge). Output is current limited for both sourcing and sinking. Output short circuits of unlimited duration are allowed, provided the power dissipation specification is not exceeded.
The MIC6211 is available in the tiny, 5 -lead SOT-23-5 sur-face-mount package.

## Applications Information

## Common-Mode Range and Output Voltage

The input common-mode range of the MIC6211 is from the negative supply voltage to 1.2 V below the positive supply voltage. The output voltage swings within 1V of the positive and negative supply voltage.

## Voltage Buffer

Figure 1 shows a standard voltage follower/buffer. The output voltage equals the input voltage. This circuit is used to buffer a high impedance signal source. This circuit works equally well with single or split supplies.

Figure 1. Voltage Buffer

## Inverting Amplifier

Figure 2 shows an inverting amplifier with its gain set by the ratio of two resistors. This circuit works best with split supplies, but will perform with single supply systems if the non-inverting input (+ input) is biased up above ground.

Figure 2. Inverting Amplifer

## Voltage Controlled Current Sink

Figure 3 is a voltage controlled current sink. A buffer transistor forces current through a programming resistor until the feedback loop is satisfied. Current flow is $V_{\mathbb{I N}} / R$. This circuit works with single or split supplies.

## High-Pass Filter

Figure 4 is an active filter with 20dB (10x) gain and a lowfrequency cutoff of 10 Hz . The high gain-bandwidth of the MIC6211 allows operation beyond 100 kHz . This filter configuration is designed for split supplies.

Figure 4b. High-Pass Filter Response

## Summing Amplifier

Figure 5 is a single supply summing amplifier. In this configuration, the output voltage is the sum of V 1 and V 2 , minus the sum of V 3 and V 4 . By adding more resistors to either the inverting or non-inverting input, more voltages may be summed. This single supply version has one important restriction: the sum of V1 and V2 must exceed the sum of V3 and V 4 , since the output voltage cannot pull below zero with only a single supply.
