PROPERTIES OF PLASTIC MATERIALS

Combustibility test for plastics according to UL subject 94

The plastic materials are classified as follows:

UL 94 V-0:

The test samples are extinguished within 5 seconds average time (mean of 10 succesive tests). None of the test sample burns longer than 10 seconds. None of the test sample emits burning particles.

UL 94 V-1:

The test samples are extinguished within 25 seconds average time (mean of 10 succesive tests). None of the test sample burns longer than 30 seconds. None of the test sample emits burning particles.

UL 94 V-2:

Same Test as UL 94 V-1, but the test samples emits burning particles during the

The test samples mentioned above are extinguished in all cases. If the test samples keeps burning after 30 seconds, a horizontal test can be carried out to reach the classification UL 94 HB.

CHOICE OF MATERIAL:

Reinforced Polyester

Excellent temperature stability combined with a high degree of impact strength. On the whole, a high stability against chemicals. Good long-time rupture strength.

Noryl

Extremely good mechanical, thermal and electrical properties. Good ageing stability and weathering resistance. High stability against chemicals.

Polyamide

Thermoplast with high temperature stability, extremely solid and tenacious. Good sliding properties and high capacity of resistance to wear. Contact with humidity may result in a change of properties.

Polycarbonate

Thermoplast with high temperature stability with excellent resistance to all kinds of temperature. On the whole, good resistance against chemicals and UV-light.

PC-ABS Blend

Good stability in case of high temperature combined with enormous impact strength as well as toughness at subzero temperature. On the whole, good resistance against chemicals. UV-light may have a negative effect.

ARS

Good resistance against medium temperature combined with good impact strength (only certain types) and antistatic adjustment. On the whole, good resistance against chemicals. UV-light may have a negative effect.

Polystyrene

Normally brittle and resistant to fairly low temperature. SB-types are impact resistant and less sensitive to tearing under pressure. Glossy surface. Metal-cutting is possible.

PMMA (plexiglass®)

Good mechanical properties, slightly brittle. Superior from optical point of view. Permeable to light up to 92% for certain types.

RECOMMENDED APPLICATION:

For dimensionally stable and temperature-resistant parts. Outdoor application.

Dimensionally stable, heat-resistant, self-extinguishing parts, mainly when exchanged with metal. Component parts and cases for entertainment industry and data processing units.

Ideally suited for technical application, especially for machine elements with complicated geometry.

Recommended for cases housing instruments and general indoor and outdoor application. Not recommended for use with strong alkalis or for direct exposure to sunlight.

Ideally suited for indoor use with moderate corrosive conditions. Limited outdoor suitability. Special materials comply with ball-thrust hardness test according to VDE 700 at 125°.

Cases and operating elements of all kinds. Indoor use, also suitable for low temperature. Limited outdoor application. Suitable for galvanic coating.

For cases and operating elements with working temperature of less than 65°. Suitable for indoor use. Exposure to UV-light should be avoided.

Cases and front panels for infrared transmitters and receivers as well as transparent parts.

The plastic and packaging material used by OKW are on the whole harmless and, apart from some exceptions, can easily be recycled and reutilized.

The plastic properties on pages 222/223 are exclusively applicable for the specified standard test pieces. Variations may occur as far as cases and technical parts are concerned.
