Product Family Overview

Introduction

Totalizers are used in a wide variety of applications where accurate totals are needed. Typical applications include counting the number of parts produced, amount of material used, or the number of machine cycles occurring. Totalizers are the simplest and most common type of counter. As an added bonus, some models can perform both totalizing and ratemeter functions.

Application Example

Parts are fed into a machine or process, an operation is performed, and the finished parts exit the machine or process. The subtract totalizer is used to indicate the number of parts in process.

Product Description

Small in size and price, but large in design versatility and model variety is the ME Series of miniature electric counters. Models in most popular AC or DC voltages operate on as little as 3 watts, with the non-reset models measuring only 1 x 1.593 x 2.187 inches (25.4 x 40.5 x 55.5 mm) and weighing just three ounces (85 grams).

Available in 4, 6 or 7 figures, the counters feature stainless steel self-lubricating shafts, nylatron pinions and a synchronous electromagnetic drive to assure accurate, reliable, long life operation. Designed for mounting flexibility and aesthetic attractiveness, the miniature electric counters are available with three types of mounting and a glare retarding finish Delrin, with crisp easy-to-read numerals set close to a tamper-proof sealed figure window.

Product Family Overview

Introduction

Count controls are counters that provide output signal(s) at preset count value(s). Typical applications include cut-to-length, batching, filling, mixing and dispensing. Available from Eaton are a variety of count controls in different sizes, display types and feature sets.

Application Example

The illustration shows a simple cut-to-length application. The roll of paper is measured using a measuring wheel and rotary contactor (or encoder). Once the desired length is reached, an output signal may be directed to a shear for activation. Following the cut-off, the count control will reset to zero and begin measurement of the next piece. Options such as batch counting, where the number of cut pieces is counted, are also typical of this application.

Product Description

The PD-Q Series is a five-digit, true subtracting electric predetermined counter that features pushbutton operation of both predetermined count settings and reset. The predetermined count is set by holding the RESET button in and then depressing the easy to operate pushbutton selectors under each digit. The unit subtracts, one count for each contact closure or impulse and actuates a 4 ampere, 250V AC switch when zero is reached. The output signal from this switch can be used to halt or change the flow of items being counted, and/or operate other electrical apparatus. The counter returns to the predetermined number when the RESET button is depressed and it is immediately ready to control the next lot or batch.

The PD-ER Series is identical to the PD-Q Series, except that it has electric reset (ER) for remote operation, allowing either local or remote use.

Product Family Overview

Introduction

Ratemeters are used in a variety of applications where it is necessary to monitor the speed of a process. Conveyors, baking ovens, material flow and motor speed are typical uses for ratemeters. Eaton/Durant models with alarm outputs can be used to detect high or low rates. Rate indicators are often included as a standard feature on totalizers and count controls.

Application Example

One of the most common ratemeter applications is a tachometer. A tachometer displays motor or shaft RPM. The inductive proximity sensor detects the key on the shaft and the meter calculates the rate at which the shaft is turning based on a user-defined scaling factor. Signals from encoders, mag pick-ups, Hall effect sensors, etc. may also be used as inputs.

Product Family Overview

Introduction

Timers are used in applications where time itself is the main focus. These include simple knowledge of how long a machine has been running to determine machine maintenance, for example, (elapsed time) to knowing when to change an elevator cable (cable life and safety). Timers generally have the ability to stop and then to continue on from the point at which they stopped. Timer Relays are used in applications where an output is required to make something happen at a predetermined point in time (to stop or start the process).

Application Examples

- Elapsed time indication for interval maintenance of construction and agricultural equipment
- Usage metering for determining charges on rental equipment
- Controlled process timing for adhesive application/curing equipment

Product Family Overview

Introduction

Flow products are used in a variety of applications where liquid gas flow needs to be monitored or controlled. Eaton offers models for flow total, flow rate and flow batch control. Several optional outputs allow great flexibility to meet most application needs.

Application Example

In many processes, it is desirable to know both the total quantity of product being produced and the rate at which the product is being produced.

In the illustration at right, the output of a turbine flow sensor is connected to a totalizer/ratemeter. The flow sensor produces a known number of pulses per gallon (or other unit of measure). The instrument scales these pulses into the desired units of flow volume (gallons, liters, barrels, etc.), and flow rate (gallons/minute, barrels/hour, etc.).

Product Description

The BASIC monitor control (BMC) has two count inputs. Eight other rear terminal inputs and the fourteen front panel keys are user definable. The same is true for the two relay and five transistor outputs. Configuration is done through a BASIC language program entered by the user, putting the BMC in specialized control applications where dedicated count controls are not as well suited.

The 6460 sequential control can be thought of as a counter and/or timer with 500 presets. Most users load a number of programs or "recipes" into the 6460 and have the operator select one recipe at a time to run. The 6460 is often found in roll forming and coil winding applications and is used on induction heat treating scanners.

Application Description

Cut-to-Length Application

In a "typical" cut-to-length application, raw stock is pulled from a coil through straightening rollers, and fed past a pneumatic shear. A quadrature encoder riding on the stock sends pulses to a counter that "measures" the amount of stock fed. The primary counter function

is to supply an output signal to the shear to cut the stock at a certain "preset" length, then reset itself and start measuring the next piece, and continue to do so until the desired number of pieces have been cut.

Modern counters provide two other functions. The first is the slowdown, or "prewarn" output. The motor that drives the stock through the machine usually is run at a high speed until just before the cutoff occurs. A prewarn output from the counter to the drive drops the motor speed so that the feed rate for the stock slows to a "creep" speed that is maintained until the final cutoff preset is reached. Due to variations in feed speed and shear response, this creep speed is necessary for achieving a consistent cut length.

The second additional function of the counter is to count the number of pieces that are cut and stop the machine when a preset number of pieces is reached. This is done by a second count register, called the batch counter, inside the counter.

Cat. No. 58868400

Product Description

The 58868400 closed-loop position control provides digital output signals (run, direction and fast/slow) to a drive to cause a motor-driven tool to be positioned along a single axis. These signals can also be used to control valves in a hydraulic positioning system. Typically, a quadrature encoder, coupled to the drive mechanism, provides the feedback signal to the position control. Up to five destinations can be automatically sequenced through in a move-and-dwell process, or the operator can select a single destination for move-and-stop positioning.

Cat. No. 57401400

Product Description

The Ambassador speed control provides a tightly regulated, isolated, 0 – 10V speed reference signal to a drive. It is most often used in follower mode applications, such as conveyor speed matching/mis-matching, cable production lay control, cable take-up reel traversing mechanism speed control and many others. In master mode, it is most commonly used for constant web speed take-up roll control, where the increasing roll diameter requires constant motor slowing over the course of filling a roll. Also, where feedback scaling and presets are required in units other than RPM or Hz. For instance, using a flowmeter as the feedback sensor, control the speed of a motor-driven pump in units of gallons/minute.

The two preset version offers additional features, such as reversing, and remote preset adjustments by “bumping” external pushbuttons.

Features and Benefits

Cat. No. 57550400

Product Description

The Fusion Integrated Machine Control has advanced features, including a five-preset high speed counter with prewarn, a totalizer with preset, a batch counter with preset and a rate-meter with high and low setpoints. Unique to the count control world, the Fusion has five output relays (rather than two), along with two transistors and two analog setpoint or follower outputs. Its ten available parameter sets of pre-loaded values are useful as recipes, for job-stacking or for a variety of application-specific purposes.

The Fusion has a multi-line alphanumeric display which can be programmed to show text messages, logic-generated prompts, alarms and machine status. Up to eight screens can be shown or optionally locked out. Count and time presets can be made view-only or editable. Preset entry is achieved with simple 0-9 keys on the front panel rather than complicated scrolling methods. The Fusion's real time clock/calendar may be displayed and/or used to time and date stamp printouts.

With its ladder logic, the Fusion is actually a 26 I/O controller, making it a complete control for many machines and processes, integrating the functions of external timers, pushbuttons, power supplies, indicating lights, control relays and other components in the same box.

Features

- User-configurable operator interface with back-lit LCD display and 18-button tactile feedback keypad
