|  |  |  |  |  |  |  |

Operating temperature: $-50^{\circ} \mathrm{C}$ to $+160^{\circ} \mathrm{C}$
Life expectancy is average time to half initial light output level at nominal current.
Current may be increased or decreased from the nominal value, when the life expectancy will vary
according to a 3.3 power law:

$$
\mathrm{L}_{2}=\mathrm{L}_{1}\left(\frac{\mathrm{I}_{1}}{\mathrm{I}_{2}}\right)^{3.3}
$$

Neon lamps should not be operated at more than twice the nominal current.
Operation at currents below the nominal value may result in the discharge becoming unstable (ie lamps flicker).
