## Notes

1. Luminous flux is the total luminous flux output as measured with an integrating sphere.
2. Iv (flux $\Phi_{v}$ ) classification code is marked on each packing bag.
3. The chromaticity coordinates ( $\mathrm{x}, \mathrm{y}$ ) is derived from the 1931 CIE chromaticity diagram.
4. Caution in ESD:

Static Electricity and surge damages the LED. It is recommended using a wrist band or anti-electrostatic glove when handling the LED. All devices, equipment and machinery must be properly grounded.
5. CAS140B is the test standard for the chromaticity coordinates $(x, y) \& \Phi_{v}$.
6. The chromaticity coordinates ( $\mathrm{x}, \mathrm{y}$ ) guarantee should be added $+/-0.01$ tolerances
7. CRI measurement allowance is $\pm 5$
8. The thermal resistance is defined
as the figure, $R_{j t}$ is the $R_{t h}$ from $T_{j}$ to thermal pad solder:
Reference for thermal resistance:
Using $2.5 \times 2.5 \times 0.17 \mathrm{~cm}$ aluminum MCPCB,

Rjs = Rth of Tj to Ts
Rit $=$ Rth of Tj to Thermal pad solder

- Rth definition in Datasheet $=$ Rjt
- Rit < Rjc
- $\mathrm{Tj}=\mathrm{Rj} \mathrm{s}^{\mathrm{t}} \mathrm{W}+\mathrm{Ts}$

## Notes:

1. The LEDs can be soldered using the reflow soldering or hand soldering method. The recommended hand soldering condition is $350^{\circ} \mathrm{C}$ max. and 2 secs max. for one time only, and the recommended reflow soldering condition is $260^{\circ} \mathrm{C}$ max. and 5 secs max. for three times max.
2. All temperatures refer to topside of the package, measured on the package body surface.

## LIGHT LED <br> 5630SZNxx Series

3. The soldering condition referring to J-STD-020. The storage ambient for the LEDs should not exceed $30^{\circ} \mathrm{C}$ temperature or $70 \%$ relative humidity. It is recommended that LEDs out of their original packaging are soldered within one week. For extended storage out of their original packaging, it is recommended that the LEDs were stored in a sealed container with appropriate desiccant, or desiccators with nitrogen ambient. If the LEDs were unpacked more than 168 hrs , baking the LEDs at $60{ }^{\circ} \mathrm{C}$ for 24 hrs before soldering process.
4. The soldering profile could be further referred to different soldering grease material characteristic. The grease vendor will provide this information.
5. A rapid-rate process is not recommended for the LEDs cooling down from the peak temperature.
6. Although the recommended reflow conditions are specified above, the reflow or hand soldering condition at the lowest possible temperature is desirable for the LEDs.
7. LiteOn cannot make a guarantee on the LEDs which have been already assembled using the dip soldering method.

## 10. Cautions

### 10.1 Application

The LEDs described here are intended to be used for ordinary electronic equipment (such as office equipment, communication equipment and household applications).Consult Liteon's Sales in advance for information on applications in which exceptional reliability is required, particularly when the failure or malfunction of the LEDs may directly jeopardize life or health (such as in aviation, transportation, traffic control equipment, medical and life support systems and safety devices).

### 10.2 Storage

This product is qualified as Moisture sensitive Level 3 per JEDEC J-STD-020 Precaution when handing this moisture sensitive product is important to ensure the reliability of the product.

The package is sealed:
The LEDs should be stored at $30^{\circ} \mathrm{C}$ or less and $90 \%$ RH or less. And the LEDs are limited to use within one year, while the LEDs is packed in moisture-proof package with the desiccants inside.

The package is opened:
The LEDs should be stored at $30^{\circ} \mathrm{C}$ or less and $60 \%$ RH or less. Moreover, the LEDs are limited to solder process within 168hrs. If exceed the storage limiting time since opened, that we recommended to baking LEDs at $60^{\circ} \mathrm{C}$ at least 24 hrs . To seal the remainder LEDs return to package, it's recommended to be with workable desiccants in original package.

### 10.3 Cleaning

Use alcohol-based cleaning solvents such as isopropyl alcohol to clean the LED if necessary.

### 10.4 Drive Mode

An LED is a current-operated device. In order to ensure intensity uniformity on multiple LEDs connected in parallel in an application, it is recommended that a current limiting resistor be incorporated in the drive circuit, in series with each LED as shown in Circuit A below

Circuit model A

Circuit model B

## LIGHT LED

(B) The brightness of each LED might appear different due to the differences in the I-V characteristics of those LEDs.

### 10.5 ESD (Electrostatic Discharge)

Static Electricity or power surge will damage the LED. Suggestions to prevent ESD damage:

- Use of a conductive wrist band or anti-electrostatic glove when handling these LEDs.
- All devices, equipment, and machinery must be properly grounded.
- Work tables, storage racks, etc. should be properly grounded.
- Use ion blower to neutralize the static charge which might have built up on surface of the LED's plastic lens as a result of friction between LEDs during storage and handling.

ESD-damaged LEDs will exhibit abnormal characteristics such as high reverse leakage current, low forward voltage, or "no lightup" at low currents. To verify for ESD damage, check for "light up" and $V_{F}$ of the suspect LEDs at low currents. The $\mathrm{V}_{\mathrm{F}}$ of "good" LEDs should be $>2.0 \mathrm{~V} @ 0.1 \mathrm{~mA}$ for InGaN product and $>1.4 \mathrm{~V} @ 0.1 \mathrm{~mA}$ for AllnGaP product.

### 10.6 Suggested Checking List:

2. If conductive footwear used, conductive flooring also present where operator stand or walk?
3. Garments, hairs or anything closer than 1 ft to ESD items measure less than 100 V *?
