## NOTES:

1. The JEDEC type numbers shown (B suffix) have a $\pm 5 \%$ tolerance on nominal Zener voltage. The suffix $C$ will have $\pm 2 \%$ tolerance; and suffix D will have $\pm 1 \%$ tolerance.
2. Zener voltage $\left(\mathrm{V}_{\mathrm{z}}\right)$ is measured after the test current has been applied for $20 \pm 5$ seconds. The device shall be suspended by its leads with the inside edge of the mounting clips between $0.375^{\prime \prime}$ and 0.500 " from the body. Mounting clips shall be maintained at temperature of $25 \pm 8 /-$ $2^{\circ} \mathrm{C}$.
3. The Zener impedance is derived when a 60 cycle ac current having an rms value equal to $10 \%$ of the dc $Z$ ener current $\left(\mathrm{I}_{z \tau}\right.$ or $\left.\mathrm{I}_{\mathrm{zk}}\right)$ is superimposed on $\mathrm{I}_{\text {tт }}$ or $\mathrm{I}_{\mathrm{zk}}$. Zener impedance is measured at 2 points to ensure a sharp knee on the breakdown curve and to eliminate unstable units. See MicroNote 202 for variation in dynamic impedance with different Zener currents.
4. The values of $\mathrm{I}_{\mathrm{zM}}$ are calculated for $\mathrm{a} \pm 5 \%$ tolerance on nominal Zener voltage. Allowance has been made for the rise in Zener voltage above $V_{Z \tau}$ which results from Zener impedance and the increase in junction temperature as power dissipation approaches 400 mW . In the case of individual diodes $\mathrm{I}_{\mathrm{zM}}$ is that value of current which results in a dissipation of 400 mW at $75^{\circ} \mathrm{C}$ lead temperature at $3 / 8^{\prime \prime}$ from body.
5. The surge for $I_{z S M}$ is a square wave or equivalent half-sine wave pulse of $1 / 120 \mathrm{sec}$. duration.
