Product Selector

Industrial Adhesives, Sealants
and Surface Treatment Solutions

Henkel

Nowadays, if you want to create added value, an excellent product portfolio simply is not good enough. You need a partner who understands your business and your products, who develops new production techniques, optimises your processes together with you and designs tailor-made system solutions.

A partner who can make a real contribution to long-lasting value creation for you:
Henkel – the worldwide market leader in adhesives, sealants and surface treatment. Get access to our unique and comprehensive product portfolio, benefit from our expertise and guarantee your highest process reliability. The General Industry Business fulfils specific industry and maintenance needs from one source.

The formula for efficient cleaning

Innovative pretreatment technology to improve your production process

High performance engineering adhesives and sealants

Advanced flexible bonding and sealing solutions

Partner

- Experienced sales and technical engineers are available around the clock
- Extensive technical support and certified testing methods provide the most effective and reliable solutions
- Advanced training programmes tailored to your specific needs will help you become the expert
- A strong distribution network puts our complete product range close to your operation, ensuring a high level of worldwide product availability
- Identify potential cost savings and process improvements for your operations

Innovation

- Advanced solutions to increase your innovation power
- Set new industry standards for sustainability and health and safety in your processes
- Create the basis for the development of new product design opportunities

Empowering your business

Technology

- Access to a complete product portfolio delivering superior performance for an extensive number of applications
- Use products that have been designed to meet the specific challenges of your industry
- Trust in state-of-the-art technologies and sustainable products

Brands

- The preferred global brands for high-performance adhesive, sealant and surface treatment solutions in industrial manufacturing and maintenance
- Loctite®, Teroson and Bonderite are known all over the world for proven high reliability and performance

Threadlocking

Locking of Threaded Fasteners

Why use a Loctite® Threadlocker?

Loctite® threadlocking products prevent self-loosening and secure any threaded fastener against vibration and shock loads. They are easy-flowing liquids which completely fill the gaps between mating threads. When used to assemble threaded fasteners, Loctite® Threadlockers permanently secure threaded assemblies and eliminate fretting corrosion by creating a unitised assembly.

Loctite® Threadlockers are much superior to traditional mechanical locking methods:

- Mechanical devices, e.g. split pins, tab washers: Only used to prevent the loss of nuts and bolts
- Friction devices: add to absolute elasticity and/or increase friction; but will not ensure permanent threadlocking under dynamic loads
- Locking devices, like tooth flanged and ribbed flanged bolts, nuts and washers: They prevent self-loosening, but are expensive and need larger flange-bearing surfaces; and they may damage the surfaces.

Loctite® Threadlockers are single-component liquid and semi-solid adhesives. They cure at room temperature to a hard solid thermoset plastic when applied between steel, aluminium, brass and most other metal surfaces. They cure in the absence of air. The adhesive completely fills the gaps between mating threads to lock threads and joints.

Advantages of Loctite® Threadlockers as compared to traditional mechanical locking devices:

- Prevent unwanted movement, loosening, leaks, and corrosion
- Resist vibration
- Single-component – clean and easy to apply
- Can be used on all sizes of fasteners – reduces inventory costs
- Seal threads – allow through-hole tapping

Choose the right Loctite® Threadlocker for your application:

Loctite® Threadlockers are available in varying viscosities and strengths and can be used for a wide range of applications.

Low Strength:

Removable with standard hand tools, good for adjustment screws, calibration screws, meters and gauges, for thread size up to M80.

Medium Strength:

Removable with hand tools, but more difficult to disassemble; good for machine tools and presses, pumps and compressors, mounting bolts, gear boxes, for thread size up to M80.

High Strength:

Very difficult to disassemble with standard hand tools; may require localised heat for removal. Good for permanent assemblies at heavy equipment, studs, motor and pump mounts, for thread size up to M80.

Wicking:

Very difficult to disassemble with standard hand tools; may require localised heat for removal. For preassembled fasteners, instrumentation or carburettor screws.

Non-liquids (semi-solid):

Medium and high strength semi-solid Threadlocker Sticks that can be used on thread size up to M50.

Surface Preparation

Correct surface preparation is the most important factor to assure the total success of any adhesive performance.

- Degrease, clean and dry threads prior to applying the adhesive – use Loctite® 7063 (see Cleaning on page 96)
- If the parts were in contact with aqueous washing solutions or cutting fluids which leave a protective layer on the surface, wash with hot water
- If the adhesive is applied below 5 °C, pre-treatment with Loctite® 7240 or Loctite® 7649 is advised (see Surface Treatment on page 114)
- For locking of plastic fasteners: see Instant Bonding on pages 30–37

Dispensing Equipment

Loctite® products are used for a wide variety of threadlocking applications. For some jobs it is sufficient to dispense adhesives and sealants manually from the bottle or cartridge onto the surfaces to be joined. In other cases, however, more precise hand-held or stationary automated dispensing is required. Loctite® dispensing equipment is specially designed to make application and use of our products fast, precise, clean and economical:

Semi-Automatic Dispensing Equipment

Loctite® 97009 / 97121 / 97201

Loctite® Semi-Automatic Dispensing Equipment combines a controller and reservoir into a single unit for valve dispensing of many Loctite® Threadlockers. Provides digital timing control, empty and end-of-cycle signal. Pinch Valve suitable for stationary or hand-held mode. The reservoirs are large enough to accept up to 2kg bottles, and units can be equipped with low level sensing.

97009 / 97121 / 97201

Hand-Held Applicator

Loctite® 98414 Peristaltic Hand Pump, 50ml bottle

Loctite® 97001 Peristaltic Hand Pump, 250ml bottle

These hand-held applicators mount easily on any anaerobic Loctite® 50 ml or 250 ml bottle, converting the bottle into a portable dispenser. They are designed to dispense at any angle in drop sizes from 0.01 to 0.04 ml, without leaks or product waste (suitable for viscosities up to 2,500 mPa·s).

97001 / 98414

For information on semi or fully-automatic dispensing equipment, available valves, spare parts, accessories and dispensing tips, please refer to page 128 or the Loctite® Equipment Sourcebook.

Loctite® 243

- Works on all metals, including passive substrates (e.g. stainless steel, aluminium, plated surfaces)
- Proven to tolerate slight contaminations of industrial oils, e.g. engine oils, corrosion prevention oils and cutting fluids
- Prevents loosening on vibrating parts, e.g. pumps, gear boxes or presses
- Permits disassembly with hand tools for servicing

P1 NSF Reg. No.: 123000

Loctite® 2400

- Leading in health and safety
- No hazard symbols, no risk phrases & no safety phrases
- “White” Material Safety Data Sheet – no entries in sections 2, 3, 15 and 16 of MSDS acc. to (EC) No. 1907/2006 – ISO 11014-1
- Excellent chemical and thermal resistance of cured product
- Permits disassembly with hand tools for servicing.

Loctite® 270

- Suitable for all metal fasteners, including stainless steel, aluminium, plated surfaces and chrome-free coatings
- Tolerates slight contaminations of industrial oils, e.g. engine oils, corrosion prevention oils, cutting fluids
- Ideal for permanently locking studs on engine blocks and pump housings
- For applications where disassembly is not required.

Thread Sealing

Sealing of Threaded Components

Why use a Loctite® Thread Sealant?

Loctite® Thread Sealants, available in liquid form or as sealing cord, prevent leakage of gasses and liquids. Designed for low and high pressure applications, they fill the space between threaded parts and provide an instant, low pressure seal. When fully cured, they seal to the burst pressure of most pipe systems.

Loctite® Sealants are much superior to traditional sealant types:

- Solvent-based sealing compounds: Shrink during cure as solvents evaporate. Fittings must be re-torqued to minimise voids. They lock the assembly by a combination of friction and deformation.
- PTFE tape: Lubricates in off direction, allowing fittings to loosen under dynamic loads and resulting in loss of clamping force and leakage. Dynamic loads may accelerate creep, causing leakage over time. The lubricating effect of PTFE frequently results in over-tightening of fasteners, adding stress or causing breakage of parts. Application requires good professional skills to avoid stressing fittings or castings.
- Hemp & Paste: are slow to apply and require a lot of expertise, are messy to assemble, and interfere with the torque needed to obtain the correct pre-stress. Frequently require re-work to achieve a 100 % seal of the assembly.

Advantages of Loctite® Thread Sealants as compared to traditional sealant types:

- Single-component – clean and easy to apply
- Does not creep, shrink or block systems
- Can be used on any size of pipe fitting
- Replaces all types of tape and hemp/paste sealants
- The seal resists vibration and shock loads
- Grades with several approvals, e.g. Loctite® 55 Sealing Cord: Potable water (KTW) and Gas (DVGW) approvals
- Protect mated threaded areas against corrosion

Choose the right Loctite® Thread Sealants for your application:

Sealants must be chosen for reliable long-term sealing performance. Pipes must remain leak-free under the severest vibration, chemical attack, heat or pressure surges. When choosing a thread sealant, the substrates to be sealed are a key criterion. Are we dealing with plastic threads, metal threads or a combination of both? Plastic threads usually require a different sealant than metal threads. The following explanations should help you identify which technology should be selected for each type of pipe fitting material:

Anaerobic:

Technology: Loctite® anaerobic thread sealants cure in the absence of air and by contact with metals when confined within the threads of pipe connections. Application area: Any type of metal fittings.

Silicone:

Technology:

Loctite® silicone thread sealant polymerises at room temperature, reacting with ambient moisture (RTV = Room Temperature Vulcanising)

Application area:

Ideal for use on threaded plastic or plastic/metal substrate combinations

Sealing cord – Loctite® 55:

Technology:

Loctite® 55 Sealing Cord is a non-curing, coated multifilament cord that seals out water, gas and most industrial oils. (Potable water (KTW) and gas (DVGW) approvals)

Application area:

Recommended for sealing metal and plastic tapered threads. Loctite® 55 allows for post assembly adjustments.

Surface Preparation

Correct surface preparation is the most important factor to assure the total success of any sealant performance. Without suitable surface preparation, Loctite® thread sealing applications can fail.

- Degrease, clean and dry surfaces prior to applying the sealant – use Loctite® 7063 (See Cleaning – page 96)
- If anaerobic sealants are applied below 5 °C, pre-treatment with Activator Loctite® 7240, Loctite® 7471 or Loctite® 7649 is required (see page 114)
- For Sealing Cord Loctite® 55: Clean parts with Loctite® 7063 and roughen smooth threads

Dispensing Equipment

Anaerobic Sealants:

Loctite® anaerobic sealants can be applied by hand or with automatic or semi-automatic equipment. Excess material can be wiped away.

Hand-Held Applicator:

Loctite® 98414 Peristaltic Hand Pump with stand for the Loctite® 50 ml bottle, and Loctite® 97001 Peristaltic Hand Pump for the Loctite® 250 ml bottle. They are designed to dispense at any angle in drop sizes from 0.01 to 0.04 ml with viscosities up to 2,500 mPa-s, without post-dripping or product waste.

Loctite® 97002 Pneumatic Cartridge Dispenser

Hand-held unit for 300ml cartridges and 250ml squeeze tubes. With integrated pressure regulator and quick pressure relief valve. No-run-on.

For information on semi or fully-automatic dispensing equipment, available valves, spare parts, accessories and dispensing tips, please refer to page 128 or the Loctite® Equipment Sourcebook.

Gasketing

Sealing of Flanges

Why use a Loctite® Gasketing Product?

Gaskets are used to prevent leakage of fluids or gases by forming impervious barriers. For successful gasketing, it is necessary that the seal must remain intact and leak-free over a long period of time. The gasket must be resistant to fluids and/or gasses, and withstand the operating temperatures and pressures to which it is subjected. Loctite® gasketing products are self-forming gaskets that provide a perfect seal between components, with maximum face-to-face contact, eliminating flange face corrosion. A low-pressure seal is formed immediately on assembly, with full cure in 24 hours giving a joint that won't shrink, crack or relax.

Loctite® Gasketing products offer a much higher performance and provide numerous benefits over traditional sealing systems such as pre-cut gaskets:

The major causes of failure and leakage of compression gaskets are:

- Surface contact: Compression gaskets do not provide total contact between the gasket and the flange surfaces. Therefore minor leakages may always occur (weeping rate).
- Compression set: Compression gaskets relax under dynamic loads and decrease in thickness, with subsequent loss of bolt tension in the flange joint resulting in leakage
- Extrusion: Gaskets can be squeezed out between flanges
- Bolt hole distortion: High stresses are transferred to the gasket material under the bolt head, causing the gasket to crack, tear, rupture or extrude.

Advantages of Loctite® Gasketing products as compared to conventional pre-cut compression gaskets:

- Single-component - easy and clean to apply
- Replace conventional gaskets – reduce inventory
- Fills all voids
- No need for retorquing
- Excellent instant seal
- High resistance to solvents
- Resists high pressure when fully cured

Choose the right Loctite® Gasket for your application:

Many factors influence gasket choice. Henkel offers a variety of gasketing materials:

Anaerobic products for rigid flanges:

They remain liquid when exposed to air, but cure when confined between mating flanges. Loctite® anaerobic gasketing products are best suited for rigid metal-to-metal assemblies where the sealing gap is zero or small.

Silicone products for flexible flanges:

Loctite® silicone gasketing materials include products with specific properties including excellent fluid resistance and formulations for high operating temperatures. They are best suited for large gap applications and assemblies where flange movement occurs.

Loctite® Gasketing products:

Loctite® gaskets can be used on almost every flange type. They are applied as a liquid sealant to one of the flange surfaces before the parts are assembled. After assembly the gasket spreads and cures between the flanges, filling gaps, scratches, and surface irregularities to provide a durable seal.

Surface Preparation

Components should be clean and free from contamination such as grease, oil, gasket and sealant residues, etc.

- Degrease, clean and dry surfaces prior to applying the sealant – use Loctite® 7063 (See Cleaning on page 96)
- For maintenance and repair, remove residues of old gaskets with Loctite® 7200 Gasket Remover and clean surfaces with Loctite® 7063 (see Cleaning on page 96)
- If the anaerobic sealant is applied below 5 °C, pre-treatment with Loctite® 7240, Loctite® 7471 or Loctite® 7649 is advised (see Surface Treatment on page 114)

Dispensing Equipment

Loctite® Cartridge Dispensers are ergonomically designed for the hand application of Loctite® sealants. Whether manual or pneumatic, each item is designed for simple, clean, hand-held dispensing of Loctite® gasketing products:

Cartridge Gun

Loctite® 142240 Cartridge Gun for 50ml and 300ml cartridges

- Hand-held, manually operated dispenser for all standard 150ml and 300ml cartridges
- Rapid loading system to make cartridge changes clean and easy

Cartridge Gun

Loctite® 97002 Pneumatic Cartridge Dispenser

- Hand-held unit for 300ml cartridges and 250ml squeeze tubes
- Integrated pressure regulator
- Quick pressure relief, to minimise run-on effect

For information on semi or fully-automatic dispensing equipment, available valves, spare parts, accessories and dispensing tips, please refer to page 128 or the Loctite® Equipment Sourcebook.

Handy Hints:

- Remove residues of old gaskets with Loctite® 7200 Gasket Remover
- Degrease, clean and dry surfaces prior to applying the adhesive – use Loctite® 7063 (See Cleaning on page 96)
- If the anaerobic sealant is applied below 5 °C, pre-treatment with Loctite® 7240 or Loctite® 7649 is advised (See Surface Treatment on page 114)

Loctite® 573

Ideal for sealing large, rigid metal flanges or flanges where assembly may take up to several hours.

Loctite® 574

Ideal for use on rigid metal parts, e.g. cast iron components and pump housings.

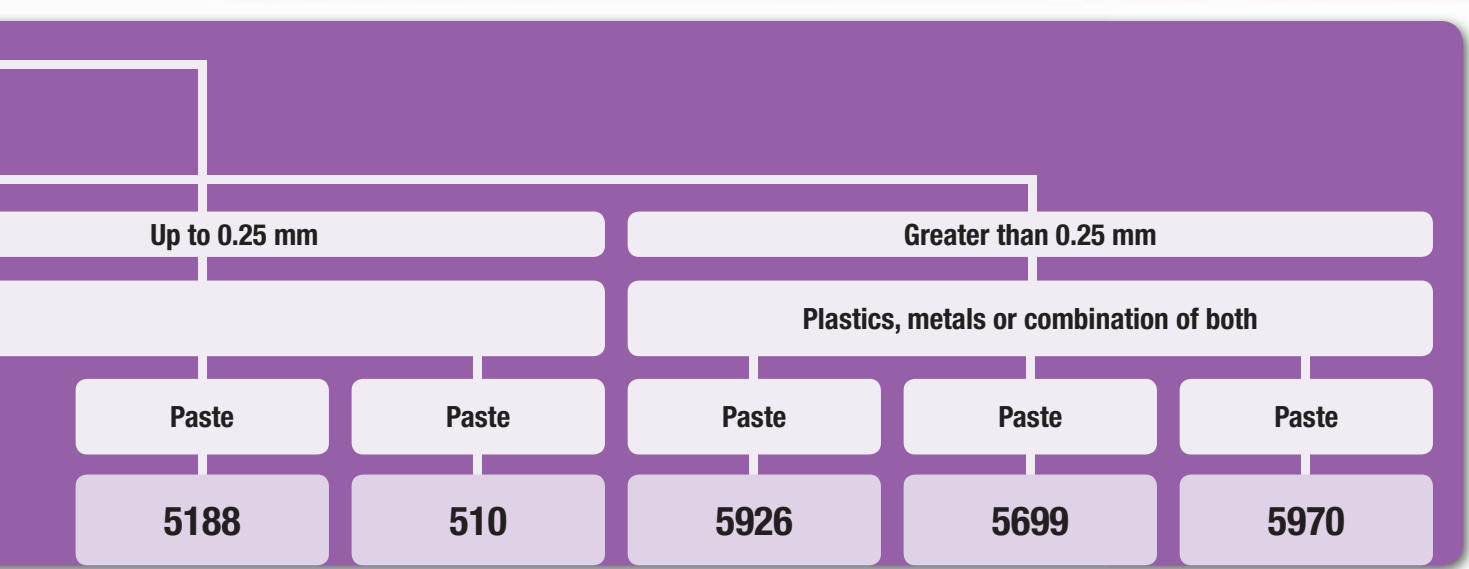

Loctite® 518

Ideal for use on rigid iron, steel and aluminium flanges.

P1 NSF Reg. No.: 123758

¹ For detailed information see pages 128-135

Loctite® 5188

Ideal for sealing all kinds of rigid metal flanges, especially aluminium flanges. Excellent in demanding applications, excellent chemical resistance, resist flexing. Superior adhesion, can tolerate slight oil contamination on the flange surface.

Loctite® 510

Ideal for use on rigid flanges where high temperature and chemical resistance is necessary.
P1 NSF Reg. No.: 123007

Loctite® 5926

Multi-purpose flexible silicone sealant. Can be used on metal, plastic and painted parts. Resists vibration, thermal expansion and contraction.

Loctite® 5699

Ideal for sealing all types of flanges including stamped sheet metal where water glycol resistance is required. Tack free after 10 min.
P1 NSF Reg. No.: 122998

Loctite® 5970

Replacement for cork and paper cut gaskets on flanges and stamped sheet metal covers. Ideal for use where high vibration or flexing occurs. Can be used with plastic and painted parts. Tack free after 25 min.

Retaining

Cylindrical Assemblies

Why use a Loctite® Retaining Compound?

Loctite® Retaining Compounds secure bearings, bushes and cylindrical parts into housings or onto shafts. They achieve maximum load transmission capability and uniform stress distribution and eliminate fretting corrosion. Applied as a liquid, they form 100 % contact between mating metal surfaces, eliminating the need for expensive replacement parts, time consuming machining or the use of mechanical methods.

Loctite® Retaining Compounds fill the inner space between components and cure to form a strong precision assembly.

Loctite® Retaining Compounds are much superior to conventional assembly methods:

- Pins, key/keyway assemblies: Have uneven distribution of mass, an imbalance that can lead to vibration at high speeds
- Splines: They cause high stresses due to the "notch effect" that occurs. High machining costs. Backlash between drive and over run.
- Clamp rings, press fits, shrink fits, and taper fits: They rely on friction alone to transmit torque, therefore they are limited by material, surfaces and design. Close tolerances are needed to obtain specific load capacities, leading to higher production costs. Interference fitting creates stresses in the components that can lead to failure, particularly when combined with operational stresses.
- Welding and soldering: Only compatible metals can be joined, the parts can be distorted by the high temperatures required. Heating of the material can lead to residual stresses and structural degradation and distortion. Disassembly can also be difficult or impossible.

Advantages of Loctite® Retaining Compounds as compared to conventional assembly methods:

- High-strength products can carry high loads
- Fill all voids to prevent corrosion and fretting
- 100 % contact – load and stress is distributed evenly over the joint

Advantages of Loctite Retaining Compounds in combination with shrink fits or press fits:

- Higher load transmission and performance with existing design and geometry solutions
- Equal performance by lower interference / lighter construction

Key factors to consider when choosing the right Loctite® Retaining Compound:

1. Gap size between parts:

Typically, low viscosity retaining compounds (125 to 2,000 mPa·s) are used for gaps up to 0.15 mm. For gaps greater than 0.15 mm, retaining compounds with higher viscosities (>2,000 mPa·s) should be used.

2. Temperature resistance:

Most Loctite® Retaining Compounds are capable of withstanding temperatures up to 150 °C. For applications that require resistance to higher temperatures, Henkel has developed a special range of retaining products that can withstand up to 230 °C.

3. Bond strength:

A high-strength retaining compound is recommended for applications that require a permanent bond. If parts need to be taken apart for maintenance, it is better to use a medium strength product because shear strength is lower.

4. Cure speed:

Many production applications require retaining compounds with fast cure speed to optimise production rates. On the other hand, some applications call for a slower cure so that adjustments can be made after the parts have been assembled. Our range of Loctite® Retaining Compounds offers a wide choice of cure speed options.

Surface Preparation

Components should be clean and free from contamination such as grease, oil, cutting fluids, protective coatings, etc.

- Degrease, clean and dry surfaces prior to applying the sealant – use Loctite® 7063 (See Cleaning on page 96)
- If the adhesive is applied below 5 °C, pre-treatment with Activator Loctite® 7240 or Loctite® 7649 is advised (see Surface Preparation on page 114)
- The cure speed of the retaining compound can be increased by use of Activator Loctite® 7649 or Loctite® 7240 (see Surface Treatment on page 114).

Dispensing Equipment

Formulated in a wide variety of viscosities, gap-filling capabilities, flexibility and strength characteristics, Loctite® Retaining Compounds can be applied with automated process equipment or dispensed manually.

Semi-Automatic Dispensing Equipment

Loctite® 97009 / 97121 / 97201

Loctite® Semi-Automatic Dispensing Equipment combines a controller and reservoir into a single unit for valve dispensing of many Loctite® products. Provides digital timing control, empty and end-of-cycle signal. Pinch Valve suitable for stationary or hand-held setup mode. The reservoirs are large enough to accept 2kg bottles, and units can be equipped with low level sensing.

97009 / 97121 / 97201

Hand-Held Applicator

Loctite® 98414 Peristaltic Hand Pump, 50ml bottle

Loctite® 97001 Peristaltic Hand Pump, 250ml bottle

These hand-held applicators mount easily on any anaerobic Loctite® 50 ml or 250 ml bottle, converting the bottle into a portable dispenser. They are designed to dispense at any angle in drop sizes from 0.01 to 0.04 ml, without leaks or product waste (suitable for viscosities up to 2,500 mPa·s).

97001/98414

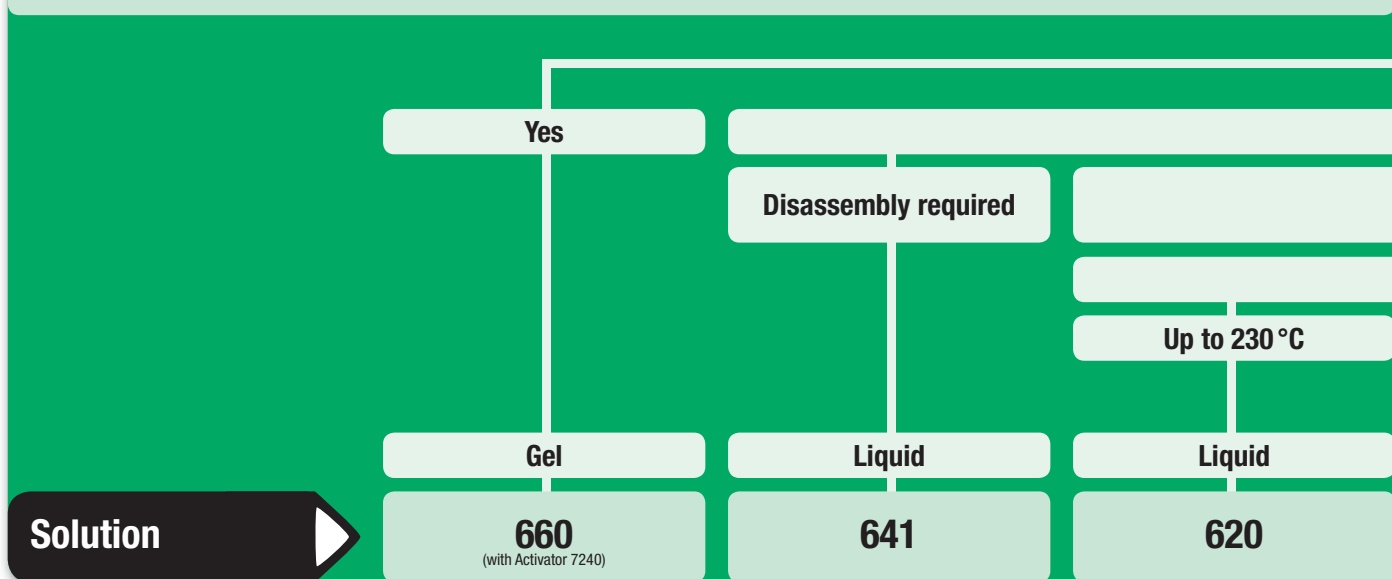

For information on semi or fully-automatic dispensing equipment, available valves, spare parts, accessories and dispensing tips, please refer to page 128 or the Loctite® Equipment Sourcebook.

Instant Bonding

For small to medium size parts

Why use a Loctite® Instant Adhesive?

Instant adhesives, or cyanoacrylates, cure very quickly when confined between surfaces. Surface humidity on the substrates triggers the cure reaction, which moves from the substrate surfaces towards the middle of the adhesive joint. Cyanoacrylates are chosen for bonding small parts to achieve extremely fast fixturing. Due to their limited gap filling capacity they require close fitting surfaces. Their adhesion to most substrates is excellent and the bonding strength in shear and tensile mode is very good. They should not be used on float glass or glazed ceramics, but can be used on GRP plastics. Bonds continuously exposed to water need proper adhesive selection and ageing evaluation.

Advantages of Loctite® Instant Adhesives:

- Clean and easy to apply
- Very fast positioning and fixturing of parts
- Joining a wide variety of dissimilar materials
- Excellent adhesion on a wide range of substrates, especially plastics and rubbers. Special formulations are available for bonding metals or porous substrates. Primer Loctite® 770 offers to improve adhesion on difficult-to-bond materials such as PP, PE, POM, PTFE, or silicone
- High strength on very small bond faces
- Free of solvents
- Do not require complex part geometries, e.g. for snap-fits

Choosing the right Loctite® Instant Adhesive:

Loctite® Instant Adhesives come in a variety of types optimised for specific application requirements, e.g. the parts to be bonded, the loads to be resisted, the joint geometry, the process parameters, etc.

The following explanations should help you identify which technology is best suited for any particular application.

Instant adhesives for bonding porous or acidic substrates:

These formulations are specially tailored to porous and acidic substrates, e.g. paper or galvanised metals, to achieve fast cure and fixturing.

Shock and impact resistant instant adhesives:

Elastomer-modified instant adhesives achieve very good shock and impact resistance. In addition, they offer improved thermal performance and resistance of metal bonds in humid environments.

High temperature instant adhesives:

These instant adhesives are resistant to temperatures up to 120 °C and for short periods even up to 140 °C.

Flexible instant adhesives:

Where bonded components are subjected to bending loads, flexible instant adhesives will reduce localised stress concentrations or encourage a more homogeneous deformation.

Low bloom, low odour instant adhesives:

Specially formulated low-bloom instant adhesives are recommended for cosmetically sensitive applications and/or very low odour.

2-component instant adhesives:

Innovative, two-component technology provides fast cure independent of gap. This applies especially for assemblies which are not a perfect fit, or where excess adhesive may be present.

Light curing instant adhesives:

Light curing formulations are recommended for bonding clear and transparent substrates with good aesthetic finish, or for curing of excess fillets (see Light Cure Adhesives on page 38).

Surface Preparation

Correct surface preparation is a key factor to assure the total success of any adhesive performance.

- The surfaces to be bonded should be clean, dry and free of grease. If necessary, clean the parts with Loctite® 7063 or Loctite® 7070 and allow to dry (see Cleaning on page 96)
- For faster fixture time, apply Loctite® Activator to one of the mating surfaces (see Surface Preparation on page 114)
- To improve adhesion to difficult-to-bond materials (PP, PE, PTFE, etc.), coat these bond faces completely with Primer Loctite® 770 (see Surface Preparation on page 114)

Dispensing Equipment

Loctite® Instant Adhesives are used for a wide variety of bonding applications. For some jobs it is sufficient to dispense the product manually from bottles designed specifically for easy and accurate dispensing.

In other cases, however, more precise hand-held or stationary automated dispensing is required. Loctite® dispensing equipment is designed to make application and use of our products fast, precise, clean and economical:

Peristaltic Dispenser Loctite® 98548

The peristaltic motion of the rotor provides volumetric dispensing of the adhesive directly from the bottle. The unit is designed mainly for manual work stations but can also be integrated into automatic production lines. A precise amount of product can be set and high repetition accuracy is ensured.

Semi-Automatic Dispensing System Loctite® 1388646

The system is suitable for dispensing dots or beads of low to medium viscosity Loctite® Instant Adhesives. It is designed for integration into automated assembly lines. The diaphragm valve provides high-resolution stroke adjustment and achieves no-drip dispensing. The controller actuates valve, reservoir and start of operation via footswitch, keyboard or higher ranking PLC.

For information on semi or fully-automatic dispensing equipment, available valves, spare parts, accessories and dispensing tips, please refer to page 128 or the Loctite® Equipment Sourcebook.

Handy Hints:

- In combination with Loctite® Instant Adhesives:
 - to improve adhesion of difficult-to-bond materials use Primer Loctite® 770
 - to increase cure speed use Activator Loctite® 7458, 7455, 7452 or 7457 (see Surface Treatment on page 114)
- For difficult-to-bond plastics (PE and PP) see also Loctite® 3030 or Loctite® 3038 on page 60

Loctite® 406

- Rapid bonding of plastics, rubbers, including EPDM, and elastomers
- Loctite® 770 Polyolefin Primer improves bonding on difficult to bond substrates

Loctite® 435

- High resistance to impact and shock loads, high peel strength
- Bonding of plastics, rubber, metals, porous and absorbent substrates and acidic surfaces
- Good resistance in humid environments

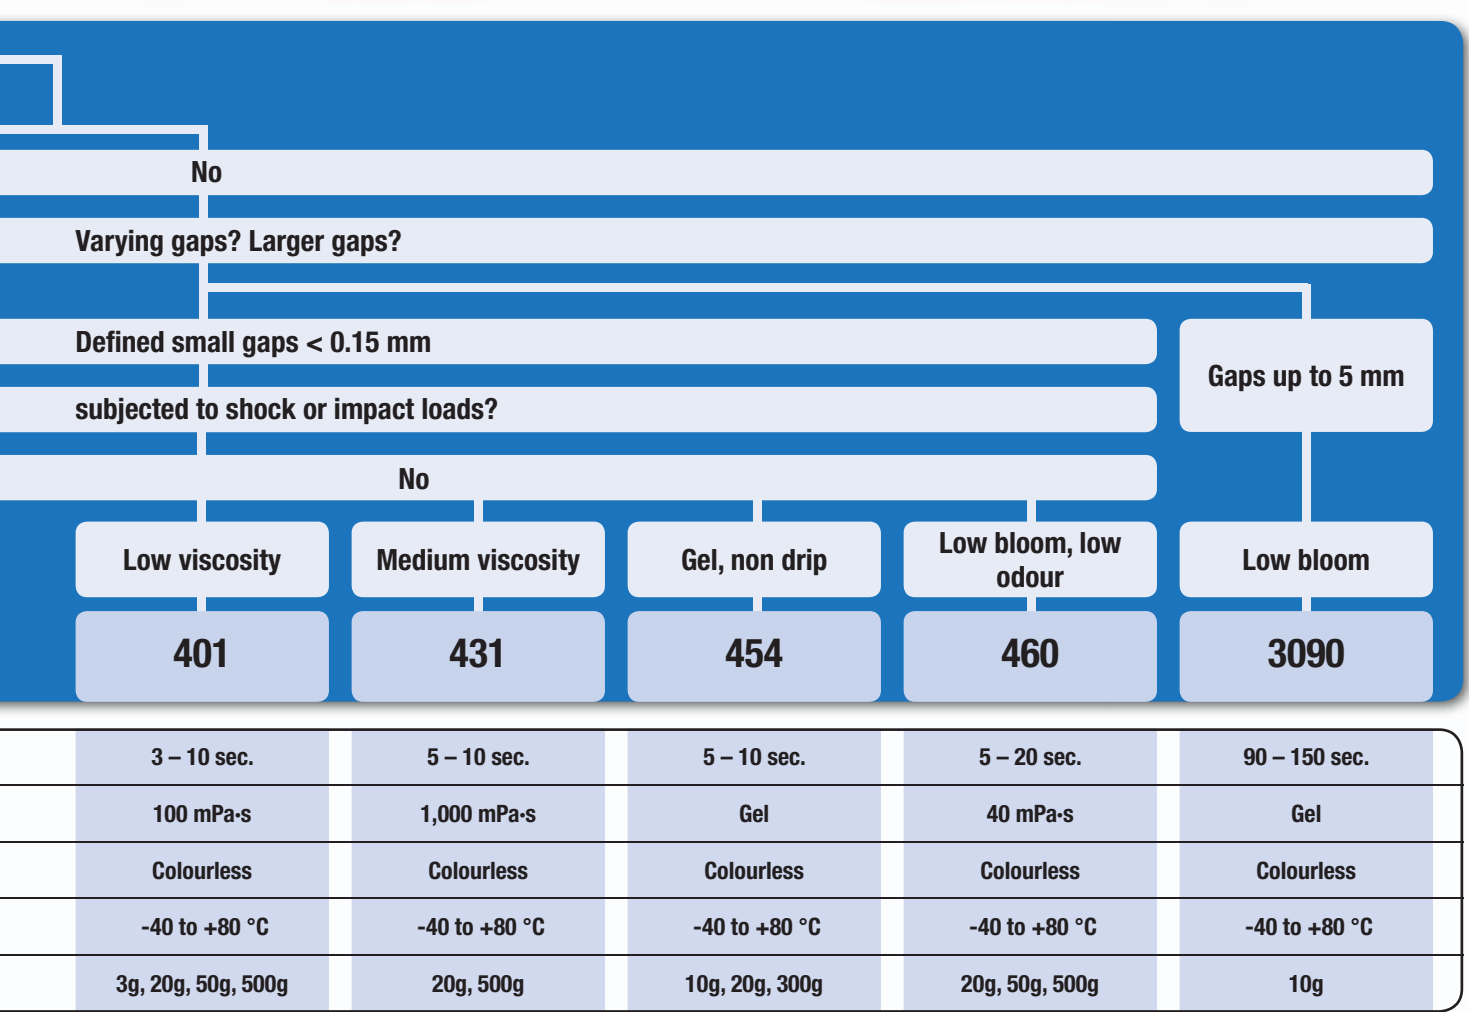

Loctite® 480

- For applications where shock resistance is required or shock or peel loads are present
- Ideal for bonding metal to metal, to rubber or magnets
- Good resistance in humid environments

Loctite® 4850

- For bonding materials subjected to bending or distortion, as well as flexible components
- For porous and adsorbent substrates and acidic surfaces

Loctite® 401

- General purpose
- For acidic surfaces such as chromated or galvanised surfaces
- For porous substrates such as wood, paper, leather, cork and fabric

P1 NSF Reg. No.: 123011

Loctite® 431

- General purpose
- For acidic surfaces such as chromated or galvanised surfaces
- For porous substrates such as wood, paper, leather, cork and fabric

Loctite® 454

- General purpose gel
- Ideal when non-dripping is required, or for use on vertical or overhead surfaces
- Bonding paper, wood, cork, foam, leather, card, metals and plastics

P1 NSF Reg. No.: 123009

Loctite® 460

- For applications where cosmetic aspects and low bloom are required
- For low odour during use
- For porous substrates such as wood, paper, leather, cork and fabric

Loctite® 3090

- For applications with gaps up to 5 mm or where excess of adhesive is present
- For applications where cosmetic aspects and low bloom are required
- For porous substrates such as wood, paper, leather, cork and fabric

Instant Bonding

Light Cure Adhesives

For fast processing

Why use a Loctite® Light Cure Adhesive?

In addition to their excellent bonding characteristics and transparency, light cure adhesives also provide unique processing advantages and compelling process cost reduction benefits. When exposed to sufficient light of the appropriate wavelength, they cure very rapidly and allow fast production cycles, in-line quality control and fast cycling to subsequent process steps. For best performance, light cure adhesives are available in various adhesive families. Loctite® Light Cure Equipment is engineered to match the adhesives with respect to intensity and radiation spectrum, and suit specific part size and manufacturing process requirements.

Advantages of Loctite® Light Cure Adhesives:

Light cure technology offers a unique combination of performance, design and processing benefits:

Cure on demand

- Material remains liquid until exposed to light systems, then cures in seconds
- Allows time to align parts precisely prior to cure
- Choice of cure system determines cure time

High speed of cure

- Achieves high process speeds for maximum throughput
- Fast cycling to subsequent process steps

Optical clarity

- Ideal for bonding clear and transparent substrates with perfect aesthetic finish
- Greatly expands the design options

Quality assurance

- Product presence monitoring by fluorescence
- Fast snap cure allows 100% in-line inspection
- Monitoring functions for cure parameters such as intensity, exposure time, etc.

One part systems

- Automated accurate dispensing
- No need to measure or mix, no pot life concerns
- Solvent-free

Choosing the right Loctite® Light Cure Adhesive:

To ensure reliable cure it is essential that the light reaches the adhesive. At least one of the bonded parts must be transparent to the curing wavelength of the adhesive selected. For UV-stabilised plastics, for example, visible light or INDIGO curing adhesives should be chosen.

Dual cure, initiated by heat or activator, moisture or anaerobic cure, can also be provided to cure adhesives in shadowed areas. Dual cure expands the benefits of light cure technology to non-transparent substrates, other adhesive technologies and application areas.

The targeted radiation wavelength is another key factor. Visible light offers a safer working environment. Especially the INDIGO light cure adhesives are designed to cure solely with low energy light in the visible spectrum. This eliminates the need for ventilation, reduces energy usage, and saves money due to fewer replacements, as well as reduced maintenance and repair.

Last but not least, adhesive performance is an important factor to consider. Loctite® Light Cure Adhesives cover the broadest range of adhesive technologies:

Loctite® Light Cure Adhesive Technologies

- Light cure acrylics offer the most extensive variety of properties of all light cure chemistries. A transparency equal to glass and clear plastics, as well as versatile adhesion characteristics are their most notable properties
- Light cure silicones, which cure into soft, flexible thermoset elastomers, are excellent for elastic bonding, sealing and leak proofing
- Light cure cyanoacrylates offer outstanding plastic bonding capabilities combined with rapid cure at low intensity light irradiation
- Light cure anaerobics show excellent metal bonding capabilities and offer outstanding chemical resistance combined with shadow cure

Surface Preparation

Correct surface preparation is a key factor to assure the total success of any adhesive performance.

- The surfaces to be bonded should be clean, dry and free of grease. If necessary, clean the parts with Loctite® 7063 or Loctite® 7070 and allow to dry (see Cleaning on page 96)

Dispensing Equipment and Light Cure Systems

For some jobs it is sufficient to dispense the product manually from the bottle onto the parts to be bonded. In other cases, however, more precise hand-held or stationary automated dispensing is required. Loctite® dispensing equipment is specially designed to make application and use of our products fast, precise, clean and economical:

Semi-Automatic Dispensing System Loctite® 1388647

The system is suitable for dispensing dots or beads of low to medium viscosity Loctite® light cure adhesives, and is designed for integration into automated assembly lines. The valve is a modular design used to facilitate field repairs. The reservoir accommodates up to 1.0 litre Loctite® bottles. The controller actuates valve, reservoir and start of operation via footswitch, keyboard or higher ranking PLC. An airline filter/regulator is included to provide filtered air supply.

Light Cure Systems

Loctite® Light Cure Systems are available for manual workstations as well as for production line integration. Various bulb and LED technologies ensure the proper wavelength adapted to the adhesive selected and the transparency of the parts to be bonded (for more details see Light Cure Equipment on page 134).

For information on semi or fully-automatic dispensing equipment, available valves, spare parts, accessories and dispensing tips, please refer to page 128 or the Loctite® Equipment Sourcebook.

Loctite® 3081

- UV-light curing acrylic
- Low viscosity, wicking grade for post assembly applications
- For bonding glass, plastics, metals, etc.

Loctite® 3491

- UV-light curing acrylic
- Low yellowing in sunlight environment
- For bonding glass, plastics, metals, etc.

Loctite® 3494

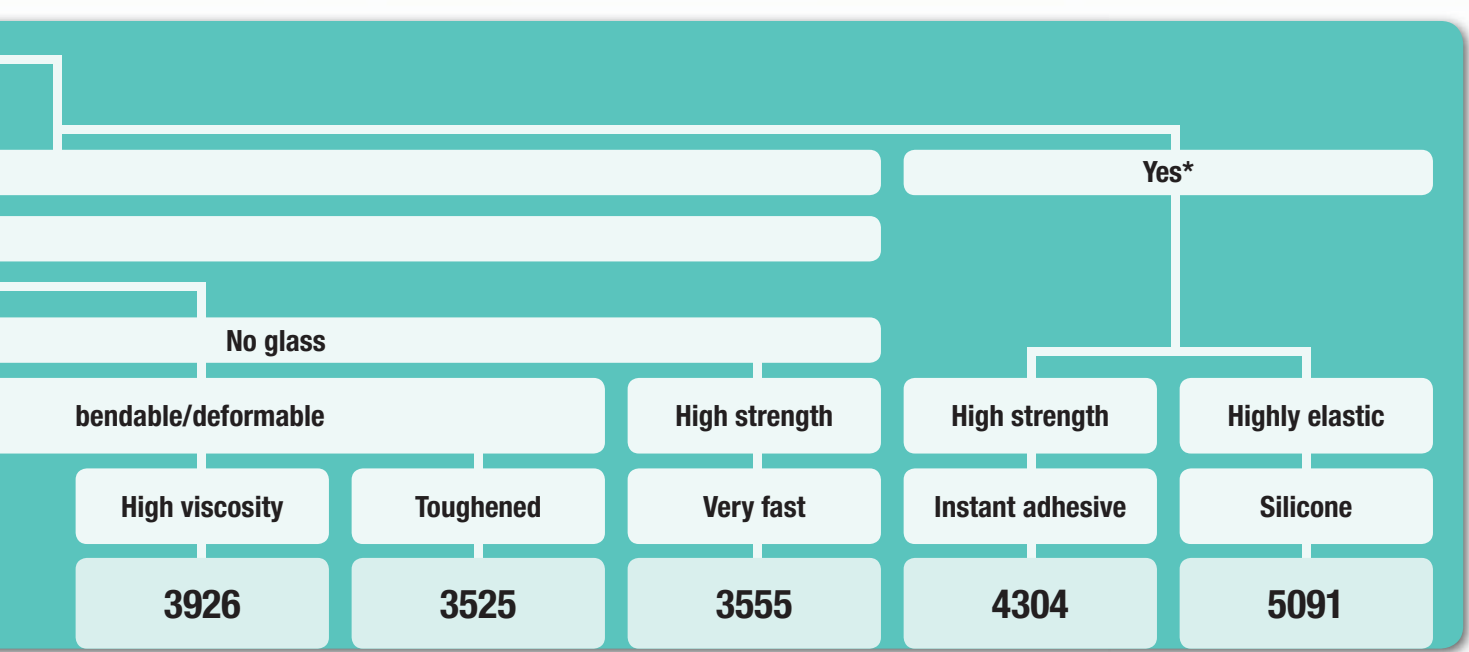

- UV-light and/or visible light curing acrylic
- Low yellowing in sunlight environment
- For bonding glass, plastics, metals, etc.

Loctite® 3922

- UV-light and/or visible light curing acrylic
- Low yellowing in sunlight environment
- For bonding plastics, metals, etc.

* more products with secondary cure mechanism, please see table on page 42

Acrylic	Acrylic	Acrylic	Cyanoacrylate	Silicone

Loctite® 3926

- UV-light and/or visible light curing acrylic
- Low yellowing in sunlight environment
- For bonding plastics, metals, etc.

Loctite® 3525

- UV-light and/or visible light curing acrylic
- Low yellowing in sunlight environment
- For bonding plastics, metals, etc.

Loctite® 3555

- Very fast light cure acrylic
- Cures with UV-light, visible light and INDIGO light
- For bonding plastics, metals etc.

Loctite® 4304

- UV-light and/or visible light curing cyanoacrylate
- Cures in bond gaps by surface humidity
- For bonding plastics, metals, paper etc.

Loctite® 5091

- UV-light curing silicone with secondary RTV cure
- For elastic sealing and bonding applications
- Good adhesion on metals, glass and most plastics

Hotmelt Adhesives

Solutions for fast processing applications

Why use a Henkel Hotmelt Adhesive?

Hotmelt adhesives are available in solid form as granules, cubes or sticks. They are based on various raw material groups, such as ethylene vinyl acetate copolymer (EVA), polyamide (PA), polyolefin copolymer (APP).

Reactive hotmelt adhesives based on polyurethane (PUR hotmelts) undergo an additional crosslinking reaction after cooling.

- Hotmelts are: used for rapid initial strength
- Are applied by means of special equipment or hot melt guns

Hotmelt adhesives were developed to bond a variety of substrates, including difficult-to-bond plastics. These adhesives can handle today's toughest applications in a broad range of industries. Hotmelts are ideal for applications that require high-speed manufacturing, bonding versatility, very large gap filling, fast green strength, and minimal shrinkage.

Hotmelt adhesives offer many benefits – from open times ranging from seconds to minutes, eliminating the need for clamps or fixtures, to long-term durability and excellent resistance to moisture, chemicals, oils, and temperature extremes.

Hotmelt products are solvent-free.

Advantages Hotmelt in general

- High manufacturing speed (short setting time)
- Process can be easily automated
- Combination of adhesives and sealants

Advantages Polyamide Hotmelts

- Good resistance to oils
- High temperature resistance
- Good flexibility at lower temperatures

Advantages Pressure sensitive Hotmelts

- Permanently tacky
- Self adhesive coating
- Coating and assembly can be separated

Advantages Polyolefin Hotmelts

- Good adhesion to PP (without corona or similar pretreatment)
- Good chemical resistance to acids, alcohols
- Higher temperature resistance than EVA

Advantages Polyurethane Hotmelts

- Low application temperature
- Long open time
- MicroEmission products available

Advantages Ethylene vinylacetate Hotmelts

- Low viscosity
- Fast melting
- High application speed

Key factors to consider when choosing the right product

Temperature resistance

Different hotmelt systems covering different service temperature ranges. Temperature resistance up to 150 °C can be achieved.

Adhesion to different substrates

There are hotmelt systems providing adhesion to polar and/or non-polar substrates. They will bond different plastics, metals, wood and paper.

Chemical resistance

Hotmelt systems also differ with respect to chemical resistance. Products are available for use in contact with oils, cleaners and even battery acid.

Strengths

Thermoplastic hotmelts reach their final strength immediately after cooling. At elevated temperatures they soften again. In addition, they can be used as resins in hotmelt moulding processes. Polyurethane hotmelts are cross-linked by moisture to form a thermoset plastic that cannot be melted and re-shaped after it is cured.

Product safety of reactive Hotmelts

Purmelt ME (MicroEmission) is a PUR hotmelt adhesive innovation. **These products do not need to be labeled as hazardous material.**

They contain less than < 0.1 % of monomeric isocyanate. This is below the limit currently specified as harmful to human health under legislation of the EU member states.

Purmelt ME is a new PUR hotmelt adhesive product line.

Surface Preparation

Surfaces should be clean and free from grease. Corona or plasma pre-treatment will improve adhesion to plastic substrates. Metal substrates can be preheated to improve adhesion.

Equipment

Glue guns for processing sticks, cartridges or granules offer simple hand-held application solutions. A wide range of different melting units is available for semi or fully-automated production environments. Drum unloaders and adhesive extruders are recommended for very high volume applications. Roller coaters are suitable for applying hotmelt coatings.

Solvent-based / Water-based Adhesives

Contact adhesive with good initial strength

Solvent-based adhesives

Solvent-based adhesives (polychloroprene) are formulated with different raw material groups including natural and synthetic rubbers and suitable resin combinations (naphthas, ketones, esters or aromatics). Adhesive films will be formed upon evaporation of solvents. Assemblies may be made by contact bonding (adhesive application to both surfaces) or wet bonding (applied to one of the bond faces). Most of the contact adhesives are based on polychloroprene rubber. They display good initial strength and achieve high strengths on numerous substrates.

Terokal 2444

Terokal 2444 can be applied by brush and spatula. It is used to bond rubber to different surfaces e.g. metal, wood, and to itself. Terokal 2444 offers high initial bond strength and contactability. The bondline is flexible and provides good heat resistance.

Macroplast B 2140

Macroplast B 2140 is a solvent-based contact adhesive based on polychloroprene. The product exhibits good high-temperature strength and the ability to bond various substrates to one another. Macroplast B 2140 is suitable for spray application and is particularly useful when bonds have to withstand temperatures up to 120 °C.

Water-based products with improved bonding characteristics

Water based or “dispersion” adhesives contain insoluble resins which are finely distributed as solid particles in water. These adhesives set by evaporation of water. Cross-linking of the dispersed particles is achieved by adding mainly basic catalysts. As a result, the resistance of the bonded joint to water and heat is greatly improved.

Generally, dispersion adhesives do not contain solvents or other problematic chemicals, they are not harmful to the environment and less critical with regard to health and safety at work. Dispersion adhesives are applied by means of rollers or handguns. Setting of the adhesives can be accelerated by applying additional heat incl. air ventilation.

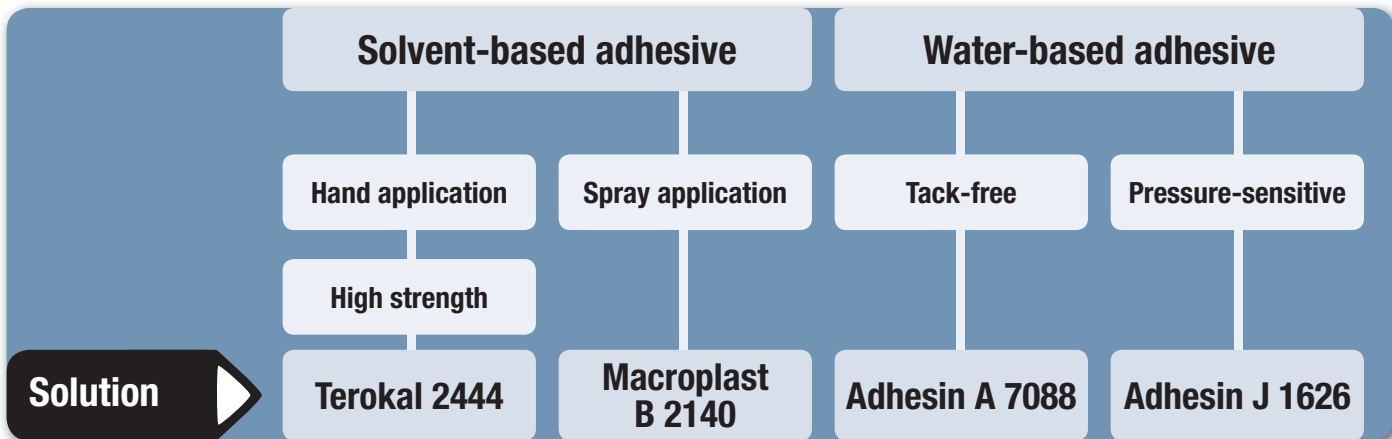

Adhesin A 7088

Adhesin A 7088 is a water-based dispersion. It is used for bonding plasticised PVC films and painted surfaces to paper and cardboard. Good bonding properties on alu-laminated PVDC-coated surfaces as well as polystyrene films.

Adhesin J 1626

Adhesin J 1626 is a water-based dispersion based on acrylic ester. It is a highly concentrated, fast setting dispersion adhesive and therefore suitable for high line speeds. Adhesin J 1626 is used for applying pressure-sensitive adhesives to paper, fabric and plastics films/sheets, for coating aluminium and plastics signboards, screens and indicating dials for the electrical/phono industries and bonding aluminium foil to aluminium sheet.

Technology	Solvent-based adhesive	Solvent-based adhesive	Water-based adhesive	Water-based adhesive

Density	approx. 0.89 g/cm ³	0.78 – 0.88 g/cm ³	–	approx. 1.0 g/cm ³
Colour	Beige	Beige	White	White
Pack sizes	340g, 5kg	Not available in the UK	30kg	Not available in the UK

Terokal 2444

- Good adhesion to rubber
- High strength
- High contactability

Macroplast B 2140

- Good sprayability
- High temperature resistance

Adhesin A 7088

- Good adhesion to plasticised PVC and polystyrene foils
- Soft elastic dry film

Adhesin J 1626

- Good surface tackiness
- High cohesion

Structural Bonding

For demanding requirements

Why use a Henkel Adhesive for Structural Bonding?

The Henkel range of Structural Bonding products offers a wide choice of solutions to meet the different requirements and conditions that apply to industrial design and construction.

Bonding:

Adhesive bonding is a process in which two similar or dissimilar materials are permanently joined. Adhesives build "bridges" between the surfaces of substrates to be joined.

To achieve the optimal bonding result, the following prerequisites must be met:

- Compatibility of the adhesive with the materials to be bonded
- Compatibility of the adhesive with the specified requirements
- Correct application of the adhesive

Advantages of adhesive bonding compared to conventional joining methods:

More uniform stress distribution over the entire bond face:

This has a very positive effect on the static and dynamic strength achieved. Where welding and riveting result in localised stress peaks, adhesive bonding achieves uniform distribution and absorption of stress loads.

No change in surface and texture of the joined materials:

Welding temperatures may change the texture and therefore the mechanical properties of materials. In addition, welding, riveting and bolting all affect the visual appearance of the parts.

Weight saving:

Adhesives are particularly popular for light-weight constructions, where thin-walled parts (wall thickness < 0.5 mm) must be joined.

Sealed joints:

Adhesives also act as sealants, preventing loss of pressure or liquids, blocking the penetration of condensation water and protecting against corrosion.

Joining dissimilar materials and reducing the risk of corrosion:

The adhesive forms an insulating film to prevent contact corrosion when different types of metals are joined. It also acts as electrical and thermal insulator.

Choosing the right Henkel Structural Bonding Adhesive:

The following key points should be observed for the design of bonded joints:

- The surfaces to be joined should be as large as possible for maximum load transmission capability
- Forces acting on the joint should be distributed across the entire bond line

Joint designs suitable for adhesive bonding:

All design with shear, tensile or compressive load e.g. single and double lap joint, single and double cover plate, tapered overlap and double overlapping.

Joint designs not suited for adhesive bonding:

Butt joint, cleavage loading and peel loading.

Rigid Bonding

Rigid adhesives are mainly used for high load transmission to replace common mechanical joining methods. Two parts bonded with such an adhesive could be considered as structurally linked. Mechanical characteristics like high strength, high modulus and high adhesion have proven to be effective for customer applications in demanding industries like aerospace and automotive.

Rigid bonding offers significant benefits:

- Simplifies construction by increasing strength/rigidity for load transmission
- Prevents material fatigue and failure by achieving uniform transmission of loads (stress distribution) and by maintaining the structural integrity (no thermal or mechanical weakening of parts)
- Saves production costs by replacing conventional mechanical fasteners (screws, rivets or welding)
- Saves material cost and saves weight by reducing material thickness while maintaining load transmission characteristics
- Allows the most varied substrate combinations, e.g. metal/plastics, metal/glass, metal/wood etc.

Stress analysis of bonded pipe joint

Elastic Bonding

Elastic adhesives are selected mainly for their capability to elastically absorb and/or compensate dynamic stresses, in addition to the load transmission properties of the adhesive assembly. Besides their elastic properties, many elastic adhesives from Henkel exhibit a high inherent strength (cohesion) and a relatively high modulus, achieving friction-locked joints which, at the same time, have elastic properties.

Elastic bonding offers significant benefits:

- Simplifies construction by increasing strength/rigidity to withstand dynamic loads
- Prevents material fatigue and failure by achieving uniform transmission of the load (stress distribution) and by maintaining the structural integrity (no thermal or mechanical weakening of parts)
- Saves production costs by replacing conventional mechanical fasteners (screws, rivets or welding)
- Allows the most varied substrate combinations, e.g. metal/plastics, metal/glass, metal/wood etc.
- Reduces and/or compensates stress caused by differential thermal expansion of joint substrates

Photovoltaic module mounting

Available Technologies

Epoxies

- Rigid bonding
- 1- or 2-component solution
- Capability to fill large gap
- Very high strength
- For small to medium surfaces
- Very good chemical resistance

Acrylics

- Rigid to slightly flexible bonding
- 1- or 2-component solution
- For small surfaces
- Very high strength
- Good chemical resistance

Polyurethanes

- Slightly flexible bonding
- 2-component solution
- Capability to fill large gap
- High strength
- For medium to large surfaces
- Good chemical resistance

Silicones

- Flexible bonding
- 1- or 2-component solution
- Very high temperature resistance
- Very good chemical resistance

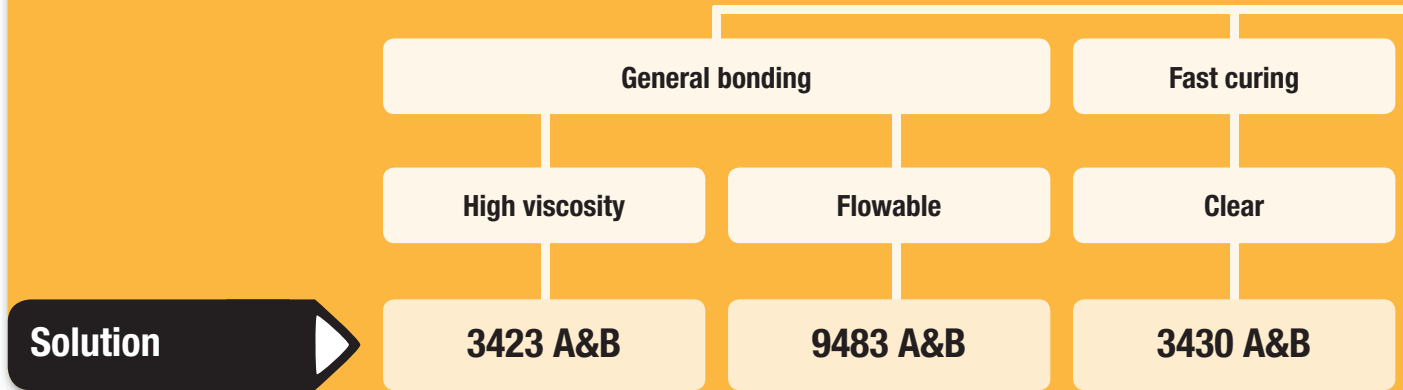

Silane modified Polymers

- Flexible bonding
- 1- or 2-component solution
- Bond most substrates

Loctite® Hysol® 3423 A&B

- Non-sag paste
- Medium working life
- Excellent chemical resistance

Loctite® Hysol® 3423 A&B is a general purpose, 2K-Epoxy adhesive, suitable for gap filling and vertical applications. Ideal for bonding metal components.

Loctite® Hysol® 9483 A&B

- Flowable
- Ultra clear
- Low moisture absorption

Loctite® Hysol® 9483 A&B is a general purpose, 2K-Epoxy adhesive, suitable for bonding and potting where optical clarity and high strength are required. Ideal for bonding decorative panels and displays.

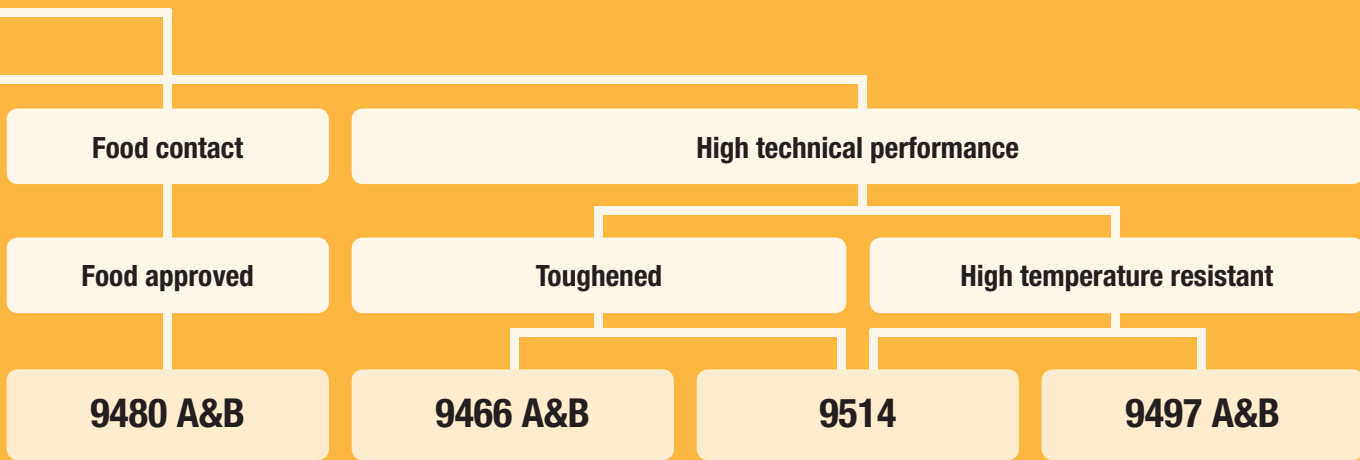

Loctite® Hysol® 3430 A&B

- Medium viscosity
- Ultra clear
- Toughened
- Water resistant

Loctite® Hysol® 3430 A&B is a five-minute, 2K-Epoxy adhesive, suitable for applications requiring an optically clear bond line. Ideal for bonding glass, decorative panels and displays and general DIY applications.

Loctite® Hysol® 9480 A&B

- Good chemical resistance
- Toughened
- Good adhesion on stainless steel

Loctite® Hysol® 9480 A&B is a food approved 2K-Epoxy adhesive, suitable for bonding metals and most of plastic parts in and around food processing area.

Loctite® Hysol® 9466 A&B

- Medium viscosity
- Low density – SG = 1,0
- High strength

Loctite® Hysol® 9466 A&B is a toughened, 2K-Epoxy adhesive, suitable for multi-purpose applications requiring long open time and high bonding strength. Ideal for a wide variety of substrates like metals, ceramic and most plastics.

Loctite® Hysol® 9514

- Suitable for induction curing
- High shear and peel strength
- Excellent chemical resistance
- High temperature resistant (200 °C)

Loctite® Hysol® 9514 is a toughened, 1K-Epoxy adhesive, suitable for gap filling and resistance to high operating temperatures. Ideal for applications requiring toughness such as filter and magnet bonding.

Loctite® Hysol® 9497 A&B

- Medium viscosity
- High thermal conductivity
- High compression strength
- High temperature resistant (180 °C)

Loctite® Hysol® 9497 A&B is a thermally conductive, 2K-Epoxy adhesive for high temperature filling and bonding applications. Ideal for heat dissipation.

Pack sizes	Not available in the UK	30kg jerry can	24kg pail

Macroplast UR 7221

- Long open time
- Multi-purpose
- Foaming
- IMO

A 1K-PU adhesive which cures with humidity from the air or fine water spray to bond PVC and PU rigid foams to lacquered or (Epoxy - primer) coated metal sheets. It has a good open time to press time relation.

Macroplast UR 7228

- Short fixture time
- Foaming
- IMO

A 1K-PU adhesive which cures with humidity from the air or fine water spray to bond PVC and PU rigid foams to lacquered or (Epoxy-primer) coated metal sheets. It provides very fast processing in panel bonding.

Macroplast UK 8103

- Multi-purpose
- Different acceleration levels available
- Good flow properties
- Wheelmark (including IMO)

A general purpose 2K-PU adhesive, easy to spread on big surfaces for bonding coated metals and PU foams especially in the shipbuilding industry.

Macroplast UK 8202

- Good flexibility at low temperatures
- High strength
- ABS approval

A low viscous 2K- PU adhesive suitable for the construction of panels for LNG/LPG tank ships complying with the regulations of American Bureau of Shipping (ABS).

Terostat 8597 HMLC

- High modulus
- Low conductivity
- Elastic
- Stress compensation

An elastic 1K-PU adhesive which cures by moisture from the air. Used for direct glazing in automotive industry and in joints where tension should be leveraged by the adhesive (elastic bonding).

Macroplast UK 8326 B30

- Primerless metal adhesion
- Good ageing stability
- Sag resistant

A sag-resistant 2K- PU adhesive which is suitable for vertical application combining primerless metal adhesion with good elastic and shock absorbent properties for use in trailer production.

Macroplast UK 1366 B10

- Short fixture time
- Good adhesion to plastics and metal
- Shock absorbent

A multi-purpose, sag-resistant cartridge grade 2K-PU adhesive with a very good extrusion rate and outstanding adhesion to metals and plastics. Slightly elastic for good shock absorbance.

Macroplast UK 1351 B25

- GL approved
- High strength
- No tempering required

A cartridge grade 2K- PU adhesive with high strength and stiffness and good compression strength. It is certified by Germanischer Lloyd for bonding in wind power applications.

Loctite® 5366

- General purpose 1-component silicone
- Clear colour
- Suitable for glass, metal, ceramics, etc.

Loctite® 5145

- Neutral curing 1-component silicone
- Non corrosive
- Especially for sealing and protecting electrical components

Loctite® 5970

- 1-component silicone with very good oil resistance
- Neutral curing
- Also used for gasketing applications (flange sealing)

Loctite® 5399

- High temperature resistant 1-component silicone
- For bonding and sealing glass, metal and ceramics e.g. industrial ovens, stove flues, etc.

Structural Bonding – Silicones

Terostat MS 931

- Self-levelling/pourable
- Sprayable

Sensoric test acc. to DIN 10955

Terostat MS 939

- Very versatile
- Elastic bonding adhesive
- High strength
- Good elasticity
- Meets damp heat test for solar industry

UL Listing for electrical equipment

Terostat MS 939 FR

- Elastic bonding adhesive
 - High strength
 - Good elasticity
 - Flame retardant
- DIN 5510 S3 NF P 92507, M1 NF F 16-101, NF P 92-512-M1**

Terostat MS 9380

- High modulus
- Fast skin formation
- Gap filling
- High initial strength
- GL (Germanischer Lloyd) approved elastomeric adhesive

Terostat MS 9399

- 2-component cartridge grade
- High initial strength
- Short tack free time
- Independent from air/humidity
- Easy handling 2K-system

Structural Bonding – Silane Modified Polymers

Sealing – Butyls

Plastic sealants in different shapes

Why use a Henkel Butyl?

Plastic sealants

Like adhesives, sealants are employed in diverse areas of industry and occupations. Modern sealants ideally complement traditional joining and sealing techniques, such as the use of solid gaskets, and can often even replace them.

Fundamentals

Butyl and polyisobutylene (PIB) sealants have different chemical structures, but users will detect practically no differences in their properties when using them. Both groups of plastic sealants are 1-component products. As they need no hardener and no time to cure, their final properties are evident immediately after application. This, and the characteristics below, make butyl and PIB sealants interesting solutions for production and processing tasks in industry and professional occupations.

Properties

- Excellent adhesion to almost all substrates
- Final properties directly upon application
- Low permeability to water vapour and gases
- Good resistance to water and aging
- High flexibility even at low temperatures
- Self-welding

Due to their inherent tackiness, butyl and PIB sealants adhere to metals, glass, ceramics, mineral substrates, wood, PS, EPDM and other plastics. They even achieve excellent adhesion to substrates which are generally difficult to bond, such as PE, PP and POM.

Plastic vs. elastic

An important criterion in the selection of sealants is their mechanical behaviour under deformation. When exposed to forces, each sealant shows both a plastic (i.e. deformable) and an elastic (i.e. rubber-like) reaction. If the plastic reaction is dominant, the sealant is referred to as plastic. Two important groups of these plastic sealants are the products based on butyl rubber and/or polyisobutylene.

Plastic sealants

Wherever the term plastic sealants is used on the following pages, it refers to butyl and PIB sealants. Henkel breaks the plastic sealants down as follows:

- Profiles and extruded parts
- Putties
- Hotmelt butyls
- Gun-grade sealants

Profiles

Butyl adhesives their different profiles by means of extrusion at temperatures between 60 and 80 °C. They are subsequently applied to backing paper and coiled. The backing paper is removed immediately before the profile is used. Profiles come in the form of flat(tapes) or round (cords) with a great variety of dimensions. They are either wound on reels or cut to length (pre-cut profiles). In order to increase their longitudinal dimensional stability, flat and round profiles are also available with a core made of cotton or synthetic yarn or with a fabric sheath. Laminating one side of the tapes to plastic films/sheets, nonwovens or aluminium composite foils achieves further special properties such as UV and weathering stability, tear resistance, or compatibility with plasters or paints. No application equipment or particular precautions are required for handling the profiles. They are easy, safe and clean to use. Thanks to our long experience and the excellent reliability of our production processes, profiles from Henkel have outstanding dimensional accuracy. This is ensured by uniform application of material during production, a feature which is constantly monitored by our Quality Assurance.

Putties

Putties are easily shapeable sealants based on polyisobutylene. The required shape is achieved by hand and then pressed into gaps, joints or openings. Putties from Henkel easily mould themselves to any kind of surface geometry. Having good adhesion as well as easy shapeability, they provide an excellent seal against water, moisture, gases and dust.

Hotmelt butyls

At room temperature, hotmelt butyl sealants are highly viscous and very tacky. For processing, they are heated to 80 to 120 °C, which considerably reduces their viscosity. As a result, they process easily and at high speed when applied using heatable equipment. Moreover, hotmelt butyls can be applied in very thin layers. As highly tacky sealants, these products can be used on a wide variety of profiles, tapes, foils/films and mouldings. Once applied, the sealant can be covered with a release paper for transport and storage. Hotmelt butyls remain highly tacky even at low temperatures, allowing them to be processed at near to freezing point. The products are available in hobbocs and drums. They can be applied from these containers using equipment with screw extruders, piston pumps, gear pumps or rotary pumps.

Gun-grade butyl sealants

Gun-grade butyl sealants are 1-component cold-processable sealants based on butyl rubber. They can be applied at room temperature. These sealants are available in cartridges or foil cartridges for pressure guns, or in drums requiring suitable applicators. A distinction is made between solvent-free and solvent-based products. Solvent-based products release their organic solvent after application. During this process, they set physically, forming a plastic butyl sealant which is resistant to aging. The solvent-free products cure when exposed to heat.

Sealing – Butyls

Casting resins based on epoxy and polyurethane

Possessing versatile characteristics, casting resins based on epoxy and polyurethane have been steadily gaining ground over the past decades. They can be chemically engineered to be very hard and impact resistant or soft and elastic. A casting resin usually consists of two basic components which are mixed and react with each other to form a cross-linked product. Systems of this kind generally display high strength, are easy to apply, and have very good gap filling properties. Polyurethane casting resins are compatible with a broad range of materials and withstand temperatures of up to 120 °C (with brief peaks up to 150 °C). If higher temperatures are required (up to 180 °C), epoxy casting resins are used.

Macroplast UK 8439-21

- Self levelling
 - Fast setting
 - Broad adhesion spectrum
- Macroplast UK 8439-21 has very good workability and self levelling properties. It is designed for the manufacturing of particulate air filters. The product meets the requirements in HEPA filter industry.

Macroplast UK 8180 N

- Fast built-in thixotropy
 - Short processing time
 - Good penetration into filter media
- Macroplast UK 8180 N forms a chemical thixotropy which allows to have a very fast inline processing for the assembly of filter elements. The product is suitable for clean room applications.

Macroplast CR 3525

- Fast setting
 - Easy processibility
- Macroplast CR 3525 has low exothermic reaction and therefore allows fast processing.
KTW approval
EG 1935 2004, direct food contact approval
2002/72/EG approval for the plastic industry

Macroplast EP 3299

- Good adhesion properties
 - High processing temperature resistance
- Macroplast EP 3299 has a very good chemical resistance and good adhesion properties to wet fibres in the production process. The product has KTW approval.

Macroplast CR 3502

- Allows steam, ETO or gamma ray sterilisation
 - Very good adhesion
- Macroplast CR 3502 has very good penetration properties during centrifuging. The product is ISO 10993 compliant for medical equipment and approved for dialysers.

Macroplast EP 3030

- Multi-purpose filter applications
 - High chemical resistance
 - Low viscosity
- Macroplast EP 3030 has low viscosity and controlled exothermic reaction in the process. It is well-proven in the production of membrane filters.

Macroplast EP 3430

- Long pot life
 - High temperature stability
 - Low shrinkage
- Macroplast EP 3430 has a very good resistance to hydraulic fluids, fuel and chemicals. Due to its long open time it can also be used for large potting applications e.g. in gas separation filters.

Macroplast CR 6127

- Flame retardant acc. to UL 94 V0
 - Elastic properties
 - Very good electrical properties e.g. dielectric strength or constant
- Macroplast CR 6127 is qualified for the casting of telecommunication articles, transformers or other electrical/electronic devices.

Acoustic Coatings

Soundproofing

Why use Teroson Acoustic Coatings?

Basically, there are two options for controlling noise: It can be insulated or absorbed. As both options can be applied to airborne and to structure-borne sound, there are in fact four different types of noise control:

1. Absorption of structure-borne sound

Absorption of structure-borne sound is achieved by converting part of the sound energy into thermal energy while the sound travels through homogeneous materials attached or bonded to a solid body. In this way, the structure-borne sound is absorbed before it generates air-borne sound. The better the absorption properties of such damping materials, the better the structure-borne sound absorption. The "loss factor" is a parameter for measuring this effect.

2. Insulation against structure-borne sound

Insulation against structure-borne sound is achieved by attenuating the propagation of sound by using a flexible material for sound insulation. The softer and more voluminous this material, the better the structure-borne sound insulation.

3. Absorption of air-borne sound

Absorption of air-borne sound is achieved by converting part of the air-borne sound energy into thermal energy as the sound penetrates into fibrous or foam materials. The thicker the fibrous or foam materials, the better the air-borne sound absorption.

4. Insulation against air-borne sound

Insulation against air-borne sound is achieved when part of the sound energy is reflected by a wall. The remaining sound energy is transmitted through the wall and re-radiated on the opposite side in the form of air-borne sound. The heavier and more flexible the partitioning wall, the better the air-borne sound insulation.

Sound Measurement and Evaluation:

The pressure of air-borne sound waves is measured by means of a sound level meter with a microphone. Sound levels are measured in units of decibels (dB). As the subjective response to noise as perceived by the human ear is largely dependent on the frequency or the frequency spectrum of a sound, level meters are provided with weighting filters for equalisation. The A-weighted sound level, expressed as dBA, will be sufficiently accurate for most comparative noise measurements.

Loss factor "d":

The acoustic loss factor "d" is used as a measure of the noise absorption capability of a material. This factor indicates how much of the sound energy propagated in the form of flexural waves will be absorbed and converted into heat energy. The loss factor of a material depends on frequency and temperature. It does not, however, provide a meaningful indication of the actual reduction of noise level which can be achieved. It must therefore be measured on site. Striking a reasonable compromise between economic cost and benefit, a loss factor of approx. 0.1 has been found acceptable for a wide range of applications.

Air-borne sound absorption coefficient α :

The absorption capability of a material is expressed as air-borne sound absorption coefficient α . It describes the percentage of incident sound energy which is absorbed and converted into heat energy. The absorption coefficient α depends to a great extent on frequency. The lower (deeper) the frequency, the thicker the absorbent material to be used!

Soundproofing

- Highly efficient paste-type soundproofing materials
- Offer outstanding absorption capabilities
- Reduction of structure-borne noise
- Can be coated in any thickness to meet the most exacting requirements for universal structure-borne sound absorption
- Can be applied by spatula or spray gun

Solution

Terophon 112 DB

Terophon 123 WF

Chemical base	Aqueous synthetic resin dispersion	Aqueous synthetic resin dispersion
Density wet/dry	1.4 g/cm ³ / 1.2 g/cm ³	1.4 g/cm ³ / 1.2 g/cm ³
Solids contents	65 %	73 %
Drying time (4 mm wet film) (DIN 50014)	24 h	15 h
Temperature resistance	-50 to +120 °C	-50 to +120 °C
Pack sizes	40kg	Not available in the UK

Handy Hints:

- Never apply Terophon water-based products to bare steel sheets because there is a serious risk of corrosion while the aqueous product cures on the steel face and afterwards, when humidity migrates into the Terophon coating. Non-galvanized steel sheets or non-anodised aluminium substrates always require a water-impermeable primer protection
- The Henkel range includes other soundproofing products which are available on request

Terophon 112 DB

- Solvent-free
- Ready to apply from spray guns
- Excellent fire resistance
- Low flammability
- Good thermal insulation properties

Terophon 112 DB is used for secondary noise and vibration control on thin walled sheet metal constructions in the manufacture of vehicles, railway carriages, ship building as well as plant and equipment building. In addition, the product is also applied to ventilation ducts, fan housings, lifts, waste disposal units, to the rear side of facade elements as well as to container buildings. Coatings with Terophon 112 DB must not be subjected to standing water or direct weathering.

Terophon 123 WF

- Solvent-free
- Ready to apply from spray guns
- Moisture resistant
- Low flammability
- Good thermal insulation properties

Terophon 123 WF is used for secondary noise and vibration control on thin walled sheet metal constructions in the manufacture of vehicles, railway carriages, ship building as well as plant and equipment building. Coatings with Terophon 123 WF can be subjected to standing water for a longer period of time.

Metal-filled Compounds

To repair metal parts

Why use a Loctite® Hysol® Metal-filled Compound?

Loctite® Hysol® Metal-filled Compounds offer maintenance solutions to the problems caused by erosion and mechanical damage, including cracks in housings, worn keyways in shafts and collars, worn cylindrical shafts, etc.

Loctite® Hysol® Metal-filled Compounds repair, rebuild and restore damaged machinery and equipment permanently and without the need of heat or welding.

Traditional methods vs modern solutions:

Traditional repair methods such as hard face welding are time consuming and expensive. Alternatively, Loctite® Hysol® Metal-filled Compounds are easily applied and offer superior compressive strength and protection qualities.

Loctite® Hysol® Metal-filled Compounds and Loctite® Nordbak® Wearing Compounds help you restore and rebuild a wide variety of worn parts and put them back in serviceable condition.

Key benefits of Loctite® Hysol® Metal-filled Compounds are:

- Fast repair
- Low shrinkage to reduce stress on components
- Easy to apply
- No need to heat parts
- Make repairs right on the production line
- Match metal colour
- Can be drilled, tapped or machined after cure
- Good adhesion to metal, ceramic, wood, glass and some plastics
- Excellent resistance to aggressive chemicals to increase part life
- Choice of mild steel, aluminium or non-metallic fillers
- Create durable repairs
- High compression strength for mechanical applications

Key factors to consider when choosing the right Loctite® Hysol® Metal-filled Compound

Metal to repair

Loctite® Hysol® products for metal repair use steel or aluminium fillers to obtain properties as close as possible to the part being repaired. Non-metal filled products can be used to rebuild worn areas constantly subjected to cavitation and wear.

Consistency

Product viscosity must be formulated to meet customer needs. The range of Loctite® Hysol® Metal-filled range includes pourable, putty or kneadable products to answer your requirements.

Special requirements

As some applications are extremely demanding, Henkel has developed special products to resist to high compression loads, high temperature or abrasion.

Surface Preparation

Correct surface preparation is vital for the successful application of these products.

Good surface preparation will:

- Improve adhesion of Loctite® Hysol® Metal-filled Compounds to parts
- Prevent corrosion between the metal surface and the Loctite® Hysol® Metal-filled Compound
- Extend part life

After surface preparation, parts must be:

- Clean and dry
- Without surface or internal chemical contamination
- Without corrosion
- With a surface profile of 75 µm minimum

Product application

Loctite® Hysol® Metal-filled Compounds are two component epoxies. Products must be mixed correctly before application, using the proper mixing ratio, until a uniform colour is achieved.

Putty products should be applied in thin layers. Press in place firmly and build up to the required thickness to fill the gap. Particular attention must be taken to prevent air bubbles forming.

Shaft repair

Use Loctite® Hysol® 3478 for shaft-repair and to rebuild bearing seats. Please contact your local Technical Support to obtain specific recommendations for shaft repair solutions.

- Rebuilding keyways and spline assemblies
 - Rebuilding of bearings, clamp connections, tensioning elements, gear wheels or bearing seats
- Ferro-silicon filled with outstanding compression strength. Ideal for renewing surfaces subjected to compression, thrust, impact and harsh environments.

Loctite® Hysol® 3471 A&B

- Seal cracks in tanks, castings, vessels and valves
 - Patch non-structural defects in steel casings
 - Resurface worn air seals
 - Repair pitting caused by cavitation and/or corrosion
- General purpose steel-filled, non-sagging 2K-Epoxy. Used to rebuild worn metal parts.

Loctite® Hysol® 3472 A&B

- Form moulds, fixtures and prototypes
 - Repair threaded parts, pipes and tanks
- Pourable, steel-filled, self levelling. Recommended for casting into hard to reach areas, anchoring and levelling, forming moulds and parts.

Loctite® Hysol® 3473 A&B

- Repair holes in tanks, leaks in pipes and elbows
 - Renew stripped threads
 - Rebuild worn steel parts
- Fast curing, steel filled, nonsagging. Ideal for emergency repair and repairing worn metal parts to prevent downtime.

Loctite® Hysol® 3475 A&B

- Repair aluminium castings, cracked or worn aluminium parts and stripped aluminium threads
- A non sagging, heavily reinforced, aluminium powder filled 2K-Epoxy. Easily mixed and moulded to form odd shapes if required. Cures to a non-rusting, aluminium-like finish.

Loctite® Hysol® 3479 A&B

- Rebuilding and repairing worn metal parts in high operating temperature applications.
- A non sagging, heavily reinforced, aluminium powder filled 2K-Epoxy. Easily mixed and moulded to form odd shapes if required. Cures to a non-rusting, aluminium-like finish.

Loctite® Hysol® 3474 A&B

- Ideal for repairing metallic surfaces under friction
- Steel putty, high wear resistant. Forms a self-lubricating surface to reduce sliding wear on moving parts.

Wearing Compounds

Protection of parts against external attack

Why use a Loctite® Nordbak® Wearing Compound?

Loctite® Wearing Compounds offer maintenance solutions to the problems caused by wear, abrasion, chemical attack, cavitation and erosion.

Typical applications for this product range include air ducts, pumps, impellers, fan blades, propellers, cyclones, etc.

With extremely hard fillers, Loctite® Nordbak® Wearing Compound have excellent wear resistance and superior adhesion. They are designed for specific service conditions and to protect and extend the service life of a wide range of plant areas and plant equipment. Their key advantage is their capability to create a sacrificial and renewable working surface, protecting the structural integrity of the original substrate.

Available in trowelable, brushable and sprayable formulations with special fillers for tough conditions, Loctite® Nordbak® Wearing Compounds stand up to every corrosion, abrasion, and wear problem you can encounter, and are ideal for all those large-scale repairs that have to last.

Traditional methods vs modern solutions:

Traditional repair methods such as hard metal welding or flame spraying are expensive and difficult to use for large surfaces. Alternatively, Loctite® Nordbak® Wearing Compounds are easily applied on all surface sizes and offer the extra benefit of corrosion protection.

Loctite® Hysol® Metal-filled and Loctite® Nordbak® Wearing Compounds help you restore and rebuild a wide variety of worn parts and put them back in serviceable condition.

Key benefits of Loctite® Nordbak® Wearing Compounds:

- Restore worn surfaces and extend part life
- Save cost by avoiding part replacement
- Reduce spare part inventories
- Protect parts against corrosion
- Non-shrinking and non-sag formulations for large or vertical applications
- Good chemical resistance for effective protection of assemblies
- Wide range tailored to specific applications
- Extend life of new parts
- Increase part efficiency

Key factors to consider when choosing the right Loctite® Nordbak® Wearing Compound

Particle size

To improve abrasion resistance, particle sizes of the abrasive materials and of the Loctite® Nordbak® Wearing Compound should be similar. The range of Loctite® Nordbak® Wearing Compounds offers grades for coarse particles as well as fine particle protection. A special product offering high impact resistance is also included in the range.

Temperature resistance

Operating temperatures of Loctite® Nordbak® Wearing Compounds range from -30 °C to +120 °C. Some special grades, e.g. Loctite® Nordbak® 7230 or Loctite® Nordbak® 7229, can be used up to +230 °C. These special grades require post curing to achieve their ultimate high temperature performance.

Chemical resistance

Thanks to the special epoxy matrix of Loctite® Nordbak® Wearing Compounds, this range of products is resistant to most types of chemical attack. The products offer good protection against fresh water and sea water, ammonium sulphate and sodium hydroxide. Please contact your local Technical Support for specific chemicals requirements.

Surface Preparation

Correct surface preparation is vital for the successful application of these products.

Good surface preparation will:

- Improve adhesion of the Loctite® Nordbak® Wearing Compound to parts.
- Prevent corrosion between the metal surface and the Loctite® Nordbak® Wearing Compound
- Extend maintenance intervals.

After surface preparation parts, must be:

- Clean and dry
- Without surface or internal chemical contamination
- Without corrosion
- With a surface profile of 75 µm minimum
- With a blast profile of class 2.5

For large surfaces, an anticorrosion coating compatible with Loctite® Nordbak® Wearing Compounds could be applied to avoid flash rusting.

Product application

Loctite® Nordbak® Wearing Compounds are two component epoxies. Products must be mixed correctly before application, using the proper mixing ratio, until a uniform colour is achieved.

To insure good wettability of Loctite® Nordbak® Wearing Compound product, it is recommended to apply a brushable product like Loctite® Nordbak® 7117 as a primer prior to use coarse particle reinforced Loctite® Nordbak® Wearing Compound product.

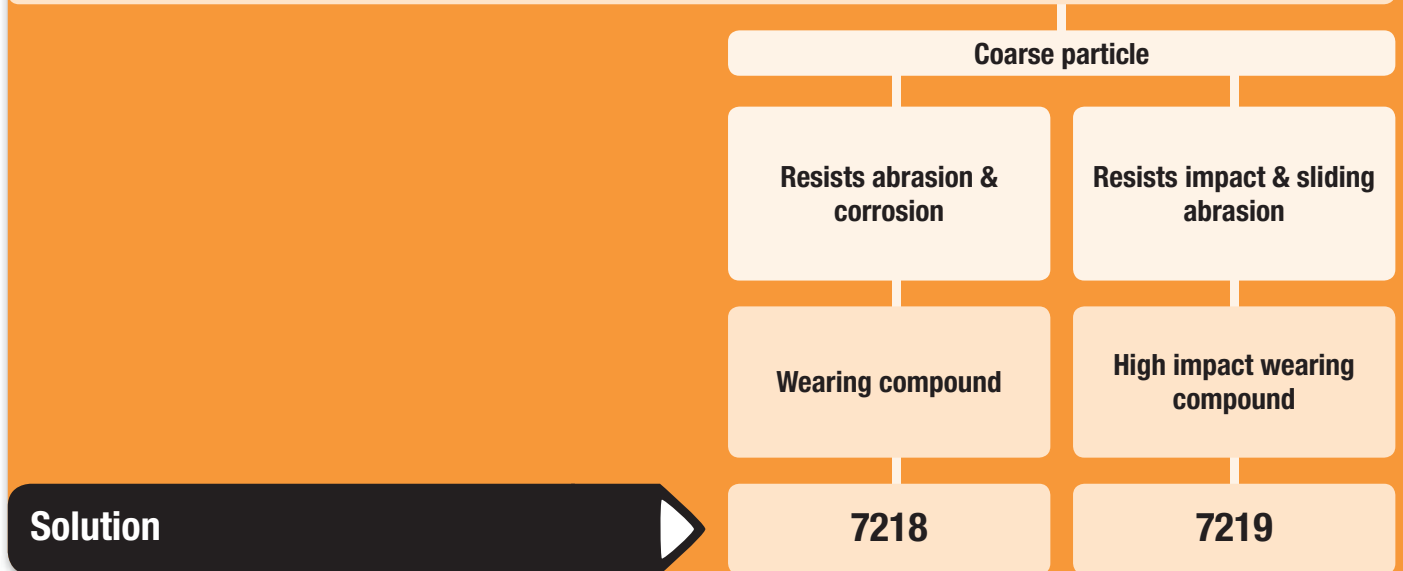

For coating thicker than 25 mm, apply material in layers of 25 mm at a time, allowing the layer to cool before applying the next layer.

Wearing Compounds

Product table

What type of abrasive particle wear to be resisted?

Colour	Grey	Grey
Service temperature range	-30 to +120 °C	-30 to +120 °C
Mix ratio by volume	2:1	2:1
Working life	30 min.	30 min.
Cure time	7 h	6 h
Recommended layer thickness	min. 6 mm	min. 6 mm
Pack sizes	1kg, 10kg	1kg, 10kg

Badly worn surfaces are rebuilt using Loctite® Nordbak® 7222 Wear Resistant Putty or Loctite® Nordbak® 7232 High Temperature Wear Resistant Putty, prior to applying protective Loctite® Nordbak® composite coatings.

Loctite® Nordbak® 7218

- Cyclone and separator bodies
 - Dust collectors and exhausters
 - Pump liners and impellers
 - Fan blades and housings
 - Chutes and hoppers
 - Elbows and transition points
- Trowelable, ceramic filled epoxy designed to protect, rebuild and repair high wear areas of processing equipment. Suitable for overhead applications and irregular surfaces.

Loctite® Nordbak® 7219

- Dredge pump liners
 - Flumes and troughs
 - Pump impellers
 - Vibrating feeders
 - Chutes/hoppers
- Rubber modified, ceramic filled epoxy that offers high impact resistance. Ideal for areas exposed to abrasion and impact. Nonsagging and suitable for overhead applications and irregular surfaces.

Fine particle

Loctite® Nordbak® 7226

- Dredge pump liners
- Flumes and troughs
- Pump impellers
- Vibrating feeders
- Chutes/hoppers

Carbid-filled epoxy for protecting processing equipment from fine particle abrasion. This trowelable and non-sag epoxy is suitable for overhead and vertical surfaces.

Loctite® Nordbak® 7255

- Lining tanks and chutes
- Rudders and pintle housings
- Heat exchangers
- Condensers
- Cooling pump impellers

Ultra-smooth, ceramic reinforced epoxy that provides a high gloss, low friction coating to protect against turbulence and abrasion. Seals and protects equipment from corrosion and wear.

Loctite® Nordbak® 7117 Replacement of Loctite® Nordbak® 7227 offering improved abrasion resistance

- Impellers, butterfly valves
- Pump housings
- Cyclones
- Lining tanks

Brushable two-part epoxy that provides a high gloss, low friction coating to protect equipment from wear abrasion and corrosion.

Loctite® Nordbak® 7234

- Exhausters
- Heat exchangers and condensers
- Lining tanks and chutes
- Butterfly valves

Brushable two-part epoxy designed to protect against turbulence and abrasion under extreme heat.

Cleaning

Parts and maintenance cleaning

Why use a Loctite® Cleaner?

Loctite® Cleaners and Degreasers are highly effective and are available in both aqueous and solvent-based formulations. When choosing a cleaner or degreaser, the major factors to consider are drying time, residue, odour, and substrate compatibility. Residue is a particularly important concern: if there is any secondary processing of the part, e.g. painting or bonding, a residue could interfere with that process. Substrate compatibility is a common concern when dealing with plastics and solvent-based cleaners.

The following chart will help you to select the appropriate cleaner for your application.

- Cleaning of components before applying Loctite® adhesives/sealants
- Cleaning and degreasing of worktops and parts
- Removing cured sealant residue

The product line includes:

- Two highly effective gentle and biodegradable hand cleaners
- Electrical contact cleaner
- Food grade cleaner (NSF A7)

Why use a P3 Cleaner?

P3 cleaners are mainly used for cleaning parts and assemblies in the metal working industry, in workshops, in the railway and boat industry and for maintenance applications. P3 cleaners are also suitable for removing paint from surfaces (graffiti), cleaning hands, floors, car bodies, track vehicles, boats, awnings, tanks, pipes and many other applications.

- P3 combines high quality water-based alkaline, acidic and neutral cleaners. P3 cleaners are suitable for metal substrates, plastics, concrete, stone, ceramics, glass, painted surfaces etc.
- P3 cleaners can be applied by spraying, dipping, high pressure, ultrasonic, manually or with a machine as final or intermediate cleaning process
- Good cleaning results can be achieved at temperatures of 5 °C up to 100 °C
- P3 cleaners are available as concentrate (mix with water) or as ready-to-use products
- In addition cleaners with corrosion protection properties are available

The cleaning function is removal of contaminants from the surface to prepare it for subsequent operations. These are materials left on the surface from previous operations as cutting, stamping, drilling, drawing, grinding, etc. or the surface condition of incoming stock.

Contamination can may generally be divided into three categories:

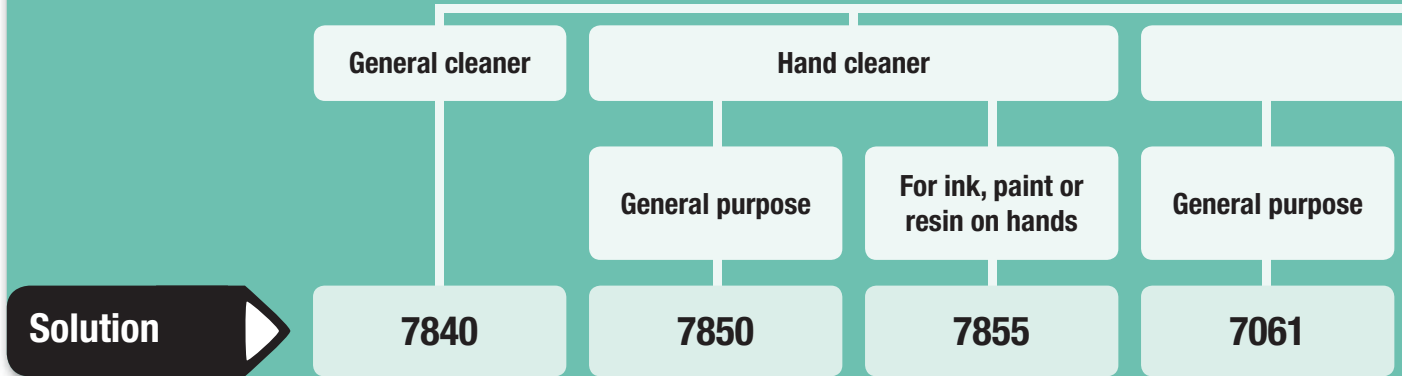

- Organic - are typically the lubricants used in metal forming and machining operations or corrosion preventive compounds. Mainly alkaline cleaners are suitable
- Inorganic - include rust, heat and weld scale, smuts and oxides. Acids or acidic cleaners are designed to remove such kind of soils. Acidic cleaners are also used to clean injection-moulded thermoset plastic
- Miscellaneous - include shop dirt, inks, glove and finger prints. Alkaline or neutral cleaners could be applied

Neutral cleaners are suitable for sensitive surfaces, especially self demulsifying cleaners

Cleaning

Product table

Do you need a hand cleaner or a parts/surface cleaner?

Description	Cleaner & degreaser	Hand cleaner	Hand cleaner	Cleaner & degreaser
Pack sizes	750ml trigger spray, 5 lt can, 20 lt drum	400ml bottle, 3 lt pump dispenser, 10 lt drum	400ml bottle, 1.75 lt pump dispenser	400ml aerosol

Loctite® 7840 Cleaner & degreaser

- Biodegradable
- Solvent-free, non-toxic, non-flammable
- Diluted with water
- Removes grease, oil, cutting fluids and workshop grime

Loctite® 7850 Hand cleaner

- Natural extract base
- Free from mineral oils
- Biodegradable
- Contains premium skin conditioners
- Works with or without water
- Removes ground-in dirt, grease, grime, and oil

Loctite® 7855 Hand cleaner

- Biodegradable
- Non toxic
- Removes paint, resin and adhesives

Loctite® 7061 Cleaner & degreaser

- Solvent-based (acetone) general parts cleaner
- Very fast evaporation
- Removes dirt, resins, lacquer, oils and greases

Parts, machines and surface cleaners

General purpose	Plastic parts	Low VOC	Gasket remover	Electrical contact
7063	7070	7066	7200	7039

Cleaner & degreaser	Cleaner & degreaser	Cleaner & degreaser	Gasket remover	Contact cleaner spray
400ml aerosol, pump, 10 lt can, 200 lt	400ml aerosol, pump, 10 lt	Not available in the UK	400ml aerosol	400ml aerosol

Loctite® 7063
Cleaner & degreaser

- Solvent-based general parts cleaner
- Leaves no residue
- Ideal for use prior to adhesive bonding and sealing applications
- Removes most greases, oils, lubrication fluids, metal cuttings and fines from all surfaces

Loctite® 7070
Cleaner & degreaser

- Solvent-based general parts cleaner
- Usable as spray or in immersion cleaning process at room temperature
- Removes special heavy oils
- For most plastic parts without the risk of stress cracks

Loctite® 7066
Cleaner & degreaser

- Water-based emulsion with low VOC
 - Use for metals and plastics
- A7 NSF Reg.No.: 138407**

Loctite® 7200
Gasket remover

- Removes cured gasket sealants and traditional gaskets in 10 to 15 minutes
- Minimal scraping
- Usable on most types of surfaces

Loctite® 7039
Contact cleaner spray

- For cleaning electrical contacts exposed to moisture or other contaminations
- Does not affect insulating varnishes
- Typical application: Cleaning of electrical contacts, relays, switch-gear etc.

	Application area	Substrates to clean	Short discription
	Metal working industry	Steel, iron	Acid cleaner, pickle for heavy duty operations
	Metal working industry, paint shops	Paint application area/ equipments: guns, bells, nozzles	Waterbased cleaner to remove uncured water-born paint systems, overspray
	Metal working industry	Steel, cast iron	Corrosion protection emulsion (3–4 months)
	Metal working, electronic industry, hardening plants	Multi metal	All-purpose alkaline cleaner with corrosion protection (leaves hydrophobic surface, for final and intermediate cleaning, excellent for removing of polishing pastes)
	Metal working industry	Steel, cast iron	Corrosion protection oil (6–12 months)
	Metal working industry, work shops, store/social rooms	Tiles, concrete, synthetic material	Floor cleaner, applicable by floor cleaning machines, manual by wipes or brush
	Metal working industry, work shops, machines, floors, store/social rooms	Multi metal, plastic, painted surfaces	Multi-purpose cleaner, self-demulsifying, manual with sponge, brush or rag
	Railway carriages, boats, engines, repair parts, tanks, pipes, floors	Multi metal	Alkaline cleaner, cold applicable, for nearly all surfaces and substrates
	Metal working industry, car bodys, engines, repair parts	Steel, non-ferrous metals	Steam high pressure cleaner
	Metal working industry	Dirty hands	Hand cleaner
	Metal working industry, manufactures of engines	Steel, aluminum	Self-demulsifying neutral cleaner
	Metal working industry, manufactures of engines	Multi metal	Salt-free neutral cleaner with corrosion protection
	Metal working industry	Steel, cast iron	Aqueous corrosion protection (2–3 days)
	Metal working industry, cleaning of painted surfaces, facades, work shops, all kind of plastics	Multimetal, plastics, natural stone, concrete	High performance neutral cleaner for all substrates
	External bodies/carriages, smooth, non absorbing surfaces	Painted surfaces, glass, ceramics	Graffiti remover free of chlorinated solvents and mineral oil distillates
	Industrial cleaning plants, processing of high precision parts	Multi metal	Solvent containing cleaner, free of halogenated hydrocarbons, flash point >100 °C
	Metal working industry	Acid resistant membranes	Acidic membrane cleaner
	Metal working industry	Alkali resistant membranes	Alkaline membrane cleaner
	Metal working industry	Steel, plastic	Alkaline spray cleaner suitable for metals and all kind of plastics
	Mould and cast plastic manufactures	S.M.C., R.I.M., R-TPU, PC	Acidic cleaner for all kind of plastics prior painting

Lubrication

Lubrication and Protection

Why use a Loctite® Lubricant?

Loctite® Lubricants offer protection for industrial plant and equipment. This range includes organic, mineral and synthetic based products meeting the requirements of industrial applications.

What is the function of a lubricant?

The typical function of a lubricant is to protect against friction and wear. Lubricants are also used to protect against corrosion by displacing moisture and leaving a continuous coating on the part.

What considerations are important when choosing a lubricant?

When choosing a lubricant, it is important to consider the intended application as well as the environmental conditions to which the assembly will be exposed. Environmental conditions are critical to the successful selection of the right lubricant product. Factors including high temperature, harsh chemicals and contaminants may have an adverse effect on the expected lubricant performance.

Loctite® Anti-Seize

Loctite® Anti-Seize products provide protection in harsh environments and operating conditions, e.g. extreme temperatures and corrosive attack. They prevent fretting and galvanic corrosion, and can also be used as running-in lubricant for new equipment.

Loctite® Dry Film Lubricants

MoS₂ and PTFE based Loctite® Dry Film Lubricants reduce friction, prevent seizing, ensure protection against corrosion and enhance the performance of oils and greases.

Loctite® Lubricating Oils

Loctite® lubricating Oils have been developed for moving parts in equipment ranging from big plants to smaller machines. Flowability and surface adhesion ensure good lubrication at both high and low speeds within the specified temperature range.

Loctite® Lubricating Greases

Loctite® Lubricating Greases have been developed to offer the following performance benefits:

- Protect against friction
- Reduce wear
- Prevent overheating

Carefully balanced formulations and high-quality ingredients help Loctite® lubricants meet the requirements of a wide range of applications. To match specific requirements, Loctite® Greases are made of mineral or synthetic based oils combined with a thickening agent, e.g. lithium soap or inorganic material such as silica gel. Loctite® Greases protect against corrosion and withstand extreme pressures.

Multan® Cutting Fluid Emulsions – New biostable cutting fluids

Henkel patented emulsifier technology

Excellent wetting properties result in:

- High cleanliness of machined parts, machines and tools
- Good run-off characteristics and low drag-out rates
- Minimised replenishment rates
- Excellent anti-corrosion behaviour
- Bactericide-free cutting fluids without bacterial growth – even the addition of bactericides is unnecessary
- No bactericide costs – even during replenishment / stable also during long idle periods / Self repairing – Fill the system, maintain 5 % fill concentration
- Bactericide-free formulation ensures very good skin compatibility
- Remarkable little foam formation
- Milky white cutting fluids used for drilling, turning, milling, grinding
- Multi-metal applications (cast iron, steel, aluminium, non-ferrous metals, etc.)
- Multi-machining characteristics (turning, drilling, milling, tapping, grinding, etc.)
- Multifunctional – A true all-rounder-generalist Multan 71-2
- High performance cutting fluid for aluminium/stainless steel machining where high lubricity is required: Specialist Multan 77- 4

Handy Hints:

- Loctite® 8065 now offers the same trusted performance in a semi-solid stick formula, but clean, fast and easy to apply.
- Special equipment available on request

Loctite® 8023 brush top

- Anti-Seize with ultimate wash out resistance
- For stainless steel
- Metal free

American Bureau of Shipping certified

Loctite® 8013 brush top

- High purity metal free Anti-Seize
- Excellent chemical resistance
- For stainless steel
- Ideal for use in the nuclear industry

PMUC

Loctite® 8009 brush top

- Metal free Anti-Seize
- Provides long term lubrication
- For all metals including stainless steel and titanium

Standard applications

Black	Copper	Grey	Black	White
MoS ₂ & rust inhibitors	Copper & graphite	Aluminium, graphite, extreme pressure (EP) additives	MoS ₂	White oil and extreme pressure (EP) additives
1	-	1	1	-
-30 to +400 °C	-30 to +980 °C	-30 to +900 °C	-30 to +450 °C	-30 to +400 °C

Loctite® 8012 brush top

- MoS₂ assembly paste ensures maximum lubricity
- Gives good resistance to extremely high loads
- Ideal for protection of parts during running in or cold start

C5-A®

Loctite® 8007 aerosol
Loctite® 8008 brush top
Loctite® 8065 stick

- Copper based Anti-Seize
- Typical applications: screws, nuts, pipes, exhaust bolts, brake caliper bolts

Loctite® 8150 can

Loctite® 8151 aerosol

- Protects threaded connections
- Prevents seizing and corrosion
- Typical applications: screws, nuts, pipes, heat exchangers and fittings of oil and gas burners

Loctite® 8154 aerosol

- Assembly paste with MoS₂
 - Facilitates assembly and disassembly of cylindrical parts
 - Withstands heavy operation conditions
 - Lubricates and seals cylindrical parts, bearings, gearwheels at low speed
- H2 NSF Reg. Nr.: 122982**

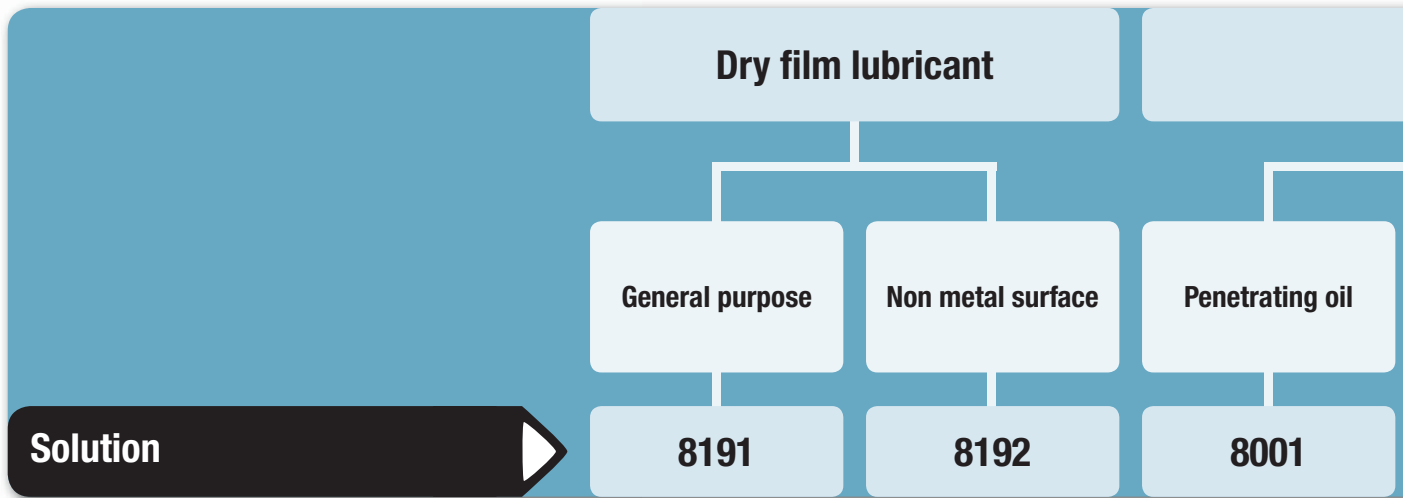

Loctite® 8014

- Food grade metal free Anti-Seize
 - For stainless steel components
 - Suitable for wet environments
- H1 NSF Reg. Nr.: 123004**

Lubrication – Dry Film and Oils

Product table

Solution	8191	8192	8001
Appearance	Black	White	Colourless
Base	MoS ₂	PTFE	Mineral oil
Viscosity	11 s (Cup 4)	11 s (Cup 4)	4 cSt

Load test 4 ball N (Weld load)	N.A.	N.A.	1,200
Pack sizes	400ml aerosol	400ml aerosol	400ml aerosol

Loctite® 8191

- MoS₂ Anti-friction coating – aerosol
- Quick drying
- Surface protection against corrosion
- Enhances the performance of oils and greases

Loctite® 8192

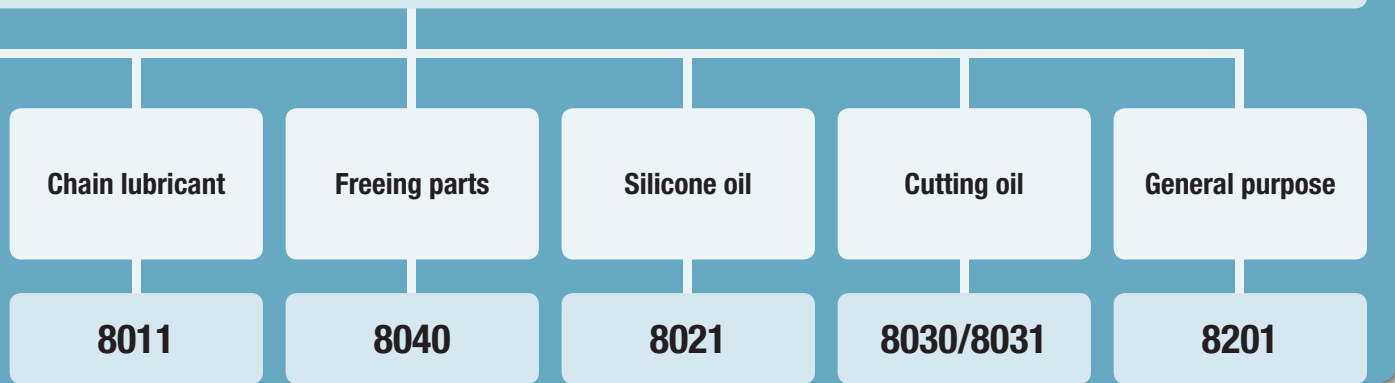

- PTFE coating
 - For non-metal and metal surfaces
 - Creates sliding surface for free movement
 - Prevents dust/dirt accumulation
 - Protection against corrosion
 - For conveyor belts, slideways and cams
- H2 NSF Reg. No.: 122980**

Loctite® 8001

- Penetrating mineral oil spray
 - Multi-purpose penetrating oil for micro mechanisms
 - Penetrates inaccessible mechanisms
 - Lubricates valve seats, collars, chains, hinges and cutting knives
- H1 NSF Reg. No.: 122999**

Oil

Loctite® 8011

- High temperature chain oil spray
 - Oxidation resistance prolongs lubricant service life
 - Lubricates open mechanisms, conveyors and chains at elevated temperatures up to 250 °C
- H2 NSF Reg. No.: 122978**

Loctite® 8040 Freeze & Release

- Releases rusted, corroded and seized components by the shock-freezing effect
- Wicks directly into the rust by capillary action
- Released parts remain lubricated and protected from corrosion

Loctite® 8021

- Silicone oil
 - Lubricates metal and non-metal surfaces
 - Suitable as release agent
- H1 NSF Reg.No.: 141642**

Loctite® 8030 bottle Loctite® 8031 aerosol

- Cutting oil
- Protects cutting tools in operation
- Improves surface finish
- Increases tool life
- For drilling, sawing or tapping steel, stainless steel and most non-ferrous metals

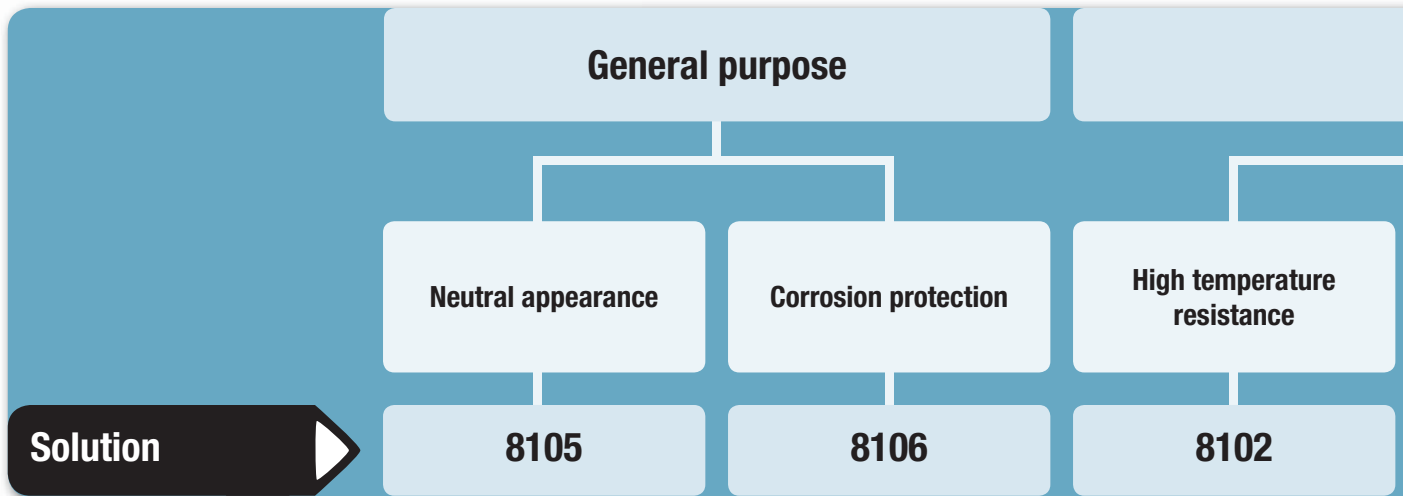

Loctite® 8201 Five way spray

- Frees assemblies
- For light lubrication of metals
- Cleans parts
- Displaces moisture
- Prevents corrosion

Handy Hints:

Additives for lubricant systems:

- Multan S: System cleaner to extend the lifetime of emulsions
- Multan AS: Defoamer for emulsions

Multan 46-81

- Wide range of grinding operations
- Mineral oil-free
- Excellent foam control
- pH-value: 9.3
- Inhibited against attack on copper alloys
- Resistant against bacteria growth
- No formation of Nitrosodiethanolamines

Multan 21-70

- Drilling, turning, milling, threading, grinding operations
- Boron and amine free
- Free of EP-additives (chlorine, sulphur, phosphorus)
- pH-value: 9.1
- Mineral oil based
- No staining on aluminium and non-ferrous metals
- Resistant against bacteria growth
- Suitable for moderate to extreme water hardness – 20–150 GH

Multan 71-2

- Drilling, turning, milling, threading, reaming, grinding
- Bactericide-free
- pH-value: 9.2
- Low replenishment rates
- Highly resistant to micro-organisms, bacteria, fungi
- Extremely efficient lubrication resulting in longer tool life and excellent cooling performance

Stamping and drawing

Suitable	Suitable	Suitable	Preferred
Preferred	Suitable	Suitable	Suitable
Suitable	Suitable	Suitable	Suitable
4 – 8 %	2 – 10 % (in addition to semi-synthetic emulsions)	Ready-to-use	Ready-to-use

Multan 77-4

- Drilling, turning, milling, threading, grinding operations
- Bactericide-free
- pH-value: 9.4
- Novel lubricating component
- Highly resistant to micro-organisms, bacteria, fungi
- High performance cutting fluid
- Extremely efficient lubrication resulting in longer tool life
- Contains aluminium inhibitors

Multan 233-1

- Enables the most difficult machining work, e.g. deep hole drilling, cutting, drilling
- Part of the HD-System
- Dispersible in cutting fluids: e.g. Multan 71-2
- Mineral oil-free
- Contains EP-additives with excellent lubricating performance
- Biodegradable vegetable oils, good oxidation resistance

Multan F AFS 105

- Low-viscosity for low and medium stamping operations
- Rolling, dipping, spraying, pour application
- Aluminium fin and hair pin manufacturing
- Evaporating type product
- Easy to clean
- No staining on aluminium and copper
- Suitable in manufacturing parts of air-conditioners

Multan F 7161

- Water-miscible
- Rolling, spraying, brush, pour application
- Compatible with downstream processes as cleaning, pretreatment, paint systems

Surface Treatment

Preparation & Protection

Why use a Loctite® Surface Treatment product?

The Loctite® portfolio of Surface Treatment products offers solutions for all types of surface treatments or preparations:

1. Belt dressing

Prevent slippage and increase friction for all types of belts

2. Rust treatment and corrosion protection

Protect surfaces against corrosion by converting rust into a stable base – restoring the protective coating on galvanised parts – coating parts with a non drying, tack free product

3. Leak detection

Detect leaks in gas handling systems

4. Tamper proofing

Visually detect movements in adjusted parts

5. Repair tape

Repair, reinforce, fix, seal and protect with a fabric reinforced tape

All products are easy to use. Some of them are recommended for emergency repairs where fast and efficient help is needed. Ideal also for maintenance and line production.

Why use a Loctite® Activator or Primer?

1. Loctite® Activators / Primers for Instant Bonding (Cyanoacrylate)

Loctite® Primers are used for improving adhesion to substrates. They are applied before the adhesive. For low surface energy plastic substrates, e.g. polyolefin, PP, PE, best adhesion will be achieved with Loctite® 770 / 7701.

Loctite® Activators are used to increase cure speed. Like the primers, activators are mostly applied before the adhesive. Heptane based activators have well "on part life" and provide good aesthetic appearance of the bond line. They are also suitable for stress cracking sensitive plastics. Activators can also be post applied after the adhesive, e.g. for curing residual adhesive. They provide excellent cosmetic appearance by avoiding white staining of instant adhesives.

2. Loctite® Activators for Modified Acrylics

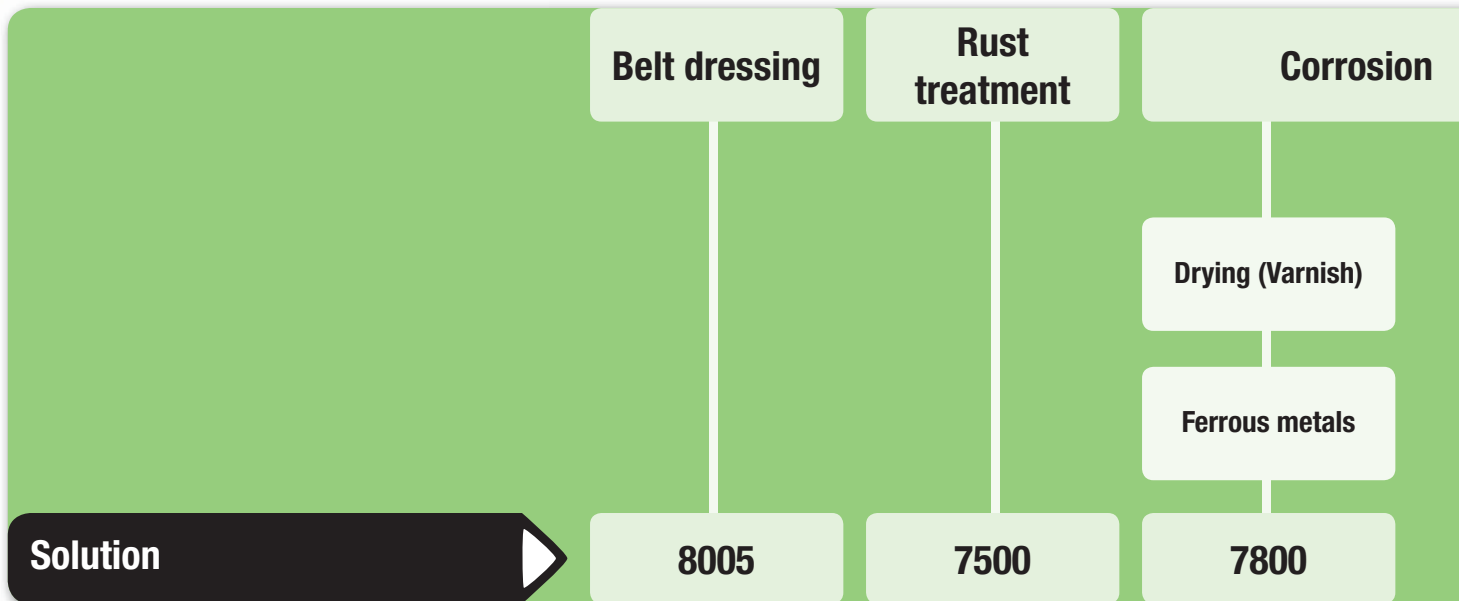

Loctite® Activators for modified acrylics are needed to initiate the curing process. Usually, the activator is applied to one part and the modified acrylic to the other part. The curing process starts when the two parts are assembled. Fixture time is dependent on the adhesive, on the substrate and on the cleanliness of the surfaces.

3. Loctite® Activators for Threadlocking, Pipe and Thread Sealing, Gasketing, Retaining and Anaerobic Acrylics

Loctite® Activators for this group of adhesives are used to increase the cure speed of the products. They are recommended for applications on passive metals such as stainless steel, plated or passivated surfaces. Activators are available as solvent-based or solvent-free formulations.

Surface Treatment

Product table

Description	Liquid spray	Rust treatment	Zinc spray
Colour	Clear yellow	Matt black	Grey
Service temperature range	N.A.	N.A.	-50 to +550 °C
Pack sizes	Not available in the UK	1 lt can	Not available in the UK

Loctite® 8005
Belt dressing

- Prevents slippage
- Increases friction for all types of belts
- Extends belt life

Loctite® 7500
Rust treatment

- Converts existing rust into a stable base
- Protects surfaces from corrosion
- Cured product acts as a primer ready for painting
- For metal pipes, valves, fittings, storage tanks, fences, guard rails, conveyors, construction and agricultural equipment

Loctite® 7800
Zinc spray

- Excellent cathodic corrosion protection on ferrous metals
- Restores protection to galvanised parts
- Typical applications: Touching-up of metal parts after welding, long term protection of metal assemblies

Metal protection coating	Detection of micro and larger leaks	Detect movements of parts	Detect movements of parts	Fabric reinforced tape
White	Colourless	Blue	Red	Metallic grey
-30 to +60 °C	+10 to +50 °C	-35 to +145 °C	-35 to +145 °C	Up to 70 °C
Not available in the UK	Not available in the UK	50ml	20ml, 500ml	Not available in the UK

Loctite® 7803
Metal protection coating spray

- Non drying, tack free coating
- Provides long term corrosion protection
- For iron, steel, sheet steel, pipes, moulds, machines and installations that have to be stored outdoors

Loctite® 7100
Leak Detector

- Produces bubbles at areas where a leak is present
- Non toxic
- Non flammable
- For use with all gases and gas mixtures except pure oxygen. Use also for iron, copper and plastic piping

Loctite® 7414
Tamper Proofing

- Visually detect movement of adjusted parts
- Use for fittings, studs, nuts etc.
- Good adhesion to metals
- Non-corrosive
- Also for outdoor applications

Loctite® 7400
Tamper Proofing

- Visually detect movement of adjusted parts, mark adjustment points, or mark components that have been set or tested
- Use for electronic equipment
- Good adhesion to a wide range of substrates

Loctite® 5080
Fix & Repair Tape

- Pressure resistance up to 4 bar (pipe leakage)
- The tape is easy to tear by hand
- For repairing, reinforcing, fixing, sealing and protecting

Surface Treatment

Pack sizes	Not available in the UK	10g, 300g, 16 oz	500ml	25ml, 150ml, 500ml, 20 lt

Loctite® 7239 Plastic Primer

- General purpose
- Suitable for use on all industrial plastics
- Improves the adhesion of instant adhesives on polyolefins and other low surface energy plastics

Loctite® 770 Polyolefin Primer

- Only for difficult to bond plastics
- Provides (best) adhesion of instant adhesives to polyolefins and other low surface energy plastics

Loctite® 7458

- General purpose
- For all substrates
- Good on part life – can be pre- or post-applied
- Low odour
- Minimises post cure white discolouring
- Provides good aesthetic appearance of the bondline

Loctite® 7455

- General purpose
- For all substrates
- Fast fixturing between close fitting parts
- For post application

* For medical applications

500ml	150ml, 500ml	7386: 500ml	150ml, 500ml	90ml

Loctite® 7452

- Cures excess adhesive
- Provides excellent cosmetic appearance avoiding white discolouring of instant adhesive
- Not recommended on stress cracking sensitive plastics

Loctite® 7457

- Good on part life – can be pre- or post-applied
- Recommended for use on stress cracking sensitive plastics

Loctite® 7386

- Initiate the cure of modified acrylic adhesives
- Fixture time and cure speed depends on adhesive, bonded substrate and surface cleanliness

Loctite® 7471 Loctite® 7649

- Speed up cure on passive and inactive surfaces
- For large bond gaps
- On part life of:
Loctite® 7649: ≤ 30 days
Loctite® 7471: ≤ 7days

Loctite® 7240

- Increases cure speed on passive and inactive surfaces
- For large bond gaps
- For low (< 5 °C) temperature curing

Mould Release Agents

Semi-permanent Mould Release Technology

World standard products for release application

Henkel offers highly effective solutions for tough moulding and application challenges. Customers around the globe turn to Frekote® not just for our unique mould release products, but also for our expertise in developing “customised” solutions. We take pride in our knowledge, experience, and responsiveness in providing the best technical service to our customers around the globe.

The Frekote® line offers the broadest range of semi-permanent release agents, mould sealers and cleaners in the industry. Frekote® mould release agents, backed by over 50 years of research and development, are the global industry standard for performance, quality and value. By pioneering release solutions for many of the world’s largest manufacturing organisations, Henkel understands what it takes to release the most complex materials in the most demanding applications.

Lowest cost per release – Frekote® semi-permanent release agents minimise fouling and ensure the highest number of releases possible per application. Our customers realise higher productivity and profitability through reduced downtime; lower reject rates, and higher quality products. Frekote® products are the industry standard replacement for sacrificial release agents. Unlike sacrificial waxes or silicones, Frekote® semi-permanent mould release agents do not transfer to your parts; instead they chemically bond with the mould surface and they provide multiple releases. The parts release cleanly, and will not stick to low energy film. Only one touch-up coat is necessary to refresh the mould after multiple releases. Frekote® products are designed to save your money.

Henkel has designed mould release agents for virtually all composite, plastic and rubber moulding operations. From airliners to tennis rackets, truck tyres to O-rings, bathtubs to custom yachts, we have the release agent to fulfill your requirements.

Markets Served

For an initial market overview

Thermoset Plastics

Advanced Composites Epoxy Systems

- **Renewable energies**
Wind rotor blades
- **Aerospace**
Aircraft, helicopters, etc.
- **Recreational**
Bicycles, skis, rackets, etc.
- **Special**
Racing parts, medicals, electronics, filament windings, etc.

GRP Composites Polyester, Vinyl Ester

- **Marine GRP**
Boats, yachts, jet-skis, etc.
- **Transportation GRP**
Panels, roofs, spoilers, etc.
- **Construction GRP**
Wind rotor blades, cultured marble sinks & countertops, bathtubs, etc.

Thermoplastics

Rotational Moulding

- **Recreational**
Kayaks, pedal boats, etc.
- **Construction**
Containers, tanks, chairs, waste bins, etc.

Rubbers

Rubber Industry

- **Tyre**
Treads/side walls
- **Technical Rubber**
Vibration dampers, roller blade wheels, footwear, custom moulding, etc.

How Frekote® release agents work

Solvent-based semi-permanent Frekote® products are moisture curing, while the resins used in the Aqualine range are heat or room temperature cured. Frekote® release agents can be wiped on or sprayed on. Cured Frekote® release coatings form a solid, non-greasy, durable film which withstands the shear forces encountered in moulding and demoulding operations. The maximum film thickness is 5µm. This prevents mould build-up to minimize costly mould cleaning while achieving excellent part detail and mould geometry retention. Special Frekote® release agents are available that allow post-mould painting or bonding without the need for any cleaning of the released parts.

Semi-permanent technology coats the mould with a low energy film.

Sealing

Frekote® sealers are used prior to application of mould release coats to seal mould micro-porosity and provide a uniform, stable base coat for the release agent. Sealers also improve the durability of the Frekote® film, ensuring the maximum number of releases per application. Some release agents contain a mould sealer, for example the water-based Frekote® Aqualine C-600. Previous release contamination, e.g. sacrificial or semi-permanent release agents, should be removed before the sealer coat is applied.

Sealers seal micro-porosity to achieve a uniform release coating

Cleaning

For maximum performance, Frekote® release agents should be applied to a completely cleaned mould. Therefore, mould cleaning is an important preparatory step to ensure that all cured release agent and other unwanted contaminants left on the mould are removed. Frekote® water based and solvent-based cleaners remove all contaminants from composite and metal moulds.

Unwanted contaminants may impair adhesion of the Frekote® release agent to the mould.

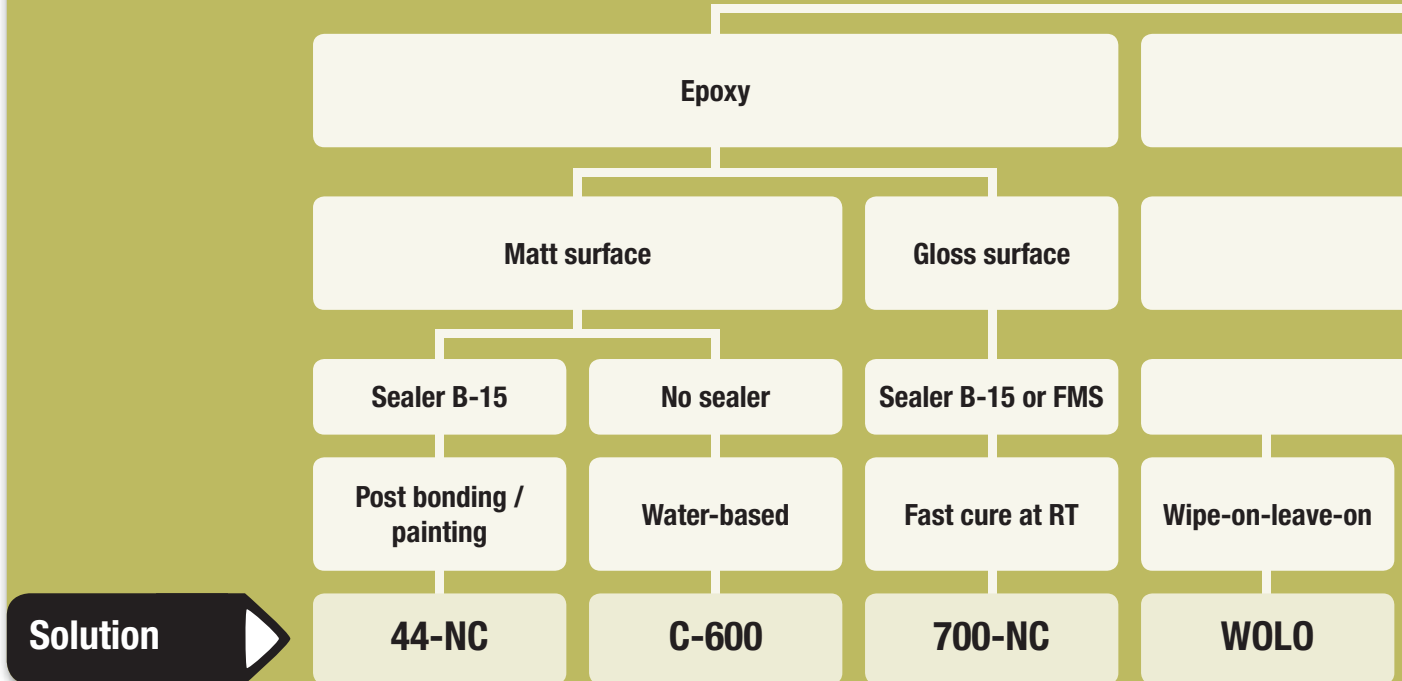

Frekote® Features – Benefits

- Semi-permanent technology – multiple release performance
- Quick room temperature cure, heat accelerated cure – reduces process down time
- Spray on, wipe on – easy to apply with cloth or spray gun
- Low or no transfer – reduces post part cleaning
- 5 µm film ensures low mould build-up – reduces post mould cleaning
- Form a hard durable and dry thermoset film – extended mould life
- Reduced cleaning and application time – lower cost per parts

Mould Release Agents

Product table

Are you releasing composites or rubber?

Description	Release agent	Release agent	Release agent	Release agent
Appearance	Clear liquid	White emulsion	Clear liquid	Clear liquid

Equipment

Semi-automatic dispensing systems

The systems are designed for integration into automated assembly lines and can be actuated by a PLC. They are suitable for dispensing microdots, dots, drops or beads of low to high viscosity products. Each system is equipped with Controller 97152, Reservoir 97108 accommodating up to 1.0 lt Loctite® bottles, Footswitch 97201 and Airline Filter / Regulator 97120 for combination with the appropriate valve. The valve is selected to suit the viscosity of the product and the amount to be dispensed. Please see table below.

Viscosity		● Microdot	● Dot	● Dot
		Micro bead	Medium bead	Bead
Low*	—	IDH 1388647 IDH 1388646	IDH 1388648 IDH 1388647 IDH 1388646	IDH 1388648

High***	—	On request	On request	IDH 1388650

* Low viscosity up to 2.500 mPa-s

** Medium viscosity approx. 2.500 – 7.500 mPa-s

*** High viscosity over 7.500 mPa-s

IDH 1388651

- Includes: 97113 Stationary Applicator Valve ¼")
- Suitable for all 1-component technologies

IDH 1388650

- Includes: 97114 Stationary Applicator Valve 3/8"
- Suitable for all 1-component technologies

IDH 1388647

- Includes: 98009 Light Cure Dispensing Valve
- Suitable for light cure adhesives

IDH 1388648

- Includes: 97135 Diaphragm Valve
- Suitable for all low viscosity methacrylates and acrylic adhesives

IDH 1388649

- Includes: 97136 Diaphragm Valve
- Suitable for all low to medium viscosity methacrylates and acrylic adhesives

IDH 1388646

- Includes: 98013 (Cyanoacrylate Dispensing Valve) - not UVCA
- Suitable for all 1-component technologies except light cure adhesives

1-component technologies: e.g. methacrylates, acrylics, light cure acrylics and cyanoacrylates. For other technologies please contact us.

Hand-held dispensing systems

The systems are designed for single user manual workstations. They are suitable for dispensing dots, drops or beads of low to medium viscosity products.

The systems comprise an integrated Controller & Reservoir 97009, Footswitch 97201 and Airline Filter / Regulator 97120 for combination with the appropriate valve. The valve is selected to suit the viscosity of the product and the amount to be dispensed. Please see table below.

Viscosity		● Microdot	● Dot	● Drop
		Micro bead	Medium bead	Bead
Low*	—	On request	IDH 1388652	IDH 1388652
Medium**	▬	On request	IDH 1388653	IDH 1388653
High***	▬▬	On request	IDH 1388653	On request

* Low viscosity up to 2,500 mPa-s

** Medium viscosity approx. 2,500 – 7,500 mPa-s

*** High viscosity over 7,500 mPa-s

IIDH 1388652

- Includes: 97121 Pinch Valve Applicator
- Suitable for all 1-component adhesive technologies

IDH 1388653

- Includes: 97130 LV Hand-Held Applicator
- Suitable for all 1-component adhesives technologies, except light cure adhesives

Customised systems

Henkel offers a wide range of stand alone dispensing equipment and turnkey packages for all adhesive and sealant dispensing needs. Systems range from built sealant dispensing pumps to custom built UV cure systems to fully integrated robot and special machine systems.

Henkel engineers can support customers with recommendations and specifications for custom built equipment.

Contact the Henkel equipment team on: 01442 278100

Equipment

Light curing equipment

Four major effects must be taken into consideration when designing a successful light cure application: emission spectrum of the cure system, light intensity, transmission properties of substrate and required cure characteristics. As a manufacturer of both the chemistry and the curing equipment, Henkel knows how to match light cure adhesives to the correct dispensing and curing system.

Flood cure systems

Bulb technology

Loctite® 97055 / 97056

- Loctite® 97055 high intensity light cure chamber system for manual loading
 - Loctite® 97056 tunnel version designed for integration into automated lines
- Three different bulbs are available for appropriate emission spectrums

Bulb	IDH No.	UV	UV/Visible	INDIGO
Loctite® 97346	870098	☀☀☀	☀	☀
Loctite® 97347	870097	☀☀☀	☀☀☀	☀
Loctite® 97348	870096	☀	☀☀☀	☀☀☀

LED technology

Loctite® 97070 / 97071

- Loctite® 97070 high intensity, cool radiation LED system, designed to emit UVA light
 - Loctite® 97071 high intensity, cool radiation LED system, designed to emit visible light
- Mounting stand available on request.

LED head	IDH No.	UV	UV/Visible	INDIGO
Loctite® 97070	1427234	☀☀☀	—	—
Loctite® 97071	1427233	—	☀☀☀	—

- ☀ Medium intensity
- ☀☀ High intensity
- ☀☀☀ Very high intensity

- 1000 W** Energy consumption of bulb
- LED** LED system
- Emission spectrum contains UV light
- Exposure timer
- Emission spectrum contains UV / Visible light
- Interface for PLC connection, e.g. external start
- Indigo** Emission spectrum contains visible INDIGO light
- Internal intensity monitoring

Spot cure systems

Bulb technology

Loctite® 97057 (IDH 941764)

High intensity light guide system emitting UVA, UV/Visible and INDIGO light. To be combined with appropriate light guide.

Loctite® 97323: Ø 5 x 1,500 mm (IDH 376720), Loctite® 97324: Ø 8 x 1,500 mm (IDH 298849),

Loctite® 97318: 2x Ø 3 x 1,500 mm (IDH 951637)

Loctite® 97034 (IDH 331219)

High intensity light guide system emitting UVC, UVA, UV/Visible and INDIGO light. To be combined with appropriate light guide.

Loctite® 97326: Ø 5 x 1,000 mm (IDH 329278), Loctite® 97327: Ø 8 x 1,000 mm (IDH 376721),

Loctite® 97328: 2x Ø 3 x 1,000 mm (IDH 352194)

LED technology

Loctite® 97069 (IDH 1305340)

High intensity, long lifetime system designed for curing Loctite® UV adhesives and coatings with UV light. Modern LED technology provides "cool" radiation at narrow bandwidth.

Accessories

Product	Item no.	IDH no.	Description
	Loctite® 98727 Loctite® 98770	1390323 1265282	The Dosimeter-Radiometer measures light dose (energy) and light intensity of the UV curing equipment and is a self-contained one channel device. Loctite® 98727 for UV light, Loctite® 98770 for UV / visible light.
	Loctite® 98002	1406024	The Loctite® Spot Radiometer 7020 is a self-contained, electro-optic instrument designed to measure and display the UV power density (irradiance) emitted by a UV light guide. For light guides Ø 3 mm, Ø 5 mm and Ø 8 mm.
	Loctite® 8953426 Loctite® 8953427	1175127 1175128	UV protection glasses Loctite® 8953426: protection glasses grey, best to use for UV light Loctite® 8953427: protection glasses orange, best to use for UV / Visible and INDIGO light.
