Notes:

At high powers, the dissipation in the switch can be significant and the resulting thermal effects need to be taken in to account. The device should be mounted with appropriate heat sinking to take this into account.

The maximum allowable junction temperature is $T_{JMAX}=125^{\circ}C$ and for the thermal calculation, the dissipation within the switch should be taken as $\eta = 5.5\%$. This should include the power input to the switch and anything reflected back from an external mismatch.

The thermal resistance of the FET should be taken as $R_{TH}=70^{\circ}C/W$.

$$T_J = T_{OP} + P_{IN} \cdot \eta \cdot R_{TH}, \text{ where } T_J < T_{JMAX}$$

Preferred Assembly Instructions

This package is compatible with both lead free and leaded solder reflow processes as defined within IPC/JEDEC J-STD-020C. The maximum package temperature should not exceed 260 °C.

Handling Precautions

To avoid damage to the devices, care should be exercised during handling. Proper Electrostatic Discharge (ESD) precautions should be observed at all stages of storage, handling, assembly, and testing.

ESD Rating

These devices should be treated as Class 1A (250V to 500V), using the Human Body Model, as defined in JEDEC Standard No. 22-A114. Further information on ESD control measures can be found in MIL-STD-1686 and MIL-HDBK-263.

MSL Rating

The device has an MSL rating of Level 1. To determine this rating, preconditioning was performed to the device per the Pb-free solder profile defined within IPC/JEDEC J-STD-020, Moisture/Reflow sensitivity classification for non-hermetic solid state surface mount devices.
