+72V, SOT23/TDFN, Simple Swapper Hot-Swap Controllers

MAX5902/MAX5903

General Description

The MAX5902/MAX5903 are hot-swap controllers that allow a circuit card to be safely hot plugged into a live backplane without causing a glitch on the power-supply rail. These devices operate from +9V to +72V and provide the simplest hot-swap solution by eliminating all external components except the external p-channel MOSFET.

The MAX5902/MAX5903 limit the inrush current to the load and provide a circuit-breaker function for overcurrent protection. During startup the circuit-breaker function is disabled and the MAX5902/MAX5903 limit the inrush current by gradually turning on the external MOSFET. Once the external MOSFET is fully enhanced, the circuit-breaker function is enabled and the MAX5902/MAX5903 provide overcurrent protection by monitoring the voltage drop across the external MOSFET's on-resistance.

The MAX5902/MAX5903 include an undervoltage lockout (UVLO) function, ON/$\overline{\text{OFF}}$ control input, and a power-good status output, $\overline{\text{PGOOD}}$ (MAX5902) or PGOOD (MAX5903). A built-in thermal shutdown feature is also included to protect the external MOSFET in case of overheating.

The MAX5902/MAX5903 offer latched or autoretry fault management and are available with 300mV, 400mV or 500mV circuit-breaker thresholds. Both the MAX5902 and MAX5903 are available in small SOT23 and TDFN packages, and are specified for the extended -40°C to +85°C temperature range. For specific ordering information, see the *Selector Guide* at the end of the data sheet.

Features

♦ **Wide +9V to +72V Operation**

♦ **Requires No External Sense Resistor**

♦ **Drives External p-Channel MOSFET**

♦ **Limits Inrush Current**

♦ **Circuit-Breaker Function**

♦ **Less than 2mA Quiescent Current**

♦ **ON/$\overline{\text{OFF}}$ Input Permits Load Power-Supply Control and Sequencing**

♦ **Adjustable Undervoltage Lockout**

♦ **Power-Good Output with +72V Rating**

♦ **Latching or Automatic Retry Fault Management**

♦ **Thermal Shutdown Helps Protect the External MOSFET**

♦ **Available in Two Small Packages 6-Pin TDFN and SOT23**

6	6	ON/$\overline{OFF}$	ON/$\overline{OFF}$ Control Input. ON/$\overline{OFF}$ is referenced to GND. Drive ON/$\overline{OFF}$ above 1.38V or leave unconnected to enable the device. Drive ON/$\overline{OFF}$ below 1V to disable the device. ON/$\overline{OFF}$ is also used to adjust the UVLO threshold. Internally clamped to nominally 3V through a 1kΩ resistor (See Figure 1). (See the _Undervoltage Lockout_ section in the _Applications Information_.)
—	—	EP	Exposed Pad (TDFN only). Connect to GND.

_____Detailed Description

The MAX5902/MAX5903 are integrated hot-swap controller ICs contained in 6-pin SOT23 and TDFN packages. They allow a board to be safely hot-plugged into a live backplane without causing a glitch on the power-supply rail. They are well suited for +48V power systems allowing cost-effective, simple, and compact design. The MAX5902/MAX5903 operate from +9V to +72V to cover a wide range of end equipment hot-swap needs. They require only an external p-channel power MOSFET to provide hot-swap control. Figure 1 shows a functional block diagram of the MAX5902/MAX5903.

The MAX5902/MAX5903 controls an external p-channel power MOSFET placed in the positive power-supply pathway. When power is first applied, the MAX5902/MAX5903 keep the MOSFET turned off. The MAX5902/MAX5903 hold the MOSFET off indefinitely if ON/$\overline{OFF}$ is held low, if the supply voltage is below the undervoltage lockout level, or if the die temperature exceeds +125°C. If none of these conditions exist for 150ms (typ), the MAX5902/MAX5903 begin to gradually turn on the MOSFET. During this turn-on phase, the MAX5902/MAX5903 slowly enhance the MOSFET, allowing the voltage on the load, i.e. the drain of the MOSFET, to rise at a rate of 9V/ms (typ). The inrush current to the load is thus limited to a level proportional to the load capacitance, and the constant slew rate. After

Figure 1. Functional Block Diagram

the MOSFET is fully enhanced, and the load voltage is settled to its final value, the MAX5902A/ MAX5903A and MAX5902L/MAX5903L monitor the voltage drop across the MOSFET. If the voltage drop exceeds the circuit-breaker threshold the MAX5902A/MAX5903A and

MAX5902L/MAX5903L turn off the MOSFET, disconnecting the load immediately. If no circuit-breaker fault exists, the MAX5902/MAX5903 assert the power-good output. Then, if any of four conditions exist, the power-good output deasserts and the MAX5902/MAX5903 turn off the MOSFET. The four conditions are: the voltage across the MOSFET exceeds the circuit-breaker threshold; the supply voltage falls below the undervoltage lockout level; the die temperature exceeds +125°C; or ON/$\overline{OFF}$ is forced low. After a circuit-breaker fault, the MAX5902L/MAX5903L keep the MOSFET off until the power is cycled, or the part is reset by toggling ON/$\overline{OFF}$ low for 10ms (typ). After a circuit-breaker fault, the MAX5902A/MAX5903A automatically restarts in 150ms (typ). All versions automatically restart after a thermal fault, or an undervoltage shutdown, if the fault condition goes away for at least 150ms (typ).

ON/$\overline{OFF}$ offers external control of the MAX5902/MAX5903, facilitating power-supply sequencing, and may also be used to change the undervoltage lockout (UVL) level. UVLO keeps the external MOSFET switched off as long as the input voltage is below the desired level.

A power-good output, $\overline{PGOOD}$ (MAX5902) or PGOOD (MAX5903), asserts when the external MOSFET is fully enhanced and the source-drain voltage is below the circuit-breaker threshold. $\overline{PGOOD}$ and PGOOD are open-drain outputs referenced to GND, and can withstand up to +72V.

Figure 2. Test Circuits

Figure 3. Programmed +18V Lockout, with Optional Optocoupler On/Off Control.

A thermal shutdown feature protects the external MOS-FET by turning it off if the die temperature of the MAX5902/MAX5903 exceeds +125°C. The MAX5902/MAX5903 must be in good thermal contact with the external MOSFET. See *Layout Guidelines* in the *Applications* section of the data sheet.

A circuit-breaker function monitors the voltage across the external MOSFET, V_{SD}, and turns off the MOSFET if V_{SD} exceeds the circuit-breaker threshold, V_{CB}. The circuit-breaker function is enabled after the MOSFET is fully enhanced. Three threshold voltage options are available—300mV, 400mV, and 500mV. One version is available with no circuit-breaker function. Fault management for the MAX5902/MAX5903 is offered with two different configurations; latched and automatic retry.

Latched Circuit Breaker
After a circuit-breaker trip event, the latched versions (MAX5902L/MAX5903L) drive GATE to V_S, turning off the external MOSFET, and $\overline{PGOOD}$ (PGOOD) is deasserted. A latched off condition needs to be reset by toggling ON/$\overline{OFF}$ low for at least 10ms, or by cycling the power supply, V_S.

Automatic Retry Circuit Breaker
After a circuit-breaker trip event, the automatic retry versions (MAX5902A/MAX5903A) drive GATE to V_S, turning off the external MOSFET, and $\overline{PGOOD}$ (PGOOD) is deasserted. If the start conditions are met for a full 150ms (t_{RS}) the start sequence is re-initiated. The start conditions are: the device is not in UVLO; ON/$\overline{OFF}$ is not driven low; and the device is not in thermal shutdown.

No Circuit Breaker
For the versions without a circuit breaker, MAX5902N (MAX5903N), $\overline{PGOOD}$ (PGOOD) are asserted when the MOSFET is fully enhanced. Once powered up the MAX5902N/MAX5903N ignore the MOSFET drain-to-source voltage for applications where a circuit-breaker function is not desired.

Applications Information

ON/$\overline{OFF}$ Control Input
The ON/$\overline{OFF}$ control input provides three functions: external ON/$\overline{OFF}$ control; setting of the UVLO level; and resetting after a circuit-breaker event has caused the MAX5902L/MAX5903L to turn off the external MOSFET. Pulling ON/$\overline{OFF}$ to GND for at least 10ms (t_{OFF}) forces the MAX5902/MAX5903 to turn off the external MOSFET (see Figure 3 for a circuit example). To reset the MAX5902L/MAX5903L after a circuit-breaker event, toggle ON/$\overline{OFF}$ to GND for at least 10ms (t_{OFF}).

ON/$\overline{OFF}$ can be used to sequence power supplies. Connecting a capacitor from ON/$\overline{OFF}$ to GND will delay the rise of ON/$\overline{OFF}$ proportional to the capacitance and input impedance of ON/$\overline{OFF}$, typically 33kΩ (Figure 4).

The MAX5902/MAX5903 can be controlled by logic-level signals. Logic-level signals of 3.3V or 1.8V may be directly connected to ON/$\overline{OFF}$. For 5V logic level control, insert a series 47kΩ resistor as shown in Figure 5.

Figure 4. Power-Supply Sequencing

Figure 5. Logic Control

Figure 6. Defeating Undervoltage Lockout

Turn-On and Turn-Off Delays

After power is applied, or ON/$\overline{\text{OFF}}$ is released, there is a 150ms delay (t_{ON}) before the gate ramp is started. This delay is also the automatic restart time delay.

In the event of a circuit-breaker condition or an overtemperature fault condition, the turn-off delay is less than 4μs. An undervoltage condition must exist for at least 10ms (t_{OFF}) before the MAX5902/MAX5903 turns off the external MOSFET. ON/$\overline{\text{OFF}}$ must be held low for at least 10ms (t_{OFF}) before the MAX5902/MAX5903 turns off the external MOSFET. Turn-off delay minimizes spurious shutdowns due to noisy signals or momentary voltage spikes, as well as preventing accidental resetting of the circuit-breaker latch (MAX5902L/MAX5903L).

Thermal Shutdown

A thermal shutdown feature helps protect the external MOSFET. If the die temperature of the MAX5902/MAX5903 exceeds +125°C, the MOSFET is turned off. For accurate performance the MAX5902/MAX5903 must be in close thermal contact with the external MOSFET. See the *Layout Guidelines* section for information. Due to the low power dissipation of the MAX5902/MAX5903, its junction temperature will typically be within a few degrees of the MOSFET. All versions of the MAX5902/MAX5903 automatically restart from a temperature fault when the junction temperature drops below +110°C.

Undervoltage Lockout

The MAX5902/MAX5903 turns off the external MOSFET if the magnitude of the input voltage is below the level set by ON/$\overline{\text{OFF}}$ for longer than 10ms (t_{OFF}). If ON/$\overline{\text{OFF}}$ is left unconnected, the lockout voltage (V_{UVLO}) defaults to 31.5V. V_{UVLO} may also be set to any value within the power-supply range by using external resistors. To set the lockout voltage to a value between +9V
and +72V use a resistor divider connected between V_S and GND, with the center node of the divider connected to ON/$\overline{\text{OFF}}$. For example, use a 3kΩ resistor (R1 in Figure 3) from ON/$\overline{\text{OFF}}$ to GND and calculate the other resistor, R2, using:

$$R2 = R1 \times \left(\frac{V_{UVLO}}{V_{ON/\overline{OFF}}} - 1 \right)$$

where V_{UVLO} is the desired lockout voltage, and $V_{ON/\overline{OFF}}$ is the ON/$\overline{\text{OFF}}$ reference threshold specified in the *Electrical Characteristics* table (typically 1.26V).

Figure 3 shows an example circuit with V_{UVLO} set for +18V. To defeat the UVLO simply connect a single 100kΩ resistor between ON/$\overline{\text{OFF}}$ and V_S, as shown in Figure 6.

The Power-Good Output

The power-good output, $\overline{\text{PGOOD}}$ (PGOOD), is open-drain and asserts when the external MOSFET is fully enhanced and V_{SD} is less than the circuit-breaker threshold (V_{CB}). For versions without the circuit-breaker function (MAX5902N/MAX5903N), $\overline{\text{PGOOD}}$ (PGOOD) asserts when the external MOSFET is fully enhanced.

$\overline{\text{PGOOD}}$ (PGOOD) deasserts within 4μs when a circuit-breaker event occurs or if the die temperature exceeds +125°C. $\overline{\text{PGOOD}}$ (PGOOD) deasserts if $V_S < V_{UVLO}$ for longer than 10ms or ON/$\overline{\text{OFF}}$ is held low for longer than 10ms.

The MAX5902 $\overline{\text{PGOOD}}$ is active-low and the MAX5903 PGOOD is active-high. Both are open-drain n-channel MOSFETs with their sources connected to GND, and can withstand up to +72V.

Selecting a Circuit-Breaker Threshold

The MAX5902A/MAX5903A and the MAX5902L/MAX5903L offer a circuit-breaker function to protect the external MOSFET and the load from the potentially damaging effects of excessive current. As load current flows through the external MOSFET, a voltage, V_{SD}, is generated from source to drain due to the MOSFET's on-resistance, $R_{DS(ON)}$. The MAX5902A/MAX5903A and MAX5902L/MAX5903L monitor V_{SD} when the external MOSFET is fully enhanced. If V_{SD} exceeds the circuit-breaker threshold the external MOSFET is turned off, and $\overline{PGOOD}$ (PGOOD) is deasserted. To accommodate different MOSFETs and different load currents the MAX5902/MAX5903 are available with circuit-breaker threshold voltages of 300mV, 400mV, and 500mV. To determine the proper circuit-breaker threshold for an application use:

$$V_{CB} > (R_{DS(ON)}) \times (I_{OUT(MAX)})$$

where $R_{DS(ON)}$ is the on-resistance of the MOSFET and I_{OUT}(MAX) is the maximum expected output current.

The MAX5902N/MAX5903N have no circuit-breaker function. For these parts choose an external MOSFET which meets the load requirements.

The circuit-breaker function is intended to protect against gross overcurrent or short-circuit conditions. During a gross overcurrent or short-circuit condition, the MAX5902/MAX5903 disconnect the load by disabling the external MOSFET. For calculating the circuit-breaker threshold use the MOSFET's R_{ON} at the worst possible operating condition, and add a 20% overcurrent margin to the maximum circuit current. For instance, if a MOSFET has an R_{ON} of 0.06Ω at T_A = +25°C, and a normalized on-resistance factor of 1.75 at T_A = +130°C (from the MOSFET data sheet), the R_{ON} used for calculation is the product of these two numbers, or (0.06Ω) x (1.75) = 0.105Ω. Then, if the maximum current is expected to be 2A, using a 20% margin, the current for calculation is (2A) x (1.2) = 2.4A. The resulting minimum circuit-breaker threshold is then a product of these two results, or (0.105Ω) x (2.4A) = 0.252V. The next highest minimum available threshold is 0.280V of the MAX5902ABEUT, which is an ideal choice given these parameters. Using this method to choose a circuit-breaker threshold allows the circuit to operate under worst case conditions without causing a circuit-breaker fault, but the circuit-breaker function will still operate if a short circuit, or a gross overcurrent condition exists.

Figure 7. Circuit Board Layout Example.

Determining Inrush Current

Determining a circuit's inrush current is necessary to help choose the proper MOSFET. The MAX5902/MAX5903 regulate the inrush current by means of controlling the load voltage slew rate, but inrush current is also a function of load capacitance. Determine inrush current using:

$$I = C\,\frac{dV}{dt} = C \times SR$$

where C is the load capacitance, and SR is the MAX5902/MAX5903 Load Voltage Slew-Rate Magnitude from the *Electrical Characteristics* table. For example, assuming a load capacitance of 100µF, and using the typical value of 9V/ms for the slew rate, the inrush current is 0.9A typical.

If the maximum possible Load Voltage Slew Rate is used, the maximum inrush current calculates to 1.8A. Choose a MOSFET with a maximum pulsed current specification that exceeds the maximum inrush current.

MAXIMUM I_{LOAD} (A)	SUGGESTED EXTERNAL MOSFET	SUGGESTED MAXIM PART
0.5	IRF9540NS	MAX5902AAEUT
1	IRF9540NS	MAX5902ABEUT
2	IRF5210S	MAX5902ABEUT
3	IRF5210S	MAX5902ACEUT

V_{IN} = +9V to +72V

MAX5902/MAX5903

Suggested External MOSFETs

Layout Guidelines

Good thermal contact between the MAX5902/MAX5903 and the external MOSFET is essential for the thermal shutdown feature to operate effectively. Place the MAX5902/MAX5903 as close as possible to the drain of the external MOSFET, and use wide circuit board traces for good heat transfer. See Figure 7 for an example of a PC board layout.

6LSOT.EPS

NOTES:
1. ALL DIMENSIONS ARE IN MILLIMETERS.
2. FOOT LENGTH MEASURED AT INTERCEPT POINT BETWEEN DATUM A & LEAD SURFACE.
3. PACKAGE OUTLINE EXCLUSIVE OF MOLD FLASH & METAL BURR. MOLD FLASH, PROTRUSION OR METAL BURR SHOULD NOT EXCEED 0.25 MM.
4. PACKAGE OUTLINE INCLUSIVE OF SOLDER PLATING.
5. PIN 1 IS LOWER LEFT PIN WHEN READING TOP MARK FROM LEFT TO RIGHT. (SEE EXAMPLE TOP MARK)
6. PIN 1 I.D. DOT IS 0.3 MM Ø MIN. LOCATED ABOVE PIN 1.
7. MEETS JEDEC MO178, VARIATION AB.
8. SOLDER THICKNESS MEASURED AT FLAT SECTION OF LEAD BETWEEN 0.08mm AND 0.15mm FROM LEADTIP.
9. LEAD TO BE COPLANAR WITHIN 0.1 MM.
10. NUMBER OF LEADS SHOWN ARE FOR REFERENCE ONLY.
11. MARKING IS FOR PACKAGE ORIENTATION REFERENCE ONLY.

Ordering Information

Notes:

1. Other options and links for purchasing parts are listed at: http://www.maxim-ic.com/sales.
2. Didn't Find What You Need? Ask our applications engineers. Expert assistance in finding parts, usually within one business day.
3. Part number suffixes: T or T&R = tape and reel; + = RoHS/lead-free; # = RoHS/lead-exempt. More: SeeFull Data Sheet or Part Naming Conventions.
4. * Some packages have variations, listed on the drawing. "PkgCode/Variation" tells which variation the product uses.

Devices: 1-112 of 112

MAX5903AAEUT-T			SOT-23;6 pin;9 mm Dwg: 21-0058I (PDF) Use pkgcode/variation: U6F-6*	-40C to +85C	RoHS/Lead-Free: No Materials Analysis
MAX5903ABEUT-T			SOT-23;6 pin;9 mm Dwg: 21-0058I (PDF) Use pkgcode/variation: U6F-6*	-40C to +85C	RoHS/Lead-Free: No Materials Analysis
MAX5903ABETT			THIN QFN (Dual);6 pin;10 mm Dwg: 21-0137I (PDF) Use pkgcode/variation: T633-2*	-40C to +85C	RoHS/Lead-Free: No Materials Analysis
MAX5903LAETT+			THIN QFN (Dual);6 pin;10 mm Dwg: 21-0137I (PDF) Use pkgcode/variation: T633+2*	-40C to +85C	RoHS/Lead-Free: Lead Free Materials Analysis
MAX5903LAETT			THIN QFN (Dual);6 pin;10 mm Dwg: 21-0137I (PDF) Use pkgcode/variation: T633-2*	-40C to +85C	RoHS/Lead-Free: No Materials Analysis
MAX5903LBETT+			THIN QFN (Dual);6 pin;10 mm Dwg: 21-0137I (PDF) Use pkgcode/variation: T633+2*	-40C to +85C	RoHS/Lead-Free: Lead Free Materials Analysis
MAX5903LBETT			THIN QFN (Dual);6 pin;10 mm Dwg: 21-0137I (PDF) Use pkgcode/variation: T633-2*	-40C to +85C	RoHS/Lead-Free: No Materials Analysis
MAX5903LCETT+			THIN QFN (Dual);6 pin;10 mm Dwg: 21-0137I (PDF) Use pkgcode/variation: T633+2*	-40C to +85C	RoHS/Lead-Free: Lead Free Materials Analysis
MAX5903LCETT			THIN QFN (Dual);6 pin;10 mm Dwg: 21-0137I (PDF) Use pkgcode/variation: T633-2*	-40C to +85C	RoHS/Lead-Free: No Materials Analysis
MAX5903ACETT			THIN QFN (Dual);6 pin;10 mm Dwg: 21-0137I (PDF) Use pkgcode/variation: T633-2*	-40C to +85C	RoHS/Lead-Free: No Materials Analysis
MAX5903NNETT+			THIN QFN (Dual);6 pin;10 mm Dwg: 21-0137I (PDF) Use pkgcode/variation: T633+2*	-40C to +85C	RoHS/Lead-Free: Lead Free Materials Analysis
MAX5903ACETT+			THIN QFN (Dual);6 pin;10 mm Dwg: 21-0137I (PDF) Use pkgcode/variation: T633+2*	-40C to +85C	RoHS/Lead-Free: Lead Free Materials Analysis
MAX5903ABETT+			THIN QFN (Dual);6 pin;10 mm Dwg: 21-0137I (PDF) Use pkgcode/variation: T633+2*	-40C to +85C	RoHS/Lead-Free: Lead Free Materials Analysis
MAX5903NNETT			THIN QFN (Dual);6 pin;10 mm Dwg: 21-0137I (PDF) Use pkgcode/variation: T633-2*	-40C to +85C	RoHS/Lead-Free: No Materials Analysis
MAX5903AAETT			THIN QFN (Dual);6 pin;10 mm Dwg: 21-0137I (PDF) Use pkgcode/variation: T633-2*	-40C to +85C	RoHS/Lead-Free: No Materials Analysis
MAX5903AAETT+			THIN QFN (Dual);6 pin;10 mm Dwg: 21-0137I (PDF) Use pkgcode/variation: T633+2*	-40C to +85C	RoHS/Lead-Free: Lead Free Materials Analysis
MAX5903NNETT-T			THIN QFN (Dual);6 pin;10 mm Dwg: 21-0137I (PDF) Use pkgcode/variation: T633-2*	-40C to +85C	RoHS/Lead-Free: No Materials Analysis
MAX5903NNETT+T			THIN QFN (Dual);6 pin;10 mm Dwg: 21-0137I (PDF) Use pkgcode/variation: T633+2*	-40C to +85C	RoHS/Lead-Free: Lead Free Materials Analysis
MAX5903LCETT-T			THIN QFN (Dual);6 pin;10 mm Dwg: 21-0137I (PDF) Use pkgcode/variation: T633-2*	-40C to +85C	RoHS/Lead-Free: No Materials Analysis
MAX5903LCETT+T			THIN QFN (Dual);6 pin;10 mm Dwg: 21-0137I (PDF) Use pkgcode/variation: T633+2*	-40C to +85C	RoHS/Lead-Free: Lead Free Materials Analysis
MAX5903LBETT-T			THIN QFN (Dual);6 pin;10 mm Dwg: 21-0137I (PDF) Use pkgcode/variation: T633-2*	-40C to +85C	RoHS/Lead-Free: No Materials Analysis
MAX5903LBETT+T			THIN QFN (Dual);6 pin;10 mm Dwg: 21-0137I (PDF) Use pkgcode/variation: T633+2*	-40C to +85C	RoHS/Lead-Free: Lead Free Materials Analysis

MAX5903LAETT+T			THIN QFN (Dual);6 pin;10 mm Dwg: 21-0137I (PDF) Use pkgcode/variation: T633+2*	-40C to +85C	RoHS/Lead-Free: Lead Free Materials Analysis
MAX5903ACETT-T			THIN QFN (Dual);6 pin;10 mm Dwg: 21-0137I (PDF) Use pkgcode/variation: T633-2*	-40C to +85C	RoHS/Lead-Free: No Materials Analysis
MAX5903ACETT+T			THIN QFN (Dual);6 pin;10 mm Dwg: 21-0137I (PDF) Use pkgcode/variation: T633+2*	-40C to +85C	RoHS/Lead-Free: Lead Free Materials Analysis
MAX5903ABETT-T			THIN QFN (Dual);6 pin;10 mm Dwg: 21-0137I (PDF) Use pkgcode/variation: T633-2*	-40C to +85C	RoHS/Lead-Free: No Materials Analysis
MAX5903ABETT+T			THIN QFN (Dual);6 pin;10 mm Dwg: 21-0137I (PDF) Use pkgcode/variation: T633+2*	-40C to +85C	RoHS/Lead-Free: Lead Free Materials Analysis
MAX5903AAETT+T			THIN QFN (Dual);6 pin;10 mm Dwg: 21-0137I (PDF) Use pkgcode/variation: T633+2*	-40C to +85C	RoHS/Lead-Free: Lead Free Materials Analysis
MAX5903AAETT-T			THIN QFN (Dual);6 pin;10 mm Dwg: 21-0137I (PDF) Use pkgcode/variation: T633-2*	-40C to +85C	RoHS/Lead-Free: No Materials Analysis
