Pin No.	Symbol	Description
1	NC	No connection.
2	/CS1	This is the chip select signal. When /CS1 = "L", then the chip select become active, and data/command I/O is enabled.
3	/RES	When /RES is set to "L," the settings are initialized. The reset operation is performed by the /RES signal level.
4	A0	This is connected to the least significant bit of the normal MPU address bus, and it determines whether the data bits are data or a command. A0 = "H": Indicates that D0 to D7 are display data. A0 = "L": Indicates that D0 to D7 are control data.
5	/WR	When connected to an 8080 MPU, this is active LOW. This terminal connects to the 8080 MPU /WR signal. The signals on the data bus are latched at the rising edge of the /WR signal.
6	/RD	When connected to an 8080 MPU, this is active LOW. This pin is connected to the /RD signal of the 8080 MPU, and the SED1565 series data bus is in an output status when this signal is "L".
7	D0	This is an 8-bit bi-directional data bus that connects to an 8-bit or 16-bit 8 standard MPU data bus.

Table 2 (b)

Pin No.	Symbol	Description
23~27	V1,V2, V3,V4, V5	<p>This is a multi-level power supply for the liquid crystal drive. The voltage applied is determined by the liquid crystal cell, and is changed through the use of a resistive voltage divider or through changing the impedance using an op. amp. Voltage levels are determined based on VDD, and must maintain the relative magnitudes shown below.</p> $VDD (= V0) \geq V1 \geq V2 \geq V3 \geq V4 \geq V5$ <p>Master operation: When the power supply turns ON, the internal power supply circuits produce the V1 to V4 voltages shown below. The voltage settings are selected using the LCD bias set command.</p> <p>For 1/7 bias: $V1=(1/7) \times V5$, $V2=(2/7) \times V5$, $V3=(5/7) \times V5$, $V4=(6/7) \times V5$.</p>
28	VR	<p>Output voltage regulator terminal. Provides the voltage between VDD and V5 through a resistive voltage divider.</p> <p>These are only enabled when the V5 voltage regulator internal resistors are not used (IRS = "L").</p> <p>These cannot be used when the V5 voltage regulator internal resistors are used (IRS = "H").</p>
29	C86	<p>This is the MPU interface switch terminal.</p> <p>C86 = "H": 6800 Series MPU interface.</p> <p>C86 = "L": 8080 MPU interface.</p>
30	IRS	<p>This terminal selects the resistors for the V5 voltage level adjustment.</p> <p>IRS = "H": Use the internal resistors</p> <p>IRS = "L": Do not use the internal resistors. The V5 voltage level is regulated by an external resistive voltage divider attached to the VR terminal.</p> <p>This pin is enabled only when the master operation mode is selected.</p> <p>It is fixed to either "H" or "L" when the slave operation mode is selected.</p>
	+	Anode of backlight
	-	Cathode of backlight.
