

NCP4629

500 mA, Wide Input Range, LDO Linear Voltage Regulator

The NCP4629 is a CMOS 500 mA LDO linear voltage regulator which features a high input voltage range while maintaining a low quiescent current. Several protection features like current limiting and thermal shutdown are fully integrated to create a versatile and robust device. A high maximum input voltage (36 V) and wide temperature range (-40°C to 105°C) makes the NCP4629 an ideal choice for high power industrial applications.

Features

- Operating Input Voltage Range: 4 V to 24 V
- Output Voltage Range: 3.0 to 12.0 V (available in 0.1 V steps)
- $\pm 2\%$ Output Voltage Accuracy
- Output Current: min. 500 mA ($V_{IN} = V_{OUT} + 1$ V)
- Line Regulation: 0.05%/V
- Current Limit Circuit
- Thermal Shutdown Circuit
- Available in SOT-89-5 and DPAK5 Package
- These are Pb-Free Devices

Typical Applications

- Home appliances, industrial equipment
- Cable boxes, satellite receivers, entertainment systems
- Car audio equipment, navigation systems
- Notebook adaptors, LCD TVs, cordless phones and private LAN systems
- Office equipment: copiers, printers, facsimiles, scanners, projectors, monitors

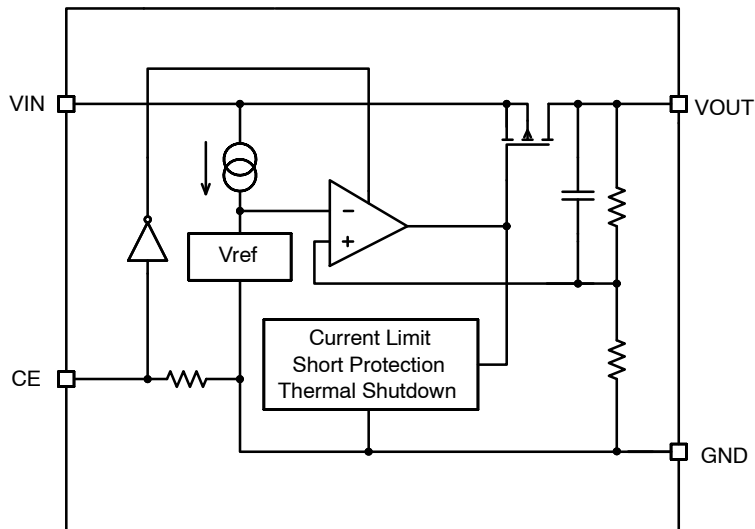

Figure 2. Simplified Schematic Block Diagram

PIN FUNCTION DESCRIPTION

Pin No. SOT-89	Pin No. DPAK	Pin Name	Description
1	1	VIN	Input pin
2	2	GND*	Ground pin, all ground pins must be connected together when it is mounted on board
3	3	GND*	Ground pin, all ground pins must be connected together when it is mounted on board
4	4	CE	Chip enable pin ("H" active)
5	5	VOUT	Output pin
6		GND	Heatsink surface is internally connected to Pin 2 – GND
	6	GND	Heatsink surface is internally connected to Pin 3 – GND

*Pin no.2 – GND and pin no.3 – GND of SOT-89 and DPAK-5 packages must be wired to the GND line when it is mounted on board.

ABSOLUTE MAXIMUM RATINGS

Rating	Symbol	Value	Unit
Input Voltage	V_{IN}	-0.3 to 36	V
Output Voltage	V_{OUT}	-0.3 to $V_{IN} \leq 36$	V
Chip Enable Input	V_{CE}	-0.3 to $V_{IN} \leq 36$	V
Power Dissipation SOT-89-5	P_D	900	mW
Power Dissipation DPAK-5		1900	
Junction Temperature	T_J	-40 to 150	°C
Storage Temperature	T_{STG}	-55 to 125	°C
ESD Capability, Human Body Model (Note 2)	ESD_{HBM}	2000	V
ESD Capability, Machine Model (Note 2)	ESD_{MM}	200	V

Stresses exceeding Maximum Ratings may damage the device. Maximum Ratings are stress ratings only. Functional operation above the Recommended Operating Conditions is not implied. Extended exposure to stresses above the Recommended Operating Conditions may affect device reliability.

1. Duration time = 200 ms
2. This device series incorporates ESD protection and is tested by the following methods:
 ESD Human Body Model tested per AEC-Q100-002 (EIA/JESD22-A114)
 ESD Machine Model tested per AEC-Q100-003 (EIA/JESD22-A115)
 Latch-up Current Maximum Rating tested per JEDEC standard: JESD78.

APPLICATION INFORMATION

A typical application circuit for NCP4629 series is shown in Figure 39.

Figure 39. Typical Application Schematic

When VOUT voltage could be higher than VIN voltage it is necessary to use protective diode D1. If there is possibility that VOUT voltage could be negative then it is necessary to use schottky diode D2. See Figure 40 for details. Do not force the voltage to the VOUT pin.

Figure 40. Typical Application Schematic with Protective Diodes

Input Decoupling Capacitor (C1)

A 470 nF ceramic input decoupling capacitor should be connected as close as possible to the input and ground pin of the NCP4629. Higher values and lower ESR improves line transient response.

Output Decoupling Capacitor (C2)

A 10 μF ceramic output decoupling capacitor is sufficient to achieve stable operation of the IC. If tantalum capacitor is used, and its ESR is high, the loop oscillation may result. The capacitor should be connected as close as possible to the output and ground pin. Larger values and lower ESR improves dynamic parameters.

Enable Operation

The enable pin CE may be used for turning the regulator on and off. The IC is switched on when a high level voltage is applied to the CE pin. The enable pin has an internal pull down current source. If the enable function is not needed connect CE pin to VIN.

Thermal

As a power across the IC increase, it might become necessary to provide some thermal relief. The maximum power dissipation supported by the device is dependent upon board design and layout. Mounting pad configuration on the PCB, the board material, and also the ambient temperature affect the rate of temperature increase for the part. When the device has good thermal conductivity through the PCB the junction temperature will be relatively low in high power dissipation applications.

The IC includes internal thermal shutdown circuit that stops operation of regulator, if junction temperature is higher than 160°C. After that, when junction temperature decreases below 135°C, the operation of voltage regulator would restart. While high power dissipation condition is, the regulator starts and stops repeatedly and protects itself against overheating.

PCB layout

Pins number 2 and 3 must be wired to the GND plane while it is mounted on board. Make VIN and GND lines sufficient. If their impedance is high, noise pickup or unstable operation may result. Connect capacitors C1 and C2 as close as possible to the IC, and make wiring as short as possible.

ORDERING INFORMATION

Device	Nominal Output Voltage	Description	Marking	Package	Shipping†
