

36V, 2 μ A I_Q, 100mA Low Dropout Voltage Linear Regulator

General Description

The RT9058 is a low dropout (LDO) linear voltage regulator that features high input voltage, low dropout voltage, ultra-low operating current, and miniaturized packaging. With quiescent current as low as 2 μ A, the RT9058 is ideal for battery-powered equipment.

The RT9058's stability requirements are easily met with all types of output capacitors, including tiny ceramic capacitors, over its wide input range (3.5V to 36V) and its load current range (0mA to 100mA). The RT9058 offers standard output voltages of 2.5V, 3V, 3.3V, 5V, 6V, 9V and 12V.

Applications

- Portable, Battery Powered Equipment
- Ultra Low Power Microcontrollers
- Notebook Computers

Features

- 2 μ A Quiescent Current
- \pm 2% Output Accuracy
- 100mA Output Current
- 3.5V to 36V Input Voltage Range
- Dropout Voltage : 0.35V at 10mA/V_{CC} 5V
0.5V at 10mA/V_{CC} 3.5V
- Fixed Output Voltage : 2.5V, 3V, 3.3V, 5V, 6V, 9V, 12V
- Stable with Ceramic or Tantalum Capacitors
- Current Limit Protection
- Over Temperature Protection
- SOT-23-3, SOT-89-3 Packages
- RoHS Compliant and Halogen Free

Function Block Diagram

Operation

The RT9058 is a high input voltage linear regulator specifically designed to minimize external components. The input voltage range is from 3.5V to 36V.

Output Transistor

The RT9058 includes a built-in low on-resistance P-MOSFET output transistor for low dropout voltage applications.

Error Amplifier

The Error Amplifier compares the output feedback voltage from an internal feedback voltage divider to an internal reference voltage and controls the P-MOSFET's gate voltage to maintain output voltage regulation.

Current Limit Protection

The RT9058 provides a current limit function to prevent damage during output over-load or shorted-circuit conditions. The output current is detected by an internal sensing transistor.

Over Temperature Protection

The over temperature protection function will turn off the P-MOSFET when the internal junction temperature exceeds 150°C (typ.) and the output current exceeds 4mA. Once the junction temperature cools down by approximately 20°C, the regulator will automatically resume operation.

Note 1. Stresses beyond those listed “Absolute Maximum Ratings” may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions may affect device reliability.

Note 2. θ_{JA} is measured at $T_A = 25^\circ\text{C}$ on a high effective thermal conductivity four-layer test board per JEDEC 51-7.

Note 3. Devices are ESD sensitive. Handling precaution is recommended.

Note 4. The device is not guaranteed to function outside its operating conditions.

Applications Information

Like any low dropout linear regulator, the RT9058's external input and output capacitors must be properly selected for stability and performance. Use a 1μF or larger input capacitor and place it close to the IC's VCC and GND pins.

Any output capacitor meeting the minimum 1mΩ ESR (Equivalent Series Resistance) requirement may be used. Place the output capacitor close to the IC's VOUT and GND pins. Increasing capacitance and decreasing ESR can improve the circuit's PSRR and line transient response.

Thermal Considerations

For continuous operation, do not exceed absolute the maximum junction temperature. The maximum power dissipation depends on the thermal resistance of the IC package, PCB layout, rate of surrounding airflow, and the allowed difference between the junction and ambient temperatures. The maximum power dissipation can be calculated by the following formula :

$$P_{D(MAX)} = (T_{J(MAX)} - T_A) / \theta_{JA}$$

where $T_{J(MAX)}$ is the maximum junction temperature, T_A is the ambient temperature, and θ_{JA} is the junction to ambient thermal resistance.

The recommended operating conditions specify a maximum junction temperature is 125°C. The junction to ambient thermal resistance, θ_{JA} , is layout dependent. On a standard JEDEC 51-7 four-layer thermal test board , the thermal resistance, θ_{JA} , of the SOT-23-3 package is 243.3°C/W. For the SOT-89-3 package, the θ_{JA} , is 167.7°C/W. The maximum power dissipation at $T_A = 25^\circ\text{C}$ can be calculated by the following formula :

$$P_{D(MAX)} = (125^\circ\text{C} - 25^\circ\text{C}) / (243.3^\circ\text{C/W}) = 0.41\text{W for SOT-23-3 package}$$

$$P_{D(MAX)} = (125^\circ\text{C} - 25^\circ\text{C}) / (167.7^\circ\text{C/W}) = 0.6\text{W for SOT-89-3 package}$$

For a fixed $T_{J(MAX)}$ of 125°C, the maximum power dissipation depends on the operating ambient temperature and the package's thermal resistance, θ_{JA} . The derating curve in Figure 1 shows the effect of rising ambient temperature on the maximum recommended power dissipation.
