## Monolithic CMOS Analog Multiplexers

#### Abstract

General Description Maxim's DG508A and DG509A are monolithic CMOS analog multiplexers (muxes): the DG508A is a single 8-channel (1-of-8) mux, and the DG509A is a differential 4-channel (2-of-8) mux. Both devices guarantee break-before-make switching. Maxim guarantees these muxes will not latch up if the power supplies are turned off with the input signals still present. Maxim also guarantees continuous operation when these devices are powered by supplies ranging from $\pm 4.5 \mathrm{~V}$ to $\pm 18 \mathrm{~V}$. The DG508A/DG509A are plug-in upgrades for the industry-standard DG508A/DG509A, respectively. Maxim's parts have faster enable switching times and significantly lower leakage currents. The DG508A/ DG509A also consume significantly lower power, making them ideal for portable equipment.

Applications
Control Systems
Data Logging Systems
Aircraft Heads-Up Displays
Data-Acquisition Systems
Signal Routing
Typical Operating Circuits

Features

- Improved Second Source
- Operate from $\pm 4.5 \mathrm{~V}$ to $\pm 18 \mathrm{~V}$ Supplies
- Symmetrical, Bidirectional Operation
- Logic and Enable Inputs, TTL and CMOS Compatible
- Latchup-Proof Construction
- Monolithic, Low-Power CMOS Design

Lead Temperature (soldering, 10s) ................................. $300^{\circ} \mathrm{C}$
Soldering Temperature (reflow)
PDIP, Wide SO, Narrow SO, CERDIP containing lead(Pb)... $+240^{\circ} \mathrm{C}$
PDIP, Wide SO, Narrow SO lead(Pb)-free .................... $+260^{\circ} \mathrm{C}$

Note 1: Signals on S_ or D_ exceeding V+ or V- are clamped by internal diodes. Limit forward-diode current to maximum current ratings
Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

( $\mathrm{V}+=15 \mathrm{~V}, \mathrm{~V}_{\mathrm{GND}}=0 \mathrm{~V}, \mathbf{T}_{\mathbf{A}}=\mathbf{T}_{\text {MIN }}$ to $\mathbf{T}_{\mathbf{M A X}}$, unless otherwise noted.)

Note 2: $\operatorname{ID}(O N)$ is leakage from driver into on switch.

Note 3: Off-isolation $=20 \log \frac{\left|\mathrm{~V}_{\mathrm{S}}\right|}{\left|\mathrm{V}_{\mathrm{D}}\right|}$
$V_{S}=$ input to off switch,
$V_{D}=$ output due to $V_{S}$.
Note 4: Electrical characteristics (such as on-resistance) change when power supplies other than $\pm 15 \mathrm{~V}$ are used.
Note 5: For designs requiring single 5 V or dual $\pm 5 \mathrm{~V}$ operation, refer to Maxim's improved MAX338 and MAX339. Minimum operating voltage for DG508ADY/MY and DG509ADY/MY is $\pm 9 \mathrm{~V}$.
