LTC6255/LTC6256/LTC6257

$6.5 \mathrm{MHz}, 65 \mu \mathrm{~A}$ Power Efficient Rail-to-Rail I/O Op Amps

## fertures

- Gain Bandwidth Product: 6.5MHz
- -3 dB Bandwidth ( $\mathrm{A}_{V}=+1$ ): 4.5 MHz
- Low Quiescent Current: 65 1 A
- Stable for Capacitive Load Up to 100nF
- Offset Voltage: $350 \mu \mathrm{~V}$ Maximum
- Rail-to-Rail Input and Output
- Supply Voltage Range: 1.8 V to 5.25 V
- Input Bias Current: 50nA Maximum
- CMRR/PSRR: 100dB/100dB
- Shutdown Current: 7uA Maximum
- Operating Temperature Range: $-40^{\circ} \mathrm{C}$ to $125^{\circ} \mathrm{C}$
- Single in 6-Lead TSOT-23 Package
- Dual in 8-Lead MS8, MS10, TSOT-23, $2 \mathrm{~mm} \times 2 \mathrm{~mm}$

Thin DFN Packages

- Quad in MS16 Package

## APPLICATIONS

- Micropower Active Filters
- Portable Instrumentation
- Battery or Solar Powered Systems
- Automotive Electronics

## DESCRIPTIOn

The LTC ${ }^{\circledR} 6255 /$ LTC6256/LTC6257 are single/dual/quad operational amplifiers with low noise, low power, low supply voltage, and rail-to-rail inputs and outputs. They are unity gain stable with capacitive load up to 100 nF . They feature 6.5 MHz gain-bandwidth product, $1.8 \mathrm{~V} / \mu \mathrm{s}$ slew rate while consuming only $65 \mu \mathrm{~A}$ of supply current per amplifier operating on supply voltages ranging from 1.8 V to 5.25 V . The combination of low supply current, low supply voltage, high gain bandwidth product and low noise makes the LTC6255 family unique among rail-to-rail input/output op amps with similar supply current. These operational amplifiers are ideal for low power and low noise applications.

For applications that require power-down, the LTC6255 and LTC6256 in S6 and MS10 packages offer shutdown which reduces the current consumption to $7 \mu \mathrm{~A}$ maximum.

The LTC6255 family can be used as plug-in replacements for many commercially available op amps to reduce power and improve input/output range and performance.

[^0]
## TYPICAL APPLICATION

Low Power, Low Distortion ADC Driver

LTC6255 Driving LTC2361 ADC

## LTC6255/LTC6256/LTC6257

## ABSOLUTE MAXIMUM RATIOGS

Note 1: Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. Exposure to any Absolute Maximum Rating condition for extended periods may affect device reliability and lifetime.
Note 2: The inputs are protected by back-to-back diodes as well as ESD protection diodes to each power supply. If the differential input voltage exceeds 3.6 V or the input extends more than 500 mV beyond the power supply, the input current should be limited to less than 10 mA .
Note 3: A heat sink may be required to keep the junction temperature below the absolute maximum rating when the output is shorted indefinitely.
Note 4: The LTC6255C/LTC6256C/LTC6257C and LTC6255I/LTC6256I/ LTC6257I are guaranteed functional over the temperature range of $-40^{\circ} \mathrm{C}$ to $85^{\circ} \mathrm{C}$. The LTC6255H/LTC6256H/LTC6257H are guaranteed functional over the temperature range of $-40^{\circ} \mathrm{C}$ to $125^{\circ} \mathrm{C}$.

Note 5: The LTC6255C/LTC6256C/LTC6257C are guaranteed to meet the specified performance from $0^{\circ} \mathrm{C}$ to $70^{\circ} \mathrm{C}$. The LTC6255C/LTC6256C/ LTC6257C are designed, characterized and expected to meet specified performance from $-40^{\circ} \mathrm{C}$ to $85^{\circ} \mathrm{C}$ but are not tested or QA sampled at these temperatures. The LTC6255I/LTC6256I/LTC6257I are guaranteed to meet specified performance from $-40^{\circ} \mathrm{C}$ to $85^{\circ} \mathrm{C}$. The LTC6255H/ LTC6256H/LTC6257H are guaranteed to meet specified performance from $-40^{\circ} \mathrm{C}$ to $125^{\circ} \mathrm{C}$.
Note 6: Thermal resistance varies with the amount of PC board metal connected to the package. The specified values are for short traces connected to the leads.
Note 7: The input bias current is the average of the currents through the positive and negative input pins.
Note 8: Full power bandwidth is calculated from the slew rate FPBW =
$S R / \pi \cdot V_{\text {P-p. }}$.

-IN: Inverting Input of the Amplifier. Voltage range of this pin can go from $\mathrm{V}^{-}-0.1 \mathrm{~V}$ to $\mathrm{V}^{+}+0.1 \mathrm{~V}$.
+IN: Non-Inverting Input of Amplifier. This pin has the same voltage range as -IN.
$\mathrm{V}^{+}$: Positive Power Supply. Typically the voltage is from 1.8 V to 5.25 V . Split supplies are possible as long as the voltage between $\mathrm{V}^{+}$and $\mathrm{V}^{-}$is between 1.8 V and 5.25 V . A bypass capacitor of $0.1 \mu \mathrm{~F}$ as close to the part as possible should be used between power supply pins or between supply pins and ground.
$\mathbf{V}^{-}$: Negative Power Supply. It is normally tied to ground. It can also be tied to a voltage other than ground as long as the voltage between $\mathrm{V}^{+}$and $\mathrm{V}^{-}$is from 1.8 V to 5.25 V . If it is not connected to ground, bypass it with a capacitor of $0.1 \mu \mathrm{~F}$ as close to the part as possible.
SHDN: Active Low Shutdown. Shutdown threshold is 0.6 V above negative rail. If left unconnected, the amplifier will be on.

OUT: Amplifier Output. The voltage range extends to within millivolts of each supply rail.

## SIMPLIFIED SCHEMATIC

Figure 1. LTC6255/LTC6256/LTC6257 Simplified Schematic

## OPERATION

The LTC6255 family input signal range extends beyond the negative and positive power supplies. The output can even extend all the way to the negative supply with the proper external pull-down current source. Figure 1 depicts a Simplified Schematic of the amplifier. The input stage is comprised of two differential amplifiers, a PNP stage Q1/Q2 and NPN stage Q3/Q4 that are active over different ranges of common mode input voltage. The PNP stage is active between the negative power supply to approximately 1 V below the positive supply. As the input voltage approaches the positive supply, transistor $Q 5$ will steer the tail current $I_{1}$ to the current mirror Q6/Q7, activating the NPN differential pair and the PNP pair becomes inactive
for the remaining input common mode range. Also for the input stage, devices Q17, Q18 and Q19 act to cancel the bias current of the PNP input pair. When Q1/Q2 is active, the current in Q16 is controlled to be the same as the current Q1/Q2. Thus, the base current of Q16 is normally equal to the base current of the input devices of Q1/Q2. Similar circuitry (not shown) is used to cancel the base current of Q3/Q4. The buffer and output bias stage uses a special compensation technique to take full advantage of the process technology to drive high capacitive loads. The common emitter topology of Q14/Q15 enables the output to swing from rail to rail.

## APPLICATIONS INFORMATION

## Low Supply Voltage and Low Power Consumption

The LTC6255 family of operational amplifiers can operate with power supply voltages from 1.8 V to 5.25 V . Each amplifier draws only $65 \mu \mathrm{~A}$. The low supply voltage capability and low supply current are ideal for portable applications.

## High Capacitive Load Driving Capability and Wide Bandwidth

The LTC6255 family is optimized for wide bandwidth low power applications. They have an extremely high gain-bandwidth to power ratio and are unity gain stable. When the load capacitance increases, the increased capacitance at the output pushed the non-dominant pole to lower frequency in the open loop frequency response, worsening the phase and gain margin. They are designed to directly drive up to 100 nF capacitive load in unity gain configuration (see Typical Performance Characteristics, Capacitive Load Handling). Higher gain configurations tend to have better capacitive drive capability than lower gain configurations due to lower closed loop bandwidth and hence higher phase margin.

## Low Input Referred Noise

The LTC6255 family provides a low input referred noise of $20 \mathrm{nV} / \sqrt{\mathrm{Hz}}$ at 1 kHz . The noise density will grow slowly with the frequency in wideband range. The average noise voltage density over 3 MHz range is less than $24 \mathrm{nV} / \sqrt{\mathrm{Hz}}$. The LTC6255 family is ideal for low noise and low power signal processing applications.

## Low Input Offset Voltage

The LTC6255 family has a low offset voltage of $350 \mu \mathrm{~V}$ maximum which is essential for precision applications. The offset voltage is trimmed with a proprietary trim algorithm to ensure low offset voltage over the entire common mode voltage range.

## Low Input Bias Current

The LTC6255 family uses a bias current cancellation circuit to compensate for the base current of the input transistors. When the input common mode voltage is within 200 mV of either rail, the bias cancellation circuit are no longer active. For common mode voltages ranging from 0.2 V above

## LTC6255/LTC6256/LTC6257

## APPLICATIONS INFORMATION

the negative supply to 0.2 V below the positive supply, the low input bias current allows the amplifiers to be used in applications with high resistance sources.

## Ground Sensing and Rail to Rail Output

The LTC6255 family has excellent output drive capability, delivering over 10 mA of output drive current. The output stage is a rail-to-rail topology that is capable of swinging to within 30 mV of either rail. If output swing to the negative rail is required, an external pull down resistor to a negative supply can be added. For 5V/0V op amp supplies, a pull down resistor of 2.1 k to -2 V will allow a 'true zero' output swing. In this case, the output can swing all the way to the bottom rail while maintaining 80 dB of open loop gain. Since the inputs can go 100 mV beyond either rail, the op amp can easily perform 'true ground' sensing.
The maximum output current is a function of total supply voltage. As the supply voltage to the amplifier increases, the output current capability also increases. Attention must be paid to keep the junction temperature of the IC below $150^{\circ} \mathrm{C}$ when the output is in continuous short-circuit. The output of the amplifier has reverse-biased diodes connected to each supply. The output should not be forced more than 0.5 V beyond either supply, otherwise current will flow through these diodes.

## Input Protection and Output Overdrive

To prevent breakdown of the input transistors, the input stages are protected against a large differential input voltage by two pairs of back-to-back diodes, D5 to D8. If the differential input voltage exceeds 1.4 V , the current in these diodes must be limited to less than 10 mA . These amplifiers are not intended for open loop applications such as comparators. When the output stage is overdriven, internal limiting circuitry is activated to improve overdrive recovery. In some applications, this circuitry may draw as much as 1 mA supply current.

## ESD

The LTC6255 family has reverse-biased ESD protection diodes on all inputs and output as shown in Figure 1.

## Supply Voltage Ramping

Fast ramping of the supply voltage can cause a current glitch in the internal ESD protection circuits. Depending on the supply inductance, this could result in a supply voltage transient that exceeds the maximum rating. A supply voltage ramp time of greater than 1 ms is recommended.

## Feedback Components

Care must be taken to ensure that the pole formed by the feedback resistors and the parasitic capacitance at the inverting input does not degrade stability. For example, in a gain of +2 configuration with gain and feedback resistors of 10k, a poorly designed circuit board layout with parasitic capacitance of 5 pF (part + PC board) at the amplifier's inverting input will cause the amplifier to oscillate due to a pole formed at 3.2 MHz . An additional capacitor of 5 pF across the feedback resistor as shown in Figure 2 will eliminate any ringing or oscillation.

## Shutdown

The single and dual versions have $\overline{\text { SHDN }}$ pins that can shut down the amplifier to less than $7 \mu \mathrm{~A}$ supply current. The SHDN pin voltage needs to be within 0.6 V of $\mathrm{V}^{-}$for the amplifier to shut down. During shutdown, the output will be in high output resistance state, which is suitable for multiplexer applications. When left floating, the SHDN pin is internally pulled up to the positive supply and the amplifier remains enabled.

## LTC6255 Very Low Power 2nd Order Lowpass Filter

The LTC6256 circuit shown in Figure 4 is a 2nd order, 100 kHz , Butterworth lowpass filter. The filter's differential output maximizes the dynamic range in very low voltage operation. A general 2nd order lowpass circuit is shown in

Figure 5 with the equations to calculate the RC components for cutoff frequencies up to 100 kHz for a Butterworth or a Bessel approximation (a Bessel lowpass filter has very low transient response overshoot). In addition the equations for a 4th order lowpass filter are provided to calculate the RC components for two cascaded 2nd order sections.

## $2 \mu s$ Rise Time Analog 1A Pulsed LED Current Driver

Figure 6 shows the LTC6255 applied as a fast, efficient analog LED current driver. High power LEDs are used in applications ranging from brake lights to video projectors. MostLED applications pulse the LEDs for the bestefficiency, and many applications take advantage of control of both pulse width and analog current amplitude.
In order to extend the circuit's input range to accommodate 5 V output DACs, the input voltage is initially divided by 50 through the R1:R2 divider. The reduced step is applied to the LTC6255 non inverting input, and LTC6255 output rises until MOSFETs Q1 through Q3 begin to turn on, increasing the current in their drains and therefore the LED. The amount of current is sensed on R3, and fed back to the LTC6255 inverting input through R5. The Ioop is compensated by R5 and C1, with R4 distancing the gate capacitance from the op amp output for the best time domain response. $10 \%$ to $90 \%$ rise time was measured at $2 \mu \mathrm{~s}$ on a 10 mA to 1 A pulse. Starting at 0 current there is an additional delay of $2.7 \mu \mathrm{~s}$.
It may seem strange to use a micropower op amp in a high current LED application, but it can be justified by the Iow duty cycles encountered in LED drive applications. A one amp LED is quite bright even when driven at $1 \%$ or even $0.1 \%$ duty cycles and these constitute 10 mA and 1 mA average current levels respectively, in which case the supply current of the op amp becomes noticeable. The LTC6255 combines 6.5MHzof gain-bandwidth product and $1.8 \mathrm{~V} / \mu \mathrm{s}$ slew rate on a supply current budget of only $65 \mu \mathrm{~A}$.

## LTC6255/LTC6256/LTC6257

## TYPICAL APPLICATIONS

When $\mathrm{V}_{\text {IN }}$ is at 0 V , the op amp supply current is nominally $65 \mu \mathrm{~A}$, but the $450 \mu \mathrm{~V}$ maximum input offset may appear across R3 inducing a 4.5 mA current in the LED. Some applications want aguaranteed zero LED currentat $\mathrm{V}_{\text {IN }}=0$, and this is the purpose of $R_{U P}$. R ${ }_{U P}$ forces $5 \mu \mathrm{~A}$ reverse current through R5 creating a negative 1.2 mV output offset at R3. This guarantees a zero LED current, but note that the op
$2 \mu \mathrm{~s}$ Rise Time Analog 1A Pulsed LED Current Driver

amp supply current rises from $65 \mu \mathrm{~A}$ to a still respectable $650 \mu \mathrm{~A}$ in this case due to internal protection circuitry for the output stage. For reduced current, the LTC6255 can be shut down, but the output becomes high impedance and may leak high which will turn on the MOSFETs and LED hard. Adding pull-down resistor RSD ensures that the LTC6255 output goes low when shutting down.
