User's Manual: Hardware

Renesas 32-Bit RISC Microcomputer
SuperH™ RISC engine Family / SH7260 Series

SH7266	R5S7266
SH7267	R5S7267

Notice

1. All information included in this document is current as of the date this document is issued. Such information, however, is subject to change without any prior notice. Before purchasing or using any Renesas Electronics products listed herein, please confirm the latest product information with a Renesas Electronics sales office. Also, please pay regular and careful attention to additional and different information to be disclosed by Renesas Electronics such as that disclosed through our website.
 2. Renesas Electronics does not assume any liability for infringement of patents, copyrights, or other intellectual property rights of third parties by or arising from the use of Renesas Electronics products or technical information described in this document. No license, express, implied or otherwise, is granted hereby under any patents, copyrights or other intellectual property rights of Renesas Electronics or others.
 3. You should not alter, modify, copy, or otherwise misappropriate any Renesas Electronics product, whether in whole or in part.
 4. Descriptions of circuits, software and other related information in this document are provided only to illustrate the operation of semiconductor products and application examples. You are fully responsible for the incorporation of these circuits, software, and information in the design of your equipment. Renesas Electronics assumes no responsibility for any losses incurred by you or third parties arising from the use of these circuits, software, or information.
 5. When exporting the products or technology described in this document, you should comply with the applicable export control laws and regulations and follow the procedures required by such laws and regulations. You should not use Renesas Electronics products or the technology described in this document for any purpose relating to military applications or use by the military, including but not limited to the development of weapons of mass destruction. Renesas Electronics products and technology may not be used for or incorporated into any products or systems whose manufacture, use, or sale is prohibited under any applicable domestic or foreign laws or regulations.
 6. Renesas Electronics has used reasonable care in preparing the information included in this document, but Renesas Electronics does not warrant that such information is error free. Renesas Electronics assumes no liability whatsoever for any damages incurred by you resulting from errors in or omissions from the information included herein.
 7. Renesas Electronics products are classified according to the following three quality grades: "Standard", "High Quality", and "Specific". The recommended applications for each Renesas Electronics product depends on the product's quality grade, as indicated below. You must check the quality grade of each Renesas Electronics product before using it in a particular application. You may not use any Renesas Electronics product for any application categorized as "Specific" without the prior written consent of Renesas Electronics. Further, you may not use any Renesas Electronics product for any application for which it is not intended without the prior written consent of Renesas Electronics. Renesas Electronics shall not be in any way liable for any damages or losses incurred by you or third parties arising from the use of any Renesas Electronics product for an application categorized as "Specific" or for which the product is not intended where you have failed to obtain the prior written consent of Renesas Electronics. The quality grade of each Renesas Electronics product is "Standard" unless otherwise expressly specified in a Renesas Electronics data sheets or data books, etc.
 - "Standard": Computers; office equipment; communications equipment; test and measurement equipment; audio and visual equipment; home electronic appliances; machine tools; personal electronic equipment; and industrial robots.
 - "High Quality": Transportation equipment (automobiles, trains, ships, etc.); traffic control systems; anti-disaster systems; anti-crime systems; safety equipment; and medical equipment not specifically designed for life support.
 - "Specific": Aircraft; aerospace equipment; submersible repeaters; nuclear reactor control systems; medical equipment or systems for life support (e.g. artificial life support devices or systems), surgical implantations, or healthcare intervention (e.g. excision, etc.), and any other applications or purposes that pose a direct threat to human life.
 8. You should use the Renesas Electronics products described in this document within the range specified by Renesas Electronics, especially with respect to the maximum rating, operating supply voltage range, movement power voltage range, heat radiation characteristics, installation and other product characteristics. Renesas Electronics shall have no liability for malfunctions or damages arising out of the use of Renesas Electronics products beyond such specified ranges.
 9. Although Renesas Electronics endeavors to improve the quality and reliability of its products, semiconductor products have specific characteristics such as the occurrence of failure at a certain rate and malfunctions under certain use conditions. Further, Renesas Electronics products are not subject to radiation resistance design. Please be sure to implement safety measures to guard them against the possibility of physical injury, and injury or damage caused by fire in the event of the failure of a Renesas Electronics product, such as safety design for hardware and software including but not limited to redundancy, fire control and malfunction prevention, appropriate treatment for aging degradation or any other appropriate measures. Because the evaluation of microcomputer software alone is very difficult, please evaluate the safety of the final products or system manufactured by you.
 10. Please contact a Renesas Electronics sales office for details as to environmental matters such as the environmental compatibility of each Renesas Electronics product. Please use Renesas Electronics products in compliance with all applicable laws and regulations that regulate the inclusion or use of controlled substances, including without limitation, the EU RoHS Directive. Renesas Electronics assumes no liability for damages or losses occurring as a result of your noncompliance with applicable laws and regulations.
 11. This document may not be reproduced or duplicated, in any form, in whole or in part, without prior written consent of Renesas Electronics.
 12. Please contact a Renesas Electronics sales office if you have any questions regarding the information contained in this document or Renesas Electronics products, or if you have any other inquiries.
- (Note 1) "Renesas Electronics" as used in this document means Renesas Electronics Corporation and also includes its majority-owned subsidiaries.
- (Note 2) "Renesas Electronics product(s)" means any product developed or manufactured by or for Renesas Electronics.

General Precautions on Handling of Product

1. Treatment of NC Pins

Note: Do not connect anything to the NC pins.

The NC (not connected) pins are either not connected to any of the internal circuitry or are used as test pins or to reduce noise. If something is connected to the NC pins, the operation of the LSI is not guaranteed.

2. Treatment of Unused Input Pins

Note: Fix all unused input pins to high or low level.

Generally, the input pins of CMOS products are high-impedance input pins. If unused pins are in their open states, intermediate levels are induced by noise in the vicinity, a pass-through current flows internally, and a malfunction may occur.

3. Processing before Initialization

Note: When power is first supplied, the product's state is undefined.

The states of internal circuits are undefined until full power is supplied throughout the chip and a low level is input on the reset pin. During the period where the states are undefined, the register settings and the output state of each pin are also undefined. Design your system so that it does not malfunction because of processing while it is in this undefined state. For those products which have a reset function, reset the LSI immediately after the power supply has been turned on.

4. Prohibition of Access to Undefined or Reserved Addresses

Note: Access to undefined or reserved addresses is prohibited.

The undefined or reserved addresses may be used to expand functions, or test registers may have been allocated to these addresses. Do not access these registers; the system's operation is not guaranteed if they are accessed.

Configuration of This Manual

This manual comprises the following items:

1. General Precautions on Handling of Product
2. Configuration of This Manual
3. Preface
4. Contents
5. Overview
6. Description of Functional Modules
 - CPU and System-Control Modules
 - On-Chip Peripheral Modules

The configuration of the functional description of each module differs according to the module. However, the generic style includes the following items:

 - i) Feature
 - ii) Input/Output Pin
 - iii) Register Description
 - iv) Operation
 - v) Usage Note

When designing an application system that includes this LSI, take notes into account. Each section includes notes in relation to the descriptions given, and usage notes are given, as required, as the final part of each section.

7. List of Registers
8. Electrical Characteristics
9. Appendix
 - Package Dimensions, etc.
10. Main Revisions and Additions in this Edition (only for revised versions)

The list of revisions is a summary of points that have been revised or added to earlier versions. This does not include all of the revised contents. For details, see the actual locations in this manual.

11. Index

Preface

This LSI is an RISC (Reduced Instruction Set Computer) microcomputer which includes a Renesas-original RISC CPU as its core, and the peripheral functions required to configure a system.

Target Users: This manual was written for users who will be using this LSI in the design of application systems. Target users are expected to understand the fundamentals of electrical circuits, logical circuits, and microcomputers.

Objective: This manual was written to explain the hardware functions and electrical characteristics of this LSI to the target users.
Refer to the SH-2A, SH2A-FPU Software Manual for a detailed description of the instruction set.

Notes on reading this manual:

- In order to understand the overall functions of the chip
Read the manual according to the contents. This manual can be roughly categorized into parts on the CPU, system control functions, peripheral functions and electrical characteristics.
- In order to understand the details of the CPU's functions
Read the SH-2A, SH2A-FPU Software Manual.
- In order to understand the details of a register when its name is known
Read the index that is the final part of the manual to find the page number of the entry on the register. The addresses, bits, and initial values of the registers are summarized in section 36, List of Registers.

- Description of Numbers and Symbols

Aspects of the notations for register names, bit names, numbers, and symbolic names in this manual are explained below.

(1) Overall notation

In descriptions involving the names of bits and bit fields within this manual, the modules and registers to which the bits belong may be clarified by giving the names in the forms "module name"."register name"."bit name" or "register name"."bit name".

(2) Register notation

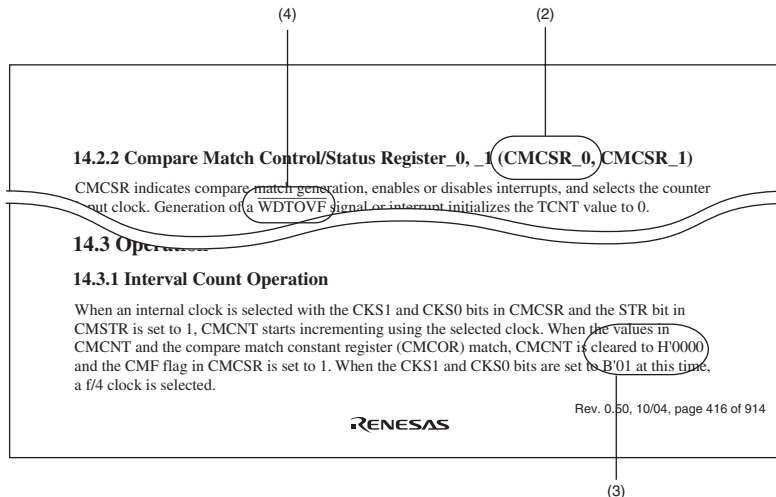

The style "register name"_"instance number" is used in cases where there is more than one instance of the same function or similar functions.
 [Example] CMCSR_0: Indicates the CMCSR register for the compare-match timer of channel 0.

(3) Number notation

Binary numbers are given as B'nnnn (B' may be omitted if the number is obviously binary), hexadecimal numbers are given as H'nnnn or 0xnnnn, and decimal numbers are given as nnnn.
 [Examples] Binary: B'11 or 11
 Hexadecimal: H'EFA0 or 0xEFA0
 Decimal: 1234

(4) Notation for active-low

An overbar on the name indicates that a signal or pin is active-low.
 [Example] WDTOVF

Note: The bit names and sentences in the above figure are examples and do not refer to specific data in this manual.

- Description of Registers

Each register description includes a bit chart, illustrating the arrangement of bits, and a table of bits, describing the meanings of the bit settings. The standard format and notation for bit charts and tables are described below.

[Bit Chart]

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	ASID2	ASID1	ASID0	—	—	—	—	—	—	Q	ACMP2	ACMP1	ACMP0	IFE
Initial value:	0	0	0	0	0	0	1	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

[Table of Bits]

Bit	Bit Name	Initial Value	R/W	Description
15	—	0	R	Reserved
14	—	0	R	These bits are always read as 0.
13 to 11	ASID2 to ASID0	All 0	R/W	Address Identifier These bits enable or disable the pin function.
10	—	0	R	Reserved This bit is always read as 0.
9	—	1	R	Reserved This bit is always read as 1.
—	—	0	—	—

Note: The bit names and sentences in the above figure are examples, and have nothing to do with the contents of this manual.

- Bit**
Indicates the bit number or numbers.
In the case of a 32-bit register, the bits are arranged in order from 31 to 0. In the case of a 16-bit register, the bits are arranged in order from 15 to 0.
- Bit name**
Indicates the name of the bit or bit field.
When the number of bits has to be clearly indicated in the field, appropriate notation is included (e.g., ASID[3:0]).
A reserved bit is indicated by "—".
Certain kinds of bits, such as those of timer counters, are not assigned bit names. In such cases, the entry under Bit Name is blank.
- Initial value**
Indicates the value of each bit immediately after a power-on reset, i.e., the initial value.
0: The initial value is 0
1: The initial value is 1
—: The initial value is undefined
- R/W**
For each bit and bit field, this entry indicates whether the bit or field is readable or writable, or both writing to and reading from the bit or field are impossible.
The notation is as follows:
R/W: The bit or field is readable and writable.
R/(W): The bit or field is readable and writable.
However, writing is only performed to flag clearing.
R: The bit or field is readable.
"R" is indicated for all reserved bits. When writing to the register, write the value under Initial Value in the bit chart to reserved bits or fields.
W: The bit or field is writable.
- Description**
Describes the function of the bit or field and specifies the values for writing.

All trademarks and registered trademarks are the property of their respective owners.

11.4.10	TCNT Capture at Crest and/or Trough in Complementary PWM Operation ...	561
11.5	Interrupt Sources.....	562

11.5.1	Interrupt Sources and Priorities	562
11.5.2	Activation of Direct Memory Access Controller	564
11.5.3	A/D Converter Activation.....	564
11.6	Operation Timing.....	566
11.6.1	Input/Output Timing	566
11.6.2	Interrupt Signal Timing	573
11.7	Usage Notes.....	577
11.7.1	Module Standby Mode Setting	577
11.7.2	Input Clock Restrictions	577
11.7.3	Caution on Period Setting	578
11.7.4	Contention between TCNT Write and Clear Operations.....	578
11.7.5	Contention between TCNT Write and Increment Operations.....	579
11.7.6	Contention between TGR Write and Compare Match.....	580
11.7.7	Contention between Buffer Register Write and Compare Match	581
11.7.8	Contention between Buffer Register Write and TCNT Clear	582
11.7.9	Contention between TGR Read and Input Capture.....	583
11.7.10	Contention between TGR Write and Input Capture.....	584
11.7.11	Contention between Buffer Register Write and Input Capture	585
11.7.12	TCNT2 Write and Overflow/Underflow Contention in Cascade Connection.....	585
11.7.13	Counter Value during Complementary PWM Mode Stop	587
11.7.14	Buffer Operation Setting in Complementary PWM Mode	587
11.7.15	Reset Sync PWM Mode Buffer Operation and Compare Match Flag	588
11.7.16	Overflow Flags in Reset Synchronous PWM Mode	589
11.7.17	Contention between Overflow/Underflow and Counter Clearing.....	590
11.7.18	Contention between TCNT Write and Overflow/Underflow	591
11.7.19	Cautions on Transition from Normal Operation or PWM Mode 1 to Reset-Synchronized PWM Mode	591
11.7.20	Output Level in Complementary PWM Mode and Reset-Synchronized PWM Mode.....	592
11.7.21	Interrupts in Module Standby Mode	592
11.7.22	Simultaneous Capture of TCNT_1 and TCNT_2 in Cascade Connection.....	592
11.7.23	Notes on Output Waveform Control During Synchronous Counter Clearing in Complementary PWM Mode	593
11.8	Output Pin Initialization for Multi-Function Timer Pulse Unit 2	595
11.8.1	Operating Modes	595
11.8.2	Reset Start Operation.....	595
11.8.3	Operation in Case of Re-Setting Due to Error during Operation, etc.	596
11.8.4	Overview of Initialization Procedures and Mode Transitions in Case of Error during Operation, etc.	597

Section 12	Compare Match Timer	627
12.1	Features	627
12.2	Register Descriptions	628
12.2.1	Compare Match Timer Start Register (CMSTR)	629
12.2.2	Compare Match Timer Control/Status Register (CMCSR)	630
12.2.3	Compare Match Counter (CMCNT)	632
12.2.4	Compare Match Constant Register (CMCOR)	632
12.3	Operation	633
12.3.1	Interval Count Operation	633
12.3.2	CMCNT Count Timing	633
12.4	Interrupts	634
12.4.1	Interrupt Sources and DMA Transfer Requests	634
12.4.2	Timing of Compare Match Flag Setting	634
12.4.3	Timing of Compare Match Flag Clearing	635
12.5	Usage Notes	636
12.5.1	Conflict between Write and Compare-Match Processes of CMCNT	636
12.5.2	Conflict between Word-Write and Count-Up Processes of CMCNT	637
12.5.3	Conflict between Byte-Write and Count-Up Processes of CMCNT	638
12.5.4	Compare Match between CMCNT and CMCOR	638
Section 13	Watchdog Timer	639
13.1	Features	639
13.2	Input/Output Pin	640
13.3	Register Descriptions	641
13.3.1	Watchdog Timer Counter (WTCNT)	641
13.3.2	Watchdog Timer Control/Status Register (WTCSR)	642
13.3.3	Watchdog Reset Control/Status Register (WRCSR)	645
13.3.4	Notes on Register Access	646
13.4	Usage	648
13.4.1	Canceling Software Standby Mode	648
13.4.2	Using Watchdog Timer Mode	648
13.4.3	Using Interval Timer Mode	650
13.5	Usage Notes	651
13.5.1	Timer Variation	651
13.5.2	Prohibition against Setting H'FF to WTCNT	651
13.5.3	Interval Timer Overflow Flag	651
13.5.4	System Reset by $\overline{\text{WDTOVF}}$ Signal	652
13.5.5	Manual Reset in Watchdog Timer Mode	652

Section 14	Realtime Clock	653
14.1	Features.....	653
14.2	Input/Output Pin	655
14.3	Register Descriptions.....	656
14.3.1	64-Hz Counter (R64CNT)	657
14.3.2	Second Counter (RSECCNT)	658
14.3.3	Minute Counter (RMINCNT)	659
14.3.4	Hour Counter (RHRCNT)	660
14.3.5	Day of Week Counter (RWKCNT)	661
14.3.6	Date Counter (RDAYCNT)	662
14.3.7	Month Counter (RMONCNT)	663
14.3.8	Year Counter (RYRCNT).....	664
14.3.9	Second Alarm Register (RSECAR).....	665
14.3.10	Minute Alarm Register (RMINAR).....	666
14.3.11	Hour Alarm Register (RHRAR)	667
14.3.12	Day of Week Alarm Register (RWKAR)	668
14.3.13	Date Alarm Register (RDAYAR).....	669
14.3.14	Month Alarm Register (RMONAR)	670
14.3.15	Year Alarm Register (RYRAR).....	671
14.3.16	Control Register 1 (RCR1)	672
14.3.17	Control Register 2 (RCR2)	674
14.3.18	Control Register 3 (RCR3)	676
14.3.19	Control Register 5 (RCR5)	677
14.3.20	Frequency Register H/L (RFRH/L)	678
14.4	Operation	680
14.4.1	Initial Settings of Registers after Power-On	680
14.4.2	Setting Time.....	680
14.4.3	Reading Time.....	681
14.4.4	Alarm Function.....	682
14.5	Usage Notes.....	683
14.5.1	Register Writing during Count.....	683
14.5.2	Use of Realtime Clock Periodic Interrupts	683
14.5.3	Transition to Standby Mode after Setting Register.....	683
14.5.4	Usage Notes when Writing to and Reading the Register	684
Section 15	Serial Communication Interface with FIFO	685
15.1	Features.....	685
15.2	Input/Output Pins.....	688
15.3	Register Descriptions.....	689

15.3.1	Receive Shift Register (SCRSR).....	693
15.3.2	Receive FIFO Data Register (SCFRDR)	693
15.3.3	Transmit Shift Register (SCTSR)	694
15.3.4	Transmit FIFO Data Register (SCFTDR).....	694
15.3.5	Serial Mode Register (SCSMR).....	695
15.3.6	Serial Control Register (SCSCR).....	698
15.3.7	Serial Status Register (SCFSR)	702
15.3.8	Bit Rate Register (SCBRR)	710
15.3.9	FIFO Control Register (SCFCR)	716
15.3.10	FIFO Data Count Set Register (SCFDR)	719
15.3.11	Serial Port Register (SCSPTR)	720
15.3.12	Line Status Register (SCLSR)	723
15.3.13	Serial Extension Mode Register (SCEMR).....	724
15.4	Operation	725
15.4.1	Overview.....	725
15.4.2	Operation in Asynchronous Mode	728
15.4.3	Operation in Clock Synchronous Mode.....	739
15.5	Interrupts.....	748
15.6	Usage Notes	749
15.6.1	SCFTDR Writing and TDFE Flag	749
15.6.2	SCFRDR Reading and RDF Flag	749
15.6.3	Restriction on Direct Memory Controller Usage	750
15.6.4	Break Detection and Processing	750
15.6.5	Sending a Break Signal.....	750
15.6.6	Receive Data Sampling Timing and Receive Margin (Asynchronous Mode).....	750
15.6.7	Selection of Base Clock in Asynchronous Mode.....	752
Section 16 Renesas Serial Peripheral Interface		753
16.1	Features.....	753
16.2	Input/Output Pins	756
16.3	Register Descriptions	757
16.3.1	Control Register (SPCR).....	759
16.3.2	Slave Select Polarity Register (SSLP)	761
16.3.3	Pin Control Register (SPPCR)	762
16.3.4	Status Register (SPSR)	764
16.3.5	Data Register (SPDR).....	767
16.3.6	Sequence Control Register (SPSCR)	768
16.3.7	Sequence Status Register (SPSSR)	770
16.3.8	Bit Rate Register (SPBR).....	771

16.3.9	Data Control Register (SPDCR)	773
16.3.10	Clock Delay Register (SPCKD).....	775
16.3.11	Slave Select Negation Delay Register (SSLND)	776
16.3.12	Next-Access Delay Register (SPND)	777
16.3.13	Command Register (SPCMD)	778
16.3.14	Buffer Control Register (SPBFCR)	783
16.3.15	Buffer Data Count Setting Register (SPBFDR).....	785
16.4	Operation	786
16.4.1	Overview of Operations.....	786
16.4.2	Pin Control.....	787
16.4.3	System Configuration Example	788
16.4.4	Transfer Format	791
16.4.5	Data Format	793
16.4.6	Error Detection	805
16.4.7	Initialization.....	810
16.4.8	SPI Operation.....	811
16.4.9	Error Handling	824
16.4.10	Loopback Mode	825
16.4.11	Interrupt Sources.....	826
Section 17 Renesas Quad Serial Peripheral Interface		827
17.1	Features.....	827
17.2	Input/Output Pins.....	829
17.3	Register Descriptions.....	830
17.3.1	Control Register (SPCR)	831
17.3.2	Slave Select Polarity Register (SSLP)	832
17.3.3	Pin Control Register (SPPCR)	833
17.3.4	Status Register (SPSR)	835
17.3.5	Data Register (SPDR).....	838
17.3.6	Sequence Control Register (SPSCR)	839
17.3.7	Sequence Status Register (SPSSR).....	840
17.3.8	Bit Rate Register (SPBR)	841
17.3.9	Data Control Register (SPDCR)	843
17.3.10	Clock Delay Register (SPCKD).....	844
17.3.11	Slave Select Negation Delay Register (SSLND)	845
17.3.12	Next-Access Delay Register (SPND)	846
17.3.13	Command Register n (SPCMDn) (n = 0 to 3)	847
17.3.14	Buffer Control Register (SPBFCR)	853
17.3.15	Buffer Data Count Setting Register (SPBDCR)	855

17.3.16	Transfer Data Length Multiplier Setting Register n (SPBMULn) (n = 0, 1, 2, 3)	856
17.4	Operation	857
17.4.1	Overview of Operations	857
17.4.2	Pin Control	859
17.4.3	Transfer Format	861
17.4.4	Transfer Data	863
17.4.5	Non-Normal Transfer Operations	870
17.4.6	Initialization	871
17.4.7	SPI Operation	871
17.4.8	Interrupt Sources	885
17.4.9	Loopback Mode	886
Section 18 I²C Bus Interface 3		887
18.1	Features	887
18.2	Input/Output Pins	889
18.3	Register Descriptions	890
18.3.1	I ² C Bus Control Register 1 (ICCR1)	891
18.3.2	I ² C Bus Control Register 2 (ICCR2)	894
18.3.3	I ² C Bus Mode Register (ICMR)	896
18.3.4	I ² C Bus Interrupt Enable Register (ICIER)	898
18.3.5	I ² C Bus Status Register (ICSR)	900
18.3.6	Slave Address Register (SAR)	903
18.3.7	I ² C Bus Transmit Data Register (ICDRT)	903
18.3.8	I ² C Bus Receive Data Register (ICDRR)	904
18.3.9	I ² C Bus Shift Register (ICDRS)	904
18.3.10	NF2CYC Register (NF2CYC)	905
18.4	Operation	906
18.4.1	I ² C Bus Format	906
18.4.2	Master Transmit Operation	907
18.4.3	Master Receive Operation	909
18.4.4	Slave Transmit Operation	911
18.4.5	Slave Receive Operation	914
18.4.6	Clocked Synchronous Serial Format	915
18.4.7	Noise Filter	919
18.4.8	Example of Use	920
18.5	Interrupt Requests	924
18.6	Bit Synchronous Circuit	925
18.7	Usage Notes	927
18.7.1	Note on Setting for Multi-Master Operation	927

18.7.2	Note on Master Receive Mode	927
18.7.3	Note on Setting ACKBT in Master Receive Mode.....	928
18.7.4	Note on the States of Bits MST and TRN when Arbitration is Lost.....	928
18.7.5	Note on I ² C-bus Interface Master Receive Mode.....	928
18.7.6	Note on IICRST and BBSY bits	928
Section 19 Serial Sound Interface		929
19.1	Features.....	929
19.2	Input/Output Pins.....	932
19.3	Register Description	933
19.3.1	Control Register (SSICR).....	935
19.3.2	Status Register (SSISR).....	942
19.3.3	Transmit Data Register (SSITDR).....	946
19.3.4	Receive Data Register (SSIRDR)	946
19.3.5	FIFO Control Register (SSIFCR)	947
19.3.6	FIFO Status Register (SSIFSR)	950
19.3.7	Transmit FIFO Data Register (SSIFTDR)	953
19.3.8	Receive FIFO Data Register (SSIFRDR)	954
19.4	Operation Description.....	955
19.4.1	Bus Format.....	955
19.4.2	Non-Compressed Modes.....	956
19.4.3	Operation Modes	967
19.4.4	Transmit Operation	968
19.4.5	Receive Operation	971
19.4.6	Serial Bit Clock Control	974
19.5	Usage Notes.....	975
19.5.1	Limitations from Underflow or Overflow during DMA Operation	975
19.5.2	Note on Changing Mode from Master Transceiver to Master Receiver	975
Section 20 Serial I/O with FIFO.....		977
20.1	Features.....	977
20.2	Input/Output Pins.....	979
20.3	Register Descriptions.....	980
20.3.1	Mode Register (SIMDR)	981
20.3.2	Control Register (SICTR).....	983
20.3.3	Transmit Data Register (SITDR)	986
20.3.4	Receive Data Register (SIRDR)	987
20.3.5	Status Register (SISTR).....	988
20.3.6	Interrupt Enable Register (SIIER)	993
20.3.7	FIFO Control Register (SIFCTR)	995

20.3.8	Clock Select Register (SISCR)	997
20.3.9	Transmit Data Assign Register (SITDAR)	998
20.3.10	Receive Data Assign Register (SIRDAR).....	1000
20.4	Operation	1001
20.4.1	Serial Clocks.....	1001
20.4.2	Serial Timing	1002
20.4.3	Transfer Data Format.....	1003
20.4.4	Register Allocation of Transfer Data	1004
20.4.5	FIFO.....	1006
20.4.6	Transmit and Receive Procedures.....	1008
20.4.7	Interrupts.....	1013
20.4.8	Transmit and Receive Timing.....	1015
Section 21 Controller Area Network		1019
21.1	Summary.....	1019
21.1.1	Overview.....	1019
21.1.2	Scope.....	1019
21.1.3	Audience	1019
21.1.4	References.....	1020
21.1.5	Features.....	1020
21.2	Architecture	1021
21.3	Programming Model - Overview	1024
21.3.1	Memory Map	1024
21.3.2	Mailbox Structure	1026
21.3.3	Control Registers	1042
21.3.4	Mailbox Registers	1063
21.3.5	Timer Registers.....	1077
21.4	Application Note.....	1090
21.4.1	Test Mode Settings	1090
21.4.2	Configuration of This Module	1092
21.4.3	Message Transmission Sequence.....	1096
21.4.4	Message Receive Sequence	1111
21.4.5	Reconfiguration of Mailbox.....	1113
21.5	Interrupt Sources.....	1115

24.3.7	HEAD20 to HEAD22 Representation Control Register (CROMCTL5)	1246
24.3.8	Sync Code Status Register (CROMST0)	1247
24.3.9	Post-ECC Header Error Status Register (CROMST1).....	1248
24.3.10	Post-ECC Subheader Error Status Register (CROMST3)	1249
24.3.11	Header/Subheader Validity Check Status Register (CROMST4).....	1250
24.3.12	Mode Determination and Link Sector Detection Status Register (CROMST5)	1251
24.3.13	ECC/EDC Error Status Register (CROMST6)	1252
24.3.14	Buffer Status Register (CBUFST0)	1254
24.3.15	Decoding Stoppage Source Status Register (CBUFST1)	1255
24.3.16	Buffer Overflow Status Register (CBUFST2).....	1256
24.3.17	Pre-ECC Correction Header: Minutes Data Register (HEAD00).....	1256
24.3.18	Pre-ECC Correction Header: Seconds Data Register (HEAD01).....	1257
24.3.19	Pre-ECC Correction Header: Frames (1/75 Second) Data Register (HEAD02).....	1257
24.3.20	Pre-ECC Correction Header: Mode Data Register (HEAD03).....	1258
24.3.21	Pre-ECC Correction Subheader: File Number (Byte 16) Data Register (SHEAD00).....	1258
24.3.22	Pre-ECC Correction Subheader: Channel Number (Byte 17) Data Register (SHEAD01).....	1259

24.3.23	Pre-ECC Correction Subheader: Sub-Mode (Byte 18) Data Register (SHEAD02).....	1259
24.3.24	Pre-ECC Correction Subheader: Data Type (Byte 19) Data Register (SHEAD03).....	1260
24.3.25	Pre-ECC Correction Subheader: File Number (Byte 20) Data Register (SHEAD04).....	1260
24.3.26	Pre-ECC Correction Subheader: Channel Number (Byte 21) Data Register (SHEAD05).....	1261
24.3.27	Pre-ECC Correction Subheader: Sub-Mode (Byte 22) Data Register (SHEAD06).....	1261
24.3.28	Pre-ECC Correction Subheader: Data Type (Byte 23) Data Register (SHEAD07).....	1262
24.3.29	Post-ECC Correction Header: Minutes Data Register (HEAD20).....	1262
24.3.30	Post-ECC Correction Header: Seconds Data Register (HEAD21)	1263
24.3.31	Post-ECC Correction Header: Frames (1/75 Second) Data Register (HEAD22)	1263
24.3.32	Post-ECC Correction Header: Mode Data Register (HEAD23)	1264
24.3.33	Post-ECC Correction Subheader: File Number (Byte 16) Data Register (SHEAD20).....	1264
24.3.34	Post-ECC Correction Subheader: Channel Number (Byte 17) Data Register (SHEAD21).....	1265
24.3.35	Post-ECC Correction Subheader: Sub-Mode (Byte 18) Data Register (SHEAD22).....	1265
24.3.36	Post-ECC Correction Subheader: Data Type (Byte 19) Data Register (SHEAD23).....	1266
24.3.37	Post-ECC Correction Subheader: File Number (Byte 20) Data Register (SHEAD24).....	1266
24.3.38	Post-ECC Correction Subheader: Channel Number (Byte 21) Data Register (SHEAD25).....	1267
24.3.39	Post-ECC Correction Subheader: Sub-Mode (Byte 22) Data Register (SHEAD26).....	1267
24.3.40	Post-ECC Correction Subheader: Data Type (Byte 23) Data Register (SHEAD27).....	1268
24.3.41	Automatic Buffering Setting Control Register 0 (CBUFCTL0).....	1268
24.3.42	Automatic Buffering Start Sector Setting: Minutes Control Register (CBUFCTL1).....	1270
24.3.43	Automatic Buffering Start Sector Setting: Seconds Control Register (CBUFCTL2).....	1270
24.3.44	Automatic Buffering Start Sector Setting: Frames Control Register (CBUFCTL3).....	1271

24.3.45	ISY Interrupt Source Mask Control Register (CROMST0M)	1271
24.3.46	CD-ROM Decoder Reset Control Register (ROMDECRST)	1272
24.3.47	CD-ROM Decoder Reset Status Register (RSTSTAT)	1273
24.3.48	Serial Sound Interface Data Control Register (SSI)	1273
24.3.49	Interrupt Flag Register (INTHOLD).....	1276
24.3.50	Interrupt Source Mask Control Register (INHINT).....	1277
24.3.51	CD-ROM Decoder Stream Data Input Register (STRMDIN0)	1278
24.3.52	CD-ROM Decoder Stream Data Input Register (STRMDIN2)	1278
24.3.53	CD-ROM Decoder Stream Data Output Register (STRMDOUT0)	1279
24.4	Operation	1280
24.4.1	Endian Conversion for Data in the Input Stream	1280
24.4.2	Sync Code Maintenance Function	1281
24.4.3	Error Correction.....	1286
24.4.4	Automatic Decoding Stop Function.....	1287
24.4.5	Buffering Format	1288
24.4.6	Target-Sector Buffering Function.....	1290
24.5	Interrupt Sources.....	1292
24.5.1	Interrupt and DMA Transfer Request Signals	1292
24.5.2	Timing of Status Registers Updates.....	1294
24.6	Usage Notes.....	1294
24.6.1	Stopping and Resuming Buffering Alone during Decoding	1294
24.6.2	When CROMST0 Status Register Bits are Set	1294
24.6.3	Link Blocks.....	1295
24.6.4	Stopping and Resuming CD-DSP Operation.....	1295
24.6.5	Note on Clearing the IREADY Flag	1295
24.6.6	Note on Stream Data Transfer (1).....	1296
24.6.7	Note on Stream Data Transfer (2).....	1296
Section 25 A/D Converter		1297
25.1	Features.....	1297
25.2	Input/Output Pins.....	1299
25.3	Register Descriptions.....	1300
25.3.1	A/D Data Registers A to F (ADDRA to ADDRFB).....	1301
25.3.2	A/D Control/Status Register (ADCSR)	1302
25.4	Operation	1306
25.4.1	Single Mode.....	1306
25.4.2	Multi Mode	1309
25.4.3	Scan Mode	1311
25.4.4	A/D Converter Activation by External Trigger or Multi-Function Timer Pulse Unit 2.....	1314

25.4.5	Input Sampling and A/D Conversion Time	1314
25.4.6	External Trigger Input Timing.....	1317
25.5	Interrupt Sources and DMA Transfer Request.....	1318
25.6	Definitions of A/D Conversion Accuracy.....	1319
25.7	Usage Notes	1320
25.7.1	Module Standby Mode Setting	1320
25.7.2	Setting Analog Input Voltage	1320
25.7.3	Notes on Board Design	1320
25.7.4	Processing of Analog Input Pins.....	1321
25.7.5	Permissible Signal Source Impedance	1322
25.7.6	Influences on Absolute Precision.....	1323
25.7.7	A/D Conversion in Deep Standby Mode	1323
25.7.8	Note on Usage in Scan Mode and Multi Mode.....	1323
25.7.9	Note on Usage in Single Mode and Multi Mode	1324
Section 26 NAND Flash Memory Controller		1325
26.1	Features.....	1325
26.2	Input/Output Pins.....	1328
26.3	Register Descriptions	1329
26.3.1	Common Control Register (FLCMNCR).....	1330
26.3.2	Command Control Register (FLCMDRCR).....	1333
26.3.3	Command Code Register (FLCMCDR).....	1336
26.3.4	Address Register (FLADR)	1337
26.3.5	Address Register 2 (FLADR2)	1339
26.3.6	Data Counter Register (FLDTCNTR).....	1340
26.3.7	Data Register (FLDATAR).....	1341
26.3.8	Interrupt DMA Control Register (FLINTDMACR)	1342
26.3.9	Ready Busy Timeout Setting Register (FLBSYTMR)	1347
26.3.10	Ready Busy Timeout Counter (FLBSYCNT).....	1348
26.3.11	Data FIFO Register (FLDTFIFO).....	1349
26.3.12	Control Code FIFO Register (FLECFIFO)	1350
26.3.13	Transfer Control Register (FLTRCR).....	1351
26.3.14	Bus Hold Time Setting Register (FLHOLDRCR).....	1352
26.4	Operation	1353
26.4.1	Access Sequence.....	1353
26.4.2	Operating Modes.....	1353
26.4.3	Register Setting Procedure.....	1354
26.4.4	Command Access Mode	1355
26.4.5	Sector Access Mode.....	1358
26.4.6	Status Read	1364

26.5	Interrupt Sources.....	1365
26.6	DMA Transfer Specifications.....	1365
26.7	Usage Notes.....	1366
26.7.1	External Bus Mastership Release Timing.....	1366
26.7.2	Usage Notes for the SNAND Bit.....	1368
Section 27 USB 2.0 Host/Function Module.....		1369
27.1	Features.....	1369
27.2	Input/Output Pins.....	1372
27.3	Register Description.....	1374
27.3.1	System Configuration Control Register (SYSCFG).....	1377
27.3.2	CPU Bus Wait Setting Register (BUSWAIT).....	1382
27.3.3	System Configuration Status Register (SYSSTS).....	1383
27.3.4	Device State Control Register (DVSTCTR).....	1384
27.3.5	Test Mode Register (TESTMODE).....	1390
27.3.6	DMA-FIFO Bus Configuration Registers (D0FBCFG, D1FBCFG).....	1393
27.3.7	FIFO Port Registers (CFIFO, D0FIFO, D1FIFO).....	1394
27.3.8	FIFO Port Select Registers (CFIFOSEL, D0FIFOSEL, D1FIFOSEL).....	1396
27.3.9	FIFO Port Control Registers (CFIFOCTR, D0FIFOCTR, D1FIFOCTR).....	1404
27.3.10	Interrupt Enable Register 0 (INTENB0).....	1408
27.3.11	Interrupt Enable Register 1 (INTENB1).....	1410
27.3.12	BRDY Interrupt Enable Register (BRDYENB).....	1412
27.3.13	NRDY Interrupt Enable Register (NRDYENB).....	1413
27.3.14	BEMP Interrupt Enable Register (BEMPENB).....	1415
27.3.15	SOF Control Register (SOFCFG).....	1416
27.3.16	Interrupt Status Register 0 (INTSTS0).....	1418
27.3.17	Interrupt Status Register 1 (INTSTS1).....	1423
27.3.18	BRDY Interrupt Status Register (BRDYSTS).....	1429
27.3.19	NRDY Interrupt Status Register (NRDYSTS).....	1431
27.3.20	BEMP Interrupt Status Register (BEMPSTS).....	1433
27.3.21	Frame Number Register (FRMNUM).....	1434
27.3.22	μFrame Number Register (UFRMNUM).....	1437
27.3.23	USB Address Register (USBADDR).....	1438
27.3.24	USB Request Type Register (USBREQ).....	1439
27.3.25	USB Request Value Register (USBVAL).....	1440
27.3.26	USB Request Index Register (USBINDX).....	1441
27.3.27	USB Request Length Register (USBLENG).....	1442
27.3.28	DCP Configuration Register (DCPCFG).....	1443
27.3.29	DCP Maximum Packet Size Register (DCPMAXP).....	1444
27.3.30	DCP Control Register (DCPCTR).....	1445

27.3.31	Pipe Window Select Register (PIPESEL).....	1455
27.3.32	Pipe Configuration Register (PIPECFG)	1456
27.3.33	Pipe Buffer Setting Register (PIPEBUF).....	1463
27.3.34	Pipe Maximum Packet Size Register (PIPEMAXP).....	1466
27.3.35	Pipe Timing Control Register (PIPEPERI).....	1468
27.3.36	PIPE _n Control Registers (PIPE _n CTR) (n = 1 to 9).....	1470
27.3.37	PIPE _n Transaction Counter Enable Registers (PIPE _n TRE) (n = 1 to 5).....	1491
27.3.38	PIPE _n Transaction Counter Registers (PIPE _n TRN) (n = 1 to 5)	1493
27.3.39	Device Address n Configuration Registers (DEVADD _n) (n = 0 to A).....	1495
27.3.40	USB AC Characteristics Switching Register 1 (USBACSWR1).....	1498
27.4	Operation	1499
27.4.1	System Control and Oscillation Control	1499
27.4.2	Interrupt Functions.....	1504
27.4.3	Pipe Control	1527
27.4.4	FIFO Buffer Memory.....	1537
27.4.5	Control Transfers (DCP).....	1551
27.4.6	Bulk Transfers (PIPE1 to PIPE5).....	1554
27.4.7	Interrupt Transfers (PIPE6 to PIPE9)	1556
27.4.8	Isochronous Transfers (PIPE1 and PIPE2)	1557
27.4.9	SOF Interpolation Function	1569
27.4.10	Pipe Schedule.....	1570
27.5	Usage Notes	1572
27.5.1	Setting up the USB Transceiver.....	1572
27.5.2	Power Supply for USB Transceiver.....	1572
Section 28 Video Display Controller 3.....		1573
28.1	Overview.....	1573
28.2	Features.....	1573
28.3	Input/Output Pins	1575
28.4	Configuration.....	1576
28.5	Input Video Interface	1578
28.5.1	BT.601 Video Input	1578
28.5.2	BT.656 Video Input	1579
28.6	Functional Descriptions	1582
28.6.1	Video Display Function	1582
28.6.2	Video Recording Function.....	1587
28.6.3	Panel Control Signal Output Function	1589
28.7	Register Descriptions	1592
28.7.1	Video Operating Mode Register (VIDEO_MODE).....	1596
28.7.2	Video Interrupt Control Register (VIDEO_INT_CNT).....	1600

28.7.3	Video Input Timing Control Register (VIDEO_TIM_CNT).....	1603
28.7.4	Valid Video Size Register (VIDEO_SIZE)	1605
28.7.5	Vertical Valid Video Start Position Register (VIDEO_VSTART).....	1606
28.7.6	Horizontal Valid Video Start Position Register (VIDEO_HSTART).....	1607
28.7.7	Timing Control Register 1 for Vertical Sync Signal for Video (VIDEO_VSYNC_TIM1).....	1609
28.7.8	Video Storing Field Count Register (VIDEO_SAVE_NUM)	1610
28.7.9	Video Scaling and Correction Register (VIDEO_IMAGE_CNT).....	1611
28.7.10	Video Base Address Register (VIDEO_BASEADR)	1613
28.7.11	Video Line Offset Register (VIDEO_LINE_OFFSET).....	1614
28.7.12	Video Field Offset Register (VIDEO_FIELD_OFFSET).....	1615
28.7.13	Video Line Buffer Count Register (VIDEO_LINEBUFF_NUM).....	1616
28.7.14	Video Display and Recording Size Register (VIDEO_DISP_SIZE).....	1617
28.7.15	Horizontal Video Display Position Register (VIDEO_DISP_HSTART).....	1618
28.7.16	Graphics Block Control Registers (GRCMEN1 and GRCMEN2)	1619
28.7.17	Bus Control Registers (GRCBUSCNT1 and GRCBUSCNT2)	1621
28.7.18	Graphics Block Interrupt Control Registers (GRCINTCNT1 and GRCINTCNT2).....	1624
28.7.19	Graphics Image Base Address Registers (GROPSADR1 and GROPSADR2).....	1625
28.7.20	Graphics Image Size Registers (GROPSWH1 and GROPSWH2)	1625
28.7.21	Graphics Image Line Offset Registers (GROPSOFST1 and GROPSOFST2)	1627
28.7.22	Graphics Image Start Position Registers (GROPDPHV1 and GROPDPHV2)	1628
28.7.23	α Control Area Size Registers (GROPEWH1 and GROPEWH2).....	1629
28.7.24	α Control Area Start Position Registers (GROPEDPHV1 and GROPEDPHV2)	1630
28.7.25	α Control Registers (GROPEDPA1 and GROPEDPA2).....	1631
28.7.26	Chroma-Key Control Registers (GROPCRKY0_1 and GROPCRKY0_2)	1634
28.7.27	Chroma-Key Color Registers (GROPCRKY1_1 and GROPCRKY1_2)	1635
28.7.28	Color Registers for Outside of Graphics Image Area (GROPBASERGB1 and GROPBASERGB2)	1636
28.7.29	SG Mode Register (SGMODE)	1637
28.7.30	Interrupt Output Control Register (SGINTCNT).....	1638
28.7.31	Sync Signal Control Register (SYNCNT)	1639
28.7.32	Panel Clock Select Register (PANEL_CLKSEL).....	1641
28.7.33	Sync Signal Size Register (SYN_SIZE)	1643
28.7.34	Vertical Sync Signal Timing Control Register (PANEL_VSYNC_TIM)	1644

28.7.35	Horizontal Sync Signal Timing Control Register (PANEL_HSYNC_TIM)	1645
28.7.36	Timing Control Register 2 for Vertical Sync Signal for Video (VIDEO_VSYNC_TIM2).....	1646
28.7.37	Timing Control Register for Vertical Sync Signal for Graphics Image (GRA_VSYNC_TIM).....	1647
28.7.38	AC Modulation Signal Toggle Line Count Register (AC_LINE_NUM)	1648
28.7.39	DE Area Size Register (DE_SIZE).....	1649
28.7.40	DE Area Start Position Register (DE_START)	1650
28.8	Usage Notes	1652
28.8.1	Input Video Format Settings	1652
28.8.2	How to Use Video Recording Mode	1653
28.8.3	How to Use Video Display Mode	1654
28.8.4	How to Use Graphics Display.....	1658
28.8.5	How to Use Control Signal Output to Panel	1661
28.9	Interrupt Requests	1662
28.10	Usage Note.....	1663
28.10.1	The Procedure of Disabling the Video Receiving Block Operation	1663
Section 29 Sampling Rate Converter		1665
29.1	Features.....	1665
29.2	Register Descriptions	1667
29.2.1	Input Data Register (SRCID).....	1668
29.2.2	Output Data Register (SRCOD).....	1669
29.2.3	Input Data Control Register (SRCIDCTRL).....	1671
29.2.4	Output Data Control Register (SRCODCTRL)	1673
29.2.5	Control Register (SRCCTRL).....	1675
29.2.6	Status Register (SRCSTAT)	1681
29.3	Operation	1686
29.3.1	Initial Setting.....	1686
29.3.2	Data Input	1687
29.3.3	Data Output.....	1689
29.4	Interrupts.....	1691
29.5	Usage Notes	1692
29.5.1	Notes on Accessing Registers	1692
29.5.2	Notes on Flush Processing	1692
29.5.3	Notes on Using Two Channels at the Same Time.....	1693

Section 30	SD Host Interface	1695
Section 31	On-Chip RAM	1697
31.1	Features.....	1697
31.2	Usage Notes.....	1700
31.2.1	Page Conflict	1700
31.2.2	RAME and RAMWE Bits	1700
31.2.3	Data Retention	1701
Section 32	General Purpose I/O Ports	1703
32.1	Features.....	1703
32.2	Register Descriptions.....	1711
32.2.1	Port A I/O Registers 1, 0 (PAIOR1, PAIOR0)	1714
32.2.2	Port A Data Registers 1, 0 (PADR1, PADR0).....	1714
32.2.3	Port A Port Register 0 (PAPR0)	1716
32.2.4	Port B Control Registers 0 to 5 (PBCR0 to PBCR5).....	1716
32.2.5	Port B I/O Registers 0, 1 (PBIOR0, PBIOR1).....	1727
32.2.6	Port B Data Registers 0, 1 (PBDR0, PBDR1)	1728
32.2.7	Port B Port Registers 0, 1 (PBPR0, PBPR1).....	1730
32.2.8	Port C Control Registers 0 to 2 (PCCR0 to PCCR2).....	1732
32.2.9	Port C I/O Register 0 (PCIOR0)	1735
32.2.10	Port C Data Register 0 (PCDR0)	1736
32.2.11	Port C Port Register 0 (PCPR0).....	1738
32.2.12	Port D Control Register 0 to 3 (PDCR0 to PDCR3).....	1739
32.2.13	Port D I/O Register 0 (PDIOR0).....	1745
32.2.14	Port D Port Registers 0 (PDDR0)	1746
32.2.15	Port D Port Registers 0 (PDPR0).....	1748
32.2.16	Port E Control Registers 0, 1 (PECR0, PECR1).....	1749
32.2.17	Port E I/O Register 0 (PEIOR0).....	1751
32.2.18	Port E Data Register 0 (PEDR0).....	1751
32.2.19	Port E Port Register 0 (PEPR0)	1753
32.2.20	Port F Control Register 0 to 3 (PFCR0 to PFCR3).....	1754
32.2.21	Port F I/O Register 0 (PFIOR0)	1760
32.2.22	Port F Data Register 0 (PFDR0)	1760
32.2.23	Port F Port Register 0 (PFPR0).....	1762
32.2.24	Port G Control Register 0 to 6 (PGCR0 to PGCR6).....	1763
32.2.25	Port G I/O Registers 0, 1 (PGIOR0, PGIOR1)	1772
32.2.26	Port G Data Register 0, 1 (PGDR0, PGDR1)	1773
32.2.27	Port G Port Register 0, 1 (PGPR0, PGPR1)	1775

32.2.28	Port H Control Register 0, 1 (PHCR0, PHCR1)	1777
32.2.29	Port H Port Register 0 (PHPR0)	1779
32.2.30	Port J Control Register 0, 1(PJCR0, PJCR1)	1780
32.2.31	Port J I/O register 0 (PJIOR0).....	1782
32.2.32	Port J Data Register 0 (PJDR0).....	1783
32.2.33	Port J Port Register 0 (PJPR0)	1784
32.2.34	Serial Sound Interface Noise Canceler Control Register (SNCR)	1785
Section 33 Power-Down Modes		1787
33.1	Features.....	1787
33.1.1	Power-Down Modes	1787
33.2	Register Descriptions	1790
33.2.1	Standby Control Register 1 (STBCR1).....	1791

Section 1 Overview

1.1 SH7266/7267 Features

This LSI is a single-chip RISC (reduced instruction set computer) microcontroller that includes a Renesas-original RISC CPU as its core, and the peripheral functions required to configure a system.

The CPU in this LSI is an SH-2A CPU, which provides upward compatibility for SH-1, SH-2, and SH-2E CPUs at object code level. It has a RISC-type instruction set, superscalar architecture, and Harvard architecture, for superior rates of instruction execution. In addition, the 32-bit internal-bus architecture that is independent from the direct memory access controller enhances data processing power. This CPU brings the user the ability to set up high-performance systems with strong functionality at less expense than was achievable with previous microcontrollers, and is even able to handle realtime control applications requiring high-speed characteristics.

This LSI has a floating-point unit and cache. In addition, this LSI includes on-chip peripheral functions necessary for system configuration, such as a 64-Kbyte RAM for high-speed operation, a 1.5-Mbyte large-capacity RAM (128-Kbytes are shared by the data-retention RAM), multi-function timer pulse unit 2, compare match timer, realtime clock, serial communication interface with FIFO, I²C bus interface 3, serial sound interface, serial I/O with FIFO*², controller area network interface*², IEBusTM*¹ controller, Renesas SPDIF interface, Renesas serial peripheral interface, Renesas quad serial peripheral interface, CD-ROM decoder, A/D converter, NAND flash memory controller, USB 2.0 host/function, video display controller 3, sampling rate converter, SD host interface, motor control PWM timer, and interrupt controller modules, and general I/O ports.

This LSI also provides an external memory access support function to enable direct connection to various memory devices or peripheral LSIs. These on-chip functions significantly reduce costs of designing and manufacturing application systems.

The features of this LSI are listed in table 1.1.

- Notes: 1. IEBus (Inter Equipment Bus) is a trademark of Renesas Electronics Corporation.
2. This module is included or not depending on the product code.

Table 1.1 SH7266/7267 Features

Items	Specification
CPU	<ul style="list-style-type: none"> • Renesas original SuperH architecture • Compatible with SH-1, SH-2, and SH-2E at object code level • 32-bit internal data bus • Support of an abundant register-set <ul style="list-style-type: none"> — Sixteen 32-bit general registers — Four 32-bit control registers — Four 32-bit system registers — Register bank for high-speed response to interrupts • RISC-type instruction set (upward compatible with SH series) <ul style="list-style-type: none"> — Instruction length: 16-bit fixed-length basic instructions for improved code efficiency and 32-bit instructions for high performance and usability — Load/store architecture — Delayed branch instructions — Instruction set based on C language • Superscalar architecture to execute two instructions at one time including a floating-point unit • Instruction execution time: Up to two instructions/cycle • Address space: 4 Gbytes • Internal multiplier • Five-stage pipeline • Harvard architecture

Items	Specification
Floating-point unit	<ul style="list-style-type: none"> • Floating-point co-processor included • Supports single-precision (32-bit) and double-precision (64-bit) • Supports data type and exceptions that conforms to IEEE754 standard • Two rounding modes: Round to nearest and round to zero • Two denormalization modes: Flush to zero • Floating-point registers <ul style="list-style-type: none"> — Sixteen 32-bit floating-point registers (single-precision × 16 words or double-precision × 8 words) — Two 32-bit floating-point system registers • Supports FMAC (multiplication and accumulation) instructions • Supports FDIV (division) and FSQRT (square root) instructions • Supports FLDI0/FLDI1 (load constant 0/1) instructions • Instruction execution time <ul style="list-style-type: none"> — Latency (FMAC/FADD/FSUB/FMUL): Three cycles (single-precision), eight cycles (double-precision) — Pitch (FMAC/FADD/FSUB/FMUL): One cycle (single-precision), six cycles (double-precision) <p style="margin-left: 40px;">Note: FMAC only supports single-precision</p> • Five-stage pipeline
Cache memory	<ul style="list-style-type: none"> • Instruction cache: 8 Kbytes • Operand cache: 8 Kbytes • 128-entry/way, 4-way set associative, 16-byte block length configuration each for the instruction cache and operand cache • Write-back, write-through, LRU replacement algorithm • Way lock function available (only for operand cache); ways 2 and 3 can be locked
Interrupt controller	<ul style="list-style-type: none"> • SH7266: Nine external interrupt pins (NMI, IRQ7 to IRQ0) SH7267: Seventeen external interrupt pins (NMI, IRQ7 to IRQ0, and PINT7 to PINT0) • On-chip peripheral interrupts: Priority level set for each module • 16 priority levels available • Register bank enabling fast register saving and restoring in interrupt processing

Items	Specification
Bus state controller	<ul style="list-style-type: none"> • Address space divided into seven areas (0 to 6), each a maximum of 64 Mbytes • The following features settable for each area independently <ul style="list-style-type: none"> — Bus size (8 or 16 bits): Available sizes depend on the area. — Number of access wait cycles (different wait cycles can be specified for read and write access cycles in some areas) — Idle wait cycle insertion (between the same area access cycles or different area access cycles) — Specifying the memory to be connected to each area enables direct connection to SRAM, SRAM with byte selection, SDRAM, and burst ROM (clocked synchronous or asynchronous). The address/data multiplexed I/O (MPX) interface are also available. — PCMCIA interface — Outputs a chip select signal ($\overline{CS0}$ to $\overline{CS6}$) according to the target area (\overline{CS} assert or negate timing can be selected by software) • SDRAM refresh Auto refresh or self refresh mode selectable • SDRAM burst access
Direct memory access controller	<ul style="list-style-type: none"> • Sixteen channels; external requests are available for one of them. • Can be activated by on-chip peripheral modules • Burst mode and cycle steal mode • Intermittent mode available (16 and 64 cycles supported) • Transfer information can be automatically reloaded
Clock pulse generator	<ul style="list-style-type: none"> • Clock mode: Input clock can be selected from external input (EXTAL or USB_X1) or crystal resonator • Input clock can be multiplied by 12 (max.) by the internal PLL circuit • Three types of clocks generated: <ul style="list-style-type: none"> — CPU clock: Maximum 144 MHz — Bus clock: Maximum 72 MHz — Peripheral clock: Maximum 36 MHz
Watchdog timer	<ul style="list-style-type: none"> • On-chip one-channel watchdog timer • A counter overflow can reset the LSI

Items	Specification
Power-down modes	<ul style="list-style-type: none"> • Four power-down modes provided to reduce the power consumption in this LSI <ul style="list-style-type: none"> — Sleep mode — Software standby mode — Deep standby mode — Module standby mode
Multi-function timer pulse unit 2	<ul style="list-style-type: none"> • Maximum 16 lines of pulse inputs/outputs based on fix channels of 16-bit timers • 18 output compare and input capture registers • Input capture function • Pulse output modes <ul style="list-style-type: none"> Toggle, PWM, complementary PWM, and reset-synchronized PWM modes • Synchronization of multiple counters • Complementary PWM output mode <ul style="list-style-type: none"> — Non-overlapping waveforms output for 3-phase inverter control — Automatic dead time setting — 0% to 100% PWM duty value specifiable — A/D converter start request delaying function — Interrupt skipping at crest or trough • Reset-synchronized PWM mode <ul style="list-style-type: none"> Three-phase PWM waveforms in positive and negative phases can be output with a required duty value • Phase counting mode <ul style="list-style-type: none"> Two-phase encoder pulse counting available
Compare match timer	<ul style="list-style-type: none"> • Two-channel 16-bit counters • Four types of clock can be selected ($P\phi/8$, $P\phi/32$, $P\phi/128$, and $P\phi/512$) • DMA transfer request or interrupt request can be issued when a compare match occurs
Realtime clock	<ul style="list-style-type: none"> • Internal clock, calendar function, alarm function • Interrupts can be generated at intervals of 1/256 s by the 32.768-kHz on-chip crystal oscillator

Items	Specification
Serial communication interface with FIFO	<ul style="list-style-type: none"> • SH7266: five channels, SH7267: eight channels • Clocked synchronous or asynchronous mode selectable (channels 0 to 2, 4) • Simultaneous transmission and reception (full-duplex communication) supported • Dedicated baud rate generator • Separate 16-byte FIFO registers for transmission and reception • Modem control function (channel 1 in asynchronous mode)
Renesas serial peripheral interface	<ul style="list-style-type: none"> • SH7266: one channel, SH7267: two channels • SPI operation • Master mode and slave mode selectable • Programmable bit length, clock polarity, and clock phase can be selected. • Consecutive transfers • MSB first/LSB first selectable • Maximum transfer rate: 36 Mbps
Renesas quad serial peripheral interface	<ul style="list-style-type: none"> • Connectable to serial flash memory with multiple I/O functionality (single/dual/quad) • Programmable bit length, clock polarity, and clock phase can be selected. • Consecutive transfers • MSB first/LSB first selectable • Maximum transfer rate: 288.00 Mbps
I ² C bus interface 3	<ul style="list-style-type: none"> • Three channels • Master mode and slave mode supported
Serial sound interface	<ul style="list-style-type: none"> • Four-channel bidirectional serial transfer • Duplex communication (channel 0) • Support of various real audio formats • Support of master and slave functions • Generation of programmable word clock and bit clock • Multi-channel formats • Support of 8, 16, 18, 20, 22, 24, and 32-bit data formats • Support of eight-stage FIFO for transmission and reception

Items	Specification
Serial I/O with FIFO Note: This module is not included in the SH7266 Group.	<ul style="list-style-type: none"> • Support of 16-stage 32-bits FIFOs independently for transmission and reception • 8-bit monaural/16-bit monaural/16-bit stereo audio input and output • Connectable to linear, audio, or A-Law or μ-Law CODEC chip • Support of master and slave functions
Controller area network Note: This module is included or not depending on the product code.	<ul style="list-style-type: none"> • Two channels • TTCAN level 1 supports for all channels • BOSCH 2.0B active compatible • Buffer size: transmit/receive \times 31, receive only \times 1 • Two or more controller area network channels can be assigned to one bus to increase number of buffers with a granularity of 32 channels • 31 Mailboxes for transmission or reception
IEBus™ controller	<ul style="list-style-type: none"> • IEBus protocol control (layer 2) supported <ul style="list-style-type: none"> — Half-duplex asynchronous communications — Multi-master system — Broadcast communications function — Selectable mode (three types) with different transfer speeds • On-chip buffers (dual port RAM) for data transmission and reception that enable up to 128 bytes of consecutive transmit/reception (maximum number of transfer bytes in mode 2) • Operating frequency <ul style="list-style-type: none"> — 12 MHz, 12.58 MHz (1/2 divided clocks of Pϕ, AUDIO_X1, or AUDIO_X2.) — 18 MHz, 18.87 MHz (1/3 divided clocks of Pϕ, AUDIO_X1, or AUDIO_X2.) — 24 MHz (1/4 divided clocks of Pϕ, AUDIO_X1, or AUDIO_X2.) — 25.16 MHz (1/4 divided clocks of Pϕ) — 30 MHz, 31.45 MHz (1/5 divided clocks of Pϕ) — 36 MHz (1/6 divided clocks of Pϕ)

Items	Specification
Renesas SPDIF interface	<ul style="list-style-type: none"> • Support of IEC60958 standard (stereo and consumer use modes only) • Sampling frequencies of 32 kHz, 44.1 kHz, and 48 kHz • Audio word sizes of 16 to 24 bits per sample • Biphase mark encoding • Double buffered data • Parity encoded serial data • Simultaneous transmit and receive • Receiver autodetects IEC 61937 compressed mode data
CD-ROM decoder	<ul style="list-style-type: none"> • Support of five formats: Mode 0, mode 1, mode 2, mode 2 form 1, and mode 2 form 2 • Sync codes detection and protection (Protection: When a sync code is not detected, it is automatically inserted.) • Descrambling • ECC correction <ul style="list-style-type: none"> — P, Q, PQ, and QP correction — PQ or QP correction can be repeated up to three times • EDC check Performed before and after ECC • Mode and form are automatically detected • Link sectors are automatically detected • Buffering data control Buffering CD-ROM data including Sync code is transferred in specified format, after the data is descrambled, corrected by ECC, and checked by EDC.
NAND flash memory controller	<ul style="list-style-type: none"> • Direct-connected memory interface with NAND-type flash memory • Read/write in sectors • Two types of transfer modes: Command access mode and sector access mode (512-byte data + 16-byte management code) • Interrupt request and DMA transfer request • Supports flash memory requiring 5-byte addresses (2 Gbits and more)
USB 2.0 host/function module	<ul style="list-style-type: none"> • Conforms to the Universal Serial Bus Specification Revision 2.0 • 480-Mbps, 12-Mbps, and 1.5-Mbps transfer rates provided (host mode) • 480-Mbps and 12-Mbps transfer rates provided (function mode) • On-chip 8-Kbyte RAM as communication buffers

Items	Specification
Video display controller 3	<ul style="list-style-type: none"> • Video input Input format: BT601, BT656 (NTSC/PAL) • Video recording Can be saved in RGB565 format, at 1/2 field rate. • Video processing Video scaling: 1/2, 1/3, 1/4 Horizontal scaling: 1/2, 1/3, 2/3, 1/4 (Each scaling value can be multiplied by 6/7 for PAL.) Adjustment of contrast and brightness • Graphic image 1 and 2 (two layers) Input format: RGB565 (16 bits), αRGB4444 (16 bits) • Overlap function α-blending window function: Mixes input image, layer 1, and layer 2 in a specified area according to the transmittance α (fade-in and fade-out possible). Chroma-key function: Mixes images according to the specified RGB color and transmittance α. Dot a function: Mixes αRGB4444-format graphic images according to the transmittance α. • Output image Resolution: VGA (640 × 480), WQVGA (480 × 240), QVGA (320 × 240), QVGA (240 × 320) Format: RGB565 (16 bits)
Sampling rate converter	<ul style="list-style-type: none"> • Data format: 32-bit stereo (16 bits each to L/R), 16-bit monaural for channel 0, and 16-bit monaural for channel 1 • Input sampling rate: 8/11.025/12/16/22.05/24/32/44.1/48kHz (channel 0), 44.1kHz (channel 1) • Output sampling rate: 44.1/48 kHz (channel 0), 8/16 kHz (channel 1)

Items	Specification
SD host interface	<ul style="list-style-type: none"> • SD memory I/O card interface (1-/4-bits SD bus) • Error check function: CRC7 (command), CRC16 (data) • Interrupt requests <ul style="list-style-type: none"> — Card access interrupt — SDIO access interrupt — Card detect interrupt • DMA transfer requests <ul style="list-style-type: none"> — SD_BUF write — SD_BUF read • Card detect function, write protect supported
General I/O ports	<ul style="list-style-type: none"> • SH7266: 68 I/Os, 6 inputs with open-drain outputs, and 6 inputs • SH7267: 92 I/Os, 6 inputs with open-drain outputs, and 6 inputs • Input or output can be selected for each bit
A/D converter	<ul style="list-style-type: none"> • 10-bit resolution • Six input channels • A/D conversion request by the external trigger or timer trigger
Motor control PWM timer	<ul style="list-style-type: none"> • Two 10-bit PWM channels, each with eight outputs
User debugging interface	<ul style="list-style-type: none"> • E10A emulator support • JTAG-standard pin assignment
On-chip RAM	<ul style="list-style-type: none"> • 64-Kbyte memory for high-speed operation (16 Kbytes × 4) • 1.5-Mbyte large capacity memory for video display/recording and work (128-Kbytes are used for data retention) • 128-Kbyte memory for data retention (16 Kbytes× 2, 32 Kbytes×1, 64 Kbytes×1)
Boot modes	<ul style="list-style-type: none"> • SH7266: Two boot modes (boot modes 0 and 1) • SH7267: Four boot modes (boot modes 0 to 3) • Boot mode 0: Booting from memory connected to $\overline{CS0}$ area • Boot mode 1: Booting from a serial flash memory (low-speed communication) • Boot mode 2: Booting from a NAND flash memory • Boot mode 3: Booting from a serial flash memory (high-speed communication)

Items	Specification
Power supply voltage	<ul style="list-style-type: none">• Vcc: 1.15 to 1.35 V• PVcc: 3.0 to 3.6 V
Packages	SH7266 <ul style="list-style-type: none">• 144-pin QFP, 20-mm square, 0.5-mm pitch JEITA package code: P-LQFP144-20 × 20-0.50 Renesas code: PLQP0144KA-A SH7267 <ul style="list-style-type: none">• 176-pin QFP, 24-mm square, 0.5-mm pitch JEITA package code: P-LQFP176-24 × 24-0.50 Renesas code: PLQP0176KB-A

1.5 Pin Functions

Table 1.3 Pin Functions

Classification	Symbol	I/O	Name	Function
Power supply	Vcc	I	Power supply	Power supply pins. All the Vcc pins must be connected to the system power supply. This LSI does not operate correctly if there is a pin left open.
	Vss	I	Ground	Ground pins. All the Vss pins must be connected to the system power supply (0 V). This LSI does not operate correctly if there is a pin left open.
	PVcc	I	Power supply for I/O circuits	Power supply for I/O pins. All the PVcc pins must be connected to the system power supply. This LSI does not operate correctly if there is a pin left open.
	PLLVcc	I	Power supply for PLL	Power supply for the on-chip PLL oscillator.
	PLLVss	I	Ground for PLL	Ground pin for the on-chip PLL oscillator.
Clock	EXTAL	I	External clock	Connected to a crystal resonator. An external clock signal may also be input to the EXTAL pin.
	XTAL	O	Crystal	Connected to a crystal resonator.
	CKIO	O	System clock I/O	Supplies the system clock to external devices.
	AUDIO_CLK	I	External clock for audio	Input pin of external clock for audio. A clock input to the divider is selected from an oscillation clock input on this pin or pins AUDIO_X1 and AUDIO_X2.
	AUDIO_X1	I	Crystal resonator/ external clock for audio	Pins connected to a crystal resonator for audio. An external clock can be input on pin AUDIO_X1. A clock input to the divider is selected from an oscillation clock input on these pins or the AUDIO_CLK pin.
	AUDIO_X2	O		

Classification	Symbol	I/O	Name	Function
Clock	AUDIO_XOUT	O	AUDIO_X1 clock I/O	Output for the on-chip crystal oscillator on AUDIO_X1 or the external clock signal.
Operating mode control	MD_BOOT1 MD_BOOT0	I	Mode set	Sets the operating mode. Do not change the signal levels on these pins while the RES pin is asserted or until the mode is fixed, after the negation. Only MD_BOOT0 can be used in the SH7266 Group.
	MD_CLK	I	Clock mode set	This pin sets the clock operating mode. Do not change the signal level on this pin while the RES pin is asserted or until the mode is fixed, after the negation.
	$\overline{\text{ASEMD}}$	I	ASE mode	If a low level is input at the $\overline{\text{ASEMD}}$ pin while the RES pin is asserted, ASE mode is entered; if a high level is input, product chip mode is entered. In ASE mode, the E10A-USB emulator function is enabled. When this function is not in use, fix it high.
System control	$\overline{\text{RES}}$	I	Power-on reset	This LSI enters the power-on reset state when this signal goes low.
	$\overline{\text{WDTOVF}}$	O	Watchdog timer overflow	Outputs an overflow signal from the watchdog timer.
	$\overline{\text{BREQ}}$	I	Bus-mastership request	A low level is input to this pin when an external device requests the release of the bus mastership.
	$\overline{\text{BACK}}$	O	Bus-mastership request acknowledge	Indicates that the bus mastership has been released to an external device. Reception of the $\overline{\text{BACK}}$ signal informs the device which has output the BREQ signal that it has acquired the bus.

Classification	Symbol	I/O	Name	Function
Interrupts	NMI	I	Non-maskable interrupt	Non-maskable interrupt request pin. Fix it high when not in use.
	IRQ7 to IRQ0	I	Interrupt requests 7 to 0	Maskable interrupt request pins. Level-input or edge-input detection can be selected. When the edge-input detection is selected, the rising edge, falling edge, or both edges can also be selected.
	PINT7 to PINT0	I	Interrupt requests 7 to 0	Maskable interrupt request pins. Only level-input detection can be selected.
Address bus	A25 to A0	O	Address bus	Outputs addresses.
Data bus	D15 to D0	I/O	Data bus	Bidirectional data bus.
Bus control	$\overline{CS6}$ to $\overline{CS0}$	O	Chip select 6 to 0	Chip-select signals for external memory or devices.
	\overline{RD}	O	Read	Indicates that data is read from an external device.
	$\overline{RD}/\overline{WR}$	O	Read/write	Read/write signal.
	\overline{BS}	O	Bus start	Bus-cycle start signal.
	\overline{AH}	O	Address hold	Address hold timing signal for the device that uses the address/data-multiplexed bus.
	\overline{WAIT}	I	Wait	Inserts a wait cycle into the bus cycles during access to the external space.
	$\overline{WE0}$	O	Byte select	Indicates a write access to bits 7 to 0 of data of external memory or device.
	$\overline{WE1}$	O	Byte select	Indicates a write access to bits 15 to 8 of data of external memory or device.
	DQML	O	Byte select	Selects bits D7 to D0 when SDRAM is connected.
	DQMU	O	Byte select	Selects bits D15 to D8 when SDRAM is connected.

Classification	Symbol	I/O	Name	Function
Bus control	$\overline{\text{RAS}}$	O	RAS	Connected to the $\overline{\text{RAS}}$ pin when SDRAM is connected.
	$\overline{\text{CAS}}$	O	CAS	Connected to the $\overline{\text{CAS}}$ pin when SDRAM is connected.
	CKE	O	CK enable	Connected to the CKE pin when SDRAM is connected.
	$\overline{\text{CE1A}}, \overline{\text{CE1B}}$	O	Lower byte select for PCMCIA card	Connected to PCMCIA card select signals D7 to D0.
	$\overline{\text{CE2A}}, \overline{\text{CE2B}}$	O	Upper byte select for PCMCIA card	Connected to PCMCIA card select signals D15 to D8.
	$\overline{\text{ICIORW}}$	O	Write strobe for PCMCIA	Connected to the PCMCIA I/O write strobe signal.
	$\overline{\text{ICIORD}}$	O	Read strobe for PCMCIA	Connected to the PCMCIA I/O read strobe signal.
	$\overline{\text{WE}}$	O	Write strobe for PCMCIA memory	Connected to the PCMCIA memory write strobe signal.
	$\overline{\text{IOIS16}}$	I	PCMCIA dynamic bus sizing	Indicates 16-bit I/O of the PCMCIA.
Direct memory access controller	DREQ0	I	DMA-transfer request	Input pin to receive external requests for DMA transfer.
	DACK0	O	DMA-transfer request accept	Output pin for signals indicating acceptance of external requests from external devices.
	TEND0	O	DMA-transfer end output	Output pin for DMA transfer end.
Multi-function timer pulse unit 2	TCLKA, TCLKB, TCLKC, TCLKD	I	Timer clock input	External clock input pins for the timer.
	TIOC0A, TIOC0B, TIOC0C, TIOC0D	I/O	Input capture/output compare (channel 0)	The TGRA_0 to TGRD_0 input capture input/output compare output/PWM output pins.
	TIOC1A, TIOC1B	I/O	Input capture/output compare (channel 1)	The TGRA_1 and TGRB_1 input capture input/output compare output/PWM output pins.
	TIOC2A, TIOC2B	I/O	Input capture/output compare (channel 2)	The TGRA_2 and TGRB_2 input capture input/output compare output/PWM output pins.

Classification	Symbol	I/O	Name	Function
Multi-function timer pulse unit 2	TIOC3A, TIOC3B, TIOC3C, TIOC3D	I/O	Input capture/output compare (channel 3)	The TGRA_3 to TGRD_3 input capture input/output compare output/PWM output pins.
	TIOC4A, TIOC4B, TIOC4C, TIOC4D	I/O	Input capture/output compare (channel 4)	The TGRA_4 and TGRB_4 input capture input/output compare output/PWM output pins.
Realtime clock	RTC_X1	I	Crystal resonator for realtime clock/external clock	Connected to 32.768-kHz crystal resonator.
	RTC_X2	O		The RTC_X1 pin can also be used to input an external clock.
Serial communication interface with FIFO	TxD7 to TxD0	O	Transmit data	Data output pins. Only TxD4 to TxD0 can be used in the SH7266 Group.
	RxD7 to RxD0	I	Receive data	Data input pins. Only RxD4 to RxD0 can be used in the SH7266 Group.
	SCK4, SCK2 to SCK0	I/O	Serial clock	Clock input/output pins.
	RTS $\bar{1}$	O	Transmit request	Modem control pin.
	CTS $\bar{1}$	I	Transmit enable	Modem control pin.
Renesas serial peripheral interface	MOSI1, MOSI0	I/O	Data	Data I/O pin. Only MOSI0 can be used in the SH7266 Group.
	MISO1, MISO0	I/O	Data	Data I/O pin. Only MISO0 can be used in the SH7266 Group.
	RSPCK1, RSPCK0	I/O	Clock	Clock I/O pin. Only RSPCK0 can be used in the SH7266 Group.
	SSL10, SSL00	I/O	Chip select	Chip select I/O pin. Only SSL00 can be used in the SH7266 Group.

Classification	Symbol	I/O Name	Function
Renesas quad serial peripheral interface	QMO/QIO0	I/O Data	Data I/O pin.
	QMI/QIO1	I/O Data	Data I/O pin.
	QIO2	I/O Data	Data I/O pin.
	QIO3	I/O Data	Data I/O pin.
	QSPCLK	O Clock	Clock output pin.
	QSSL	O Chip select	Chip select output pin.
I ² C bus interface 3	SCL2 to SCL0	I/O Serial clock pin	Serial clock I/O pin.
	SDA2 to SDA0	I/O Serial data pin	Serial data I/O pin.
Serial sound interface	SSITxD0	O Data output	Serial data output pin.
	SSIRxD0	I Data input	Serial data input pin.
	SSIDATA3 to SSIDATA1	I/O Data I/O	Serial data I/O pin.
	SSISCK3 to SSISCK0	I/O SSI clock I/O	I/O pins for serial clocks.
	SSIWS3 to SSIWS0	I/O SSI clock LR I/O	I/O pins for word selection.
Serial I/O with FIFO	SIOFTxD	O Data output	Data output pin.
	SIOFRxD	I Data input	Data input pin.
	SIOFSCK	I/O I/O clock	Clock I/O pin.
	SIOFSYNC	I/O I/O chip select	I/O pin for chip selection.
Controller area network	CTx0, CTx1	O CAN bus transmit data	Output pin for transmit data on the CAN bus.
	CRx0, CRx1	I CAN bus receive data	Output pin for receive data on the CAN bus.
IEBus™ controller	IETxD	O IEBus controller transmit data	Output pin for transmit data on IEBus controller.
	IERxD	I IEBus controller receive data	Input pin for receive data on IEBus controller.
Renesas SPDIF interface	SPDIF_OUT	O Output data	Transmit data output pin.
	SPDIF_IN	I Input data	Receive data input pin.

Classification	Symbol	I/O	Name	Function
NAND flash memory controller	FALE	O	Flash memory address latch enable	Asserted for address output and negated for data I/O. Negated at data input/output.
	$\overline{\text{FRE}}$	O	Flash memory read enable	Reads data at falling edge.
	$\overline{\text{FCE}}$	O	Flash memory chip enable	Enables the flash memory connected to this LSI.
	FCLE	O	Flash memory command latch enable	Asserted at command output.
	FRB	I	Flash memory ready/busy	High level indicates ready state and low level indicates busy state.
	FWE	O	Flash memory write enable	Flash memory latches commands, addresses, and data at rising edge.
	NAF7 to NAF0	I/O	Flash memory data	Data I/O pins.
USB 2.0 host/function module	DP	I/O	USB 2.0 host/function module D+ data	D+ data pin for USB 2.0 host/function module bus.
	DM	I/O	USB 2.0 host/function module D- data	D- data pin for USB 2.0 host/function module bus.
	VBUS	I	VBUS input	Connected to Vbus on USB 2.0 host/function module bus.
	REFRIN	I	Reference input	Connected to USBAPVss via 5.6-k Ω \pm 1% resistance.
	USB_X1	I	Crystal resonator/ external clock for USB 2.0 host/function module	Connected to a crystal resonator for USB 2.0 host/function module. An external clock signal may also be input to the USB_X1 pin.
	USB_X2	O		
	USBAPVcc	I	Power supply for transceiver analog pins	Power supply for pins.
	USBAPVss	I	Ground for transceiver analog pins	Ground for pins.

Classification	Symbol	I/O	Name	Function
USB 2.0 host/function module	USBDPVcc	I	Power supply for transceiver digital pins	Power supply for pins.
	USBDPVss	I	Ground for transceiver digital pins	Ground for pins.
	USBAVcc	I	Power supply for transceiver analog core	Power supply for core.
	USBAVss	I	Ground for transceiver analog core	Ground for core.
	USBDVcc	I	Power supply for transceiver digital core	Power supply for core.
	USBDVss	I	Ground for transceiver digital core	Ground for core.
	USBVcc	I	480-MHz power supply for USB 2.0 host/function module	Power supply for 480-MHz sections
	USBVss	I	480-MHz ground for USB 2.0 host/function module	Ground for 480-MHz sections
Video display controller 3	LCD_DATA15 to LCD_DATA0	O	Output data	Data output pin for panel.
	LCD_DE	O	Data enable	Data enable output pin for panel.
	LCD_VSYNC	O	VSYNC output	VSYNC output pin for panel.
	LCD_HSYNC	O	HSYNC output	HSYNC output pin for panel.
	LCD_CLK	O	Panel clock	Panel clock output pin.
	LCD_EXTCLK	I	Panel clock source	Panel clock source input pin.
	LCD_M_DISP	O	LCD current alternation	LCD current alternating signal pin.
	DV_DATA7 to DV_DATA0	I	Input data	Data input pin for BT.601 and BT.656.
DV_VSYNC	I	VSYNC input	VSYNC input pin.	

Classification	Symbol	I/O	Name	Function
Video display controller 3	DV_HSYNC	I	HSYNC input	HSYNC input pin.
	DV_CLK	I	Input clock	Clock input signal pin for BT.601 and BT.656.
SD host interface	SD_CLK	O	SD clock	Output pin for SD clock.
	SD_CMD	I/O	SD command	SD command output and response input signal.
	SD_D3 to SD_D0	I/O	SD data	SD data bus signal.
	SD_CD	I	SD card detection	SD card detection.
	SD_WP	I	SD write protection	SD write protection signal.
A/D converter	AN5 to AN0	I	Analog input pins	Analog input pins.
	ADTRG	I	A/D conversion trigger input	External trigger input pin for starting A/D conversion.
	AVcc	I	Analog power supply	Power supply pin for A/D converter.
	AVss	I	Analog ground	Ground pin for A/D converter.
	AVref	I	Analog reference voltage	Reference voltage pin for A/D converter.
General I/O ports	PA2 to PA0, PB22 to PB1, PC8 to PC0, PD15 to PD0, PF12 to PF0, PG24 to PG0, PJ3 to PJ0	I/O	General port	68 general I/O port pins in the SH7266 Group. 92 general I/O port pins in the SH7267 Group. Only PA1, PA0, PB22 to PB1, PC8 to PC0, PD15 to PD0, PF12 to PF0, PG19, PG18, and PJ3 to PJ0 can be used in the SH7266 Group.
	PE5 to PE0	I/O	General port	6 input port pins with open-drain output.
	PH5 to PH0	I	General port	6 general input port pins.
Motor control PWM timer	PWM1H to PWM1A, PWM2H to PWM2A	O	Timer output	PWM output pins.

Classification	Symbol	I/O	Name	Function
User debugging interface	TCK	I	Test clock	Test-clock input pin.
	TMS	I	Test mode select	Test-mode select signal input pin.
	TDI	I	Test data input	Serial input pin for instructions and data.
	TDO	O	Test data output	Serial output pin for instructions and data.
	$\overline{\text{TRST}}$	I	Test reset	Initialization-signal input pin.
Emulator interface	AUDATA3 to AUDATA0	O	Data	Branch source or destination address output pins.
	AUDCK	O	Clock	Sync-clock output pin.
	$\overline{\text{AUDSYNC}}$	O	Sync signal	Data start-position acknowledge-signal output pin.
Emulator interface	$\overline{\text{ASEBRKAK}}$	O	Break mode acknowledge	Indicates that the E10A-USB emulator has entered its break mode.
	$\overline{\text{ASEBRK}}$	I	Break request	E10A-USB emulator break input pin.

1.6 List of Pins

Section 2 CPU

2.1 Register Configuration

The register set consists of sixteen 32-bit general registers, four 32-bit control registers, and four 32-bit system registers.

2.1.1 General Registers

Figure 2.1 shows the general registers.

The sixteen 32-bit general registers are numbered R0 to R15. General registers are used for data processing and address calculation. R0 is also used as an index register. Several instructions have R0 fixed as their only usable register. R15 is used as the hardware stack pointer (SP). Saving and restoring the status register (SR) and program counter (PC) in exception handling is accomplished by referencing the stack using R15.

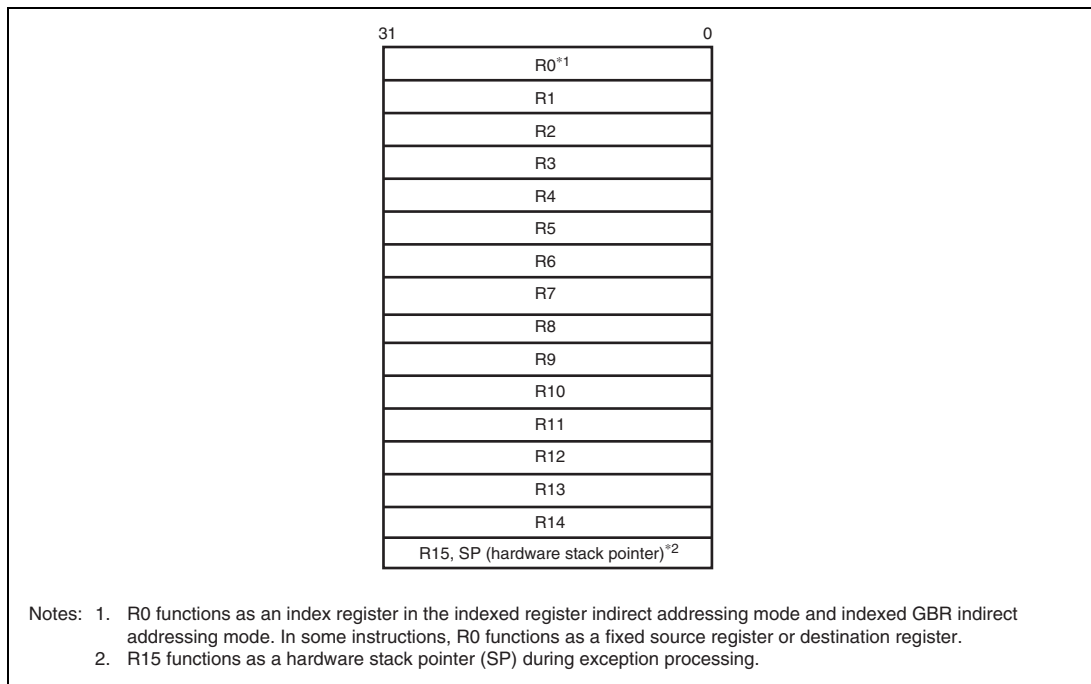

Figure 2.1 General Registers

2.1.2 Control Registers

The control registers consist of four 32-bit registers: the status register (SR), the global base register (GBR), the vector base register (VBR), and the jump table base register (TBR).

The status register indicates instruction processing states.

The global base register functions as a base address for the GBR indirect addressing mode to transfer data to the registers of on-chip peripheral modules.

The vector base register functions as the base address of the exception handling vector area (including interrupts).

The jump table base register functions as the base address of the function table area.

Figure 2.2 Control Registers

(1) Status Register (SR)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	BO	CS	-	-	-	M	Q	[3:0]			-	-	S	T	
Initial value:	0	0	0	0	0	0	-	-	1	1	1	1	0	0	-	-
R/W:	R	R/W	R/W	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 15	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
14	BO	0	R/W	BO Bit Indicates that a register bank has overflowed.
13	CS	0	R/W	CS Bit Indicates that, in CLIP instruction execution, the value has exceeded the saturation upper-limit value or fallen below the saturation lower-limit value.
12 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9	M	—	R/W	M Bit
8	Q	—	R/W	Q Bit Used by the DIV0S, DIV0U, and DIV1 instructions.
7 to 4	I[3:0]	1111	R/W	Interrupt Mask Level
3, 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1	S	—	R/W	S Bit Specifies a saturation operation for a MAC instruction.
0	T	—	R/W	T Bit True/false condition or carry/borrow bit

(2) Global Base Register (GBR)

GBR is referenced as the base address in a GBR-referencing MOV instruction.

(3) Vector Base Register (VBR)

VBR is referenced as the branch destination base address in the event of an exception or an interrupt.

(4) Jump Table Base Register (TBR)

TBR is referenced as the start address of a function table located in memory in a JSR/N@@(disp8,TBR) table-referencing subroutine call instruction.

2.1.3 System Registers

The system registers consist of four 32-bit registers: the high and low multiply and accumulate registers (MACH and MACL), the procedure register (PR), and the program counter (PC). MACH and MACL store the results of multiply or multiply and accumulate operations. PR stores the return address from a subroutine procedure. PC points four bytes ahead of the current instruction and controls the flow of the processing.

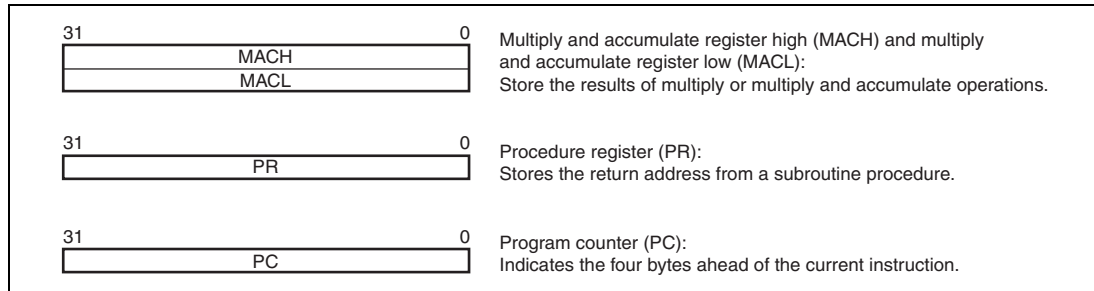

Figure 2.3 System Registers

(1) Multiply and Accumulate Register High (MACH) and Multiply and Accumulate Register Low (MACL)

MACH and MACL are used as the addition value in a MAC instruction, and store the result of a MAC or MUL instruction.

(2) Procedure Register (PR)

PR stores the return address of a subroutine call using a BSR, BSRF, or JSR instruction, and is referenced by a subroutine return instruction (RTS).

(3) Program Counter (PC)

PC points four bytes ahead of the instruction being executed.

2.1.4 Register Banks

For the nineteen 32-bit registers comprising general registers R0 to R14, control register GBR, and system registers MACH, MACL, and PR, high-speed register saving and restoration can be carried out using a register bank. The register contents are automatically saved in the bank after the CPU accepts an interrupt that uses a register bank. Restoration from the bank is executed by issuing a RESBANK instruction in an interrupt processing routine.

This LSI has 15 banks. For details, see the SH-2A, SH2A-FPU Software Manual and section 7.8, Register Banks.

2.1.5 Initial Values of Registers

Table 2.1 lists the values of the registers after a reset.

Table 2.1 Initial Values of Registers

Classification	Register	Initial Value
General registers	R0 to R14	Undefined
	R15 (SP)	Value of the stack pointer in the vector address table
Control registers	SR	Bits I[3:0] are 1111 (H'F), BO and CS are 0, reserved bits are 0, and other bits are undefined
	GBR, TBR	Undefined
	VBR	H'00000000
System registers	MACH, MACL, PR	Undefined
	PC	Value of the program counter in the vector address table

2.2 Data Formats

2.2.1 Data Format in Registers

Register operands are always longwords (32 bits). If the size of memory operand is a byte (8 bits) or a word (16 bits), it is changed into a longword by expanding the sign-part when loaded into a register.

Figure 2.4 Data Format in Registers

2.2.2 Data Formats in Memory

Memory data formats are classified into bytes, words, and longwords. Memory can be accessed in 8-bit bytes, 16-bit words, or 32-bit longwords. A memory operand of fewer than 32 bits is stored in a register in sign-extended or zero-extended form.

A word operand should be accessed at a word boundary (an even address of multiple of two bytes: address $2n$), and a longword operand at a longword boundary (an even address of multiple of four bytes: address $4n$). Otherwise, an address error will occur. A byte operand can be accessed at any address.

Only big-endian byte order can be selected for the data format.

Data formats in memory are shown in figure 2.5.

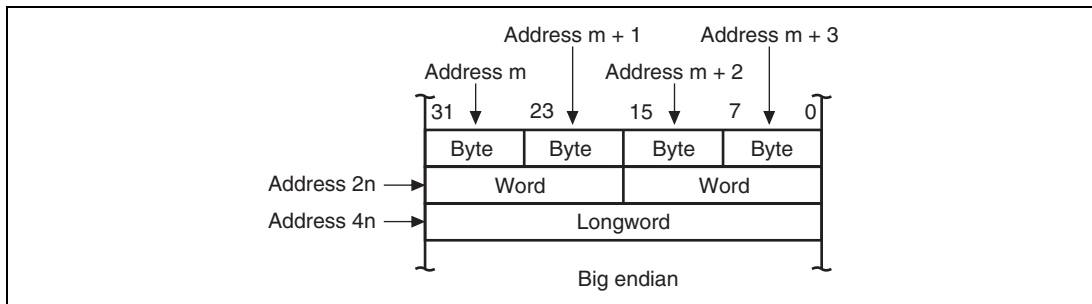

Figure 2.5 Data Formats in Memory

2.2.3 Immediate Data Format

Byte (8-bit) immediate data is located in an instruction code. Immediate data accessed by the MOV, ADD, and CMP/EQ instructions is sign-extended and handled in registers as longword data. Immediate data accessed by the TST, AND, OR, and XOR instructions is zero-extended and handled as longword data. Consequently, AND instructions with immediate data always clear the upper 24 bits of the destination register.

20-bit immediate data is located in the code of a MOVI20 or MOVI20S 32-bit transfer instruction. The MOVI20 instruction stores immediate data in the destination register in sign-extended form. The MOVI20S instruction shifts immediate data by eight bits in the upper direction, and stores it in the destination register in sign-extended form.

Word or longword immediate data is not located in the instruction code, but rather is stored in a memory table. The memory table is accessed by an immediate data transfer instruction (MOV) using the PC relative addressing mode with displacement.

See examples given in section 2.3.1 (10), Immediate Data.

2.3 Instruction Features

2.3.1 RISC-Type Instruction Set

Instructions are RISC type. This section details their functions.

(1) 16-Bit Fixed-Length Instructions

Basic instructions have a fixed length of 16 bits, improving program code efficiency.

(2) 32-Bit Fixed-Length Instructions

The SH-2A additionally features 32-bit fixed-length instructions, improving performance and ease of use.

(3) One Instruction per State

Each basic instruction can be executed in one cycle using the pipeline system.

(4) Data Length

Longword is the standard data length for all operations. Memory can be accessed in bytes, words, or longwords. Byte or word data in memory is sign-extended and handled as longword data. Immediate data is sign-extended for arithmetic operations or zero-extended for logic operations. It is also handled as longword data.

Table 2.2 Sign Extension of Word Data

SH2-A CPU	Description	Example of Other CPU
MOV.W @ (disp, PC), R1	Data is sign-extended to 32 bits, and R1 becomes H'00001234. It is next operated upon by an ADD instruction.	ADD.W #H'1234, R0
ADD R1, R0		
.DATA.W H'1234		

Note: @ (disp, PC) accesses the immediate data.

(5) Load-Store Architecture

Basic operations are executed between registers. For operations that involve memory access, data is loaded to the registers and executed (load-store architecture). Instructions such as AND that manipulate bits, however, are executed directly in memory.

(6) Delayed Branch Instructions

With the exception of some instructions, unconditional branch instructions, etc., are executed as delayed branch instructions. With a delayed branch instruction, the branch is taken after execution of the instruction immediately following the delayed branch instruction. This reduces disturbance of the pipeline control when a branch is taken.

In a delayed branch, the actual branch operation occurs after execution of the slot instruction. However, instruction execution such as register updating excluding the actual branch operation, is performed in the order of delayed branch instruction → delay slot instruction. For example, even though the contents of the register holding the branch destination address are changed in the delay slot, the branch destination address remains as the register contents prior to the change.

Table 2.3 Delayed Branch Instructions

SH-2A CPU		Description	Example of Other CPU	
BRA	TRGET	Executes the ADD before branching to TRGET.	ADD.W	R1, R0
ADD	R1, R0		BRA	TRGET

(7) Unconditional Branch Instructions with No Delay Slot

The SH-2A additionally features unconditional branch instructions in which a delay slot instruction is not executed. This eliminates unnecessary NOP instructions, and so reduces the code size.

(8) Multiply/Multiply-and-Accumulate Operations

16-bit × 16-bit → 32-bit multiply operations are executed in one to two cycles. 16-bit × 16-bit + 64-bit → 64-bit multiply-and-accumulate operations are executed in two to three cycles. 32-bit × 32-bit → 64-bit multiply and 32-bit × 32-bit + 64-bit → 64-bit multiply-and-accumulate operations are executed in two to four cycles.

(9) T Bit

The T bit in the status register (SR) changes according to the result of the comparison. Whether a conditional branch is taken or not taken depends upon the T bit condition (true/false). The number of instructions that change the T bit is kept to a minimum to improve the processing speed.

Table 2.4 T Bit

SH-2A CPU		Description	Example of Other CPU	
CMP/GE	R1, R0	T bit is set when $R0 \geq R1$.	CMP.W	R1, R0
BT	TRGET0	The program branches to TRGET0 when $R0 \geq R1$ and to TRGET1 when $R0 < R1$.	BGE	TRGET0
BF	TRGET1		BLT	TRGET1
ADD	#-1, R0	T bit is not changed by ADD.	SUB.W	#1, R0
CMP/EQ	#0, R0	T bit is set when $R0 = 0$.	BEQ	TRGET
BT	TRGET	The program branches if $R0 = 0$.		

(10) Immediate Data

Byte immediate data is located in an instruction code. Word or longword immediate data is not located in instruction codes but in a memory table. The memory table is accessed by an immediate data transfer instruction (MOV) using the PC relative addressing mode with displacement.

With the SH-2A, 17- to 28-bit immediate data can be located in an instruction code. However, for 21- to 28-bit immediate data, an OR instruction must be executed after the data is transferred to a register.

Table 2.5 Immediate Data Accessing

Classification	SH-2A CPU		Example of Other CPU	
8-bit immediate	MOV	#H'12, R0	MOV.B	#H'12, R0
16-bit immediate	MOVI20	#H'1234, R0	MOV.W	#H'1234, R0
20-bit immediate	MOVI20	#H'12345, R0	MOV.L	#H'12345, R0
28-bit immediate	MOVI20S	#H'12345, R0	MOV.L	#H'1234567, R0
	OR	#H'67, R0		
32-bit immediate	MOV.L	@(disp, PC), R0	MOV.L	#H'12345678, R0
	DATA.L H'12345678		

Note: @(disp, PC) accesses the immediate data.

(11) Absolute Address

When data is accessed by an absolute address, the absolute address value should be placed in the memory table in advance. That value is transferred to the register by loading the immediate data during the execution of the instruction, and the data is accessed in register indirect addressing mode.

With the SH-2A, when data is referenced using an absolute address not exceeding 28 bits, it is also possible to transfer immediate data located in the instruction code to a register and to reference the data in register indirect addressing mode. However, when referencing data using an absolute address of 21 to 28 bits, an OR instruction must be used after the data is transferred to a register.

Table 2.6 Absolute Address Accessing

Classification	SH-2A CPU	Example of Other CPU
Up to 20 bits	MOVI20 #H'12345, R1	MOV.B @H'12345, R0
	MOV.B @R1, R0	
21 to 28 bits	MOVI20S #H'12345, R1	MOV.B @H'1234567, R0
	OR #H'67, R1	
	MOV.B @R1, R0	
29 bits or more	MOV.L @(disp, PC), R1	MOV.B @H'12345678, R0
	MOV.B @R1, R0	
DATA.L H'12345678	

(12) 16-Bit/32-Bit Displacement

When data is accessed by 16-bit or 32-bit displacement, the displacement value should be placed in the memory table in advance. That value is transferred to the register by loading the immediate data during the execution of the instruction, and the data is accessed in the indexed indirect register addressing mode.

Table 2.7 Displacement Accessing

Classification	SH-2A CPU	Example of Other CPU
16-bit displacement	MOV.W @(disp, PC), R0	MOV.W @(H'1234, R1), R2
	MOV.W @(R0, R1), R2	
DATA.W H'1234	

2.3.2 Addressing Modes

Addressing modes and effective address calculation are as follows:

Table 2.8 Addressing Modes and Effective Addresses

Addressing Mode	Instruction Format	Effective Address Calculation	Equation
Register direct	Rn	The effective address is register Rn. (The operand is the contents of register Rn.)	—
Register indirect	@Rn	The effective address is the contents of register Rn.	Rn
Register indirect with post-increment	@Rn+	The effective address is the contents of register Rn. A constant is added to the contents of Rn after the instruction is executed. 1 is added for a byte operation, 2 for a word operation, and 4 for a longword operation.	Rn (After instruction execution) Byte: $Rn + 1 \rightarrow Rn$ Word: $Rn + 2 \rightarrow Rn$ Longword: $Rn + 4 \rightarrow Rn$
Register indirect with pre-decrement	@-Rn	The effective address is the value obtained by subtracting a constant from Rn. 1 is subtracted for a byte operation, 2 for a word operation, and 4 for a longword operation.	Byte: $Rn - 1 \rightarrow Rn$ Word: $Rn - 2 \rightarrow Rn$ Longword: $Rn - 4 \rightarrow Rn$ (Instruction is executed with Rn after this calculation)

Addressing Mode	Instruction Format	Effective Address Calculation	Equation
Register indirect with displacement	@(disp:4, Rn)	The effective address is the sum of Rn and a 4-bit displacement (disp). The value of disp is zero-extended, and remains unchanged for a byte operation, is doubled for a word operation, and is quadrupled for a longword operation.	Byte: Rn + disp Word: Rn + disp × 2 Longword: Rn + disp × 4
		<pre> graph TD Rn[Rn] --> Adder((+)) Disp[disp (zero-extended)] --> Adder Scale[1/2/4] --> Multiplier((x)) Multiplier --> Adder Adder --> Result[Rn + disp 1/2/4] </pre>	
Register indirect with displacement	@(disp:12, Rn)	The effective address is the sum of Rn and a 12-bit displacement (disp). The value of disp is zero-extended.	Byte: Rn + disp Word: Rn + disp Longword: Rn + disp
		<pre> graph TD Rn[Rn] --> Adder((+)) Disp[disp (zero-extended)] --> Adder Adder --> Result[Rn + disp] </pre>	
Indexed register indirect	@(R0, Rn)	The effective address is the sum of Rn and R0.	Rn + R0
		<pre> graph TD Rn[Rn] --> Adder((+)) R0[R0] --> Adder Adder --> Result[Rn + R0] </pre>	
GBR indirect with displacement	@(disp:8, GBR)	The effective address is the sum of GBR value and an 8-bit displacement (disp). The value of disp is zero-extended, and remains unchanged for a byte operation, is doubled for a word operation, and is quadrupled for a longword operation.	Byte: GBR + disp Word: GBR + disp × 2 Longword: GBR + disp × 4
		<pre> graph TD GBR[GBR] --> Adder((+)) Disp[disp (zero-extended)] --> Adder Scale[1/2/4] --> Multiplier((x)) Multiplier --> Adder Adder --> Result[GBR + disp 1/2/4] </pre>	

Addressing Mode	Instruction Format	Effective Address Calculation	Equation
Indexed GBR indirect	@(R0, GBR)	The effective address is the sum of GBR value and R0.	$GBR + R0$
TBR duplicate indirect with displacement	@@ (disp:8, TBR)	The effective address is the sum of TBR value and an 8-bit displacement (disp). The value of disp is zero-extended, and is multiplied by 4.	Contents of address (TBR + disp × 4)
PC indirect with displacement	@(disp:8, PC)	The effective address is the sum of PC value and an 8-bit displacement (disp). The value of disp is zero-extended, and is doubled for a word operation, and quadrupled for a longword operation. For a longword operation, the lowest two bits of the PC value are masked.	Word: $PC + disp \times 2$ Longword: $PC \& H'FFFFFFC + disp \times 4$

Addressing Mode	Instruction Format	Effective Address Calculation	Equation
PC relative	disp:8	The effective address is the sum of PC value and the value that is obtained by doubling the sign-extended 8-bit displacement (disp).	$PC + disp \times 2$
	disp:12	The effective address is the sum of PC value and the value that is obtained by doubling the sign-extended 12-bit displacement (disp).	$PC + disp \times 2$
	Rn	The effective address is the sum of PC value and Rn.	$PC + Rn$

Addressing Mode	Instruction Format	Effective Address Calculation	Equation
Immediate	#imm:20	The 20-bit immediate data (imm) for the MOVI20 instruction is sign-extended. <div style="text-align: center;"> $\begin{array}{ c c } \hline 31 & 19 & 0 \\ \hline \text{Sign-extended} & \text{imm (20 bits)} & \\ \hline \end{array}$ </div>	—
		The 20-bit immediate data (imm) for the MOVI20S instruction is shifted by eight bits to the left, the upper bits are sign-extended, and the lower bits are padded with zero. <div style="text-align: center;"> $\begin{array}{ c c c } \hline 31 & 27 & 8 & 0 \\ \hline \text{Sign-extended} & \text{imm (20 bits)} & 00000000 & \\ \hline \end{array}$ </div>	—
	#imm:8	The 8-bit immediate data (imm) for the TST, AND, OR, and XOR instructions is zero-extended.	—
	#imm:8	The 8-bit immediate data (imm) for the MOV, ADD, and CMP/EQ instructions is sign-extended.	—
	#imm:8	The 8-bit immediate data (imm) for the TRAPA instruction is zero-extended and then quadrupled.	—
	#imm:3	The 3-bit immediate data (imm) for the BAND, BOR, BXOR, BST, BLD, BSET, and BCLR instructions indicates the target bit location.	—

2.3.3 Instruction Format

The instruction formats and the meaning of source and destination operands are described below. The meaning of the operand depends on the instruction code. The symbols used are as follows:

- xxxx: Instruction code
- mmmm: Source register
- nnnn: Destination register
- iiiii: Immediate data
- dddd: Displacement

Table 2.9 Instruction Formats

Instruction Formats	Source Operand	Destination Operand	Example
0 format 	—	—	NOP
n format 	—	nnnn: Register direct	MOVT Rn
	Control register or system register	nnnn: Register direct	STS MACH, Rn
	R0 (Register direct)	nnnn: Register direct	DIVU R0, Rn
	Control register or system register	nnnn: Register indirect with pre-decrement	STC.L SR, @-Rn
	mmmm: Register direct	R15 (Register indirect with pre-decrement)	MOV.MU.L Rm, @-R15
	R15 (Register indirect with post-increment)	nnnn: Register direct	MOV.MU.L @R15+, Rn
	R0 (Register direct)	nnnn: (Register indirect with post-increment)	MOV.L R0, @Rn+

Instruction Formats	Source Operand	Destination Operand	Example
m format			
15 _____ 0 xxxx mmmm xxxx xxxx	mmmm: Register direct	Control register or system register	LDC Rm, SR
	mmmm: Register indirect with post-increment	Control register or system register	LDC.L @Rm+, SR
	mmmm: Register indirect	—	JMP @Rm
	mmmm: Register indirect with pre-decrement	R0 (Register direct)	MOV.L @-Rm, R0
	mmmm: PC relative using Rm	—	BRAF Rm
nm format			
15 _____ 0 xxxx nnnn mmmm xxxx	mmmm: Register direct	nnnn: Register direct	ADD Rm, Rn
	mmmm: Register direct	nnnn: Register indirect	MOV.L Rm, @Rn
	mmmm: Register indirect with post-increment (multiply-and-accumulate) nnnn*: Register indirect with post-increment (multiply-and-accumulate)	MACH, MACL	MAC.W @Rm+, @Rn+
	mmmm: Register indirect with post-increment	nnnn: Register direct	MOV.L @Rm+, Rn
	mmmm: Register direct	nnnn: Register indirect with pre-decrement	MOV.L Rm, @-Rn
	mmmm: Register direct	nnnn: Indexed register indirect	MOV.L Rm, @(R0, Rn)
md format			
15 _____ 0 xxxx xxxx mmmm dddd	mmmmddd: Register indirect with displacement	R0 (Register direct)	MOV.B @(disp, Rm), R0

Instruction Formats	Source Operand	Destination Operand	Example
nd4 format 15 0 <div style="border: 1px solid black; padding: 2px; width: fit-content; margin: 0 auto;"> xxxx xxxx nnnn dddd </div>	R0 (Register direct)	nnnndddd: Register indirect with displacement	MOV.B R0,@(disp,Rn)
nmd format 15 0 <div style="border: 1px solid black; padding: 2px; width: fit-content; margin: 0 auto;"> xxxx nnnn mmmm dddd </div>	mddd: Register direct	nnnndddd: Register indirect with displacement	MOV.L Rm,@(disp,Rn)
nmd12 format 32 16 <div style="border: 1px solid black; padding: 2px; width: fit-content; margin: 0 auto;"> xxxx nnnn mmmm xxxx </div> 15 0 <div style="border: 1px solid black; padding: 2px; width: fit-content; margin: 0 auto;"> xxxx dddd dddd dddd </div>	mddd: Register direct	nnnndddd: Register indirect with displacement	MOV.L Rm,@(disp12,Rn)
	mddd: Register indirect with displacement	nnnn: Register direct	MOV.L @(disp12,Rm),Rn
d format 15 0 <div style="border: 1px solid black; padding: 2px; width: fit-content; margin: 0 auto;"> xxxx xxxx dddd dddd </div>	ddddddd: GBR indirect with displacement	R0 (Register direct)	MOV.L @(disp,GBR),R0
	R0 (Register direct)	ddddddd: GBR indirect with displacement	MOV.L R0,@(disp,GBR)
	ddddddd: PC relative with displacement	R0 (Register direct)	MOVA @(disp,PC),R0
	ddddddd: TBR duplicate indirect with displacement	—	JSR/N @@(disp8,TBR)
	ddddddd: PC relative	—	BF label
d12 format 15 0 <div style="border: 1px solid black; padding: 2px; width: fit-content; margin: 0 auto;"> xxxx dddd dddd dddd </div>	ddddddddddd: PC relative	—	BRA label (label = disp + PC)
nd8 format 15 0 <div style="border: 1px solid black; padding: 2px; width: fit-content; margin: 0 auto;"> xxxx nnnn dddd dddd </div>	ddddddd: PC relative with displacement	nnnn: Register direct	MOV.L @(disp,PC),Rn

Instruction Formats	Source Operand	Destination Operand	Example
i format 15 0 xxxx xxxx iii iii	iiiiiii: Immediate	Indexed GBR indirect	AND.B #imm,@(R0,GBR)
	iiiiiii: Immediate	R0 (Register direct)	AND #imm,R0
	iiiiiii: Immediate	—	TRAPA #imm
ni format 15 0 xxxx nnnn iii iii	iiiiiii: Immediate	nnnn: Register direct	ADD #imm,Rn
ni3 format 15 0 xxxx xxxx nnnn x iii	nnnn: Register direct	—	BLD #imm3,Rn
	iii: Immediate	—	—
	—	nnnn: Register direct	BST #imm3,Rn
	—	iii: Immediate	—
ni20 format 32 16 xxxx nnnn iii xxxx	iiiiiiiiiiiiiiii: Immediate	nnnn: Register direct	MOV20 #imm20,Rn
15 0 iii iii iii iii			
nid format 32 16 xxxx nnnn xiii xxxx	nnnndddddddddd: Register indirect with displacement	—	BLD.B #imm3,@(disp12,Rn)
15 0 xxxx dddd dddd dddd	iii: Immediate	—	—
	—	nnnndddddddddd: Register indirect with displacement	BST.B #imm3,@(disp12,Rn)
	—	iii: Immediate	—

Note: * In multiply-and-accumulate instructions, nnnn is the source register.

2.4 Instruction Set

2.4.1 Instruction Set by Classification

Table 2.10 lists the instructions according to their classification.

Table 2.10 Classification of Instructions

Classification	Types	Operation		No. of Instructions
		Code	Function	
Data transfer	13	MOV	Data transfer Immediate data transfer Peripheral module data transfer Structure data transfer Reverse stack transfer	62
		MOVA	Effective address transfer	
		MOVI20	20-bit immediate data transfer	
		MOVI20S	20-bit immediate data transfer 8-bit left-shift	
		MOVML	R0–Rn register save/restore	
		MOVMU	Rn–R14 and PR register save/restore	
		MOVRT	T bit inversion and transfer to Rn	
		MOVT	T bit transfer	
		MOVU	Unsigned data transfer	
		NOTT	T bit inversion	
		PREF	Prefetch to operand cache	
		SWAP	Swap of upper and lower bytes	
		XTRCT	Extraction of the middle of registers connected	

Classification	Types	Operation		No. of Instructions
		Code	Function	
Arithmetic operations	26	ADD	Binary addition	40
		ADDC	Binary addition with carry	
		ADDV	Binary addition with overflow check	
		CMP/cond	Comparison	
		CLIPS	Signed saturation value comparison	
		CLIPU	Unsigned saturation value comparison	
		DIVS	Signed division (32 ÷ 32)	
		DIVU	Unsigned division (32 ÷ 32)	
		DIV1	One-step division	
		DIV0S	Initialization of signed one-step division	
		DIV0U	Initialization of unsigned one-step division	
		DMULS	Signed double-precision multiplication	
		DMULU	Unsigned double-precision multiplication	
		DT	Decrement and test	
		EXTS	Sign extension	
		EXTU	Zero extension	
		MAC	Multiply-and-accumulate, double-precision multiply-and-accumulate operation	
		MUL	Double-precision multiply operation	
		MULR	Signed multiplication with result storage in Rn	
		MULS	Signed multiplication	
		MULU	Unsigned multiplication	
		NEG	Negation	
		NEGC	Negation with borrow	
		SUB	Binary subtraction	
		SUBC	Binary subtraction with borrow	
		SUBV	Binary subtraction with underflow	

Classification	Types	Operation		No. of Instructions
		Code	Function	
Logic operations	6	AND	Logical AND	14
		NOT	Bit inversion	
		OR	Logical OR	
		TAS	Memory test and bit set	
		TST	Logical AND and T bit set	
		XOR	Exclusive OR	
Shift	12	ROTL	One-bit left rotation	16
		ROTR	One-bit right rotation	
		ROTCL	One-bit left rotation with T bit	
		ROTCR	One-bit right rotation with T bit	
		SHAD	Dynamic arithmetic shift	
		SHAL	One-bit arithmetic left shift	
		SHAR	One-bit arithmetic right shift	
		SHLD	Dynamic logical shift	
		SHLL	One-bit logical left shift	
		SHLLn	n-bit logical left shift	
		SHLR	One-bit logical right shift	
		SHLRn	n-bit logical right shift	
		Branch	10	
BT	Conditional branch, conditional delayed branch (branch when T = 1)			
BRA	Unconditional delayed branch			
BRAF	Unconditional delayed branch			
BSR	Delayed branch to subroutine procedure			
BSRF	Delayed branch to subroutine procedure			
JMP	Unconditional delayed branch			
JSR	Branch to subroutine procedure Delayed branch to subroutine procedure			
RTS	Return from subroutine procedure Delayed return from subroutine procedure			
RTV/N	Return from subroutine procedure with Rm → R0 transfer			

Classification	Types	Operation		No. of Instructions
		Code	Function	
System control	14	CLRT	T bit clear	36
		CLRMAC	MAC register clear	
		LDBANK	Register restoration from specified register bank entry	
		LDC	Load to control register	
		LDS	Load to system register	
		NOP	No operation	
		RESBANK	Register restoration from register bank	
		RTE	Return from exception handling	
		SETT	T bit set	
		SLEEP	Transition to power-down mode	
		STBANK	Register save to specified register bank entry	
		STC	Store control register data	
		STS	Store system register data	
		TRAPA	Trap exception handling	
Floating-point instructions	19	FABS	Floating-point absolute value	48
		FADD	Floating-point addition	
		FCMP	Floating-point comparison	
		FCNVDS	Conversion from double-precision to single-precision	
		FCNVSD	Conversion from single-precision to double - precision	
		FDIV	Floating-point division	
		FLDI0	Floating-point load immediate 0	
		FLDI1	Floating-point load immediate 1	
		FLDS	Floating-point load into system register FPUL	
		FLOAT	Conversion from integer to floating-point	
		FMAC	Floating-point multiply and accumulate operation	
		FMOV	Floating-point data transfer	
		FMUL	Floating-point multiplication	
		FNEG	Floating-point sign inversion	

Classification	Types	Operation		No. of Instructions
		Code	Function	
Floating-point instructions	19	FSCHG	SZ bit inversion	48
		FSQRT	Floating-point square root	
		FSTS	Floating-point store from system register FPUL	
		FSUB	Floating-point subtraction	
		FTRC	Floating-point conversion with rounding to integer	
FPU-related CPU instructions	2	LDS	Load into floating-point system register	8
		STS	Store from floating-point system register	
Bit manipulation	10	BAND	Bit AND	14
		BCLR	Bit clear	
		BLD	Bit load	
		BOR	Bit OR	
		BSET	Bit set	
		BST	Bit store	
		BXOR	Bit exclusive OR	
		BANDNOT	Bit NOT AND	
		BORNOT	Bit NOT OR	
BLDNOT	Bit NOT load			
Total:	112			253

The table below shows the format of instruction codes, operation, and execution states. They are described by using this format according to their classification.

Instruction	Instruction Code	Operation	Execution States	T Bit
Indicated by mnemonic.	Indicated in MSB ↔ LSB order.	Indicates summary of operation.	Value when no wait states are inserted.*1	Value of T bit after instruction is executed.
[Legend]	[Legend]	[Legend]		Explanation of Symbols
Rm: Source register	mmmm: Source register	→, ←: Transfer direction		—: No change
Rn: Destination register	nnnn: Destination register	(xx): Memory operand		
imm: Immediate data	0000: R0 0001: R1	M/Q/T: Flag bits in SR		
disp: Displacement*2	1111: R15 iiii: Immediate data dddd: Displacement	&: Logical AND of each bit : Logical OR of each bit ^: Exclusive logical OR of each bit ~: Logical NOT of each bit <<n: n-bit left shift >>n: n-bit right shift		

- Notes: 1. Instruction execution cycles: The execution cycles shown in the table are minimums. In practice, the number of instruction execution states will be increased in cases such as the following:
- When there is a conflict between an instruction fetch and a data access
 - When the destination register of a load instruction (memory → register) is the same as the register used by the next instruction.
2. Depending on the operand size, displacement is scaled by ×1, ×2, or ×4. For details, refer to the SH-2A, SH2A-FPU Software Manual.

2.4.2 Data Transfer Instructions

Table 2.11 Data Transfer Instructions

Instruction	Instruction Code	Operation	Execu- tion Cycles	T Bit	Compatibility			
					SH2, SH2E	SH4	SH-2A	
MOV	#imm,Rn	1110nnnniiiiiii	imm → sign extension → Rn	1	—	Yes	Yes	Yes
MOV.W	@(disp,PC),Rn	1001nnnnddddddd	(disp × 2 + PC) → sign extension → Rn	1	—	Yes	Yes	Yes
MOV.L	@(disp,PC),Rn	1101nnnnddddddd	(disp × 4 + PC) → Rn	1	—	Yes	Yes	Yes
MOV	Rm,Rn	0110nnnnmmmm0011	Rm → Rn	1	—	Yes	Yes	Yes
MOV.B	Rm,@Rn	0010nnnnmmmm0000	Rm → (Rn)	1	—	Yes	Yes	Yes
MOV.W	Rm,@Rn	0010nnnnmmmm0001	Rm → (Rn)	1	—	Yes	Yes	Yes

Notes: 1. Instruction execution cycles: The execution cycles shown in the table are minimums. In practice, the number of instruction execution states in cases such as the following:

- a. When there is a conflict between an instruction fetch and a data access
- b. When the destination register of a load instruction (memory → register) is the same as the register used by the next instruction.

* In the event of bank overflow, the number of cycles is 19.

2.5 Processing States

The CPU has five processing states: reset, exception handling, bus-released, program execution, and power-down. Figure 2.6 shows the transitions between the states.

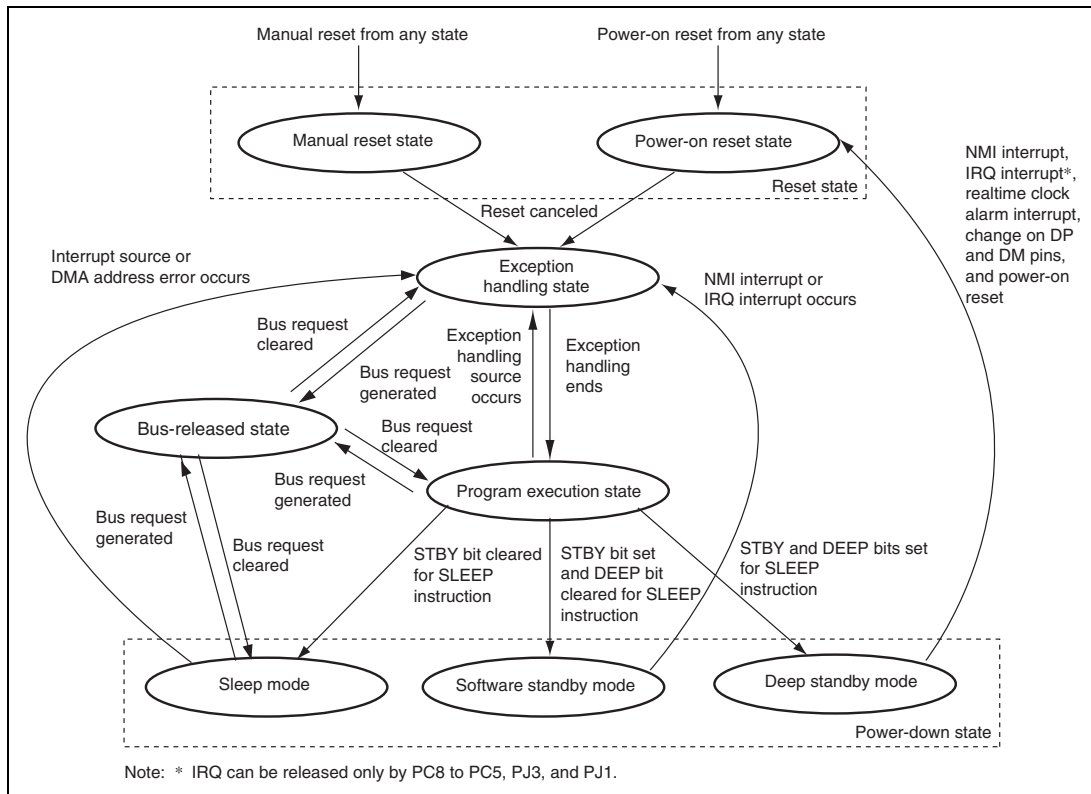

Figure 2.6 Transitions between Processing States

(1) Reset State

In the reset state, the CPU is reset. There are two kinds of reset, power-on reset and manual reset.

(2) Exception Handling State

The exception handling state is a transient state that occurs when exception handling sources such as resets or interrupts alter the CPU's processing state flow.

For a reset, the initial values of the program counter (PC) (execution start address) and stack pointer (SP) are fetched from the exception handling vector table and stored; the CPU then branches to the execution start address and execution of the program begins.

For an interrupt, the stack pointer (SP) is accessed and the program counter (PC) and status register (SR) are saved to the stack area. The exception service routine start address is fetched from the exception handling vector table; the CPU then branches to that address and the program starts executing, thereby entering the program execution state.

(3) Program Execution State

In the program execution state, the CPU sequentially executes the program.

(4) Power-Down State

In the power-down state, the CPU stops operating to reduce power consumption. The SLEEP instruction places the CPU in sleep mode, software standby mode, or deep standby mode.

(5) Bus-Released State

In the bus-released state, the CPU releases bus to a device that has requested it.

Section 3 Floating-Point Unit (FPU)

3.1 Features

The FPU has the following features.

- Conforms to IEEE754 standard
- 16 single-precision floating-point registers (can also be referenced as eight double-precision registers)
- Two rounding modes: Round to nearest and round to zero
- Denormalization modes: Flush to zero
- Five exception sources: Invalid operation, divide by zero, overflow, underflow, and inexact
- Comprehensive instructions: Single-precision, double-precision, and system control

Table 3.1 Floating-Point Number Formats and Parameters

Parameter	Single-Precision	Double-Precision
Total bit width	32 bits	64 bits
Sign bit	1 bit	1 bit
Exponent field	8 bits	11 bits
Fraction field	23 bits	52 bits
Precision	24 bits	53 bits
Bias	+127	+1023
E_{\max}	+127	+1023
E_{\min}	-126	-1022

Floating-point number value v is determined as follows:

If $E = E_{\max} + 1$ and $f \neq 0$, v is a non-number (NaN) irrespective of sign s

If $E = E_{\max} + 1$ and $f = 0$, $v = (-1)^s$ (infinity) [positive or negative infinity]

If $E_{\min} \leq E \leq E_{\max}$, $v = (-1)^s 2^E (1.f)$ [normalized number]

If $E = E_{\min} - 1$ and $f \neq 0$, $v = (-1)^s 2^{E_{\min}} (0.f)$ [denormalized number]

If $E = E_{\min} - 1$ and $f = 0$, $v = (-1)^s 0$ [positive or negative zero]

Table 3.2 shows the ranges of the various numbers in hexadecimal notation.

Table 3.2 Floating-Point Ranges

Type	Single-Precision	Double-Precision
Signaling non-number	H'7FFF FFFF to H'7FC0 0000	H'7FFF FFFF FFFF FFFF to H'7FF8 0000 0000 0000
Quiet non-number	H'7FBF FFFF to H'7F80 0001	H'7FF7 FFFF FFFF FFFF to H'7FF0 0000 0000 0001
Positive infinity	H'7F80 0000	H'7FF0 0000 0000 0000
Positive normalized number	H'7F7F FFFF to H'0080 0000	H'7FEF FFFF FFFF FFFF to H'0010 0000 0000 0000
Positive denormalized number	H'007F FFFF to H'0000 0001	H'000F FFFF FFFF FFFF to H'0000 0000 0000 0001
Positive zero	H'0000 0000	H'0000 0000 0000 0000
Negative zero	H'8000 0000	H'8000 0000 0000 0000
Negative denormalized number	H'8000 0001 to H'807F FFFF	H'8000 0000 0000 0001 to H'800F FFFF FFFF FFFF
Negative normalized number	H'8080 0000 to H'FF7F FFFF	H'8010 0000 0000 0000 to H'FFEF FFFF FFFF FFFF
Negative infinity	H'FF80 0000	H'FFF0 0000 0000 0000
Quiet non-number	H'FF80 0001 to H'FFBF FFFF	H'FFF0 0000 0000 0001 to H'FFF7 FFFF FFFF FFFF
Signaling non-number	H'FFC0 0000 to H'FFFF FFFF	H'FFF8 0000 0000 0000 to H'FFFF FFFF FFFF FFFF

3.2.2 Non-Numbers (NaN)

Figure 3.3 shows the bit pattern of a non-number (NaN). A value is NaN in the following case:

- Sign bit: Don't care
- Exponent field: All bits are 1
- Fraction field: At least one bit is 1

The NaN is a signaling NaN (sNaN) if the MSB of the fraction field is 1, and a quiet NaN (qNaN) if the MSB is 0.

Figure 3.3 Single-Precision NaN Bit Pattern

An sNaN is input in an operation, except copy, FABS, and FNEG, that generates a floating-point value.

- When the EN.V bit in FPSCR is 0, the operation result (output) is a qNaN.
- When the EN.V bit in FPSCR is 1, an invalid operation exception will generate FPU exception processing. In this case, the contents of the operation destination register are unchanged.

If a qNaN is input in an operation that generates a floating-point value, and an sNaN has not been input in that operation, the output will always be a qNaN irrespective of the setting of the EN.V bit in FPSCR. An exception will not be generated in this case.

The qNaN values as operation results are as follows:

- Single-precision qNaN: H'7FBF FFFF
- Double-precision qNaN: H'7FF7 FFFF FFFF FFFF

See the individual instruction descriptions for details of floating-point operations when a non-number (NaN) is input.

3.2.3 Denormalized Numbers

For a denormalized number floating-point value, the exponent field is expressed as 0, and the fraction field as a non-zero value.

In the SH2A-FPU, the DN bit in the status register FPSCR is always set to 1, therefore a denormalized number (source operand or operation result) is always flushed to 0 in a floating-point operation that generates a value (an operation other than copy, FNEG, or FABS).

When the DN bit in FPSCR is 0, a denormalized number (source operand or operation result) is processed as it is. See the individual instruction descriptions for details of floating-point operations when a denormalized number is input.

3.3 Register Descriptions

3.3.1 Floating-Point Registers

Figure 3.4 shows the floating-point register configuration. There are sixteen 32-bit floating-point registers FPR0 to FPR15, referenced by specifying FR0 to FR15, DR0/2/4/6/8/10/12/14. The correspondence between FRPn and the reference name is determined by the PR and SZ bits in FPSCR. Refer figure 3.4.

1. Floating-point registers, FPRi (16 registers)
FPR0 to FPR15
2. Single-precision floating-point registers, FRi (16 registers)
FR0 to FR15 indicate FPR0 to FPR15
3. Double-precision floating-point registers or single-precision floating-point vector registers in pairs, DRi (8 registers)

A DR register comprises two FR registers.

DR0 = {FR0, FR1}, DR2 = {FR2, FR3}, DR4 = {FR4, FR5}, DR6 = {FR6, FR7},

DR8 = {FR8, FR9}, DR10 = {FR10, FR11}, DR12 = {FR12, FR13}, DR14 = {FR14, FR15}

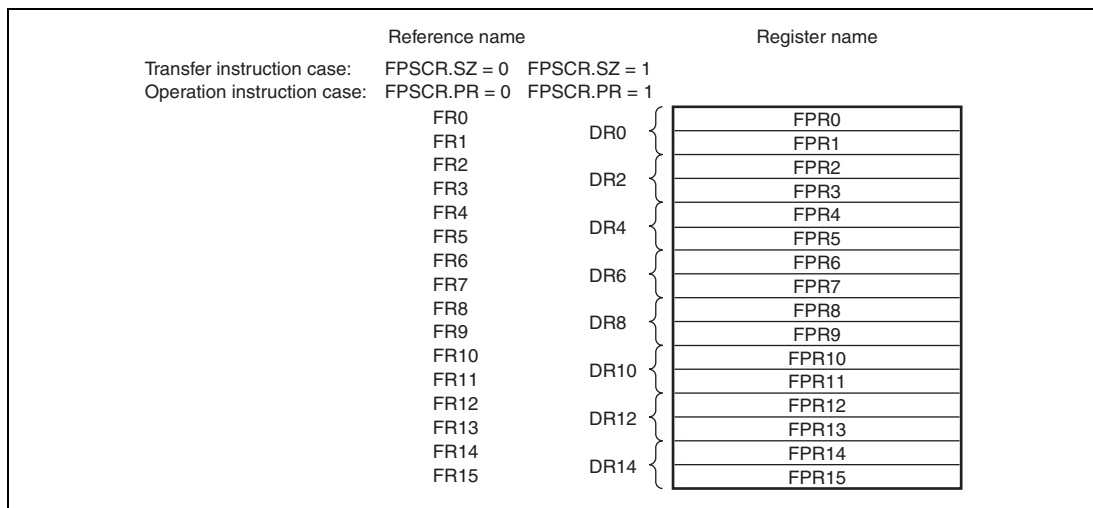

Figure 3.4 Floating-Point Registers

3.3.2 Floating-Point Status/Control Register (FPSCR)

FPSCR is a 32-bit register that controls floating-point instructions, sets FPU exceptions, and selects the rounding mode.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	QIS	-	SZ	PR	DN	Cause	
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0	0
R/W:	R	R	R	R	R	R	R	R	R	R/W	R	R/W	R/W	R	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	Cause				Enable				Flag				RM1	RM0		
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 23	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
22	QIS	0	R/W	Nonnumerical Processing Mode 0: Processes qNaN or $\pm\infty$ as such 1: Treats qNaN or $\pm\infty$ as the same as sNaN (valid only when FPSCR.Enable.V = 1)
21	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
20	SZ	0	R/W	Transfer Size Mode 0: Data size of FMOV instruction is 32-bits 1: Data size of FMOV instruction is a 32-bit register pair (64 bits)
19	PR	0	R/W	Precision Mode 0: Floating-point instructions are executed as single-precision operations 1: Floating-point instructions are executed as double-precision operations (graphics support instructions are undefined)
18	DN	1	R	Denormalization Mode (Always fixed to 1 in SH2A-FPU) 1: Denormalized number is treated as zero

Bit	Bit Name	Initial Value	R/W	Description
17 to 12	Cause	H'00	R/W	FPU Exception Cause Field
11 to 7	Enable	H'00	R/W	FPU Exception Enable Field
6 to 2	Flag	H'00	R/W	FPU Exception Flag Field
<p>Each time floating-point operation instruction is executed, the FPU exception cause field is cleared to 0 first. When an FPU exception on floating-point operation occurs, the bits corresponding to the FPU exception cause field and FPU exception flag field are set to 1. The FPU exception flag field remains set to 1 until it is cleared to 0 by software.</p> <p>As the bits corresponding to FPU exception enable field are sets to 1, FPU exception processing occurs.</p> <p>For bit allocations of each field, see table 3.3.</p>				
1	RM1	0	R/W	Rounding Mode
0	RM0	1	R/W	These bits select the rounding mode.
<p>00: Round to Nearest</p> <p>01: Round to Zero</p> <p>10: Reserved</p> <p>11: Reserved</p>				

Table 3.3 Bit Allocation for FPU Exception Handling

Field Name	FPU Error (E)	Invalid Operation (V)	Division by Zero (Z)	Overflow (O)	Underflow (U)	Inexact (I)	
Cause	FPU exception cause field	Bit 17	Bit 16	Bit 15	Bit 14	Bit 13	Bit 12
Enable	FPU exception enable field	None	Bit 11	Bit 10	Bit 9	Bit 8	Bit 7
Flag	FPU exception flag field	None	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2

Note: No FPU error occurs in the SH2A-FPU.

3.3.3 Floating-Point Communication Register (FPUL)

Information is transferred between the FPU and CPU via FPUL. FPUL is a 32-bit system register that is accessed from the CPU side by means of LDS and STS instructions. For example, to convert the integer stored in general register R1 to a single-precision floating-point number, the processing flow is as follows:

R1 → (LDS instruction) → FPUL → (single-precision FLOAT instruction) → FR1

3.4 Rounding

In a floating-point instruction, rounding is performed when generating the final operation result from the intermediate result. Therefore, the result of combination instructions such as FMAC will differ from the result when using a basic instruction such as FADD, FSUB, or FMUL. Rounding is performed once in FMAC, but twice in FADD, FSUB, and FMUL.

Which of the two rounding methods is to be used is determined by the RM bits in FPSCR.

FPSCR.RM[1:0] = 00: Round to Nearest

FPSCR.RM[1:0] = 01: Round to Zero

(1) Round to Nearest

The operation result is rounded to the nearest expressible value. If there are two nearest expressible values, the one with an LSB of 0 is selected.

If the unrounded value is $2^{E_{\max}} (2 - 2^{-P})$ or more, the result will be infinity with the same sign as the unrounded value. The values of E_{\max} and P , respectively, are 127 and 24 for single-precision, and 1023 and 53 for double-precision.

(2) Round to Zero

The digits below the round bit of the unrounded value are discarded.

If the unrounded value is larger than the maximum expressible absolute value, the value will become the maximum expressible absolute value.

3.5 FPU Exceptions

3.5.1 FPU Exception Sources

FPU exceptions may occur on floating-point operation instruction and the exception sources are as follows:

- FPU error (E): When FPSCR.DN = 0 and a denormalized number is input (No error occurs in the SH2A-FPU)
- Invalid operation (V): In case of an invalid operation, such as NaN input
- Division by zero (Z): Division with a zero divisor
- Overflow (O): When the operation result overflows
- Underflow (U): When the operation result underflows
- Inexact exception (I): When overflow, underflow, or rounding occurs

The FPU exception cause field in FPSCR contains bits corresponding to all of above sources E, V, Z, O, U, and I, and the FPU exception flag and enable fields in FPSCR contain bits corresponding to sources V, Z, O, U, and I, but not E. Thus, FPU errors cannot be disabled.

When an FPU exception occurs, the corresponding bit in the FPU exception cause field is set to 1, and 1 is added to the corresponding bit in the FPU exception flag field. When an FPU exception does not occur, the corresponding bit in the FPU exception cause field is cleared to 0, but the corresponding bit in the FPU exception flag field remains unchanged.

3.5.2 FPU Exception Handling

FPU exception handling is initiated in the following cases:

- FPU error (E): FPSCR.DN = 0 and a denormalized number is input (No error occurs in the SH2A-FPU)
- Invalid operation (V): FPSCR.Enable.V = 1 and invalid operation
- Division by zero (Z): FPSCR.Enable.Z = 1 and division with a zero divisor
- Overflow (O): FPSCR.Enable.O = 1 and instruction with possibility of operation result overflow
- Underflow (U): FPSCR.Enable.U = 1 and instruction with possibility of operation result underflow
- Inexact exception (I): FPSCR.Enable.I = 1 and instruction with possibility of inexact operation result

These possibilities of each exceptional handling on floating-point operation are shown in the individual instruction descriptions. All exception events that originate in the floating-point operation are assigned as the same FPU exceptional handling event. The meaning of an exception generated by floating-point operation is determined by software by reading from FPSCR and interpreting the information it contains. Also, the destination register is not changed when FPU exception handling operation occurs.

Except for the above, the FPU disables exception handling. In every processing, the bit corresponding to source V, Z, O, U, or I is set to 1, and a default value is generated as the operation result.

- Invalid operation (V): qNaN is generated as the result.
- Division by zero (Z): Infinity with the same sign as the unrounded value is generated.
- Overflow (O):
When rounding mode = RZ, the maximum normalized number, with the same sign as the unrounded value, is generated.
When rounding mode = RN, infinity with the same sign as the unrounded value is generated.
- Underflow (U):
Zero with the same sign as the unrounded value is generated.
- Inexact exception (I): An inexact result is generated.

Section 4 Boot Mode

This LSI can be booted from the memory connected to the CS0 space, the NAND flash memory, and the serial flash memory.

4.1 Features

- Four boot modes
 - Boot mode 0: Boots the LSI from the memory connected to the CS0 space
 - Boot mode 1: Boots the LSI from the serial flash memory (low-speed communication)
 - Boot mode 2: Boots the LSI from the NAND flash memory
 - Boot mode 3: Boots the LSI from the serial flash memory (high-speed communication)

4.2 Boot Mode and Pin Function Setting

This LSI can determine the boot mode using external pins when \overline{RES} is low. The external pin settings for selecting the boot mode are shown in table 4.1.

Table 4.1 External Pin (MD_BOOT1 and MD_BOOT0) Settings and Corresponding Boot Modes

MD_BOOT1	MD_BOOT0	Boot Mode
0	0	Boots the LSI from the memory connected to the CS0 space (boot mode 0).
0	1	Boots the LSI, through low-speed communication, from the serial flash memory connected to channel 0 of the Renesas serial peripheral interface (boot mode 1).
1	0	Boots the LSI from the NAND flash memory connected to the NAND flash memory controller (boot mode 2).
1	1	Boots the LSI, through high-speed communication, from the serial flash memory connected to channel 0 of the Renesas serial peripheral interface (boot mode 3).

4.3 Operation

4.3.1 Boot Mode 0

In boot mode 0, this LSI is booted from the memory connected to the CS0 space. In this mode, this LSI operates as follows:

After the power-on reset is canceled, the initial value (execution start address) of the program counter (PC) and the initial value of the stack pointer (SP) are fetched from the exception handling vector table located in the memory connected to the CS0 space, then program execution is started.

4.3.2 Boot Modes 1 and 3

In boot modes 1 and 3, booting up is from serial flash memory, which is connected to channel 0 of the Renesas serial peripheral interface. The flow of initiation in boot mode is as described below.

(1) Execution from on-Chip ROM of the Program for Boot Initiation

After release from the power-on reset state, the CPU executes the boot initiation program that has been stored in on-chip ROM (and is not publicly disclosed).

(2) Transfer of the Loader Program

Starting with transfer from the respective first locations, the 8-KB loader program is transferred from serial flash memory, which is connected to channel 0 of the Renesas serial peripheral interface, to high-speed on-chip RAM.

Transfer proceeds at 1/2 of the rate of the bus clock ($B\phi$) in boot mode 1 and at 1/4 of the rate of the bus clock in boot mode 3. Decide on the boot mode in accord with the connected serial flash memory.

Once transfer of the loader program has been completed, execution by the CPU jumps to high-speed on-chip RAM so that it can start executing the transferred loader program.

(3) Transfer of an Application Program (as Desired)

The loader program employs the Renesas serial peripheral interface to transfer the data to be deployed from serial flash memory to on-chip RAM or external RAM.

Figure 4.1 is a schematic view of the specification for boot modes 1 and 3.

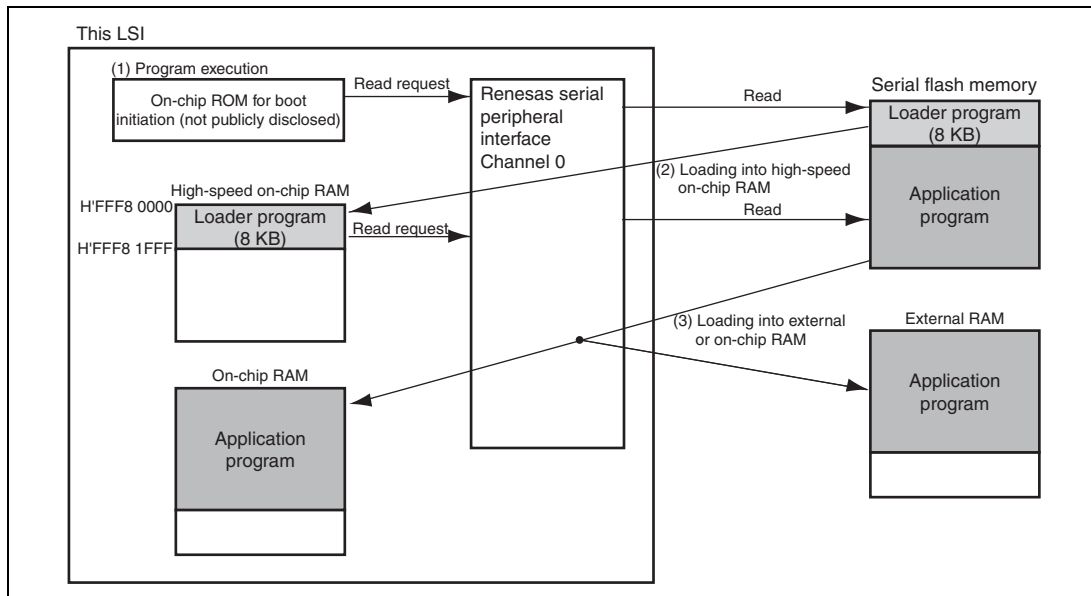

Figure 4.1 Schematic View of Specification for Boot Modes 1 and 3

4.3.3 Boot Mode 2

In boot mode 2, booting up is from NAND flash memory, which is connected to the NAND flash memory controller. Suitable NAND flash memory has a large block size (2048 + 64) and takes five-byte addresses (has a capacity of 2 GB or greater). The flow of initiation for a NAND-flash boot is as described below.

(1) Execution from on-Chip ROM of the Program for Boot Initiation

After release from the power-on reset state, the CPU executes the boot initiation program that has been stored in on-chip ROM (and is not publicly disclosed).

(2) Transfer of the Loader Program

Starting with transfer from the respective first locations, the 8-KB loader program is transferred from NAND flash memory, which is connected to the NAND flash memory controller, to high-speed on-chip RAM. Transfer and checking by the loader program proceed as follows.

- (a) A search is conducted to find the block which holds the loader program. Block addresses 0 to 1023 (max.)
- (b) The 8-KB (16-sector) loader program is read out and transferred to high-speed on-chip RAM.

Once transfer of the loader program has been completed, execution by the CPU jumps to high-speed on-chip RAM so that it can start executing the transferred loader program.

(3) Transfer of an Application Program (as Desired)

The loader program employs the NAND flash memory controller to transfer the data to be deployed from NAND flash memory to on-chip RAM or external RAM.

Figure 4.2 is a schematic view of the specifications for boot mode 2.

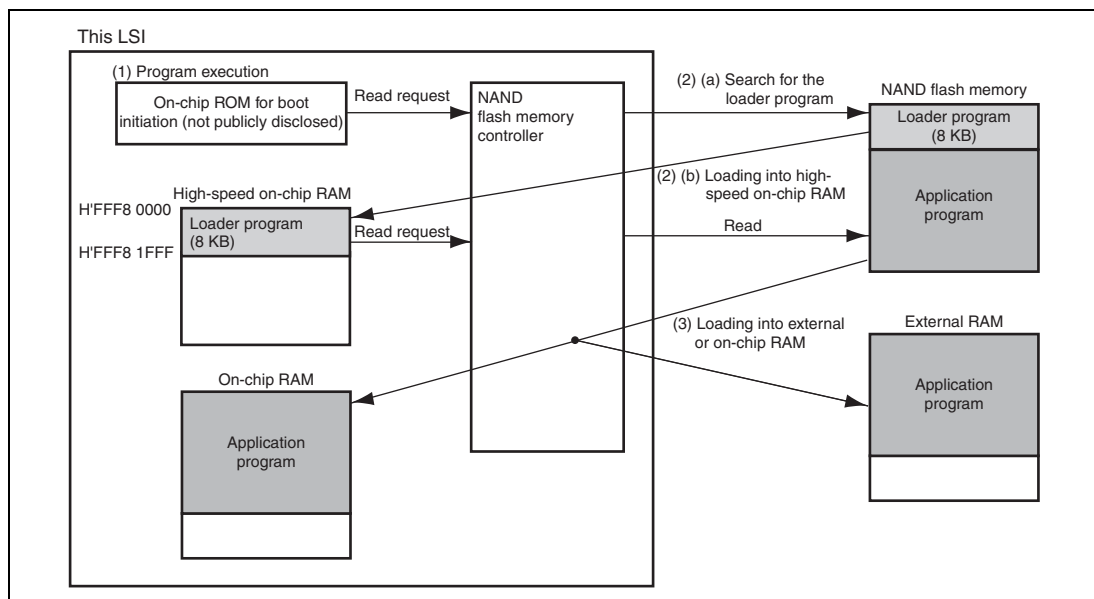

Figure 4.2 Schematic View of Specification for Boot Mode 2

Figure 4.3 shows the locations where the loader program is stored.

Store the loader program in sectors 0 to 15 of the loader block. Read out the loader program in sectors.

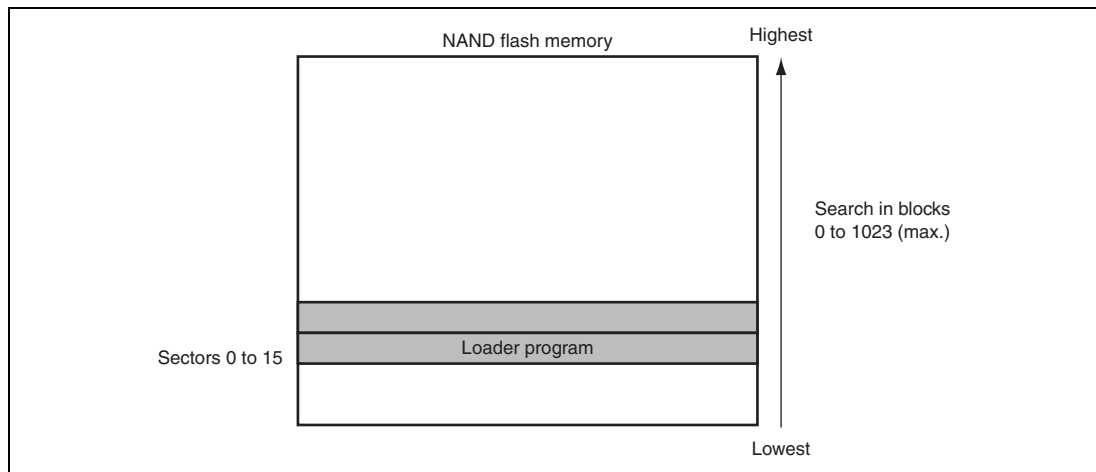

Figure 4.3 Locations where the Loader Program is Stored

4.4 Notes

4.4.1 Boot Related Pins

The initial states and output states in deep standby mode of the pins related to CS0 space memory read, NAND flash memory controller, and channel 0 of the Renesas serial peripheral interface are different in each boot mode.

For details, refer to section 9, Bus State Controller, section 32, General Purpose I/O Ports, and section 33, Power-Down Modes.

Section 5 Clock Pulse Generator

This LSI has a clock pulse generator that generates a CPU clock ($I\phi$), a peripheral clock ($P\phi$), and a bus clock ($B\phi$). The clock pulse generator consists of a crystal oscillator, PLL circuits, and divider circuits.

5.1 Features

- Two clock operating modes
The mode is selected from among the two clock operating modes based on the frequency range to be used and the input clock type: the clock from crystal resonator or the clock for USB 2.0 host/function module.
- Three clocks generated independently
A CPU clock ($I\phi$) for the CPU and cache; a peripheral clock ($P\phi$) for the on-chip peripheral modules; a bus clock ($B\phi = CKIO$) for the external bus interface
- Frequency change function
CPU and peripheral clock frequencies can be changed independently using the PLL (phase locked loop) circuits and divider circuits within this module. Frequencies are changed by software using frequency control register (FRQCR) settings.
- Power-down mode control
The clock can be stopped in sleep mode, software standby mode, and deep standby mode, and specific modules can be stopped using the module standby function. For details on clock control in the power-down modes, see section 33, Power-Down Modes.

Figure 5.1 shows a block diagram of the clock pulse generator.

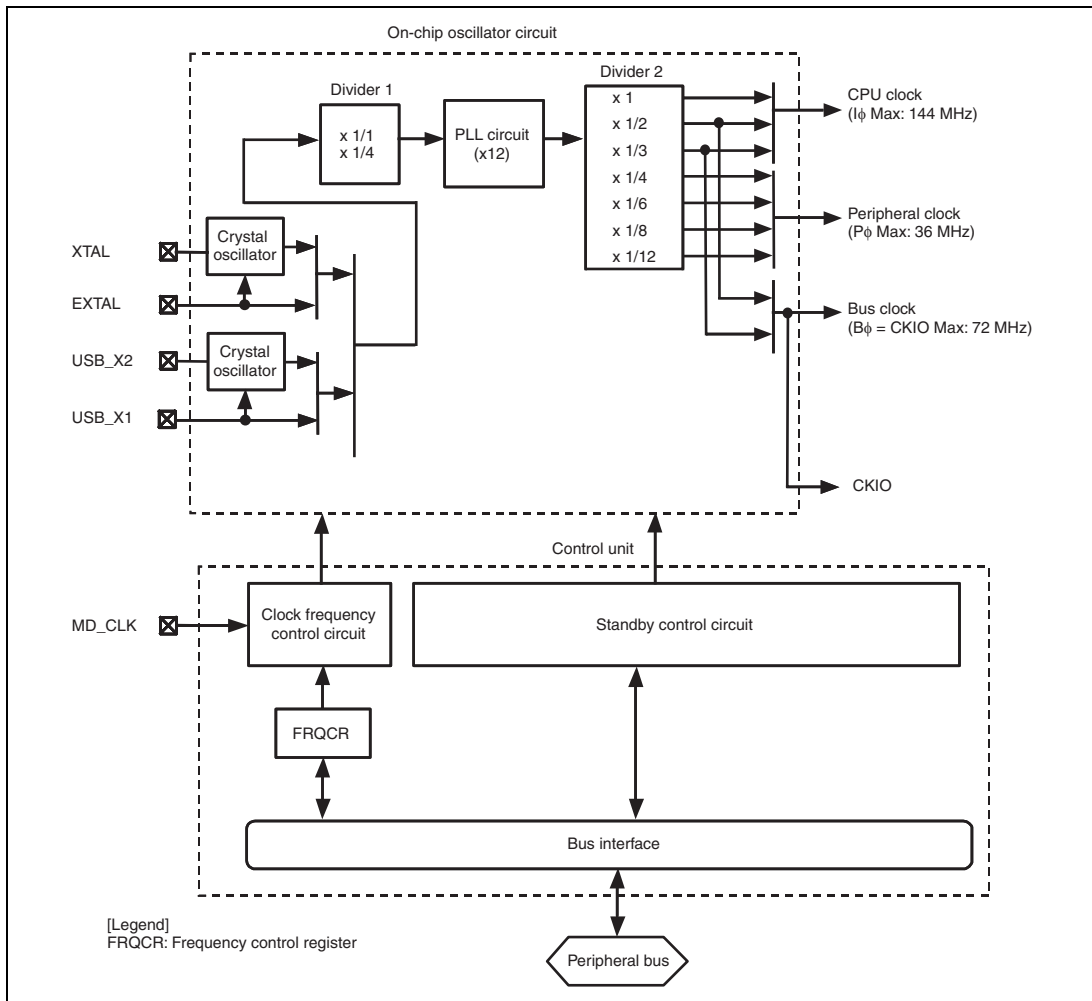

Figure 5.1 Block Diagram

The blocks of this module function as follows:

(1) Crystal Oscillator

The crystal oscillator is used in which the crystal resonator is connected to the XTAL/EXTAL pin or USB_X1/USB_X2 pin. One of them is selected according to the clock operating mode.

(2) Divider 1

Divider 1 divides the output from the crystal oscillator or the external clock input. The division ratio depends on the clock operating mode.

(3) PLL Circuit

PLL circuit multiplies the frequency of the output from the divider 1. The multiplication ratio depends on the clock operating mode.

(4) Divider 2

Divider 2 generates a clock signal whose operating frequency can be used for the CPU clock, the peripheral clock, and the bus clock. The division ratio of the bus clock depends on the clock operating mode. The division ratio of the CPU clock and the peripheral clock is set by the frequency control register.

(5) Clock Frequency Control Circuit

The clock frequency control circuit controls the clock frequency using the MD_CLK pin and the frequency control register (FRQCR).

(6) Standby Control Circuit

The standby control circuit controls the states of the on-chip oscillation circuit and other modules during clock switching, or sleep, software standby or deep standby mode.

In addition, the standby control register is provided to control the power-down mode of other modules. For details on the standby control register, see section 33, Power-Down Modes.

(7) Frequency Control Register (FRQCR)

The frequency control register (FRQCR) has control bits assigned for the following functions: clock output/non-output from the CKIO pin during software standby mode and the frequency division ratio of the CPU clock and the peripheral clock (P ϕ).

5.2 Input/Output Pins

Table 5.1 lists the clock pulse generator pins and their functions.

Table 5.1 Pin Configuration and Functions of the Clock Pulse Generator

Pin Name	Symbol	I/O	Function (Clock Operating Mode 0)	Function (Clock Operating Mode 1)
Mode control pin	MD_CLK	Input	Sets the clock operating mode.	
Crystal input/output pins (clock input pins)	XTAL	Output	Connected to the crystal resonator. (Leave this pin open when the crystal resonator is not in use.)	Leave this pin open.
	EXTAL	Input	Connected to the crystal resonator or used to input external clock.	Fix this pin (Connect it to pull-up/down resistor, power supply, or ground.)
Clock output pin	CKIO	Output	Clock output pin.	Clock output pin
Crystal input/output pins for USB 2.0 host/function module (clock input pins)	USB_X1	Input	Connected to the crystal resonator to input the clock for the USB 2.0 host/function module only, or used to input external clock. When the USB 2.0 host/function module is not used, this pin should be fixed (connected to pull-up/down resistor, power supply or ground).	Connected to the crystal resonator to input the clock for both the USB 2.0 host/function module and the LSI, or used to input external clock.
	USB_X2	Output	Connected to the crystal resonator for the USB 2.0 host/function module. (Leave this pin open when the crystal resonator is not in use.)	Connected to the crystal resonator for both the USB 2.0 host/function module and the LSI. (Leave this pin open when the crystal resonator is not in use.)

5.3 Clock Operating Modes

Table 5.2 shows the relationship between the mode control pin (MD_CLK) and the clock operating modes. Table 5.3 shows the usable frequency ranges in the clock operating modes.

Table 5.2 Clock Operating Modes

Mode	Pin Values		Clock I/O		PLL Circuit On/Off	CKIO Frequency
	MD_CLK	Source	Output	Divider 1		
0	0	EXTAL or crystal resonator	CKIO	1	ON (×12)	(EXTAL or crystal resonator) × 6
1	1	USB_X1 or crystal resonator	CKIO	1/4	ON (×12)	(USB_X1 or crystal resonator) × 3/2

- Mode 0

In mode 0, clock is input from the EXTAL pin or the crystal oscillator. The PLL circuit shapes waveforms and multiplies the frequency, and then supplies the clock to the LSI. The oscillating frequency for the crystal resonator and EXTAL pin input clock ranges from 10 to 12 MHz.

The frequency range of CKIO is from 60 to 72 MHz. To reduce current supply, fix the USB_X1 pin (connect it to a pull-up/down resistor, the power supply, or the ground) and open the USB_X2 pin when the USB 2.0 host/function module is not used.

- Mode 1

In mode 1, clock is input from the USB_X1 pin or the crystal oscillator. The external clock is input through this pin and waveform is shaped in the PLL circuit. Then the frequency is multiplied according to the frequency control register setting before the clock is supplied to the LSI. The frequency of CKIO is the same as that of the input clock (USB_X1/crystal resonator) multiplied by 3/2, (72 MHz). To reduce current supply, fix the EXTAL pin (connect it to a pull-up/down resistor, the power supply, or the ground) and open the XTAL pin when the LSI is used in mode 1.

Table 5.3 Relationship between Clock Operating Mode and Frequency Range

Clock Operating Mode	FRQCR Setting* ¹	PLL Frequency Multiplier	Ratio of Internal Clock Frequencies (I:B:P)* ²	Selectable Frequency Range (MHz)				
				Input Clock* ³	Output Clock (CKIO Pin)	CPU clock (I ϕ)	Bus Clock (B ϕ)	Peripheral Clock (P ϕ)
0	H'x103	ON (x12)	12 : 6 : 3	10 to 12	60 to 72	120 to 144	60 to 72	30 to 36
	H'x104	ON (x12)	12 : 6 : 2	10 to 12	60 to 72	120 to 144	60 to 72	20 to 24
	H'x105	ON (x12)	12 : 6 : 3/2	10 to 12	60 to 72	120 to 144	60 to 72	15 to 18
	H'x106	ON (x12)	12 : 6 : 1	10 to 12	60 to 72	120 to 144	60 to 72	10 to 12
	H'x113	ON (x12)	6 : 6 : 3	10 to 12	60 to 72	60 to 72	60 to 72	30 to 36
	H'x114	ON (x12)	6 : 6 : 2	10 to 12	60 to 72	60 to 72	60 to 72	20 to 24
	H'x115	ON (x12)	6 : 6 : 3/2	10 to 12	60 to 72	60 to 72	60 to 72	15 to 18
	H'x116	ON (x12)	6 : 6 : 1	10 to 12	60 to 72	60 to 72	60 to 72	10 to 12
1	H'x103	ON (x12)	3 : 3/2 : 3/4	48	72	144	72	36
	H'x104	ON (x12)	3 : 3/2 : 1/2	48	72	144	72	24
	H'x105	ON (x12)	3 : 3/2 : 3/8	48	72	144	72	18
	H'x106	ON (x12)	3 : 3/2 : 1/4	48	72	144	72	12
	H'x113	ON (x12)	3/2 : 3/2 : 3/4	48	72	72	72	36
	H'x114	ON (x12)	3/2 : 3/2 : 1/2	48	72	72	72	24
	H'x115	ON (x12)	3/2 : 3/2 : 3/8	48	72	72	72	18
	H'x116	ON (x12)	3/2 : 3/2 : 1/4	48	72	72	72	12

- Notes:
1. x in the FRQCR register setting depends on the set value in bits 12, 13, and 14.
 2. The ratio of clock frequencies, where the input clock frequency is assumed to be 1.
 3. In mode 0, the frequency of the EXTAL pin input clock or the crystal resonator
In mode 1, the frequency of the USB_X1 pin input clock or the crystal resonator

Caution: Do not use this LSI for frequency settings other than those in table 5.3.

5.4 Register Descriptions

Table 5.4 shows the register configuration of the clock pulse generator.

Table 5.4 Register Configuration

Register Name	Abbreviation	R/W	Initial Value	Address	Access Size
Frequency control register	FRQCR	R/W	H'0113	H'FFFE0010	16

5.4.1 Frequency Control Register (FRQCR)

FRQCR is a 16-bit readable/writable register used to specify whether a clock is output from the CKIO pin during normal operation mode, release of bus mastership, change of gain of crystal oscillator for the XTAL pin, software standby mode, and standby mode cancellation. The register specifies the frequency division ratio for the CPU clock and peripheral clock (Pφ). FRQCR is accessed by word.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
	-	CKO EN2	CKOEN[1:0]		-	-	-	-	-	-	-	IFC	-	PFC[2:0]			
Initial value:	0	0	0	0	0	0	0	1	0	0	0	1	0	0	0	1	1
R/W:	R	R/W	R/W	R/W	R	R	R	R	R	R	R	R/W	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
14	CKOEN2	0	R/W	Clock Output Enable 2 Specifies whether the CKIO pin outputs clock signals or is fixed to the low level when the gain of the crystal oscillator for the XTAL pin is changed. If this bit is set to 1, the CKIO pin is fixed to the low level when the gain of the crystal oscillator for the XTAL pin is changed. Therefore, the malfunction of an external circuit caused by an unstable CKIO clock while changing the gain of the crystal oscillator for the XTAL pin can be prevented. 0: Unstable clock output 1: Low-level output

Bit	Bit Name	Initial Value	R/W	Description
13, 12	CKOEN[1:0]	00	R/W	<p>Clock Output Enable</p> <p>Specifies whether the CKIO pin outputs clock signals, or is set to a fixed level or high impedance (Hi-Z) during normal operation mode, release of bus mastership, standby mode, or cancellation of standby mode.</p> <p>If these bits are set to 01, the CKIO pin is fixed at low during software standby mode or cancellation of software standby mode. Therefore, the malfunction of an external circuit caused by an unstable CKIO clock during cancellation of software standby mode can be prevented.</p>
11 to 9	—	All 0	R	<p>Reserved</p> <p>These bits are always read as 0. The write value should always be 0.</p>
8	—	1	R	<p>Reserved</p> <p>This bit is always read as 1. The write value should always be 1.</p>
7 to 5	—	All 0	R	<p>Reserved</p> <p>These bits are always read as 0. The write value should always be 0.</p>
4	IFC	1	R/W	<p>CPU clock Frequency Division Ratio</p> <p>This bit specifies the frequency division ratio of the CPU clock with respect to the output frequency of PLL circuit.</p> <p>0: 1 time 1: 1/2 times</p>
3	—	0	R	<p>Reserved</p> <p>This bit is always read as 0. The write value should always be 0.</p>

Bit	Bit Name	Initial Value	R/W	Description
2 to 0	PFC[2:0]	011	R/W	<p>Peripheral Clock Frequency Division Ratio</p> <p>These bits specify the frequency division ratio of the peripheral clock with respect to the output frequency of PLL circuit.</p> <p>000: Reserved (setting prohibited)</p> <p>001: Reserved (setting prohibited)</p> <p>010: Reserved (setting prohibited)</p> <p>011: 1/4 times</p> <p>100: 1/6 times</p> <p>101: 1/8 times</p> <p>110: 1/12 times</p> <p>111: Reserved (setting prohibited)</p>

Table 5.5 CKOEN[1:0] Settings

Setting	Normal Operation	Release of Bus Mastership	Software Standby Mode	Deep Standby Mode
00	Output	Output off (Hi-Z)	Output off (Hi-Z)	Low-level or high-level output
01	Output	Output	Low-level output	Low-level or high-level output
10	Output	Output	Output (unstable clock output)	Low-level or high-level output
11	Output off (Hi-Z)	Output off (Hi-Z)	Output off (Hi-Z)	Output off (Hi-Z)

5.5 Changing the Frequency

The frequency of the CPU clock ($I\phi$) and peripheral clock ($P\phi$) can be changed by changing the division rate of divider. The division rate can be changed by software through the frequency control register (FRQCR).

5.5.1 Changing the Division Ratio

The division rate of divider can be changed by the following operation.

1. In the initial state, IFC = B'1 and PFC2 to PFC0 = B'011.
2. Set the desired value in the IFC and PFC2 to PFC0 bits. The values that can be set are limited by the clock operating mode and the multiplication rate of PLL circuit. Note that if the wrong value is set, this LSI will malfunction.
3. After the register bits (IFC and PFC2 to PFC0) have been set, the clock is supplied of the new division ratio.

Note: When executing the SLEEP instruction after the frequency has been changed, be sure to read the frequency control register (FRQCR) three times before executing the SLEEP instruction.

5.6 Usage of the Clock Pins

For the connection of a crystal resonator or the input of a clock signal, this LSI circuit has the pins listed in table 5.6. With regard to these pins, take care on the following points. Furthermore, Xin pin and Xout pin are used in this section to refer to the pins listed in the table.

Table 5.6 Clock Pins

Xin Pins (Used for Connection of a Crystal Resonator and Input of External Clock Signals)	Xout Pins (Used for Connection of a Crystal Resonator)
EXTAL	XTAL
USB_X1	USB_X2
AUDIO_X1	AUDIO_X2
RTC_X1	RTC_X2

5.6.1 In the Case of Inputting an External Clock

An example of the connection of an external clock is shown in figure 5.2. In cases where the Xout pin is left open state, take the parasitic capacitance as less than 10 pF.

Figure 5.2 Example of the Connection of an External Clock

5.6.2 In the Case of Using a Crystal Resonator

An example of the connection of crystal resonator is shown in figure 5.3.

Place the crystal resonator and capacitors (CL1 and CL2) as close to pins X_{in} and X_{out} as possible. Furthermore, to avoid inductance so that oscillation is correct, use the points where the capacitors are connected to the crystal resonator in common and do not place wiring patterns close to these components.

Since the design of the user board is closely connected with the effective characteristics of the crystal resonator, refer to the example of connection of the crystal resonator that is introduced in this section and perform thorough evaluation on the user side as well. The rated value of the crystal resonator will vary with the floating capacitances and so on of the crystal resonator and mounted circuit, so proceed with decisions on the basis of full discussions with the maker of the crystal resonator. Ensure that voltages applied to the clock pins do not exceed the maximum rated values.

Although the feedback resistor is included in this LSI, an external feedback resistor may be required in some cases. This depends on the characteristics of the crystal resonator.

Set the parameters (of resistors and capacitors) with thorough evaluation on the user side.

Figure 5.3 Example of the Connection of a Crystal Resonator

5.6.3 In the Case of Not Using the Clock Pin

In cases where the pins are not in use, fix the level on the X_{in} pin (pull it up or down, or connect it to the power-supply or ground level), and leave the X_{out} pin open state.

5.7 Oscillation Stabilizing Time

5.7.1 Oscillation Stabilizing Time of the On-chip Crystal Oscillator

In the case of using a crystal resonator, please wait longer than the oscillation stabilizing time at the following cases, to keep the oscillation stabilizing time of the on-chip crystal oscillator (In the case of inputting an external clock input, it is not necessary).

- Power on
- Releasing the software standby mode or deep standby mode by $\overline{\text{RES}}$ pin
- Changing from halting oscillation to running oscillation by power-on reset or register setting (AUDIO_X1, RTC_X1)
- Changing the gain of the on-chip crystal oscillator by $\overline{\text{RES}}$ pin (EXTAL)

5.7.2 Oscillation Stabilizing Time of the PLL circuit

The clock from EXTAL in the clock mode 0 or USB_X1 in the clock mode 1 is supplied to the PLL circuit. So, regardless of whether using a crystal resonator or inputting an external clock from EXTAL (clock mode 0) or USB_X1 (clock mode 1), please wait longer than the oscillation stabilizing time at the following cases, to keep the oscillation stabilizing time of the PLL circuit.

- Power on (in the case of using the crystal resonator)/start inputting external clock (in the case of inputting the external clock)
- Releasing the software standby mode or deep standby mode by $\overline{\text{RES}}$ pin

[Remarks]

The oscillation stabilizing time is kept by the counter running in the LSI at the following cases.

- Releasing the software standby mode or deep standby mode by the other than $\overline{\text{RES}}$ pin
- Changing the gain of the on-chip crystal oscillator by the register setting (EXTAL)

5.8 Notes on Board Design

5.8.1 Note on Using a PLL Oscillation Circuit

In the PLLVcc and PLLVss connection pattern for the PLL, signal lines from the board power supply pins must be as short as possible and pattern width must be as wide as possible to reduce inductive interferences.

Since the analog power supply pins of the PLL are sensitive to the noise, the system may malfunction due to inductive interference at the other power supply pins. To prevent such malfunction, the analog power supply pins and the digital power supply pins Vcc and PVcc should not supply the same resources on the board if at all possible.

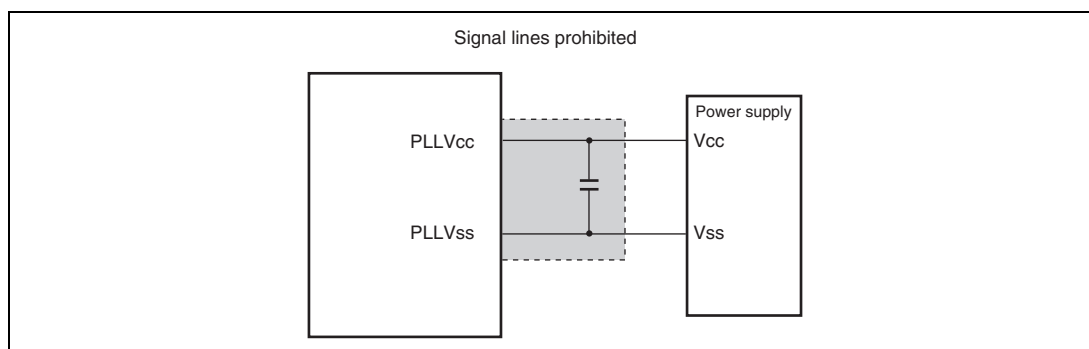

Figure 5.4 Note on Using a PLL Oscillation Circuit

Section 6 Exception Handling

6.1 Overview

6.1.1 Types of Exception Handling and Priority

Exception handling is started by sources, such as resets, address errors, register bank errors, interrupts, and instructions. Table 6.1 shows their priorities. When several exception handling sources occur at once, they are processed according to the priority shown.

Table 6.1 Types of Exception Handling and Priority Order

Type	Exception Handling	Priority
Reset	Power-on reset	
	Manual reset	
Address error	CPU address error	
	DMA address error	
Instruction	FPU exception	
	Integer division exception (division by zero)	
	Integer division exception (overflow)	
Register bank error	Bank underflow	
	Bank overflow	
Interrupt	NMI	
	User debugging interface	
	IRQ	
	PINT	

Type	Exception Handling	Priority
Instruction	Trap instruction (TRAPA instruction)	High ↑ ↓ Low
	General illegal instructions (undefined code)	
	Slot illegal instructions (undefined code placed directly after a delayed branch instruction* ¹ (including FPU instructions and FPU-related CPU instructions in FPU module standby state), instructions that rewrite the PC* ² , 32-bit instructions* ³ , RESBANK instruction, DIVS instruction, and DIVU instruction)	
Notes:	<ol style="list-style-type: none"> 1. Delayed branch instructions: JMP, JSR, BRA, BSR, RTS, RTE, BF/S, BT/S, BSRF, BRAF. 2. Instructions that rewrite the PC: JMP, JSR, BRA, BSR, RTS, RTE, BT, BF, TRAPA, BF/S, BT/S, BSRF, BRAF, JSR/N, RTV/N. 3. 32-bit instructions: BAND.B, BANDNOT.B, BCLR.B, BLD.B, BLDNOT.B, BOR.B, BORNOT.B, BSET.B, BST.B, BXOR.B, MOV.B@disp12, MOV.W@disp12, MOV.L@disp12, MOVI20, MOVI20S, MOVU.B, MOVU.W. 	

6.1.2 Exception Handling Operations

The exception handling sources are detected and start processing according to the timing shown in table 6.2.

Table 6.2 Timing of Exception Source Detection and Start of Exception Handling

Exception	Source	Timing of Source Detection and Start of Handling
Reset	Power-on reset	Starts when the RES pin changes from low to high, when the user debugging interface reset negate command is set after the user debugging interface reset assert command has been set, or when the watchdog timer overflows.
	Manual reset	Starts when the watchdog timer overflows.
Address error Interrupts		Detected when instruction is decoded and starts when the previous executing instruction finishes executing.
Register bank error	Bank underflow	Starts upon attempted execution of a RESBANK instruction when saving has not been performed to register banks.
	Bank overflow	In the state where saving has been performed to all register bank areas, starts when acceptance of register bank overflow exception has been set by the interrupt controller (the BOVE bit in IBNR of the interrupt controller is 1) and an interrupt that uses a register bank has occurred and been accepted by the CPU.

Exception	Source	Timing of Source Detection and Start of Handling
Instructions	Trap instruction	Starts from the execution of a TRAPA instruction.
	General illegal instructions	Starts from the decoding of undefined code anytime except immediately after a delayed branch instruction (delay slot) (including FPU instructions and FPU-related CPU instructions in FPU module standby state).
	Slot illegal instructions	Starts from the decoding of undefined code placed directly after a delayed branch instruction (delay slot) (including FPU instructions and FPU-related CPU instructions in FPU module standby state), of instructions that rewrite the PC, of 32-bit instructions, of the RESBANK instruction, of the DIVS instruction, or of the DIVU instruction.
	Integer division exceptions	Starts when detecting division-by-zero exception or overflow exception caused by division of the negative maximum value (H'80000000) by -1.
Instructions	FPU exceptions	Starts when detecting invalid floating point operation exception defined by IEEE standard 754, division-by-zero exception, overflow, underflow, or inexact exception. Also starts when qNaN or $\pm\infty$ is input to the source for a floating point operation instruction when the QIS bit in FPSCR is set.

When exception handling starts, the CPU operates as follows:

(1) Exception Handling Triggered by Reset

The initial values of the program counter (PC) and stack pointer (SP) are fetched from the exception handling vector table (PC and SP are respectively the H'00000000 and H'00000004 addresses for power-on resets and the H'00000008 and H'0000000C addresses for manual resets). See section 6.1.3, Exception Handling Vector Table, for more information. The vector base register (VBR) is then initialized to H'00000000, the interrupt mask level bits (I3 to I0) of the status register (SR) are initialized to H'F (B'1111), and the BO and CS bits are initialized to 0. The BN bit in IBNR of the interrupt controller is also initialized to 0. The floating point status/control register (FPSCR) is initialized to H'00040001 by a power-on reset. The program begins running from the PC address fetched from the exception handling vector table.

(2) Exception Handling Triggered by Address Errors, Register Bank Errors, Interrupts, and Instructions

SR and PC are saved to the stack indicated by R15. In the case of interrupt exception handling other than NMI with usage of the register banks enabled, general registers R0 to R14, control register GBR, system registers MACH, MACL, and PR, and the vector table address offset of the interrupt exception handling to be executed are saved to the register banks. In the case of exception handling due to an address error, register bank error, NMI interrupt, or instruction, saving to a register bank is not performed. When saving is performed to all register banks, automatic saving to the stack is performed instead of register bank saving. In this case, an interrupt controller setting must have been made so that register bank overflow exceptions are not accepted (the BOVE bit in IBNR of the interrupt controller is 0). If a setting to accept register bank overflow exceptions has been made (the BOVE bit in IBNR of the interrupt controller is 1), register bank overflow exception will be generated. In the case of interrupt exception handling, the interrupt priority level is written to the I3 to I0 bits in SR. In the case of exception handling due to an address error or instruction, the I3 to I0 bits are not affected. The exception service routine start address is then fetched from the exception handling vector table and the program begins running from that address.

6.1.3 Exception Handling Vector Table

Before exception handling begins running, the exception handling vector table must be set in memory. The exception handling vector table stores the start addresses of exception service routines. (The reset exception handling table holds the initial values of PC and SP.)

All exception sources are given different vector numbers and vector table address offsets, from which the vector table addresses are calculated. During exception handling, the start addresses of the exception service routines are fetched from the exception handling vector table, which is indicated by this vector table address.

Table 6.3 shows the vector numbers and vector table address offsets. Table 6.4 shows how vector table addresses are calculated.

Table 6.3 Exception Handling Vector Table

Exception Sources		Vector Numbers	Vector Table Address Offset
Power-on reset	PC	0	H'00000000 to H'00000003
	SP	1	H'00000004 to H'00000007
Manual reset	PC	2	H'00000008 to H'0000000B
	SP	3	H'0000000C to H'0000000F
General illegal instruction		4	H'00000010 to H'00000013
(Reserved by system)		5	H'00000014 to H'00000017
Slot illegal instruction		6	H'00000018 to H'0000001B
(Reserved by system)		7	H'0000001C to H'0000001F
		8	H'00000020 to H'00000023
CPU address error		9	H'00000024 to H'00000027
DMA address error		10	H'00000028 to H'0000002B
Interrupts	NMI	11	H'0000002C to H'0000002F
	(Reserved by system)	12	H'00000030 to H'00000033
FPU exception		13	H'00000034 to H'00000037
User debugging interface		14	H'00000038 to H'0000003B
Bank overflow		15	H'0000003C to H'0000003F
Bank underflow		16	H'00000040 to H'00000043
Integer division exception (division by zero)		17	H'00000044 to H'00000047
Integer division exception (overflow)		18	H'00000048 to H'0000004B
(Reserved by system)		19	H'0000004C to H'0000004F
		:	:
		31	H'0000007C to H'0000007F
Trap instruction (user vector)		32	H'00000080 to H'00000083
		:	:
		63	H'000000FC to H'000000FF

Exception Sources	Vector Numbers	Vector Table Address Offset
External interrupts (IRQ, PINT), on-chip peripheral module interrupts*	64 : 511	H'00000100 to H'00000103 : H'000007FC to H'000007FF

Note: * The vector numbers and vector table address offsets for each external interrupt and on-chip peripheral module interrupt are given in table 7.4 in section 7, Interrupt Controller.

Table 6.4 Calculating Exception Handling Vector Table Addresses

Exception Source	Vector Table Address Calculation
Resets	Vector table address = (vector table address offset) = (vector number) × 4
Address errors, register bank errors, interrupts, instructions	Vector table address = VBR + (vector table address offset) = VBR + (vector number) × 4

Notes: 1. Vector table address offset: See table 6.3.
2. Vector number: See table 6.3.

6.2 Resets

6.2.1 Input/Output Pins

Table 6.5 shows the pin configuration.

Table 6.5 Pin Configuration

Pin Name	Symbol	I/O	Function
Power-on reset	$\overline{\text{RES}}$	Input	When this pin is driven low, this LSI shifts to the power-on reset processing

6.2.2 Types of Reset

A reset is the highest-priority exception handling source. There are two kinds of reset, power-on and manual. As shown in table 6.6, the CPU state is initialized in both a power-on reset and a manual reset. The FPU state is initialized by a power-on reset, but not by a manual reset. On-chip peripheral module registers except a few registers are also initialized by a power-on reset, but not by a manual reset.

Table 6.6 Reset States

Type	Conditions for Transition to Reset State					Internal States		
	$\overline{\text{RES}}$	User Debugging Interface Command	Watchdog Timer Overflow	CPU	Other Modules	On-Chip High-Speed RAM	On-Chip Large-Capacity RAM (Excluding On-Chip Data Retention RAM)	On-Chip Data Retention RAM
Power-on reset	Low	—	—	Initialized	Initialized	Initialized or Retained contents* ²	Initialized or Retained contents* ³	Initialized or Retained contents* ⁴ , * ⁵
	High	User debugging interface reset assert command is set	—	Initialized	Initialized	Initialized or Retained contents* ²	Initialized or Retained contents* ³	Initialized or Retained contents* ⁴
	High	Command other than user debugging interface reset assert is set	Power-on reset	Initialized	* ¹	Initialized or Retained contents* ²	Initialized or Retained contents* ³	Initialized or Retained contents* ⁴

Type	Conditions for Transition to Reset State					Internal States		
	$\overline{\text{RES}}$	User Debugging Interface Command	Watchdog Timer Overflow	CPU	Other Modules	On-Chip High-Speed RAM	On-Chip Large- Capacity RAM (Excluding On-Chip Data Retention RAM)	On-Chip Data Retention RAM
Manual reset	High	Command other than user debugging interface reset assert is set	Manual reset	Initialized	* ¹	Retained contents	Retained contents	Retained contents

- Notes:
1. See section 36.3, Register States in Each Operating Mode.
 2. Data are retained when the setting of either the RAME or RAMWE bit is disabled.
 3. Data are retained when the setting of either the VRAME or VRAMWE bit is disabled.
 4. Data are retained when the setting of any of the VRAME, VRAMWE, or RRAMWE bits is disabled.
 5. When the deep standby mode is canceled by a power-on reset, the data cannot be retained.

6.2.3 Power-On Reset

(1) Power-On Reset by Means of $\overline{\text{RES}}$ Pin

When the $\overline{\text{RES}}$ pin is driven low, this LSI enters the power-on reset state. To reliably reset this LSI, the $\overline{\text{RES}}$ pin should be kept at the low level for the duration of the oscillation settling time at power-on or when in software standby mode (when the clock is halted), or at least 20- t_{cyc} when the clock is running. In the power-on reset state, the internal state of the CPU and all the on-chip peripheral module registers are initialized. See section 38.1, Pin States, for the status of individual pins during the power-on reset state.

In the power-on reset state, power-on reset exception handling starts when the $\overline{\text{RES}}$ pin is first driven low for a fixed period and then returned to high. The CPU operates as follows:

1. The initial value (execution start address) of the program counter (PC) is fetched from the exception handling vector table.
2. The initial value of the stack pointer (SP) is fetched from the exception handling vector table.
3. The vector base register (VBR) is cleared to H'00000000, the interrupt mask level bits (I3 to I0) of the status register (SR) are initialized to H'F (B'1111), and the BO and CS bits are initialized to 0. The BN bit in IBNR of the interrupt controller is also initialized to 0. FPSCR is initialized to H'00040001
4. The values fetched from the exception handling vector table are set in the PC and SP, and the program begins executing.

Be certain to always perform power-on reset processing when turning the system power on.

(2) Power-On Reset by Means of User Debugging Interface Reset Assert Command

When the user debugging interface reset assert command is set, this LSI enters the power-on reset state. Power-on reset by means of the user debugging interface reset assert command is equivalent to power-on reset by means of the $\overline{\text{RES}}$ pin. Setting the user debugging interface reset negate command cancels the power-on reset state. The time required between the user debugging interface reset assert command and the user debugging interface reset negate command is the same as the time to keep the $\overline{\text{RES}}$ pin low to initiate a power-on reset. In the power-on reset state generated by the user debugging interface reset assert command, setting the user debugging interface reset negate command starts power-on reset exception handling. The CPU operates in the same way as when a power-on reset was caused by the $\overline{\text{RES}}$ pin.

(3) Power-On Reset Initiated by Watchdog Timer

When a setting is made for a power-on reset to be generated in watchdog timer mode of the watchdog timer, and WTCNT of the watchdog timer overflows, this LSI enters the power-on reset state.

In this case, WRCSR of the watchdog timer and FRQCR of the clock pulse generator are not initialized by the reset signal generated by the watchdog timer.

If a reset caused by the $\overline{\text{RES}}$ pin or the user debugging interface reset assert command occurs simultaneously with a reset caused by watchdog timer overflow, the reset caused by the $\overline{\text{RES}}$ pin or the user debugging interface reset assert command has priority, and the WOVF bit in WRCSR is cleared to 0. When power-on reset exception processing is started by the watchdog timer, the CPU operates in the same way as when a power-on reset was caused by the $\overline{\text{RES}}$ pin.

6.2.4 Manual Reset

(1) Manual Reset Initiated by Watchdog Timer

When a setting is made for a manual reset to be generated in watchdog timer mode of the watchdog timer, and WTCNT of the watchdog timer overflows, this LSI enters the manual reset state.

When manual reset exception processing is started by the watchdog timer, the CPU operates as follows:

1. The initial value (execution start address) of the program counter (PC) is fetched from the exception handling vector table.
2. The initial value of the stack pointer (SP) is fetched from the exception handling vector table.
3. The vector base register (VBR) is cleared to H'00000000, the interrupt mask level bits (I3 to I0) of the status register (SR) are initialized to H'F (B'1111), and the BO and CS bits are initialized to 0. The BN bit in IBNR of interrupt controller is also initialized to 0.
4. The values fetched from the exception handling vector table are set in the PC and SP, and the program begins executing.

(2) Note in Manual Reset

When a manual reset is generated, the bus cycle is retained, but if a manual reset occurs while the bus is released or during burst transfer by the direct memory access controller, manual reset exception handling will be deferred until the CPU acquires the bus. The CPU and the BN bit in IBNR of the interrupt controller are initialized by a manual reset. The FPU and other modules are not initialized.

6.3 Address Errors

6.3.1 Address Error Sources

Address errors occur when instructions are fetched or data read or written, as shown in table 6.7.

Table 6.7 Bus Cycles and Address Errors

Bus Cycle			
Type	Bus Master	Bus Cycle Description	Address Errors
Instruction fetch	CPU	Instruction fetched from even address	None (normal)
		Instruction fetched from odd address	Address error occurs
		Instruction fetched from other than on-chip peripheral module space* or H'F0000000 to H'F5FFFFFF in on-chip RAM space*	None (normal)
		Instruction fetched from on-chip peripheral module space* or H'F0000000 to H'F5FFFFFF in on-chip RAM space*	Address error occurs
Data read/write	CPU or direct memory access controller	Word data accessed from even address	None (normal)
		Word data accessed from odd address	Address error occurs
		Longword data accessed from a longword boundary	None (normal)
		Longword data accessed from other than a long-word boundary	Address error occurs
		Double longword data accessed from double longword boundary	None (normal)
		Double longword data accessed from other than double longword boundary	Address error occurs
		Byte or word data accessed in on-chip peripheral module space*	None (normal)
		Longword data accessed in 16-bit on-chip peripheral module space*	None (normal)
		Longword data accessed in 8-bit on-chip peripheral module space*	None (normal)

Note: * See section 9, Bus State Controller, for details of the on-chip peripheral module space and on-chip RAM space.

6.3.2 Address Error Exception Handling

When an address error occurs, the bus cycle in which the address error occurred ends. When the executing instruction then finishes, address error exception handling starts. The CPU operates as follows:

1. The exception service routine start address which corresponds to the address error that occurred is fetched from the exception handling vector table.
2. The status register (SR) is saved to the stack.
3. The program counter (PC) is saved to the stack. The PC value saved is the start address of the instruction to be executed after the last executed instruction.
4. After jumping to the exception service routine start address fetched from the exception handling vector table, program execution starts. The jump that occurs is not a delayed branch.

6.4 Register Bank Errors

6.4.1 Register Bank Error Sources

(1) Bank Overflow

In the state where saving has already been performed to all register bank areas, bank overflow occurs when acceptance of register bank overflow exception has been set by the interrupt controller (the BOVE bit in IBNR of the interrupt controller is set to 1) and an interrupt that uses a register bank has occurred and been accepted by the CPU.

(2) Bank Underflow

Bank underflow occurs when an attempt is made to execute a RESBANK instruction while saving has not been performed to register banks.

6.4.2 Register Bank Error Exception Handling

When a register bank error occurs, register bank error exception handling starts. The CPU operates as follows:

1. The exception service routine start address which corresponds to the register bank error that occurred is fetched from the exception handling vector table.
2. The status register (SR) is saved to the stack.
3. The program counter (PC) is saved to the stack. The PC value saved is the start address of the instruction to be executed after the last executed instruction for a bank overflow, and the start address of the executed RESBANK instruction for a bank underflow.

To prevent multiple interrupts from occurring at a bank overflow, the priority level of the interrupt that caused the bank overflow is written to the interrupt mask level bits (I3 to I0) of the status register (SR).

4. After jumping to the exception service routine start address fetched from the exception handling vector table, program execution starts. The jump that occurs is not a delayed branch.

6.5 Interrupts

6.5.1 Interrupt Sources

The sources that start interrupt exception handling are divided into NMI, user debugging interface, IRQ, PINT, and on-chip peripheral modules.

Each interrupt source is allocated a different vector number and vector table offset. See table 7.4 in section 7, Interrupt Controller, for more information on vector numbers and vector table address offsets.

6.5.2 Interrupt Priority Level

The interrupt priority order is predetermined. When multiple interrupts occur simultaneously (overlap), the interrupt controller determines their relative priorities and starts exception handling according to the results.

The priority order of interrupts is expressed as priority levels 0 to 16, with priority 0 the lowest and priority 16 the highest. The NMI interrupt has priority 16 and cannot be masked, so it is always accepted. The priority level of user debugging interface interrupts is 15. Priority levels of IRQ interrupts, PINT interrupts, and on-chip peripheral module interrupts can be set freely using the interrupt priority registers 01, 02, and 05 to 23 (IPR01, IPR02, and IPR05 to IPR23) of the interrupt controller as shown in table 6.9. The priority levels that can be set are 0 to 15. Level 16 cannot be set. See section 7.3.1, Interrupt Priority Registers 01, 02, 05 to 23 (IPR01, IPR02, IPR05 to IPR23), for details of IPR01, IPR02, and IPR05 to IPR23.

Table 6.9 Interrupt Priority Order

Type	Priority Level	Comment
NMI	16	Fixed priority level. Cannot be masked.
User debugging interface	15	Fixed priority level.
IRQ	0 to 15	Set with interrupt priority registers 01, 02, and 05 to 23 (IPR01, IPR02, and IPR05 to IPR23).
PINT		
On-chip peripheral module		

6.5.3 Interrupt Exception Handling

When an interrupt occurs, its priority level is ascertained by the interrupt controller. NMI is always accepted, but other interrupts are only accepted if they have a priority level higher than the priority level set in the interrupt mask level bits (I3 to I0) of the status register (SR).

When an interrupt is accepted, interrupt exception handling begins. In interrupt exception handling, the CPU fetches the exception service routine start address which corresponds to the accepted interrupt from the exception handling vector table, and saves SR and the program counter (PC) to the stack. In the case of interrupt exception handling other than NMI with usage of the register banks enabled, general registers R0 to R14, control register GBR, system registers MACH, MACL, and PR, and the vector table address offset of the interrupt exception handling to be executed are saved in the register banks. In the case of exception handling due to an address error, NMI interrupt, or instruction, saving is not performed to the register banks. If saving has been performed to all register banks (0 to 14), automatic saving to the stack is performed instead of register bank saving. In this case, an interrupt controller setting must have been made so that register bank overflow exceptions are not accepted (the BOVE bit in IBNR of the interrupt controller is 0). If a setting to accept register bank overflow exceptions has been made (the BOVE bit in IBNR of the interrupt controller is 1), register bank overflow exception occurs. Next, the priority level value of the accepted interrupt is written to the I3 to I0 bits in SR. For NMI, however, the priority level is 16, but the value set in the I3 to I0 bits is H'F (level 15). Then, after jumping to the start address fetched from the exception handling vector table, program execution starts. The jump that occurs is not a delayed branch. See section 7.6, Operation, for further details of interrupt exception handling.

6.6 Exceptions Triggered by Instructions

6.6.1 Types of Exceptions Triggered by Instructions

Exception handling can be triggered by trap instructions, general illegal instructions, slot illegal instructions, integer division exceptions, and FPU exceptions, as shown in table 6.10.

Table 6.10 Types of Exceptions Triggered by Instructions

Type	Source Instruction	Comment
Trap instruction	TRAPA	
Slot illegal instructions	Undefined code placed immediately after a delayed branch instruction (delay slot) (including FPU instructions and FPU-related CPU instructions in FPU module standby state), instructions that rewrite the PC, 32-bit instructions, RESBANK instruction, DIVS instruction, and DIVU instruction	Delayed branch instructions: JMP, JSR, BRA, BSR, RTS, RTE, BF/S, BT/S, BSRF, BRAF Instructions that rewrite the PC: JMP, JSR, BRA, BSR, RTS, RTE, BT, BF, TRAPA, BF/S, BT/S, BSRF, BRAF, JSR/N, RTV/N 32-bit instructions: BAND.B, BANDNOT.B, BCLR.B, BLD.B, BLDNOT.B, BOR.B, BORNOT.B, BSET.B, BST.B, BXOR.B, MOV.B@disp12, MOV.W@disp12, MOV.L@disp12, MOVI20, MOVI20S, MOVU.B, MOVU.W.
General illegal instructions	Undefined code anywhere besides in a delay slot (including FPU instructions and FPU-related CPU instructions in FPU module standby state)	
Integer division exceptions	Division by zero	DIVU, DIVS
	Negative maximum value + (-1)	DIVS
FPU exceptions	Starts when detecting invalid operation exception defined by IEEE754, division-by-zero exception, overflow, underflow, or inexact exception.	FADD, FSUB, FMUL, FDIV, FMAC, FCMP/EQ, FCMP/GT, FLOAT, FTRC, FCNVDS, FCNVSD, FSQRT

6.6.2 Trap Instructions

When a TRAPA instruction is executed, trap instruction exception handling starts. The CPU operates as follows:

1. The exception service routine start address which corresponds to the vector number specified in the TRAPA instruction is fetched from the exception handling vector table.
2. The status register (SR) is saved to the stack.
3. The program counter (PC) is saved to the stack. The PC value saved is the start address of the instruction to be executed after the TRAPA instruction.
4. After jumping to the exception service routine start address fetched from the exception handling vector table, program execution starts. The jump that occurs is not a delayed branch.

6.6.3 Slot Illegal Instructions

An instruction placed immediately after a delayed branch instruction is called the “instruction placed in a delay slot”. When the instruction placed in the delay slot is undefined code (including FPU instructions and FPU-related CPU instructions in FPU module standby state), an instruction that rewrites the PC, a 32-bit instruction, an RESBANK instruction, a DIVS instruction, or a DIVU instruction, slot illegal exception handling starts when such kind of instruction is decoded. When the FPU has entered a module standby state, the floating point operation instruction and FPU-related CPU instructions are handled as undefined codes. If these instructions are placed in a delay slot and then decoded, a slot illegal instruction exception handling starts.

The CPU operates as follows:

1. The exception service routine start address is fetched from the exception handling vector table.
2. The status register (SR) is saved to the stack.
3. The program counter (PC) is saved to the stack. The PC value saved is the jump address of the delayed branch instruction immediately before the undefined code, the instruction that rewrites the PC, the 32-bit instruction, the RESBANK instruction, the DIVS instruction, or the DIVU instruction.
4. After jumping to the exception service routine start address fetched from the exception handling vector table, program execution starts. The jump that occurs is not a delayed branch.

6.6.4 General Illegal Instructions

When an undefined code, including FPU instructions and FPU-related CPU instructions in FPU module standby state, placed anywhere other than immediately after a delayed branch instruction, i.e., in a delay slot, is decoded, general illegal instruction exception handling starts. When the FPU has entered a module standby state, the floating point instruction and FPU-related CPU instructions are handled as undefined codes. If these instructions are placed anywhere other than immediately after a delayed branch instruction (i.e., in a delay slot) and then decoded, general illegal instruction exception handling starts.

In general illegal instruction exception handling, the CPU handles general illegal instructions in the same way as slot illegal instructions. Unlike processing of slot illegal instructions, however, the program counter value stored is the start address of the undefined code.

6.6.5 Integer Division Exceptions

When an integer division instruction performs division by zero or the result of integer division overflows, integer division instruction exception handling starts. The instructions that may become the source of division-by-zero exception are DIVU and DIVS. The only source instruction of overflow exception is DIVS, and overflow exception occurs only when the negative maximum value is divided by -1 . The CPU operates as follows:

1. The exception service routine start address which corresponds to the integer division exception that occurred is fetched from the exception handling vector table.
2. The status register (SR) is saved to the stack.
3. The program counter (PC) is saved to the stack. The PC value saved is the start address of the integer division instruction at which the exception occurred.
4. After jumping to the exception service routine start address fetched from the exception handling vector table, program execution starts. The jump that occurs is not a delayed branch.

6.6.6 FPU Exceptions

An FPU exception handling is generated when the V, Z, O, U or I bit in the FPU exception enable field (Enable) of the floating point status/control register (FPSCR) is set. This indicates the occurrence of an invalid operation exception defined by the IEEE standard 754, a division-by-zero exception, overflow (in the case of an instruction for which this is possible), underflow (in the case of an instruction for which this is possible), or inexact exception (in the case of an instruction for which this is possible).

The floating point operation instructions that may cause an FPU exception handling are FADD, FSUB, FMUL, FDIV, FMAC, FCMP/EQ, FCMP/GT, FLOAT, FTRC, FCNVDS, FCNVSD, and FSQRT.

An FPU exception handling is generated only when the corresponding FPU exception enable bit (Enable) is set. When the FPU detects an exception source in floating point operation, FPU operation is halted and generation of an FPU exception handling is reported to the CPU. When exception handling is started, the CPU operations are as follows.

1. The start address of the exception service routine which corresponds to the FPU exception handling that occurred is fetched from the exception handling vector table.
2. The status register (SR) is saved to the stack.
3. The program counter (PC) is saved to the stack. The PC value saved is the start address of the instruction to be executed after the last executed instruction.
4. After jumping to the exception service routine start address fetched from the exception handling vector table, program execution starts. This jump is not a delayed branch.

The FPU exception flag field (Flag) of FPSCR is always updated regardless of whether or not an FPU exception handling has been accepted, and remains set until explicitly cleared by the user through an instruction. The FPU exception source field (Cause) of FPSCR changes each time a floating point operation instruction is executed.

When the V bit in the FPU exception enable field (Enable) of FPSCR is set and the QIS bit in FPSCR is also set, FPU exception handling is generated when qNAN or $\pm\infty$ is input to a floating point operation instruction source.

6.7 When Exception Sources Are Not Accepted

When an address error, FPU exception, register bank error (overflow), or interrupt is generated immediately after a delayed branch instruction, it is sometimes not accepted immediately but stored instead, as shown in table 6.11. When this happens, it will be accepted when an instruction that can accept the exception is decoded.

Table 6.11 Exception Source Generation Immediately after Delayed Branch Instruction

Point of Occurrence	Exception Source			
	Address Error	Floating-Point Unit Exception	Register Bank Error (Overflow)	Interrupt
Immediately after a delayed branch instruction*	Not accepted	Not accepted	Not accepted	Not accepted

Note: * Delayed branch instructions: JMP, JSR, BRA, BSR, RTS, RTE, BF/S, BT/S, BSRF, BRAF

6.8 Stack Status after Exception Handling Ends

The status of the stack after exception handling ends is as shown in table 6.12.

Table 6.12 Stack Status After Exception Handling Ends

Exception Type	Stack Status
Address error	
Interrupt	

Exception Type	Stack Status				
Register bank error (overflow)	<p>SP →</p> <table border="1"> <tr> <td>Address of instruction after executed instruction</td> <td>32 bits</td> </tr> <tr> <td>SR</td> <td>32 bits</td> </tr> </table>	Address of instruction after executed instruction	32 bits	SR	32 bits
Address of instruction after executed instruction	32 bits				
SR	32 bits

6.9 Usage Notes

6.9.1 Value of Stack Pointer (SP)

The value of the stack pointer must always be a multiple of four. If it is not, an address error will occur when the stack is accessed during exception handling.

6.9.2 Value of Vector Base Register (VBR)

The value of the vector base register must always be a multiple of four. If it is not, an address error will occur when the stack is accessed during exception handling.

6.9.3 Address Errors Caused by Stacking of Address Error Exception Handling

When the stack pointer is not a multiple of four, an address error will occur during stacking of the exception handling (interrupts, etc.) and address error exception handling will start up as soon as the first exception handling is ended. Address errors will then also occur in the stacking for this address error exception handling. To ensure that address error exception handling does not go into an endless loop, no address errors are accepted at that point. This allows program control to be shifted to the address error exception service routine and enables error processing.

When an address error occurs during exception handling stacking, the stacking bus cycle (write) is executed. During stacking of the status register (SR) and program counter (PC), the SP is decremented by 4 for both, so the value of SP will not be a multiple of four after the stacking either. The address value output during stacking is the SP value, so the address where the error occurred is itself output. This means the write data stacked will be undefined.

6.9.4 Note before Exception Handling Begins Running

Before exception handling begins running, the exception handling vector table must be stored in a memory, and the CPU must be able to access the memory. So, if the exception handling is generated

- Ex. 1: when the exception handling vector table is stored in an external address space, but the settings of bus state controller and general I/O ports to access the external address space have been not completed yet, or
- Ex. 2: when the exception handling vector table is stored in the on-chip RAM, but the vector base register (VBR) has been not changed to the on-chip RAM address yet,

the CPU fetches an unintended value as the execution start address, and starts executing programs from unintended address.

(1) Manual Reset

Before the settings necessary to access the external CS0 space are completed, the manual reset should not be generated. When a manual reset is generated, the CPU fetches the execution start address from the location at the offset for the manual reset (H'00000008) in the vector table, that is, always from the external CS0 space. Additionally, in the case that no memory is connected to the external CS0 space in boot mode 1 to 3, the manual reset should not be generated.

(2) NMI Interrupt

Before the exception handling vector table is stored in a memory and the settings necessary to access the memory are completed, the settings to permit the interrupts should not be done.

Specially in boot mode 1 to 3, the VBR is kept as the initial value H'00000000 in the period of the boot operation (before the transfer of the loader program is completed and the CPU jumps to the on-chip high-speed RAM). Before the VBR is changed or the settings necessary to access the external address space are completed in the loader program, the settings to permit the interrupts should not be done.

(3) Interrupts Other Than NMI

Before the exception handling vector table is stored in a memory and the settings necessary to access the memory are completed, the settings to permit the interrupts should not be done.

(4) The Other Exceptions

Before the exception handling vector table is stored in a memory and the settings necessary to access the memory are completed, the exception handling should not be generated.

Section 7 Interrupt Controller

The interrupt controller ascertains the priority of interrupt sources and controls interrupt requests to the CPU. The interrupt controller registers set the order of priority of each interrupt, allowing the user to process interrupt requests according to the user-set priority.

7.1 Features

- 16 levels of interrupt priority can be set.
By setting the 21 interrupt priority registers, the priorities of IRQ interrupts, PINT interrupts, and on-chip peripheral module interrupts can be selected from 16 levels for request sources.
- NMI noise canceler function
An NMI input-level bit indicates the NMI pin state. By reading this bit in the interrupt exception service routine, the pin state can be checked, enabling it to be used as the noise canceler function.
- Register banks
This LSI has register banks that enable register saving and restoration required in the interrupt processing to be performed at high speed.

Figure 7.1 shows a block diagram.

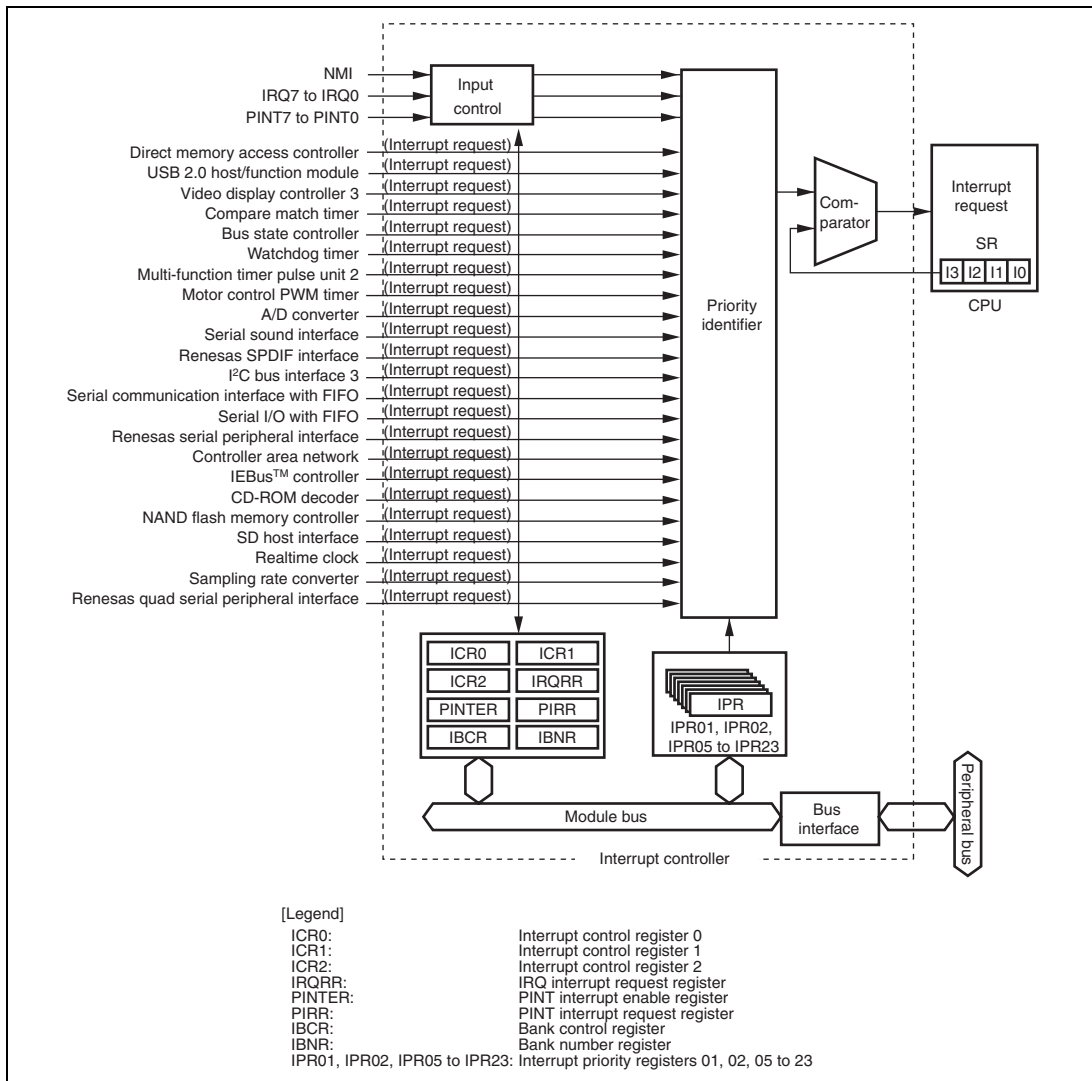

Figure 7.1 Block Diagram

7.2 Input/Output Pins

Table 7.1 shows the pin configuration.

Table 7.1 Pin Configuration

Pin Name	Symbol	I/O	Function
Nonmaskable interrupt input pin	NMI	Input	Input of nonmaskable interrupt request signal
Interrupt request input pins	IRQ7 to IRQ0	Input	Input of maskable interrupt request signals
	PINT7 to PINT0	Input	

7.3 Register Descriptions

Table 7.2 shows the register configuration. These registers are used to set the interrupt priorities and control detection of the external interrupt input signal.

Table 7.2 Register Configuration

Register Name	Abbreviation	R/W	Initial Value	Address	Access Size
Interrupt control register 0	ICR0	R/W	* ¹	H'FFFE0800	16, 32
Interrupt control register 1	ICR1	R/W	H'0000	H'FFFE0802	16, 32
Interrupt control register 2	ICR2	R/W	H'0000	H'FFFE0804	16, 32
IRQ interrupt request register	IRQRR	R/(W)* ²	H'0000	H'FFFE0806	16, 32
PINT interrupt enable register	PINTER	R/W	H'0000	H'FFFE0808	16, 32
PINT interrupt request register	PIRR	R	H'0000	H'FFFE080A	16, 32
Bank control register	IBCR	R/W	H'0000	H'FFFE080C	16, 32
Bank number register	IBNR	R/W	H'0000	H'FFFE080E	16, 32
Interrupt priority register 01	IPR01	R/W	H'0000	H'FFFE0818	16, 32
Interrupt priority register 02	IPR02	R/W	H'0000	H'FFFE081A	16, 32
Interrupt priority register 05	IPR05	R/W	H'0000	H'FFFE0820	16, 32
Interrupt priority register 06	IPR06	R/W	H'0000	H'FFFE0C00	16, 32
Interrupt priority register 07	IPR07	R/W	H'0000	H'FFFE0C02	16, 32
Interrupt priority register 08	IPR08	R/W	H'0000	H'FFFE0C04	16, 32
Interrupt priority register 09	IPR09	R/W	H'0000	H'FFFE0C06	16, 32
Interrupt priority register 10	IPR10	R/W	H'0000	H'FFFE0C08	16, 32
Interrupt priority register 11	IPR11	R/W	H'0000	H'FFFE0C0A	16, 32
Interrupt priority register 12	IPR12	R/W	H'0000	H'FFFE0C0C	16, 32
Interrupt priority register 13	IPR13	R/W	H'0000	H'FFFE0C0E	16, 32
Interrupt priority register 14	IPR14	R/W	H'0000	H'FFFE0C10	16, 32
Interrupt priority register 15	IPR15	R/W	H'0000	H'FFFE0C12	16, 32
Interrupt priority register 16	IPR16	R/W	H'0000	H'FFFE0C14	16, 32
Interrupt priority register 17	IPR17	R/W	H'0000	H'FFFE0C16	16, 32
Interrupt priority register 18	IPR18	R/W	H'0000	H'FFFE0C18	16, 32
Interrupt priority register 19	IPR19	R/W	H'0000	H'FFFE0C1A	16, 32
Interrupt priority register 20	IPR20	R/W	H'0000	H'FFFE0C1C	16, 32

Register Name	Abbreviation	R/W	Initial Value	Address	Access Size
Interrupt priority register 21	IPR21	R/W	H'0000	H'FFFE0C1E	16, 32
Interrupt priority register 22	IPR22	R/W	H'0000	H'FFFE0C20	16, 32
Interrupt priority register 23	IPR23	R/W	H'0000	H'FFFE0C22	16, 32

Notes: 1. When the NMI pin is high, becomes H'8001; when low, becomes H'0001.
2. Only 0 can be written after reading 1, to clear the flag.

7.3.1 Interrupt Priority Registers 01, 02, 05 to 23 (IPR01, IPR02, IPR05 to IPR23)

IPR01, IPR02, and IPR05 to IPR23 are 16-bit readable/writable registers in which priority levels from 0 to 15 are set for IRQ interrupts, PINT interrupts, and on-chip peripheral module interrupts. Table 7.3 shows the correspondence between the interrupt request sources and the bits in IPR01, IPR02, and IPR05 to IPR23.

Table 7.3 Interrupt Request Sources and IPR01, IPR02, and IPR05 to IPR23

Register Name	Bits 15 to 12	Bits 11 to 8	Bits 7 to 4	Bits 3 to 0
IPR01	IRQ0	IRQ1	IRQ2	IRQ3
IPR02	IRQ4	IRQ5	IRQ6	IRQ7
IPR05	PINT7 to PINT0	Reserved	Reserved	Reserved
IPR06	Direct memory access controller channel 0	Direct memory access controller channel 1	Direct memory access controller channel 2	Direct memory access controller channel 3
IPR07	Direct memory access controller channel 4	Direct memory access controller channel 5	Direct memory access controller channel 6	Direct memory access controller channel 7
IPR08	Direct memory access controller channel 8	Direct memory access controller channel 9	Direct memory access controller channel 10	Direct memory access controller channel 11
IPR09	Direct memory access controller channel 12	Direct memory access controller channel 13	Direct memory access controller channel 14	Direct memory access controller channel 15
IPR10	USB 2.0 host/function module	Video display controller 3	Compare match timer channel 0	Compare match timer channel 1
IPR11	Bus state controller	Watchdog timer	Multi-function timer pulse unit 2 channel 0 (TGI0A to TGI0D)	Multi-function timer pulse unit 2 channel 0 (TCI0V, TGI0E, TGI0F)

Register Name	Bits 15 to 12	Bits 11 to 8	Bits 7 to 4	Bits 3 to 0
IPR12	Multi-function timer pulse unit 2 channel 1 (TGI1A, TGI1B)	Multi-function timer pulse unit 2 channel 1 (TCI1V, TCI1U)	Multi-function timer pulse unit 2 channel 2 (TGI2A, TGI2B)	Multi-function timer pulse unit 2 channel 2 (TCI2V, TCI2U)
IPR13	Multi-function timer pulse unit 2 channel 3 (TGI3A to TGI3D)	Multi-function timer pulse unit 2 channel 3 (TCI3V)	Multi-function timer pulse unit 2 channel 4 (TGI4A to TGI4D)	Multi-function timer pulse unit 2 channel 4 (TCI4V)
IPR14	Motor control PWM timer channel 1	Motor control PWM timer channel 2	A/D converter	Reserved
IPR15	Serial sound interface channel 0	Serial1sound interface channel 0	Serial sound interface channel 2	Serial sound interface channel 3
IPR16	Renesas SPDIF interface	I ² C bus interface 3 channel 0	I ² C bus interface 3 channel 1	I ² C bus interface 3 channel 2
IPR17	Channel 0 for serial communication interface with FIFO	Channel 1 for serial communication interface with FIFO	Channel 2 for serial communication interface with FIFO	Channel 3 for serial communication interface with FIFO
IPR18	Channel 4 for serial communication interface with FIFO	Channel 5 for serial communication interface with FIFO	Channel 6 for serial communication interface with FIFO	Channel 7 for serial communication interface with FIFO
IPR19	Serial I/O with FIFO	Reserved	Renesas serial peripheral interface channel 0	Renesas serial peripheral interface channel 1
IPR20	Controller area network channel 0	Controller area network channel 1	IEBus™ controller	CD-ROM decoder
IPR21	NAND flash memory controller	SD host interface	Realtime clock	Reserved
IPR22	Sampling rate converter channel 0	Sampling rate converter channel 1	Reserved	Reserved
IPR23	Renesas quad serial peripheral interface	Reserved	Reserved	Reserved

As shown in table 7.3, by setting the 4-bit groups (bits 15 to 12, bits 11 to 8, bits 7 to 4, and bits 3 to 0) with values from H'0 (0000) to H'F (1111), the priority of each corresponding interrupt is set. Setting of H'0 means priority level 0 (the lowest level) and H'F means priority level 15 (the highest level).

7.3.2 Interrupt Control Register 0 (ICR0)

ICR0 is a 16-bit register that sets the input signal detection mode for the external interrupt input pin NMI, and indicates the input level at the NMI pin.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	NMIL	-	-	-	-	-	-	NMIE	-	-	-	-	-	-	NMIF	NMIM
Initial value:	*1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R	R/W	R	R	R	R	R	R	R	R/(W)*2

Notes: 1. 1 when the NMI pin is high, and 0 when the NMI pin is low.
2. Only 0 can be written to this bit.

Bit	Bit Name	Initial Value	R/W	Description
15	NMIL	*	R	NMI Input Level Sets the level of the signal input at the NMI pin. The NMI pin level can be obtained by reading this bit. This bit cannot be modified. 0: Low level is input to NMI pin 1: High level is input to NMI pin
14 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	NMIE	0	R/W	NMI Edge Select Selects whether the falling or rising edge of the interrupt request signal on the NMI pin is detected. 0: Interrupt request is detected on falling edge of NMI input 1: Interrupt request is detected on rising edge of NMI input
7 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
1	NMIF	0	R	<p>NMI Interrupt Request</p> <p>This bit indicates the status of the NMI interrupt request. This bit cannot be modified.</p> <p>0: NMI interrupt request has not occurred [Clearing conditions]</p> <ul style="list-style-type: none"> • Cleared by changing NMIE of ICR0 • Cleared by executing NMI interrupt exception handling <p>1: NMI interrupt request is detected [Setting condition]</p> <ul style="list-style-type: none"> • Edge corresponding to NMIE of ICR0 has occurred at NMI pin
0	NMIM	1	R/(W) *2	<p>NMI Mask</p> <p>Selects whether to enable interrupt request input to external interrupt input pin NMI.</p> <p>0: NMI input interrupt request is enabled 1: NMI input interrupt request is masked</p>

7.3.3 Interrupt Control Register 1 (ICR1)

ICR1 is a 16-bit register that specifies the detection mode for external interrupt input pins IRQ7 to IRQ0 individually: low level, falling edge, rising edge, or both edges.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	IRQ71S	IRQ70S	IRQ61S	IRQ60S	IRQ51S	IRQ50S	IRQ41S	IRQ40S	IRQ31S	IRQ30S	IRQ21S	IRQ20S	IRQ11S	IRQ10S	IRQ01S	IRQ00S
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15	IRQ71S	0	R/W	IRQ Sense Select
14	IRQ70S	0	R/W	These bits select whether interrupt signals corresponding to pins IRQ7 to IRQ0 are detected by a low level, falling edge, rising edge, or both edges.
13	IRQ61S	0	R/W	
12	IRQ60S	0	R/W	00: Interrupt request is detected on low level of IRQn input
11	IRQ51S	0	R/W	
10	IRQ50S	0	R/W	01: Interrupt request is detected on falling edge of IRQn input
9	IRQ41S	0	R/W	
8	IRQ40S	0	R/W	10: Interrupt request is detected on rising edge of IRQn input
7	IRQ31S	0	R/W	
6	IRQ30S	0	R/W	11: Interrupt request is detected on both edges of IRQn input
5	IRQ21S	0	R/W	
4	IRQ20S	0	R/W	
3	IRQ11S	0	R/W	
2	IRQ10S	0	R/W	
1	IRQ01S	0	R/W	
0	IRQ00S	0	R/W	

[Legend]

n = 7 to 0

7.3.4 Interrupt Control Register 2 (ICR2)

ICR2 is a 16-bit register that specifies the detection mode for external interrupt input pins PINT7 to PINT0 individually: low level or high level.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	PINT7S	PINT6S	PINT5S	PINT4S	PINT3S	PINT2S	PINT1S	PINT0S
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
7	PINT7S	0	R/W	PINT Sense Select
6	PINT6S	0	R/W	These bits select whether interrupt signals corresponding to pins PINT7 to PINT0 are detected by a low level or high level. 0: Interrupt request is detected on low level of PINTn input 1: Interrupt request is detected on high level of PINTn input
5	PINT5S	0	R/W	
4	PINT4S	0	R/W	
3	PINT3S	0	R/W	
2	PINT2S	0	R/W	
1	PINT1S	0	R/W	
0	PINT0S	0	R/W	

[Legend]

n = 7 to 0

7.3.5 IRQ Interrupt Request Register (IRQRR)

IRQRR is a 16-bit register that indicates interrupt requests from external input pins IRQ7 to IRQ0. If edge detection is set for the IRQ7 to IRQ0 interrupts, writing 0 to the IRQ7F to IRQ0F bits after reading IRQ7F to IRQ0F = 1 cancels the retained interrupts.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	IRQ7F	IRQ6F	IRQ5F	IRQ4F	IRQ3F	IRQ2F	IRQ1F	IRQ0F
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/(W)*	R/(W)*	R/(W)*	R/(W)*	R/(W)*	R/(W)*	R/(W)*	R/(W)*

Note: * Only 0 can be written to clear the flag after 1 is read.

Bit	Bit Name	Initial Value	R/W	Description
15 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
7	IRQ7F	0	R/(W)*	IRQ Interrupt Request
6	IRQ6F	0	R/(W)*	These bits indicate the status of the IRQ7 to IRQ0 interrupt requests.
5	IRQ5F	0	R/(W)*	
4	IRQ4F	0	R/(W)*	Level detection: 0: IRQn interrupt request has not occurred
3	IRQ3F	0	R/(W)*	[Clearing condition]
2	IRQ2F	0	R/(W)*	• IRQn input is high
1	IRQ1F	0	R/(W)*	1: IRQn interrupt has occurred
0	IRQ0F	0	R/(W)*	[Setting condition] • IRQn input is low Edge detection: 0: IRQn interrupt request is not detected [Clearing conditions] • Cleared by reading IRQnF while IRQnF = 1, then writing 0 to IRQnF • Cleared by executing IRQn interrupt exception handling 1: IRQn interrupt request is detected [Setting condition] • Edge corresponding to IRQn1S or IRQn0S of ICR1 has occurred at IRQn pin

[Legend]

n = 7 to 0

7.3.6 PINT Interrupt Enable Register (PINTER)

PINTER is a 16-bit register that enables interrupt request inputs to external interrupt input pins PINT7 to PINT0.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	PINT7E	PINT6E	PINT5E	PINT4E	PINT3E	PINT2E	PINT1E	PINT0E
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
7	PINT7E	0	R/W	PINT Enable
6	PINT6E	0	R/W	These bits select whether to enable interrupt request inputs to external interrupt input pins PINT7 to PINT0. 0: PINTn input interrupt request is disabled 1: PINTn input interrupt request is enabled
5	PINT5E	0	R/W	
4	PINT4E	0	R/W	
3	PINT3E	0	R/W	
2	PINT2E	0	R/W	
1	PINT1E	0	R/W	
0	PINT0E	0	R/W	

[Legend]

n = 7 to 0

7.3.7 PINT Interrupt Request Register (PIRR)

PIRR is a 16-bit register that indicates interrupt requests from external input pins PINT7 to PINT0.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	PINT7R	PINT6R	PINT5R	PINT4R	PINT3R	PINT2R	PINT1R	PINT0R
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
7	PINT7R	0	R	PINT Interrupt Request
6	PINT6R	0	R	These bits indicate the status of the PINT7 to PINT0 interrupt requests.
5	PINT5R	0	R	
4	PINT4R	0	R	0: No interrupt request at PINTn pin
3	PINT3R	0	R	1: Interrupt request at PINTn pin
2	PINT2R	0	R	
1	PINT1R	0	R	
0	PINT0R	0	R	

[Legend]

n = 7 to 0

7.3.8 Bank Control Register (IBCR)

IBCR is a 16-bit register that enables or disables use of register banks for each interrupt priority level.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	E15	E14	E13	E12	E11	E10	E9	E8	E7	E6	E5	E4	E3	E2	E1	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R

Bit	Bit Name	Initial Value	R/W	Description
15	E15	0	R/W	Enable
14	E14	0	R/W	These bits enable or disable use of register banks for interrupt priority levels 15 to 1.
13	E13	0	R/W	
12	E12	0	R/W	0: Use of register banks is disabled
11	E11	0	R/W	1: Use of register banks is enabled
10	E10	0	R/W	
9	E9	0	R/W	
8	E8	0	R/W	
7	E7	0	R/W	
6	E6	0	R/W	
5	E5	0	R/W	
4	E4	0	R/W	
3	E3	0	R/W	
2	E2	0	R/W	
1	E1	0	R/W	
0	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.

7.3.9 Bank Number Register (IBNR)

IBNR is a 16-bit register that enables or disables use of register banks and register bank overflow exception. IBNR also indicates the bank number to which saving is performed next through the bits BN3 to BN0.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	BE[1:0]		BOVE	-	-	-	-	-	-	-	-	-	BN[3:0]			
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15, 14	BE[1:0]	00	R/W	Register Bank Enable These bits enable or disable use of register banks. 00: Use of register banks is disabled for all interrupts. The setting of IBCR is ignored. 01: Use of register banks is enabled for all interrupts except NMI. The setting of IBCR is ignored. 10: Reserved (setting prohibited) 11: Use of register banks is controlled by the setting of IBCR.
13	BOVE	0	R/W	Register Bank Overflow Enable Enables or disables register bank overflow exception. 0: Generation of register bank overflow exception is disabled 1: Generation of register bank overflow exception is enabled
12 to 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
3 to 0	BN[3:0]	0000	R	Bank Number These bits indicate the bank number to which saving is performed next. When an interrupt using register banks is accepted, saving is performed to the register bank indicated by these bits, and BN is incremented by 1. After BN is decremented by 1 due to execution of a RESBANK (restore from register bank) instruction, restoration from the register bank is performed.

7.4 Interrupt Sources

There are six types of interrupt sources: NMI, user debugging interface, IRQ, PINT, and on-chip peripheral modules. Each interrupt has a priority level (0 to 16), with 0 the lowest and 16 the highest. When set to level 0, that interrupt is masked at all times.

7.4.1 NMI Interrupt

The NMI interrupt has a priority level of 16 and is accepted at all times when the NMI mask bit (NMIM) in interrupt control register 0 (ICR0) is enabled. NMI interrupt requests are edge-detected, and the NMI edge select bit (NMIE) in ICR0 selects whether the rising edge or falling edge is detected.

Though the priority level of the NMI interrupt is 16, the NMI interrupt exception handling sets the interrupt mask level bits (I3 to I0) in the status register (SR) to level 15.

When the NMIM bit in ICR0 is set to 1 (NMI interrupt request is masked), the NMI interrupt is not generated, however the NMI edge corresponding to NMIE bit of ICR0 is detected and the NMI interrupt request is retained until the interrupt request is accepted. The status of the interrupt request can be checked by reading the NMI interrupt request bit (NMIF) in the ICR0. If 0 is written to the NMIM bit (NMI interrupt request is enabled) when the NMIF bit is set to 1, the NMI interrupt request that is retained is accepted. Once the NMIM bit is set to 0 (NMI interrupt request is enabled), the NMIM bit cannot be set to 1 again, because only 0 can be written to the NMIM bit. When the NME bit is changed, the NMI interrupt request that is retained is cleared.

When canceling software standby mode by the NMI interrupt, set the NMIM bit to 0 to enable the NMI interrupt request after confirming that the NMI interrupt request has been cleared in the NMIF. If software standby mode is entered when the NMIM bit is 1 (NMI interrupt request is masked), the NMI interrupt cannot cancel software standby mode. In this case, the NMI edge cannot be detected in software standby mode and the NMI interrupt is not generated even if software standby mode is canceled by cancel source other than NMI. When the NMI pin keeps level (low level after the falling edge or high level after the rising edge) in software standby mode until software standby mode is canceled by cancel source other than NMI (until the clock is initiated after the oscillation settling), that edge of the NMI in software standby mode can be detected.

When deep standby mode is entered, deep standby mode is canceled by the NMI interrupt regardless of the NMI mask bit setting. NMIM bit is initialized by a power-on reset after canceling deep standby mode.

When a sleep instruction is to be executed after 0 has been written to the NMIM bit (enabling the NMI), read the value of the NMIM bit before executing the sleep instruction.

7.4.2 User Debugging Interface Interrupt

The user debugging interface interrupt has a priority level of 15, and occurs at serial input of a user debugging interface interrupt instruction. User debugging interface interrupt requests are edge-detected and retained until they are accepted. The user debugging interface interrupt exception handling sets the I3 to I0 bits in SR to level 15. For user debugging interface interrupts, see section 34, User Debugging Interface.

7.4.3 IRQ Interrupts

IRQ interrupts are input from pins IRQ7 to IRQ0. For the IRQ interrupts, low-level, falling-edge, rising-edge, or both-edge detection can be selected individually for each pin by the IRQ sense select bits (IRQ71S to IRQ01S and IRQ70S to IRQ00S) in interrupt control register 1 (ICR1). The priority level can be set individually in a range from 0 to 15 for each pin by interrupt priority registers 01 and 02 (IPR01 and IPR02).

When using low-level sensing for IRQ interrupts, an interrupt request signal is sent to the interrupt controller while the IRQ7 to IRQ0 pins are low. An interrupt request signal is stopped being sent to the interrupt controller when the IRQ7 to IRQ0 pins are driven high. The status of the interrupt requests can be checked by reading the IRQ interrupt request bits (IRQ7F to IRQ0F) in the IRQ interrupt request register (IRQRR).

When using edge-sensing for IRQ interrupts, an interrupt request is detected due to change of the IRQ7 to IRQ0 pin states, and an interrupt request signal is sent to the interrupt controller. The result of IRQ interrupt request detection is retained until that interrupt request is accepted. Whether IRQ interrupt requests have been detected or not can be checked by reading the IRQ7F to IRQ0F bits in IRQRR. Writing 0 to these bits after reading them as 1 clears the result of IRQ interrupt request detection.

The IRQ interrupt exception handling sets the I3 to I0 bits in SR to the priority level of the accepted IRQ interrupt.

When returning from IRQ interrupt exception service routine, execute the RTE instruction after confirming that the interrupt request has been cleared by the IRQ interrupt request register (IRQRR) so as not to accidentally receive the interrupt request again.

7.4.4 PINT Interrupts

PINT interrupts are input from pins PINT7 to PINT0. Input of the interrupt requests is enabled by the PINT enable bits (PINT7E to PINT0E) in the PINT interrupt enable register (PINTER). For the PINT7 to PINT0 interrupts, low-level or high-level detection can be selected individually for each pin by the PINT sense select bits (PINT7S to PINT0S) in interrupt control register 2 (ICR2). A single priority level in a range from 0 to 15 can be set for all PINT7 to PINT0 interrupts by bits 15 to 12 in interrupt priority register 05 (IPR05).

When using low-level sensing for the PINT7 to PINT0 interrupts, an interrupt request signal is sent to the interrupt controller while the PINT7 to PINT0 pins are low. An interrupt request signal is stopped being sent to the interrupt controller when the PINT7 to PINT0 pins are driven high. The status of the interrupt requests can be checked by reading the PINT interrupt request bits (PINT7R to PINT0R) in the PINT interrupt request register (PIRR). The above description also applies to when using high-level sensing, except for the polarity being reversed. The PINT interrupt exception handling sets the I3 to I0 bits in SR to the priority level of the PINT interrupt.

When returning from IRQ interrupt exception service routine, execute the RTE instruction after confirming that the interrupt request has been cleared by the PINT interrupt request register (PIRR) so as not to accidentally receive the interrupt request again.

7.4.5 On-Chip Peripheral Module Interrupts

On-chip peripheral module interrupts are generated by the following on-chip peripheral modules:

- Direct memory access controller
- USB 2.0 host/function module
- Video display controller 3
- Compare match timer
- Bus state controller
- Watchdog timer
- Multi-function timer pulse unit 2
- Motor control PWM timer
- A/D converter
- Serial sound interface
- Renesas SPDIF interface
- I²C bus interface 3
- Serial communication interface with FIFO
- Serial I/O with FIFO
- Renesas serial peripheral interface
- Controller area network
- IEBus™ controller
- CD-ROM decoder
- NAND flash memory controller
- SD host interface
- Realtime clock
- Sampling rate converter
- Renesas quad serial peripheral interface

As every source is assigned a different interrupt vector, the source does not need to be identified in the exception service routine. A priority level in a range from 0 to 15 can be set for each module by interrupt priority registers 05 to 23 (IPR05 to IPR23). The on-chip peripheral module interrupt exception handling sets the I3 to I0 bits in SR to the priority level of the accepted on-chip peripheral module interrupt.

7.5 Interrupt Exception Handling Vector Table and Priority

Table 7.4 lists interrupt sources and their vector numbers, vector table address offsets, and interrupt priorities.

Each interrupt source is allocated a different vector number and vector table address offset. Vector table addresses are calculated from the vector numbers and vector table address offsets. In interrupt exception handling, the interrupt exception service routine start address is fetched from the vector table indicated by the vector table address. For details of calculation of the vector table address, see table 6.4 in section 6, Exception Handling.

The priorities of IRQ interrupts, PINT interrupts, and on-chip peripheral module interrupts can be set freely between 0 and 15 for each pin or module by setting interrupt priority registers 01, 02, and 05 to 23 (IPR01, IPR02, and IPR05 to IPR23). However, if two or more interrupts specified by the same IPR among IPR05 to IPR23 occur, the priorities are defined as shown in the IPR setting unit internal priority of table 7.4, and the priorities cannot be changed. A power-on reset assigns priority level 0 to IRQ interrupts, PINT interrupts, and on-chip peripheral module interrupts. If the same priority level is assigned to two or more interrupt sources and interrupts from those sources occur simultaneously, they are processed by the default priorities indicated in table 7.4.

Table 7.4 Interrupt Exception Handling Vectors and Priorities

Interrupt Source	Interrupt Vector			Interrupt Priority (Initial Value)	Corresponding IPR (Bit)	IPR Setting Unit Internal Priority	Default Priority
	Vector	Vector Table Address Offset					
NMI	11	H'0000002C to H'0000002F		16	—	—	High
User debug interface	14	H'00000038 to H'0000003B		15	—	—

7.6 Operation

7.6.1 Interrupt Operation Sequence

The sequence of interrupt operations is described below. Figure 7.2 shows the operation flow.

1. The interrupt request sources send interrupt request signals to the interrupt controller.
2. The interrupt controller selects the highest-priority interrupt from the interrupt requests sent, following the priority levels set in interrupt priority registers 01, 02, and 05 to 23 (IPR01, IPR02, and IPR05 to IPR23). Lower priority interrupts are ignored*. If two of these interrupts have the same priority level or if multiple interrupts occur within a single IPR, the interrupt with the highest priority is selected, according to the default priority and IPR setting unit internal priority shown in table 7.4.
3. The priority level of the interrupt selected by the interrupt controller is compared with the interrupt level mask bits (I3 to I0) in the status register (SR) of the CPU. If the interrupt request priority level is equal to or less than the level set in bits I3 to I0, the interrupt request is ignored. If the interrupt request priority level is higher than the level in bits I3 to I0, the interrupt controller accepts the interrupt and sends an interrupt request signal to the CPU.
4. The CPU detects the interrupt request sent from the interrupt controller when the CPU decodes the instruction to be executed. Instead of executing the decoded instruction, the CPU starts interrupt exception handling (figure 7.4).
5. The interrupt exception service routine start address is fetched from the exception handling vector table corresponding to the accepted interrupt.
6. The status register (SR) is saved onto the stack, and the priority level of the accepted interrupt is copied to bits I3 to I0 in SR.
7. The program counter (PC) is saved onto the stack.
8. The CPU jumps to the fetched interrupt exception service routine start address and starts executing the program. The jump that occurs is not a delayed branch.

Notes: The interrupt source flag should be cleared in the interrupt handler. After clearing the interrupt source flag, "time from occurrence of interrupt request until interrupt controller identifies priority, compares it with mask bits in SR, and sends interrupt request signal to CPU" shown in table 7.5 is required before the interrupt source sent to the CPU is actually cancelled. To ensure that an interrupt request that should have been cleared is not inadvertently accepted again, read the interrupt source flag after it has been cleared, and then execute an RTE instruction.

- * Interrupt requests that are designated as edge-sensing are held pending until the interrupt requests are accepted. IRQ interrupts, however, can be cancelled by accessing the IRQ interrupt request register (IRQRR). For details, see section 7.4.3, IRQ Interrupts.

Interrupts held pending due to edge-sensing are cleared by a power-on reset.

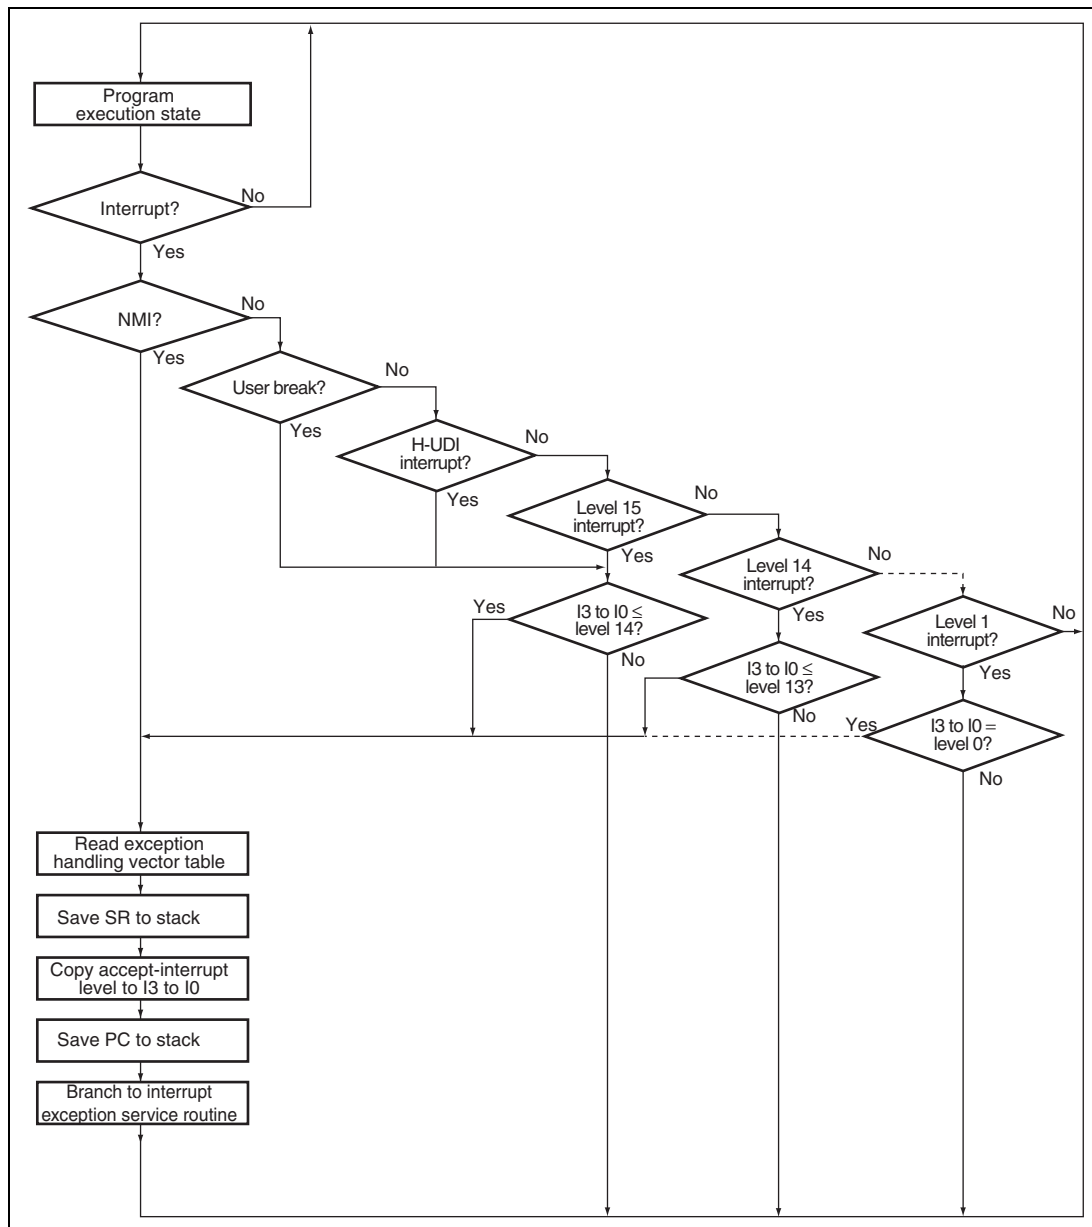

Figure 7.2 Interrupt Operation Flow

7.6.2 Stack after Interrupt Exception Handling

Figure 7.3 shows the stack after interrupt exception handling.

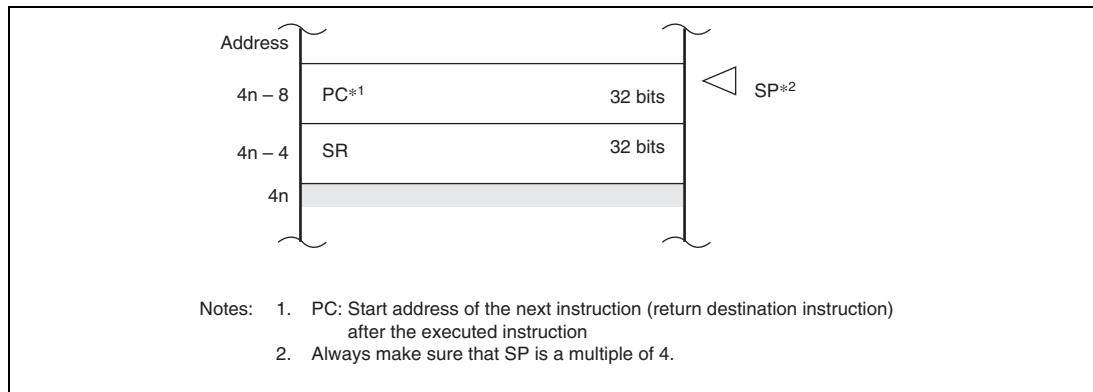

Figure 7.3 Stack after Interrupt Exception Handling

7.7 Interrupt Response Time

Table 7.5 lists the interrupt response time, which is the time from the occurrence of an interrupt request until the interrupt exception handling starts and fetching of the first instruction in the exception service routine begins. The interrupt processing operations differ in the cases when banking is disabled, when banking is enabled without register bank overflow, and when banking is enabled with register bank overflow. Figures 7.4 and 7.5 show examples of pipeline operation when banking is disabled. Figures 7.6 and 7.7 show examples of pipeline operation when banking is enabled without register bank overflow. Figures 7.8 and 7.9 show examples of pipeline operation when banking is enabled with register bank overflow.

Table 7.5 Interrupt Response Time

Item	Number of States					Remarks
	NMI	User Debugging Interface	IRQ, PINT	USB 2.0 host/function module	Peripheral Module (Other than USB 2.0 host/function module)	
Time from occurrence of interrupt request until interrupt controller identifies priority, compares it with mask bits in SR, and sends interrupt request signal to CPU	2 lcy +	2 lcy +	2 lcy +	2 lcy +	2 lcy +	
	2 Bcyc +	1 Pcyc	3 Bcyc +	4 Bcyc	2 Bcyc	
	1 Pcyc		1 Pcyc			
Time from input of interrupt request signal to CPU until sequence currently being executed is completed, interrupt exception handling starts, and first instruction in interrupt exception service routine is fetched	No register banking	Min.	3 lcy + m1 + m2			Min. is when the interrupt wait time is zero. Max. is when a higher-priority interrupt request has occurred during interrupt exception handling.
		Max.	4 lcy + 2(m1 + m2) + m3			
currently being executed is completed, interrupt exception handling starts, and first instruction in interrupt exception service routine is fetched	Register banking without register bank overflow	Min.	3 lcy + m1 + m2			Min. is when the interrupt wait time is zero. Max. is when an interrupt request has occurred during execution of the RESBANK instruction.
		Max.	12 lcy + m1 + m2			
currently being executed is completed, interrupt exception handling starts, and first instruction in interrupt exception service routine is fetched	Register banking with register bank overflow	Min.	3 lcy + m1 + m2			Min. is when the interrupt wait time is zero. Max. is when an interrupt request has occurred during execution of the RESBANK instruction.
		Max.	3 lcy + m1 + m2 + 19(m4)			

		Number of States					Peripheral Module (Other than USB 2.0 host/function module)	Remarks

		Max.	6 lcy + 2 Bcyc + 1 Pcyc + 2(m1 + m2) + m3	6 lcy + 1 Pcyc + 2(m1 + m2) + m3	6 lcy + 3 Bcyc + 1 Pcyc + 2(m1 + m2) + m3	6 lcy + 4 Bcyc + 2(m1 + m2) + m3	6 lcy + 2 Bcyc + 2(m1 + m2) + m3	144-MHz operation ^{*1*2} : 0.104 to 0.145 μs
Register banking without register bank overflow	—	Min.	—	5 lcy + 1 Pcyc + m1 + m2	5 lcy + 3 Bcyc + 1 Pcyc + m1 + m2	5 lcy + 4 Bcyc + m1 + m2	5 lcy + 2 Bcyc + m1 + m2	144-MHz operation ^{*1*2} : 0.076 to 0.118 μs
		Max.	—	14 lcy + 1 Pcyc + m1 + m2	14 lcy + 3 Bcyc + 1 Pcyc + m1 + m2	14 lcy + 4 Bcyc + m1 + m2	14 lcy + 2 Bcyc + m1 + m2	144-MHz operation ^{*1*2} : 0.138 to 0.180 μs
Register banking with register bank overflow	—	Min.	—	5 lcy + 1 Pcyc + m1 + m2	5 lcy + 3 Bcyc + 1 Pcyc + m1 + m2	5 lcy + 4 Bcyc + m1 + m2	5 lcy + 2 Bcyc + m1 + m2	144-MHz operation ^{*1*2} : 0.076 to 0.118 μs
		Max.	—	5 lcy + 1 Pcyc + m1 + m2 + 19(m4)	5 lcy + 3 Bcyc + 1 Pcyc + m1 + m2 + 19(m4)	5 lcy + 4 Bcyc + m1 + m2 + 19(m4)	5 lcy + 2 Bcyc + m1 + m2 + 19(m4)	144-MHz operation ^{*1*2} : 0.208 to 0.250 μs

Notes: m1 to m4 are the number of states needed for the following memory accesses.

m1: Vector address read (longword read)

m2: SR save (longword write)

m3: PC save (longword write)

m4: Banked registers (R0 to R14, GBR, MACH, MACL, and PR) are restored from the stack.

1. In the case that m1 = m2 = m3 = m4 = 1 lcy.

2. In the case that (Iφ, Bφ, Pφ) = (144 MHz, 72 MHz, 36 MHz).

Figure 7.9 Example of Pipeline Operation when Interrupt is Accepted during RESBANK Instruction Execution (Register Banking with Register Bank Overflow)

7.8 Register Banks

This LSI has fifteen register banks used to perform register saving and restoration required in the interrupt processing at high speed. Figure 7.10 shows the register bank configuration.

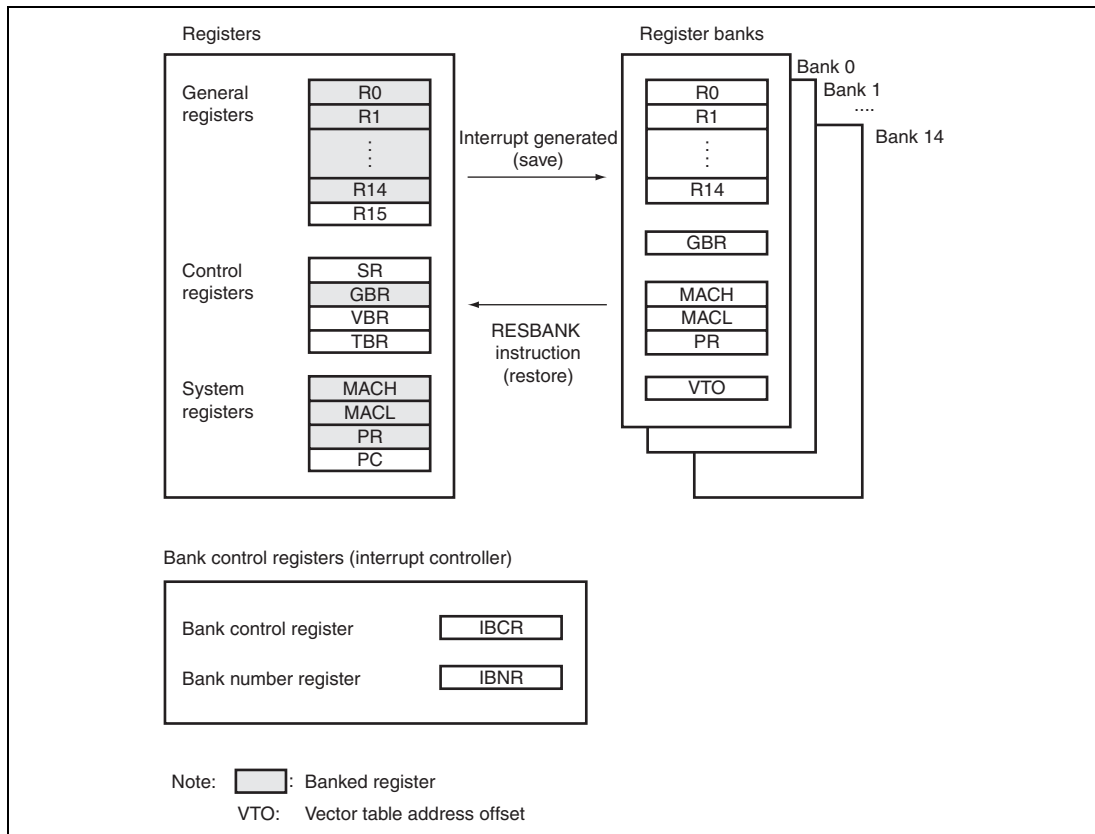

Figure 7.10 Overview of Register Bank Configuration

7.8.1 Banked Register and Input/Output of Banks

(1) Banked Register

The contents of the general registers (R0 to R14), global base register (GBR), multiply and accumulate registers (MACH and MACL), and procedure register (PR), and the vector table address offset are banked.

(2) Input/Output of Banks

This LSI has fifteen register banks, bank 0 to bank 14. Register banks are stacked in first-in last-out (FILO) sequence. Saving takes place in order, beginning from bank 0, and restoration takes place in the reverse order, beginning from the last bank saved to.

7.8.2 Bank Save and Restore Operations

(1) Saving to Bank

Figure 7.11 shows register bank save operations. The following operations are performed when an interrupt for which usage of register banks is allowed is accepted by the CPU:

- Assume that the bank number bit value in the bank number register (IBNR), BN, is i before the interrupt is generated.
- The contents of registers R0 to R14, GBR, MACH, MACL, and PR, and the interrupt vector table address offset (VTO) of the accepted interrupt are saved in the bank indicated by BN, bank i .
- The BN value is incremented by 1.

Figure 7.11 Bank Save Operations

Figure 7.12 shows the timing for saving to a register bank. Saving to a register bank takes place between the start of interrupt exception handling and the start of fetching the first instruction in the interrupt exception service routine.

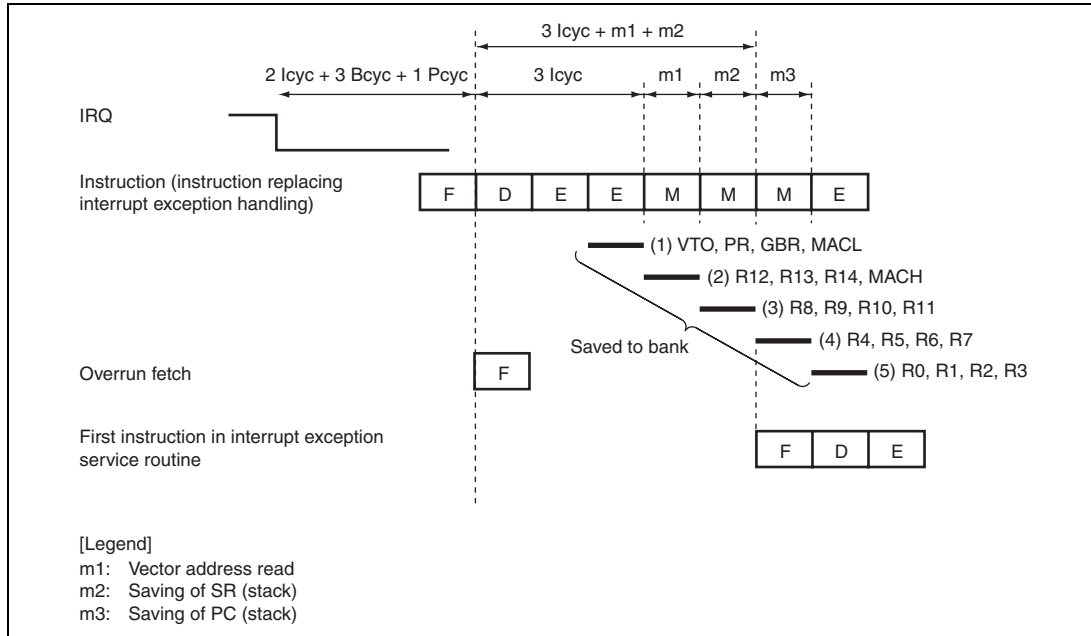

Figure 7.12 Bank Save Timing

(2) Restoration from Bank

The RESBANK (restore from register bank) instruction is used to restore data saved in a register bank. After restoring data from the register banks with the RESBANK instruction at the end of the interrupt exception service routine, execute the RTE instruction to return from interrupt exception service routine.

7.8.3 Save and Restore Operations after Saving to All Banks

If an interrupt occurs and usage of the register banks is enabled for the interrupt accepted by the CPU in a state where saving has been performed to all register banks, automatic saving to the stack is performed instead of register bank saving if the BOVE bit in the bank number register (IBNR) is cleared to 0. If the BOVE bit in IBNR is set to 1, register bank overflow exception occurs and data is not saved to the stack.

Save and restore operations when using the stack are as follows:

(1) Saving to Stack

1. The status register (SR) and program counter (PC) are saved to the stack during interrupt exception handling.
2. The contents of the banked registers (R0 to R14, GBR, MACH, MACL, and PR) are saved to the stack. The registers are saved to the stack in the order of MACL, MACH, GBR, PR, R14, R13, ..., R1, and R0.
3. The register bank overflow bit (BO) in SR is set to 1.
4. The bank number bit (BN) value in the bank number register (IBNR) remains set to the maximum value of 15.

(2) Restoration from Stack

When the RESBANK (restore from register bank) instruction is executed with the register bank overflow bit (BO) in SR set to 1, the CPU operates as follows:

1. The contents of the banked registers (R0 to R14, GBR, MACH, MACL, and PR) are restored from the stack. The registers are restored from the stack in the order of R0, R1, ..., R13, R14, PR, GBR, MACH, and MACL.
2. The bank number bit (BN) value in the bank number register (IBNR) remains set to the maximum value of 15.

7.8.4 Register Bank Exception

There are two register bank exceptions (register bank errors): register bank overflow and register bank underflow.

(1) Register Bank Overflow

This exception occurs if, after data has been saved to all of the register banks, an interrupt for which register bank use is allowed is accepted by the CPU, and the BOVE bit in the bank number register (IBNR) is set to 1. In this case, the bank number bit (BN) value in the bank number register (IBNR) remains set to the bank count of 15 and saving is not performed to the register bank.

(2) Register Bank Underflow

This exception occurs if the RESBANK (restore from register bank) instruction is executed when no data has been saved to the register banks. In this case, the values of R0 to R14, GBR, MACH, MACL, and PR do not change. In addition, the bank number bit (BN) value in the bank number register (IBNR) remains set to 0.

7.8.5 Register Bank Error Exception Handling

When a register bank error occurs, register bank error exception handling starts. When this happens, the CPU operates as follows:

1. The exception service routine start address which corresponds to the register bank error that occurred is fetched from the exception handling vector table.
2. The status register (SR) is saved to the stack.
3. The program counter (PC) is saved to the stack. The PC value saved is the start address of the instruction to be executed after the last executed instruction for a register bank overflow, and the start address of the executed RESBANK instruction for a register bank underflow. To prevent multiple interrupts from occurring at a register bank overflow, the interrupt priority level that caused the register bank overflow is written to the interrupt mask level bits (I3 to I0) of the status register (SR).
4. Program execution starts from the exception service routine start address.

7.9 Data Transfer with Interrupt Request Signals

Interrupt request signals can be used to activate the direct memory access controller and transfer data.

Interrupt sources that are designated to activate the direct memory access controller are masked without being input to the interrupt controller. The mask condition is as follows:

$$\begin{aligned} \text{Mask condition} = & \text{DME} \bullet (\text{DE0} \bullet \text{interrupt source select 0} + \text{DE1} \bullet \text{interrupt source select 1} \\ & + \text{DE2} \bullet \text{interrupt source select 2} + \text{DE3} \bullet \text{interrupt source select 3} + \\ & \text{DE4} \bullet \text{interrupt source select 4} + \text{DE5} \bullet \text{interrupt source select 5} + \text{DE6} \\ & \bullet \text{interrupt source select 6} + \text{DE7} \bullet \text{interrupt source select 7} + \text{DE8} \bullet \\ & \text{interrupt source select 8} + \text{DE9} \bullet \text{interrupt source select 9} + \text{DE10} \bullet \\ & \text{interrupt source select 10} + \text{DE11} \bullet \text{interrupt source select 11} + \text{DE12} \bullet \\ & \text{interrupt source select 12} + \text{DE13} \bullet \text{interrupt source select 13} + \text{DE14} \bullet \\ & \text{interrupt source select 14} + \text{DE15} \bullet \text{interrupt source select 15}) \end{aligned}$$

Figure 7.13 shows a block diagram of interrupt control.

Here, DME is bit 0 in DMAOR of the direct memory access controller, and DEN (n = 0 to 15) is bit 0 in CHCR_0 to CHCR_15 of the direct memory access controller. For details, see section 10, Direct Memory Access Controller.

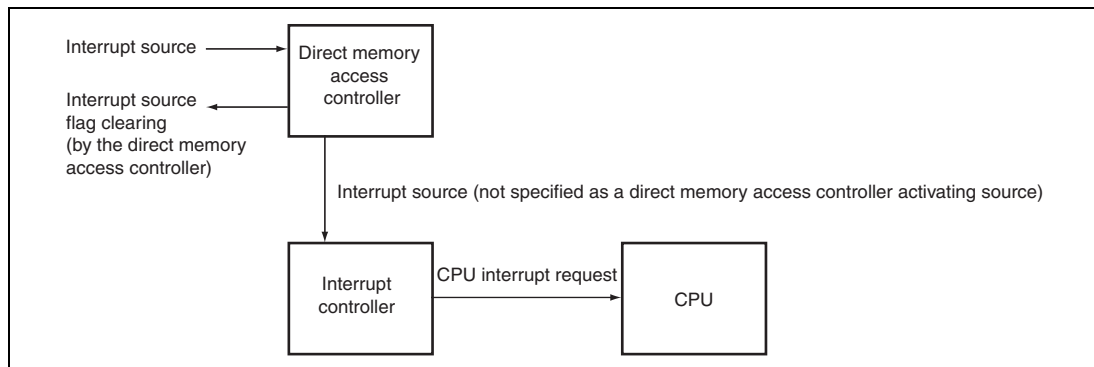

Figure 7.13 Interrupt Control Block Diagram

7.9.1 Handling Interrupt Request Signals as Sources for CPU Interrupt but Not Direct Memory Access Controller Activating

1. Do not select direct memory access controller activating sources or clear the DME bit to 0. If, direct memory access controller activating sources are selected, clear the DE bit to 0 for the relevant channel of the direct memory access controller.
2. When interrupts occur, interrupt requests are sent to the CPU.
3. The CPU clears the interrupt source and performs the necessary processing in the interrupt exception service routine.

7.9.2 Handling Interrupt Request Signals as Sources for Activating Direct Memory Access Controller but Not CPU Interrupt

1. Select direct memory access controller activating sources and set both the DE and DME bits to 1. This masks CPU interrupt sources regardless of the interrupt priority register settings.
2. Activating sources are applied to the direct memory access controller when interrupts occur.
3. The direct memory access controller clears the interrupt sources when starting transfer.

7.10 Usage Note

7.10.1 Timing to Clear an Interrupt Source

The interrupt source flags should be cleared in the interrupt exception service routine. After clearing the interrupt source flag, "time from occurrence of interrupt request until interrupt controller identifies priority, compares it with mask bits in SR, and sends interrupt request signal to CPU" shown in table 7.5 is required before the interrupt source sent to the CPU is actually cancelled. To ensure that an interrupt request that should have been cleared is not inadvertently accepted again, read* the interrupt source flag after it has been cleared, and then execute an RTE instruction.

Note: * When clearing the USB 2.0 host/function module interrupt source flag, read the flag three times after clearing it.

Section 8 Cache

8.1 Features

- Capacity
 - Instruction cache: 8 Kbytes
 - Operand cache: 8 Kbytes
- Structure: Instructions/data separated, 4-way set associative
- Way lock function (only for operand cache): Way 2 and way 3 are lockable
- Line size: 16 bytes
- Number of entries: 128 entries/way
- Write system: Write-back/write-through selectable
- Replacement method: Least-recently-used (LRU) algorithm

8.1.1 Cache Structure

The cache separates data and instructions and uses a 4-way set associative system. It is composed of four ways (banks), each of which is divided into an address section and a data section.

In each way, each of the address and data sections is divided into 128 entries. The data section of the entry is called a line. Each line consists of 16 bytes (4 bytes \times 4). The data capacity per way is 2 Kbytes (16 bytes \times 128 entries), with a total of 8 Kbytes in the cache as a whole (4 ways).

Figure 8.1 shows the operand cache structure. The instruction cache structure is the same as the operand cache structure except for not having the U bit.

Figure 8.1 Operand Cache Structure

(1) Address Array

The V bit indicates whether the entry data is valid. When the V bit is 1, data is valid; when 0, data is not valid.

The U bit (only for operand cache) indicates whether the entry has been written to in write-back mode. When the U bit is 1, the entry has been written to; when 0, it has not.

The tag address holds the physical address used in the access to external memory or large-capacity on-chip RAM. It consists of 21 bits (address bits 31 to 11) used for comparison during cache searches. In this LSI, the addresses of the cache-enabled space are H'00000000 to H'1FFFFFFF (see section 9, Bus State Controller), and therefore the upper three bits of the tag address are cleared to 0.

The V and U bits are initialized to 0 by a power-on reset but not initialized by a manual reset or in software standby mode. The tag address is not initialized by a power-on reset or manual reset or in software standby mode.

(2) Data Array

Holds a 16-byte instruction or data. Entries are registered in the cache in line units (16 bytes).

The data array is not initialized by a power-on reset or manual reset or in software standby mode.

(3) LRU

With the 4-way set associative system, up to four instructions or data with the same entry address can be registered in the cache. When an entry is registered, LRU shows which of the four ways it is recorded in. There are six LRU bits, controlled by hardware. A least-recently-used (LRU) algorithm is used to select the way that has been least recently accessed.

Six LRU bits indicate the way to be replaced in case of a cache miss. The relationship between LRU and way replacement is shown in table 8.1 when the cache lock function (only for operand cache) is not used (concerning the case where the cache lock function is used, see section 8.2.2, Cache Control Register 2 (CCR2)). If a bit pattern other than those listed in table 8.1 is set in the LRU bits by software, the cache will not function correctly. When modifying the LRU bits by software, set one of the patterns listed in table 8.1.

The LRU bits are initialized to B'000000 by a power-on reset but not initialized by a manual reset or in software standby mode.

Table 8.1 LRU and Way Replacement (Cache Lock Function Not Used)

LRU (Bits 5 to 0)	Way to be Replaced
000000, 000100, 010100, 100000, 110000, 110100	3
000001, 000011, 001011, 100001, 101001, 101011	2
000110, 000111, 001111, 010110, 011110, 011111	1
111000, 111001, 111011, 111100, 111110, 111111	0

8.2 Register Descriptions

Table 8.2 shows the register configuration of the cache.

Table 8.2 Register Configuration

Register Name	Abbreviation	R/W	Initial Value	Address	Access Size
Cache control register 1	CCR1	R/W	H'00000000	H'FFFC1000	32
Cache control register 2	CCR2	R/W	H'00000000	H'FFFC1004	32

8.2.1 Cache Control Register 1 (CCR1)

The instruction cache is enabled or disabled using the ICE bit. The ICF bit controls disabling of all instruction cache entries. The operand cache is enabled or disabled using the OCE bit. The OCF bit controls disabling of all operand cache entries. The WT bit selects either write-through mode or write-back mode for operand cache.

Programs that change the contents of CCR1 should be placed in a cache-disabled space, and a cache-enabled space should be accessed after reading the contents of CCR1.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	ICF	-	-	ICE	-	-	-	-	OCF	-	WT	OCE
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R/W	R	R	R/W	R	R	R	R	R/W	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 12	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
11	ICF	0	R/W	Instruction Cache Flush Writing 1 flushes all instruction cache entries (clears the V and LRU bits of all instruction cache entries to 0). Always reads 0. Write-back to the external memory or the large-capacity on-chip RAM is not performed when the instruction cache is flushed.
10, 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	ICE	0	R/W	Instruction Cache Enable Indicates whether the instruction cache function is enabled/disabled. 0: Instruction cache disable 1: Instruction cache enable
7 to 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
3	OCF	0	R/W	Operand Cache Flush Writing 1 flushes all operand cache entries (clears the V, U, and LRU bits of all operand cache entries to 0). Always reads 0. Write-back to the external memory or the large-capacity on-chip RAM is not performed when the operand cache is flushed.
2	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
1	WT	0	R/W	Write Through Selects write-back mode or write-through mode. 0: Write-back mode 1: Write-through mode
0	OCE	0	R/W	Operand Cache Enable Indicates whether the operand cache function is enabled/disabled. 0: Operand cache disable 1: Operand cache enable

8.2.2 Cache Control Register 2 (CCR2)

CCR2 is used to enable or disable the cache locking function for operand cache and is valid in cache locking mode only. In cache locking mode, the lock enable bit (the LE bit) in CCR2 is set to 1. In non-cache-locking mode, the cache locking function is invalid.

When a cache miss occurs in cache locking mode by executing the prefetch instruction (PREF @Rn), the line of data pointed to by Rn is loaded into the cache according to bits 9 and 8 (the W3LOAD and W3LOCK bits) and bits 1 and 0 (the W2LOAD and W2LOCK bits) in CCR2. The relationship between the setting of each bit and a way, to be replaced when the prefetch instruction is executed, are listed in table 8.3. On the other hand, when the prefetch instruction is executed and a cache hit occurs, new data is not fetched and the entry which is already enabled is held. For example, when the prefetch instruction is executed with W3LOAD = 1 and W3LOCK = 1 specified in cache locking mode while one-line data already exists in way 0 which is specified by Rn, a cache hit occurs and data is not fetched to way 3.

In the cache access other than the prefetch instruction in cache locking mode, ways to be replaced by bits W3LOCK and W2LOCK are restricted. The relationship between the setting of each bit in CCR2 and ways to be replaced are listed in table 8.4.

Programs that change the contents of CCR2 should be placed in a cache-disabled space, and a cache-enabled space should be accessed after reading the contents of CCR2.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	LE
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	W3 LOAD*	W3 LOCK	-	-	-	-	-	-	W2 LOAD*	W2 LOCK

R/W:	R	R	R	R	R	R	R/W	R/W	R	R	R	R	R	R	R/W	R/W

Note: * The W3LOAD and W2LOAD bits should not be set to 1 at the same time.

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	LE	0	R/W	Lock Enable Controls the cache locking function. 0: Not cache locking mode 1: Cache locking mode
15 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9	W3LOAD*	0	R/W	Way 3 Load
8	W3LOCK	0	R/W	Way 3 Lock When a cache miss occurs by the prefetch instruction while W3LOAD = 1 and W3LOCK = 1 in cache locking mode, the data is always loaded into way 3. Under any other condition, the cache miss data is loaded into the way to which LRU points.
7 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1	W2LOAD*	0	R/W	Way 2 Load
0	W2LOCK	0	R/W	Way 2 Lock When a cache miss occurs by the prefetch instruction while W2LOAD = 1 and W2LOCK = 1 in cache locking mode, the data is always loaded into way 2. Under any other condition, the cache miss data is loaded into the way to which LRU points.

Note: * The W3LOAD and W2LOAD bits should not be set to 1 at the same time.

Table 8.3 Way to be Replaced when a Cache Miss Occurs in PREF Instruction

LE	W3LOAD*	W3LOCK	W2LOAD*	W2LOCK	Way to be Replaced
0	x	x	x	x	Decided by LRU (table 8.1)
1	x	0	x	0	Decided by LRU (table 8.1)
1	x	0	0	1	Decided by LRU (table 8.5)
1	0	1	x	0	Decided by LRU (table 8.6)
1	0	1	0	1	Decided by LRU (table 8.7)
1	0	x	1	1	Way 2
1	1	1	0	x	Way 3

[Legend]

x: Don't care

Note: * The W3LOAD and W2LOAD bits should not be set to 1 at the same time.

Table 8.4 Way to be Replaced when a Cache Miss Occurs in Other than PREF Instruction

LE	W3LOAD*	W3LOCK	W2LOAD*	W2LOCK	Way to be Replaced
0	x	x	x	x	Decided by LRU (table 8.1)
1	x	0	x	0	Decided by LRU (table 8.1)
1	x	0	x	1	Decided by LRU (table 8.5)
1	x	1	x	0	Decided by LRU (table 8.6)
1	x	1	x	1	Decided by LRU (table 8.7)

[Legend]

x: Don't care

Note: * The W3LOAD and W2LOAD bits should not be set to 1 at the same time.

Table 8.5 LRU and Way Replacement (when W2LOCK=1 and W3LOCK=0)

LRU (Bits 5 to 0)	Way to be Replaced
000000, 000001, 000100, 010100, 100000, 100001, 110000, 110100	3
000011, 000110, 000111, 001011, 001111, 010110, 011110, 011111	1
101001, 101011, 111000, 111001, 111011, 111100, 111110, 111111	0

000000, 000001, 000011, 000100, 000110, 000111, 001011, 001111, 010100, 010110, 011110, 011111	1
100000, 100001, 101001, 101011, 110000, 110100, 111000, 111001, 111011, 111100, 111110, 111111	0

8.3 Operation

Operations for the operand cache are described here. Operations for the instruction cache are similar to those for the operand cache except for the address array not having the U bit, and there being no prefetch operation or write operation, or a write-back buffer.

8.3.1 Searching Cache

If the operand cache is enabled (OCE bit in CCR1 is 1), whenever data in a cache-enabled area is accessed, the cache will be searched to see if the desired data is in the cache. Figure 8.2 illustrates the method by which the cache is searched.

Entries are selected using bits 10 to 4 of the address used to access memory and the tag address of that entry is read. At this time, the upper three bits of the tag address are always cleared to 0. Bits 31 to 11 of the address used to access memory are compared with the read tag address. The address comparison uses all four ways. When the comparison shows a match and the selected entry is valid ($V = 1$), a cache hit occurs. When the comparison does not show a match or the selected entry is not valid ($V = 0$), a cache miss occurs. Figure 8.2 shows a hit on way 1.

Figure 8.2 Cache Search Scheme

8.3.2 Read Access

(1) Read Hit

In a read access, data is transferred from the cache to the CPU. LRU is updated so that the hit way is the latest.

(2) Read Miss

An internal bus cycle starts and the entry is updated. The way replaced follows table 8.4. Entries are updated in 16-byte units. When the desired data that caused the miss is loaded from the external memory or the large-capacity on-chip RAM to the cache, the data is transferred to the CPU in parallel with being loaded to the cache. When it is loaded in the cache, the V bit is set to 1, and LRU is updated so that the replaced way becomes the latest. In operand cache, the U bit is additionally cleared to 0. When the U bit of the entry to be replaced by updating the entry in write-back mode is 1, the cache update cycle starts after the entry is transferred to the write-back buffer. After the cache completes its update cycle, the write-back buffer writes the entry back to the memory. The write-back unit is 16 bytes. Cache update operation and write-back operation to the memory are performed in wrap-around mode. When the lower four bits of the address of read-miss data are H'4, for example, cache update operation and write-back operation to the memory are performed in the following order of the lower 4-bit value of address: H'4 → H'8 → H'C → H'0.

8.3.3 Prefetch Operation (Only for Operand Cache)

(1) Prefetch Hit

LRU is updated so that the hit way becomes the latest. The contents in other caches are not modified. No data is transferred to the CPU.

(2) Prefetch Miss

No data is transferred to the CPU. The way to be replaced follows table 8.3. Other operations are the same as those in the case of read miss.

8.3.4 Write Operation (Only for Operand Cache)

(1) Write Hit

In a write access in write-back mode, the data is written to the cache and no write cycle to the external memory or the large-capacity on-chip RAM is issued. The U bit of the entry written is set to 1 and LRU is updated so that the hit way becomes the latest.

In write-through mode, the data is written to the cache and a write cycle to the external memory or the large-capacity on-chip RAM is issued. The U bit of the written entry is not updated and LRU is updated so that the replaced way becomes the latest.

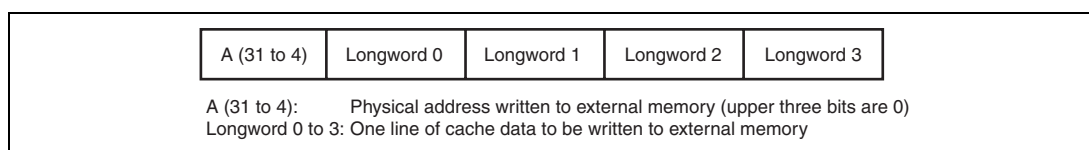

(2) Write Miss

In write-back mode, an internal bus cycle starts when a write miss occurs, and the entry is updated. The way to be replaced follows table 8.4. When the U bit of the entry to be replaced is 1, the cache update cycle starts after the entry is transferred to the write-back buffer. Data is written to the cache, the U bit is set to 1, and the V bit is set to 1. LRU is updated so that the replaced way becomes the latest. After the cache completes its update cycle, the write-back buffer writes the entry back to the memory. The write-back unit is 16 bytes. Cache update operation and write-back operation to the memory are performed in wrap-around mode. When the lower four bits of the address of write-miss data are H'4, for example, cache update operation and write-back operation to the memory are performed in the following order of the lower 4-bit value of address: H'4 → H'8 → H'C → H'0.

In write-through mode, no write to cache occurs in a write miss; the write is only to the external memory or the large-capacity on-chip RAM.

8.3.5 Write-Back Buffer (Only for Operand Cache)

When the U bit of the entry to be replaced in the write-back mode is 1, it must be written back to the external memory or the large-capacity on-chip RAM. To increase performance, the entry to be replaced is first transferred to the write-back buffer and fetching of new entries to the cache takes priority over writing back to the external memory. After the cache completes to fetch the new entry, the write-back buffer writes the entry back to the external memory or the large-capacity on-chip RAM. During the write-back cycles, the cache can be accessed. The write-back buffer can hold one line of cache data (16 bytes) and its physical address. Figure 8.3 shows the configuration of the write-back buffer.

**Figure 8.3 Write-Back Buffer Configuration**

Operations in sections 8.3.2 to 8.3.5 are summarized in table 8.8.

Table 8.8 Cache Operations

Cache	CPU Cycle	Hit/ Miss	Write-Back Mode/ Write-Through Mode	U Bit	Access to External Memory or Large-Capacity On-Chip RAM (Through Internal Bus)	Cache Contents
Instruction cache	Instruction fetch	Hit	—	—	Not generated	Not updated
		Miss	—	—	Cache update cycle is generated	Updated to new values by cache update cycle
Operand cache	Prefetch/ read	Hit	Either mode is available	x	Not generated	Not updated
		Miss	Write-through mode	—	Cache update cycle is generated	Updated to new values by cache update cycle
			Write-back mode	0	Cache update cycle is generated	Updated to new values by cache update cycle
				1	Cache update cycle is generated. Then write-back cycle in write-back buffer is generated.	Updated to new values by cache update cycle
Write	Hit	Write-through mode	—	Write cycle CPU issues is generated.	Updated to new values by write cycle the CPU issues	
			x	Not generated	Updated to new values by write cycle the CPU issues	
		Miss	Write-through mode	—	Write cycle CPU issues is generated.	Not updated*
			Write-back mode	0	Cache update cycle is generated	Updated to new values by cache update cycle. Subsequently updated again to new values in write cycle CPU issues.
1	Cache update cycle is generated. Then write-back cycle in write-back buffer is generated.	Updated to new values by cache update cycle. Subsequently updated again to new values in write cycle CPU issues.				

[Legend]

x: Don't care.

Note: Cache update cycle: 16-byte read access
Write-back cycle in write-back buffer: 16-byte write access

* Neither LRU updated. LRU is updated in all other cases.

8.3.6 Coherency of Cache and External Memory or Large-Capacity On-Chip RAM

Use software to ensure coherency between the cache and the external memory or the large-capacity on-chip RAM. When memory shared by this LSI and another device is mapped in the cache-enabled space, operate the memory-mapped cache to invalidate and write back as required. The same operation should be performed for the memory shared by the CPU and the direct memory access controller in this LSI.

8.4 Memory-Mapped Cache

To allow software management of the cache, cache contents can be read and written by means of MOV instructions. The instruction cache address array is mapped onto addresses H'F0000000 to H'F07FFFFFFF, and the data array onto addresses H'F1000000 to H'F17FFFFFFF. The operand cache address array is mapped onto addresses H'F0800000 to H'F0FFFFFFF, and the data array onto addresses H'F1800000 to H'F1FFFFFFF. Only longword can be used as the access size for the address array and data array, and instruction fetches cannot be performed.

8.4.1 Address Array

To access an address array, the 32-bit address field (for read/write accesses) and 32-bit data field (for write accesses) must be specified.

In the address field, specify the entry address for selecting the entry, the W bit for selecting the way, and the A bit for specifying the existence of associative operation. In the W bit, B'00 is way 0, B'01 is way 1, B'10 is way 2, and B'11 is way 3. Since the access size of the address array is fixed at longword, specify B'00 for bits 1 and 0 of the address.

The tag address, LRU bits, U bit (only for operand cache), and V bit are specified as data. Always specify 0 for the upper three bits (bits 31 to 29) of the tag address.

For the address and data formats, see figure 8.4.

The following three operations are possible for the address array.

(1) Address Array Read

The tag address, LRU bits, U bit (only for operand cache), and V bit are read from the entry address specified by the address and the entry corresponding to the way. For the read operation, associative operation is not performed regardless of whether the associative bit (A bit) specified by the address is 1 or 0.

(2) Address-Array Write (Non-Associative Operation)

When the associative bit (A bit) in the address field is cleared to 0, write the tag address, LRU bits, U bit (only for operand cache), and V bit, specified by the data field, to the entry address specified by the address and the entry corresponding to the way. When writing to a cache line for which the U bit = 1 and the V bit = 1 in the operand cache address array, write the contents of the cache line back to memory, then write the tag address, LRU bits, U bit, and V bit specified by the data field. When 0 is written to the V bit, 0 must also be written to the U bit of that entry. Write-

back operation to the memory is performed in the following order of the lower 4-bit value of address: H'0 → H'4 → H'8 → H'C.

(3) Address-Array Write (Associative Operation)

When writing with the associative bit (A bit) of the address field set to 1, the addresses in the four ways for the entry specified by the address field are compared with the tag address that is specified by the data field. Write the U bit (only for operand cache) and the V bit specified by the data field to the entry of the way that has a hit. However, the tag address and LRU bits remain unchanged. When there is no way that has a hit, nothing is written and there is no operation. This function is used to invalidate a specific entry in the cache.

When the U bit of the entry that has had a hit is 1 in the operand cache, writing back should be performed. However, when 0 is written to the V bit, 0 must also be written to the U bit of that entry. Write-back operation to the memory is performed in the following order of the lower 4-bit value of address: H'0 → H'4 → H'8 → H'C.

8.4.2 Data Array

To access a data array, the 32-bit address field (for read/write accesses) and 32-bit data field (for write accesses) must be specified. The address field specifies information for selecting the entry to be accessed; the data field specifies the longword data to be written to the data array.

Specify the entry address for selecting the entry, the L bit indicating the longword position within the (16-byte) line, and the W bit for selecting the way. In the L bit, B'00 is longword 0, B'01 is longword 1, B'10 is longword 2, and B'11 is longword 3. In the W bit, B'00 is way 0, B'01 is way 1, B'10 is way 2, and B'11 is way 3. Since the access size of the data array is fixed at longword, specify B'00 for bits 1 and 0 of the address.

For the address and data formats, see figure 8.4.

The following two operations are possible for the data array. Information in the address array is not modified by this operation.

(1) Data Array Read

The data specified by the L bit in the address is read from the entry address specified by the address and the entry corresponding to the way.

(2) Data Array Write

The longword data specified by the data is written to the position specified by the L bit in the address from the entry address specified by the address and the entry corresponding to the way.

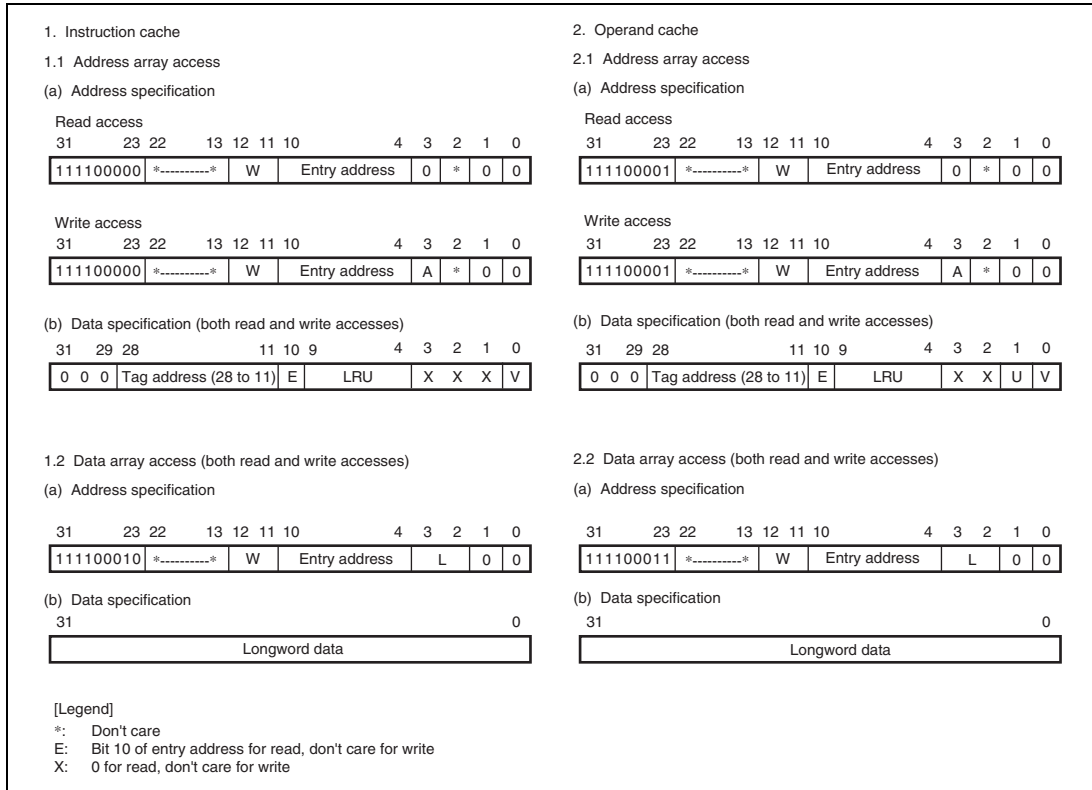

Figure 8.4 Specifying Address and Data for Memory-Mapped Cache Access

8.4.3 Usage Examples

(1) Invalidating Specific Entries

Specific cache entries can be invalidated by writing 0 to the entry's V bit in the memory mapping cache access. When the A bit is 1, the tag address specified by the write data is compared to the tag address within the cache selected by the entry address, and data is written to the bits V and U specified by the write data when a match is found. If no match is found, there is no operation. When the V bit of an entry in the address array is set to 0, the entry is written back if the entry's U bit is 1.

An example when a write data is specified in R0 and an address is specified in R1 is shown below.

```
; R0=H'0110 0010; tag address(28-11)=B'0 0001 0001 0000 0000 0, U=0, V=0
; R1=H'F080 0088; operand cache address array access, entry=B'000 1000, A=1
;
MOV.L R0,@R1
```

(2) Reading the Data of a Specific Entry

The data section of a specific cache entry can be read by the memory mapping cache access. The longword indicated in the data field of the data array in figure 8.4 is read into the register.

An example when an address is specified in R0 and data is read in R1 is shown below.

```
; R0=H'F100 004C; instruction cache data array access, entry=B'000 0100,
; Way=0, longword address=3
;
MOV.L @R0,R1
```

8.4.4 Usage Notes

1. Programs that access memory-mapped cache of the operand cache should be placed in a cache-disabled space. Programs that access memory-mapped cache of the instruction cache should be placed in a cache-disabled space, and in each of the beginning and the end of that, two or more read accesses to on-chip peripheral modules or external address space (cache-disabled address) should be executed.
2. Rewriting the address array contents so that two or more ways are hit simultaneously is prohibited. Operation is not guaranteed if the address array contents are changed so that two or more ways are hit simultaneously.
3. Registers and memory-mapped cache can be accessed only by the CPU and not by the direct memory access controller.

Section 9 Bus State Controller

The bus state controller outputs control signals for various types of memory and external devices that are connected to the external address space. The functions of this module enable this LSI to connect directly with SRAM, SDRAM, and other memory storage devices, and external devices.

9.1 Features

1. External address space
 - A maximum of 64 Mbytes for each of areas CS0 to CS6.
 - Can specify the normal space interface, SRAM interface with byte selection, burst ROM (clocked synchronous or asynchronous), MPX-I/O, SDRAM memory type, and PCMCIA interface for each address space.
 - Data bus width for CS0 space is 16 bits. Can select the data bus width (8 or 16 bits) for each of address spaces CS1 to CS6.
 - Controls insertion of wait cycles for each address space.
 - Controls insertion of wait cycles for each read access and write access.
 - Can set independent idle cycles during the continuous access for five cases: read-write (in same space/different spaces), read-read (in same space/different spaces), the first cycle is a write access.
2. Normal space interface
 - Supports the interface that can directly connect to the SRAM.
3. Burst ROM interface (clocked asynchronous)
 - High-speed access to the ROM that has the page mode function.
4. MPX-I/O interface
 - Can directly connect to a peripheral LSI that needs an address/data multiplexing.
5. SDRAM interface
 - Can set the SDRAM in up to two areas.
 - Multiplex output for row address/column address.
 - Efficient access by single read/single write.
 - High-speed access in bank-active mode.
 - Supports an auto-refresh and self-refresh.
 - Supports a power-down mode.
 - Issues MRS and EMRS commands.

6. PCMCIA direct interface
 - Supports the IC memory card and I/O card interface defined in JEIDA specifications Ver. 4.2 (PCMCIA2.1 Rev. 2.1).
 - Wait-cycle insertion controllable by program.
7. SRAM interface with byte selection
 - Can connect directly to a SRAM with byte selection.
8. Burst ROM interface (clocked synchronous)
 - Can connect directly to a burst ROM of the clocked synchronous type.
9. Bus arbitration
 - Shares all of the resources with other CPU and outputs the bus enable after receiving the bus request from external devices.
10. Refresh function
 - Supports the auto-refresh and self-refresh functions.
 - Specifies the refresh interval using the refresh counter and clock selection.
 - Can execute concentrated refresh by specifying the refresh counts (1, 2, 4, 6, or 8).
11. Usage as interval timer for refresh counter
 - Generates an interrupt request at compare match.

Figure 9.1 shows a block diagram of this module.

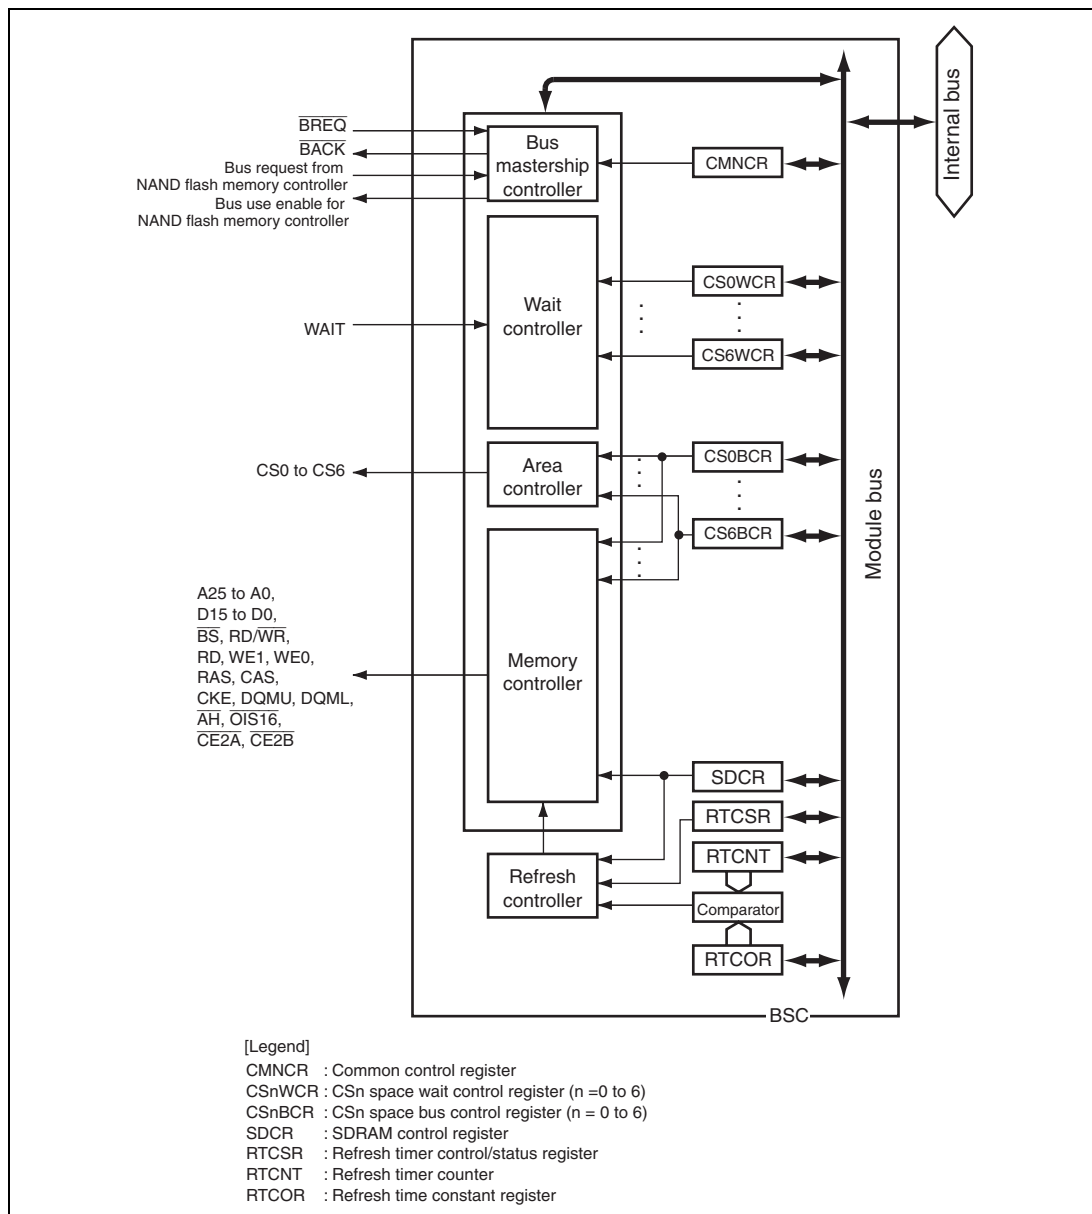

Figure 9.1 Block Diagram of Bus State Controller

9.2 Input/Output Pins

Table 9.1 shows the pin configuration.

Table 9.1 Pin Configuration

Name	I/O	Function
A25 to A0	Output	Address bus
D15 to D0	I/O	Data bus
\overline{BS}	Output	Bus cycle start
$\overline{CS0}$ to $\overline{CS4}$	Output	Chip select
$\overline{CS5}/\overline{CE1A}$, $\overline{CS6}/\overline{CE1B}$	Output	Chip select Function as PCMCIA card select signals for D7 to D0 when PCMCIA is used.
$\overline{CE2A}$, $\overline{CE2B}$	Output	Function as PCMCIA card select signals for D15 to D8.
$\overline{RD}/\overline{WR}$	Output	Read/write Connects to \overline{WE} pins when SDRAM or SRAM with byte selection is connected.
\overline{RD}	Output	Read pulse signal (read data output enable signal) Functions as a strobe signal for indicating memory read cycles when PCMCIA is used.
$\overline{ICIOWR}/\overline{AH}$	Output	Functions as a strobe signal for indicating I/O write cycles when PCMCIA is used. Functions as the address hold signal when the MPX-I/O is used.
\overline{ICIORD}	Output	Functions as a strobe signal for indicating I/O read cycles when PCMCIA is used.
$\overline{WE1}/\overline{DQMU}/\overline{WE}$	Output	Indicates that D15 to D8 are being written to. Connected to the byte select signal when a SRAM with byte selection is connected. Functions as the select signals for D15 to D8 when SDRAM is connected. Functions as a strobe signal for indicating memory write cycles when PCMCIA is used.

Name	I/O	Function
$\overline{WE0}/DQML$	Output	Indicates that D7 to D0 are being written to. Connected to the byte select signal when a SRAM with byte selection is connected. Functions as the select signals for D7 to D0 when SDRAM is connected.
\overline{RAS}	Output	Connects to \overline{RAS} pin when SDRAM is connected.
\overline{CAS}	Output	Connects to \overline{CAS} pin when SDRAM is connected.
CKE	Output	Connects to CKE pin when SDRAM is connected.
\overline{WAIT}	Input	External wait input
\overline{BREQ}	Input	Bus request input
\overline{BACK}	Output	Bus enable output
$\overline{IOIS16}$	Input	Indicates 16-bit I/O of PCMIA. Enabled only in little endian mode. The pin should be driven low in big endian mode.

9.3 Area Overview

9.3.1 Address Map

In the architecture, this LSI has a 32-bit address space, which is divided into cache-enabled, cache-disabled, and on-chip spaces (on-chip RAM, on-chip peripheral modules, and reserved areas) according to the upper bits of the address.

External address spaces CS0 to CS6 are cache-enabled when internal address A29 = 0 or cache-disabled when A29 = 1.

The kind of memory to be connected and the data bus width are specified in each partial space. The address map for the external address space is listed below.

Table 9.2 Address Map

Internal Address	Space	Memory to be Connected	Cache
H'00000000 to H'03FFFFFF	CS0	Normal space, SRAM with byte selection, burst ROM (asynchronous or synchronous)	Cache-enabled
H'04000000 to H'07FFFFFF	CS1	Normal space, SRAM with byte selection	
H'08000000 to H'0BFFFFFF	CS2	Normal space, SRAM with byte selection, SDRAM	
H'0C000000 to H'0FFFFFFF	CS3	Normal space, SRAM with byte selection, SDRAM	
H'10000000 to H'13FFFFFF	CS4	Normal space, SRAM with byte selection, burst ROM (asynchronous)	
H'14000000 to H'17FFFFFF	CS5	Normal space, SRAM with byte selection, MPX-I/O, PCMCIA	
H'18000000 to H'1BFFFFFF	CS6	Normal space, SRAM with byte selection, PCMCIA	
H'1C000000 to H'1FFFFFFF	Other	On-chip RAM	
H'20000000 to H'23FFFFFF	CS0	Normal space, SRAM with byte selection, burst ROM (asynchronous or synchronous)	Cache-disabled
H'24000000 to H'27FFFFFF	CS1	Normal space, SRAM with byte selection	
H'28000000 to H'2BFFFFFF	CS2	Normal space, SRAM with byte selection, SDRAM	
H'2C000000 to H'2FFFFFFF	CS3	Normal space, SRAM with byte selection, SDRAM	
H'30000000 to H'33FFFFFF	CS4	Normal space, SRAM with byte selection, burst ROM (asynchronous)	
H'34000000 to H'37FFFFFF	CS5	Normal space, SRAM with byte selection, MPX-I/O, PCMCIA	

Internal Address	Space	Memory to be Connected	Cache
H'38000000 to H'3BFFFFFF	CS6	Normal space, SRAM with byte selection, PCMCIA	Cache-disabled
H'3C000000 to H'3FFFFFFF	Other	On-chip RAM	—
H'40000000 to H'FFFBFFFF	Other	On-chip RAM, reserved area*	—
H'FFFC0000 to H'FFFFFFF	Other	On-chip peripheral modules, reserved area*	—

Note: * For the on-chip RAM space, access the addresses shown in section 31, On-Chip RAM. For the on-chip peripheral module space, access the addresses shown in section 36, List of Registers. Do not access addresses which are not described in these sections. Otherwise, the correct operation cannot be guaranteed.

9.3.2 Data Bus Width and Endian Specification for Each Area Depending on Boot Mode

The initial state of data bus, endian specification, and settings of the pins related to this module depends on boot mode. For boot mode, refer to section 4, Boot Mode.

In boot mode 0, the state of area 0 is fixed to the state with bus width of 16 bits and big endian, because this LSI is started up by the program stored in the ROM connected to area 0. The minimum pin functions required to read ROM, such as address, data bus, $\overline{CS0}$, and \overline{RD} are set automatically. The initial states of areas 1 to 6 are the same as that of area 0, but can be changed by the program.

In boot modes 1 to 3, the state of areas 0 to 6 can be changed from the initial state by the program, because in these modes the LSI is started by the program stored in the NAND flash memory or the serial flash memory. Since pin functions related to this module are not set automatically, they need to be set by the user. Table 9.3 shows the initial state of areas 0 to 6 in boot mode 0, 2, and 3.

The sample access waveforms shown in this section include the pins such as \overline{BS} , $\overline{RD}/\overline{WR}$, and \overline{WE} . They are the waveforms when pin functions are assigned to the general I/O ports. When 8-bit bus width is used, setting for pin A0 is also needed.

For details on pin function settings, see section 32, General Purpose I/O Ports.

Table 9.3 Initial States of Areas in Boot Modes 0, 2, and 3

Boot Mode	Item	Area 0	Areas 1 to 6
0	Data bus width	Fixed to 16 bits. Not changeable.	16 bits. Can be changed by program.
	Endian specification	Fixed to big endian. Not changeable.	Big endian. Can be changed by program.
	Settings of pins related to this module	The minimum pin functions required to read ROM, such as address, data bus, $\overline{CS0}$, and \overline{RD} are set automatically. Other pins need to be set by program.	
1 to 3	Data bus width	16 bits. Can be changed by program.	
	Endian specification	Big endian. Can be changed by program.	
	Settings of pins related to this module	General I/O function. For external bus access, all the necessary pins need to be set by program.	

9.4 Register Descriptions

Table 9.4 shows the register configuration of this module.

Do not access the areas until settings of the connected memory interface are completed.

Table 9.4 Register Configuration

Register Name	Abbreviation	R/W	Initial Value	Address	Access Size
Common control register	CMNCR	R/W	H'00001010	H'FFFC0000	32
CS0 space bus control register	CS0BCR	R/W	H'36DB0400	H'FFFC0004	32
CS1 space bus control register	CS1BCR	R/W	H'36DB0400	H'FFFC0008	32

Initial value:	0	0	0	1	0	0	0	0	0	0	0	1	0	0	0	0
R/W:	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
12	—	1	R	Reserved This bit is always read as 1. The write value should always be 1.
11	BLOCK	0	R/W	Bus Lock Specifies whether or not the $\overline{\text{BREQ}}$ signal is received. 0: Receives $\overline{\text{BREQ}}$. 1: Does not receive $\overline{\text{BREQ}}$.

Bit	Bit Name	Initial Value	R/W	Description
10, 9	DPRTY[1:0]	00	R/W	<p>DMA Burst Transfer Priority</p> <p>Specify the priority for a refresh request/bus mastership request during DMA burst transfer.</p> <p>00: Accepts a refresh request and bus mastership request during DMA burst transfer.</p> <p>01: Accepts a refresh request but does not accept a bus mastership request during DMA burst transfer.</p> <p>10: Accepts neither a refresh request nor a bus mastership request during DMA burst transfer.</p> <p>11: Reserved (setting prohibited)</p>
8 to 6	DMAIW[2:0]	000	R/W	<p>Wait states between access cycles when DMA single address transfer is performed.</p> <p>Specify the number of idle cycles to be inserted after an access to an external device with DACK when DMA single address transfer is performed. The method of inserting idle cycles depends on the contents of DMAIWA.</p> <p>000: No idle cycle inserted</p> <p>001: 1 idle cycle inserted</p> <p>010: 2 idle cycles inserted</p> <p>011: 4 idle cycles inserted</p> <p>100: 6 idle cycles inserted</p> <p>101: 8 idle cycles inserted</p> <p>110: 10 idle cycles inserted</p> <p>111: 12 idle cycles inserted</p>

Bit	Bit Name	Initial Value	R/W	Description
5	DMAIWA	0	R/W	<p>Method of inserting wait states between access cycles when DMA single address transfer is performed.</p> <p>Specifies the method of inserting the idle cycles specified by the DMAIW[2:0] bit. Clearing this bit will make this LSI insert the idle cycles when another device, which includes this LSI, drives the data bus after an external device with DACK drove it. However, when the external device with DACK drives the data bus continuously, idle cycles are not inserted. Setting this bit will make this LSI insert the idle cycles after an access to an external device with DACK, even when the continuous access cycles to an external device with DACK are performed.</p> <p>0: Idle cycles inserted when another device drives the data bus after an external device with DACK drove it.</p> <p>1: Idle cycles always inserted after an access to an external device with DACK</p>
4	—	1	R	<p>Reserved</p> <p>This bit is always read as 1. The write value should always be 1.</p>
3, 2	—	All 0	R	<p>Reserved</p> <p>These bits are always read as 0. The write value should always be 0.</p>
1	HIZMEM	0	R/W	<p>High-Z Memory Control</p> <p>Specifies the pin state in software standby mode or deep standby mode for A25 to A0, \overline{BS}, \overline{CSn}, $\overline{CS2x}$, $\overline{RD}/\overline{WR}$, $\overline{WEn}/\overline{DQMx}/\overline{AH}$, and \overline{RD}. At bus-released state, these pin are high-impedance states regardless of the setting value of the HIZMEM bit.</p> <p>0: High impedance in software standby mode or deep standby mode.</p> <p>1: Driven in software standby mode or deep standby mode</p>

Bit	Bit Name	Initial Value	R/W	Description
0	HIZCNT*	0	R/W	<p>High-Z Control</p> <p>Specifies the state in software standby mode, deep standby mode, or bus-released state for $\overline{\text{CKE}}$, $\overline{\text{RAS}}$, and $\overline{\text{CAS}}$.</p> <p>0: High impedance in software standby mode, deep standby mode, or bus-released state for $\overline{\text{CKE}}$, $\overline{\text{RAS}}$, and $\overline{\text{CAS}}$.</p> <p>1: Driven in software standby mode, deep standby mode, or bus-released state for $\overline{\text{CKE}}$, $\overline{\text{RAS}}$, and $\overline{\text{CAS}}$.</p>

Note: * For High-Z control of CKIO, see section 5, Clock Pulse Generator.

9.4.2 CSn Space Bus Control Register (CSnBCR) (n = 0 to 6)

CSnBCR is a 32-bit readable/writable register that specifies the memory connected to each space, the number of idle cycles between bus cycles, and the bus width.

Do not access external memory for the corresponding area until CSnBCR initial setting and pin setting are completed.

Idle cycles may be inserted even when they are not specified. For details, see section 9.5.11, Wait between Access Cycles.

Bit	Bit Name	Initial Value	R/W	Description
18 to 16	IWRRS[2:0]	011	R/W	<p>Idle Cycles for Read-Read in the Same Space</p> <p>Specify the number of idle cycles to be inserted after the access to a memory that is connected to the space. The target cycle is a read-read cycle of which continuous access cycles are for the same space.</p> <p>000: No idle cycle inserted 001: 1 idle cycle inserted 010: 2 idle cycles inserted 011: 4 idle cycles inserted 100: 6 idle cycles inserted 101: 8 idle cycles inserted 110: 10 idle cycles inserted 111: 12 idle cycles inserted</p>
15	—	0	R	<p>Reserved</p> <p>This bit is always read as 0. The write value should always be 0.</p>
14 to 12	TYPE[2:0]	000	R/W	<p>Specify the type of memory connected to a space.</p> <p>000: Normal space 001: Burst ROM (clock asynchronous) 010: MPX-I/O 011: SRAM with byte selection 100: SDRAM 101: PCMCIA 110: Reserved (setting prohibited) 111: Burst ROM (clock synchronous)</p> <p>For details for memory type in each area, see table 9.2.</p> <p>Note: When connecting the burst ROM to the CS0 space in boot mode 0, change the CS0WCR register to the settings by the burst ROM CS0WCR uses and then set TYPE[2:0] to the burst ROM setting. In boot mode 2 and 3, memory access should be performed after setting CS0BCR and CS0WCR.</p>

Bit	Bit Name	Initial Value	R/W	Description
11	ENDIAN	0	R/W	<p>Endian Setting</p> <p>Specifies the arrangement of data in a space.</p> <p>0: Arranged in big endian</p> <p>1: Arranged in little endian</p> <p>Note: Little endian cannot be set for area 0 in boot mode 0. In this case, this bit of CS0BCR is always read as 0. The write value should always be 0.</p>
10, 9	BSZ[1:0]	10	R/W	<p>Data Bus Width Specification</p> <p>Specify the data bus widths of spaces.</p> <p>00: Reserved (setting prohibited)</p> <p>01: 8-bit size</p> <p>10: 16-bit size</p> <p>11: Bus width selected by address when the MPX-I/O is used. When the MPX-I/O is not used, setting prohibited.</p> <p>For MPX-I/O, selects bus width by address</p> <p>Notes:</p> <ol style="list-style-type: none"> 1. If area 5 is specified as MPX-I/O, the bus width can be specified as 8 bits or 16 bits by the address according to the SZSEL bit in CS5WCR by specifying the BSZ[1:0] bits to 11. The fixed bus width can be specified as 8 bits or 16 bits 2. In boot mode 0, the BSZ[1:0] bits settings in CS0BCR are ignored. 3. If area 5 or area 6 is specified as PCMCIA space, the bus width can be specified as either 8 bits or 16 bits. 4. If area 2 or area 3 is specified as SDRAM space, the bus width can be specified as 16 bits. 5. If area 0 is specified as clocked synchronous burst ROM space, the bus width can be specified as 16 bits.
8 to 0	—	All 0	R	<p>Reserved</p> <p>These bits are always read as 0. The write value should always be 0.</p>

9.4.3 CSn Space Wait Control Register (CSnWCR) (n = 0 to 6)

CSnWCR specifies various wait cycles for memory access. The bit configuration of this register varies as shown below according to the memory type (TYPE2 to TYPE0) specified by the CSn space bus control register (CSnBCR). Specify CSnWCR before accessing the target area. Specify CSnBCR first, then specify CSnWCR.

(1) Normal Space, SRAM with Byte Selection, and MPX-I/O

- CS0WCR

9.4.5 Refresh Timer Control/Status Register (RTCSR)

RTCSR specifies various items about refresh for SDRAM.

When RTCSR is written, the upper 16 bits of the write data must be H'A55A to cancel write protection.

The phase of the clock for incrementing the count in the refresh timer counter (RTCNT) is adjusted only by a power-on reset. Note that there is an error in the time until the compare match flag is set for the first time after the timer is started with the CKS[2:0] bits being set to a value other than B'000.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved These bits are always read as 0.
7	CMF	0	R/W	Compare Match Flag Indicates that a compare match occurs between the refresh timer counter (RTCNT) and refresh time constant register (RTCOR). This bit is set or cleared in the following conditions. 0: Clearing condition: When 0 is written in CMF after reading out RTCSR during CMF = 1. 1: Setting condition: When the condition RTCNT = RTCOR is satisfied.
6	CMIE	0	R/W	Compare Match Interrupt Enable Enables or disables CMF interrupt requests when the CMF bit in RTCSR is set to 1. 0: Disables CMF interrupt requests. 1: Enables CMF interrupt requests.

Bit	Bit Name	Initial Value	R/W	Description
5 to 3	CKS[2:0]	000	R/W	<p>Clock Select</p> <p>Select the clock input to count-up the refresh timer counter (RTCNT).</p> <p>000: Stop the counting-up</p> <p>001: Bϕ/4</p> <p>010: Bϕ/16</p> <p>011: Bϕ/64</p> <p>100: Bϕ/256</p> <p>101: Bϕ/1024</p> <p>110: Bϕ/2048</p> <p>111: Bϕ/4096</p>
2 to 0	RRC[2:0]	000	R/W	<p>Refresh Count</p> <p>Specify the number of continuous refresh cycles, when the refresh request occurs after the coincidence of the values of the refresh timer counter (RTCNT) and the refresh time constant register (RTCOR). These bits can make the period of occurrence of refresh long.</p> <p>000: 1 time</p> <p>001: 2 times</p> <p>010: 4 times</p> <p>011: 6 times</p> <p>100: 8 times</p> <p>101: Reserved (setting prohibited)</p> <p>110: Reserved (setting prohibited)</p> <p>111: Reserved (setting prohibited)</p>

9.4.6 Refresh Timer Counter (RTCNT)

RTCNT is an 8-bit counter that increments using the clock selected by bits CKS[2:0] in RTCSR. When RTCNT matches RTCOR, RTCNT is cleared to 0. The value in RTCNT returns to 0 after counting up to 255. When the RTCNT is written, the upper 16 bits of the write data must be H'A55A to cancel write protection.

31 to 8	—	All 0	R	Reserved These bits are always read as 0.
7 to 0		All 0	R/W	8-Bit Counter

9.4.7 Refresh Time Constant Register (RTCOR)

RTCOR is an 8-bit register. When RTCOR matches RTCNT, the CMF bit in RTCSR is set to 1 and RTCNT is cleared to 0.

When the RFSH bit in SDCR is 1, a memory refresh request is issued by this matching signal. This request is maintained until the refresh operation is performed. If the request is not processed when the next matching occurs, the previous request is ignored.

When the CMIE bit in RTCSR is set to 1, an interrupt request is issued by this matching signal. The request continues to be output until the CMF bit in RTCSR is cleared. Clearing the CMF bit only affects the interrupt request and does not clear the refresh request. Therefore, a combination of refresh request and interval timer interrupt can be specified so that the number of refresh requests are counted by using timer interrupts while refresh is performed periodically.

When RTCOR is written, the upper 16 bits of the write data must be H'A55A to cancel write protection.

9.5 Operation

9.5.1 Endian/Access Size and Data Alignment

This LSI supports both big endian, in which the most significant byte (MSB) of data is that in the direction of the 0th address, and little endian, in which the least significant byte (LSB) is that in the direction of the 0th address. In the initial state after a power-on reset, all areas will be in big endian mode. Endian mode can be changed by setting the CSnBCR register as long as the target space is not being accessed.

Data bus width can be selected from 8 bits and 16 bits for the normal memory and SRAM with byte selection. It is fixed to 16 bits for SDRAM. Two data bus widths (8 bits and 16 bits) are available for the PCMCIA interface. For MPX-I/O, the data bus width is fixed to either 8 or 16 bits, or made selectable as 8 bits or 16 bits by one of the address lines.

Endian specification and data bus width varies depending on boot mode. For details, refer to section 9.3.2, Data Bus Width and Endian Specification for Each Area Depending on Boot Mode.

Data alignment is performed in accordance with the data bus width selected for the device. This also means that four read operations are required to read longword data from a byte-width device. In this LSI, data alignment and conversion of data length is performed automatically between the respective interfaces.

Tables 9.5 to 9.8 show the relationship between device data width and access unit. Note that the correspondence between addresses and strobe signals for the 16-bit bus width depends on the endian setting. For example, with big endian and a 16-bit bus width, $\overline{WE1}$ corresponds to the 0th address, which is represented by $\overline{WE0}$ when little endian has been selected.

Since instructions are fetched with both 32- and 16-bit accesses, their alignment in the little-endian area is difficult. Execute instructions from big-endian area.

Table 9.5 16-Bit External Device Access and Data Alignment in Big Endian

9.5.2 Normal Space Interface

(1) Basic Timing

For access to a normal space, this LSI uses strobe signal output in consideration of the fact that mainly static RAM will be directly connected. When using SRAM with a byte-selection pin, see section 9.5.8, SRAM Interface with Byte Selection. Figure 9.2 shows the basic timings of normal space access. A no-wait normal access is completed in two cycles. The \overline{BS} signal is asserted for one cycle to indicate the start of a bus cycle.

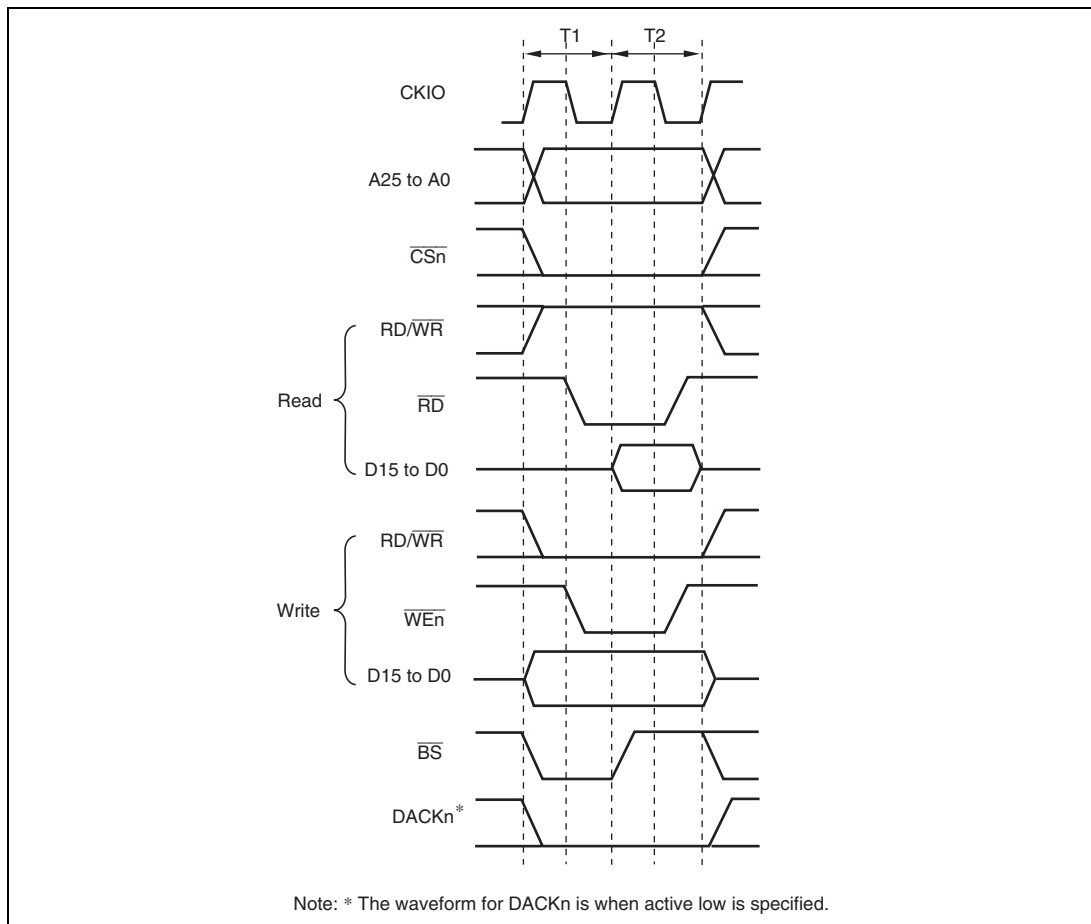

Figure 9.2 Normal Space Basic Access Timing (Access Wait 0, Word Access)

There is no access size specification when reading. The correct access start address is output in the least significant bit of the address, but since there is no access size specification, 16 bits are always read in case of a 16-bit device. When writing, only the \overline{WEn} signal for the byte to be written is asserted.

It is necessary to output the data that has been read using \overline{RD} when a buffer is established in the data bus. The $\overline{RD}/\overline{WR}$ signal is in a read state (high output) when no access has been carried out. Therefore, care must be taken when controlling the external data buffer with this signal, to avoid output collision.

Figures 9.3 and 9.4 show the basic timings in continuous access to normal space. If the WM bit in CSnWCR is cleared to 0, a T_{nop} cycle is inserted after the CSn space access to evaluate the external wait (figure 9.3). If the WM bit in CSnWCR is set to 1, external waits are ignored and no T_{nop} cycle is inserted (figure 9.4).

Figure 9.3 Continuous Access to Normal Space (1)
Bus Width = 16 Bits, Longword Access, CSnWCR.WM Bit = 0
(Access Wait = 0, Cycle Wait = 0)

Figure 9.4 Continuous Access to Normal Space (2)
Bus Width = 16 Bits, Longword Access, CSnWCR.WM Bit = 1
(Access Wait = 0, Cycle Wait = 0)

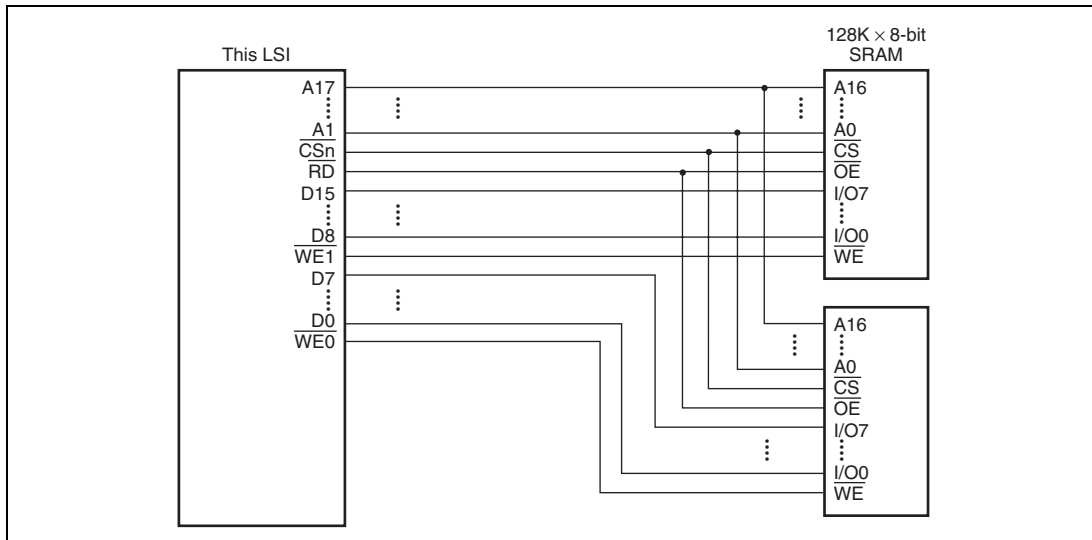

Figure 9.5 Example of 16-Bit Data-Width SRAM Connection

Figure 9.6 Example of 8-Bit Data-Width SRAM Connection

9.5.3 Access Wait Control

Wait cycle insertion on a normal space access can be controlled by the settings of bits WR3 to WR0 in CSnWCR. It is possible for areas 1, 4, and 5 to insert wait cycles independently in read access and in write access. Areas 0, 2, 3, and 6 have common access wait for read cycle and write cycle. The specified number of T_w cycles are inserted as wait cycles in a normal space access shown in figure 9.7.

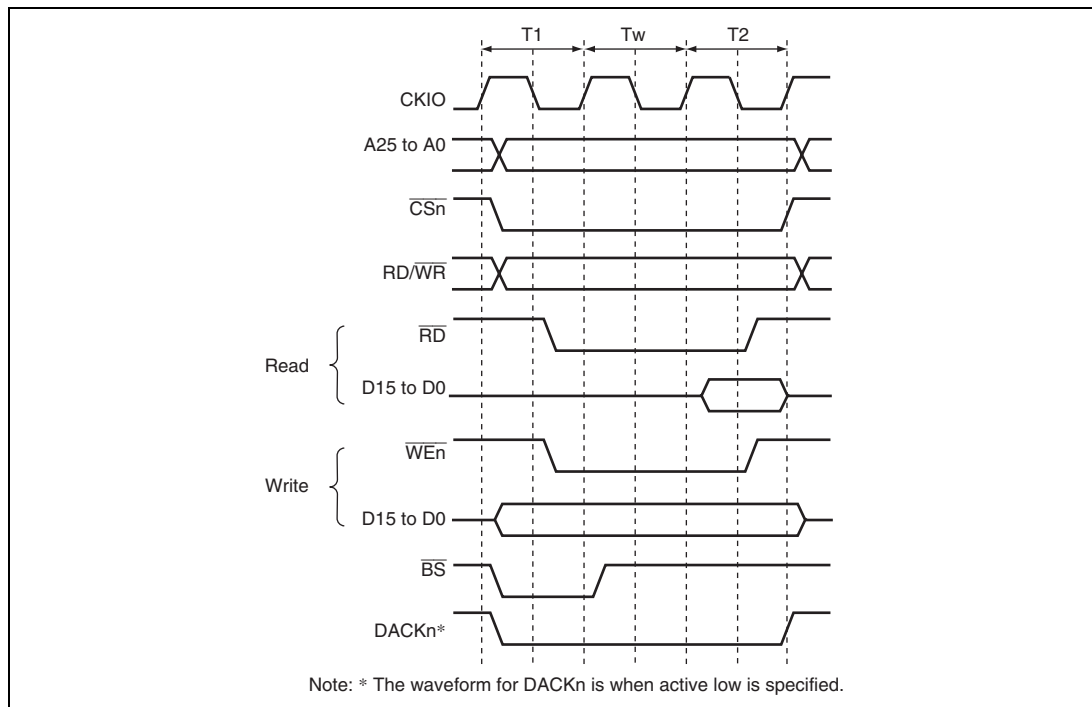

Figure 9.7 Wait Timing for Normal Space Access (Software Wait Only)

When the WM bit in CSnWCR is cleared to 0, the external wait input $\overline{\text{WAIT}}$ signal is also sampled. $\overline{\text{WAIT}}$ pin sampling is shown in figure 9.8. A 2-cycle wait is specified as a software wait. The $\overline{\text{WAIT}}$ signal is sampled on the falling edge of CKIO at the transition from the T1 or Tw cycle to the T2 cycle.

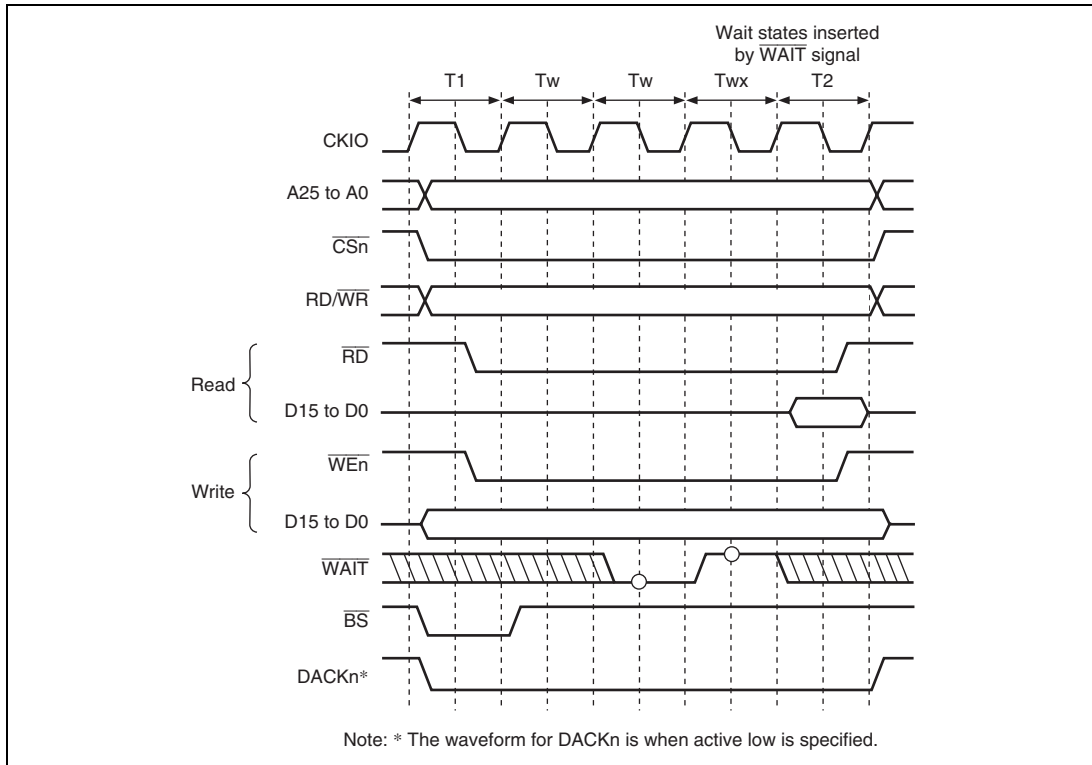

Figure 9.8 Wait Cycle Timing for Normal Space Access (Wait Cycle Insertion Using $\overline{\text{WAIT}}$ Signal)

9.5.4 \overline{CSn} Assert Period Expansion

The number of cycles from \overline{CSn} assertion to \overline{RD} , \overline{WEn} assertion can be specified by setting bits SW1 and SW0 in CSnWCR. The number of cycles from \overline{RD} , \overline{WEn} negation to \overline{CSn} negation can be specified by setting bits HW1 and HW0. Therefore, a flexible interface to an external device can be obtained. Figure 9.9 shows an example. A T_h cycle and a T_f cycle are added before and after an ordinary cycle, respectively. In these cycles, \overline{RD} and \overline{WEn} are not asserted, while other signals are asserted. The data output is prolonged to the T_f cycle, and this prolongation is useful for devices with slow writing operations.

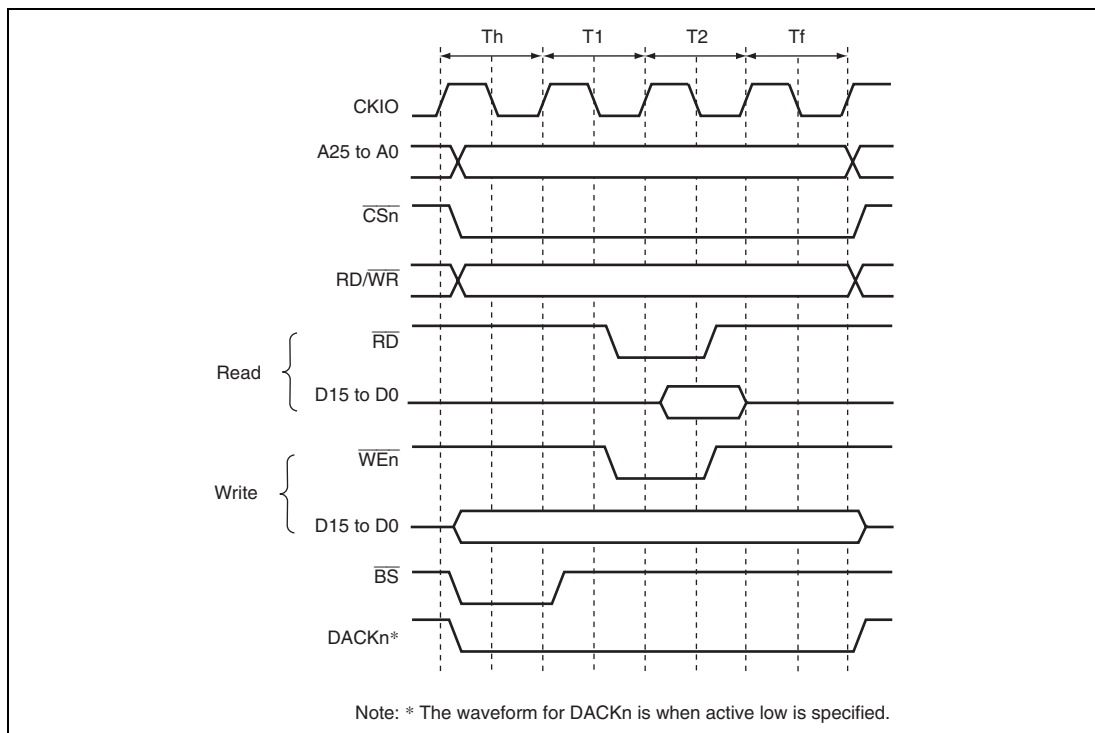

Figure 9.9 \overline{CSn} Assert Period Expansion

9.5.5 MPX-I/O Interface

Access timing for the MPX space is shown below. In the MPX space, $\overline{CS5}$, \overline{AH} , \overline{RD} , and \overline{WEn} signals control the accessing. The basic access for the MPX space consists of 2 cycles of address output followed by an access to a normal space. The bus width for the address output cycle or the data input/output cycle is fixed to 8 bits or 16 bits. Alternatively, it can be 8 bits or 16 bits depending on the address to be accessed.

Output of the addresses D15 to D0 or D7 to D0 is performed from cycle Ta2 to cycle Ta3. Because cycle Ta1 has a high-impedance state, collisions of addresses and data can be avoided without inserting idle cycles, even in continuous access cycles. Address output is increased to 3 cycles by setting the MPXW bit in CS5WCR to 1.

The $\overline{RD}/\overline{WR}$ signal is output at the same time as the $\overline{CS5}$ signal; it is high in the read cycle and low in the write cycle.

The data cycle is the same as that in a normal space access.

Timing charts are shown in figures 9.10 to 9.12.

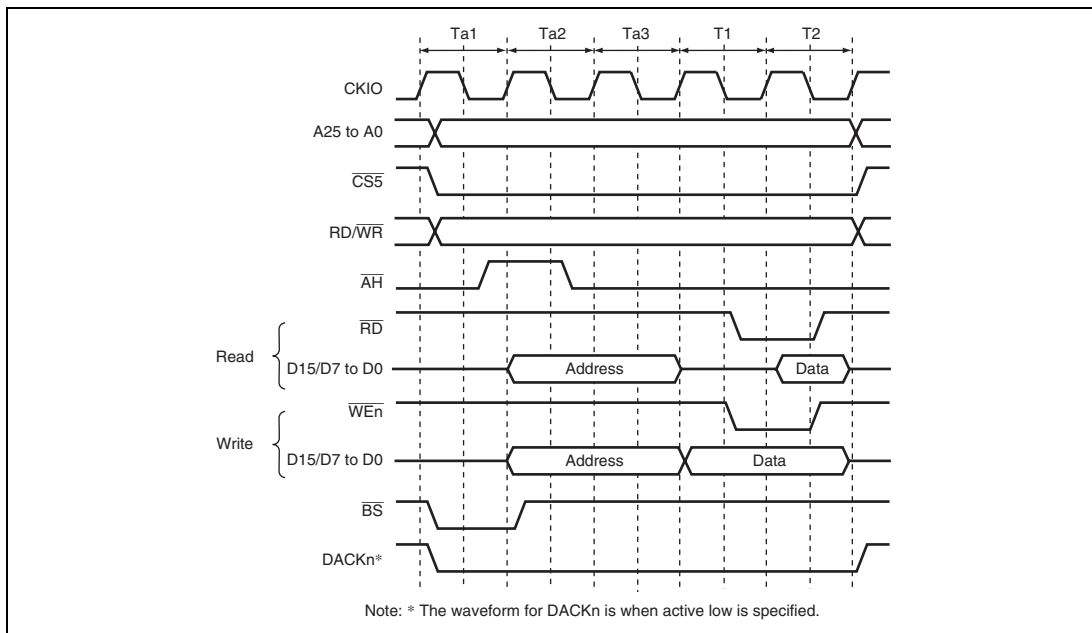

Figure 9.10 Access Timing for MPX Space (Address Cycle No Wait, Data Cycle No Wait)

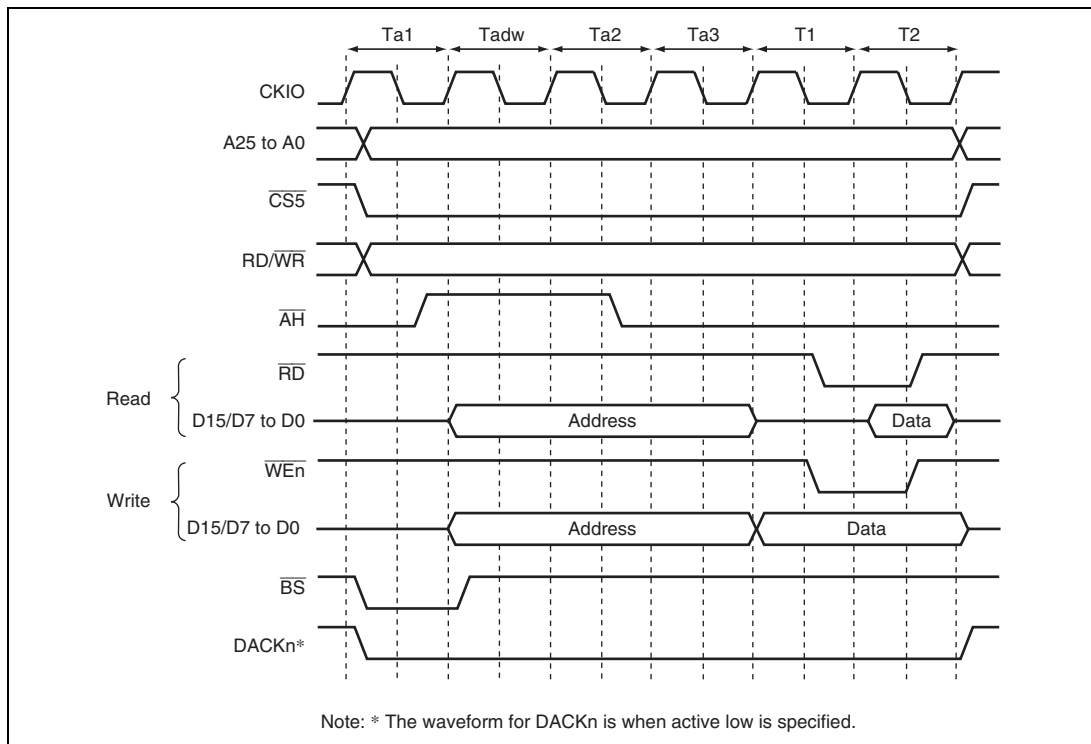

Figure 9.11 Access Timing for MPX Space (Address Cycle Wait 1, Data Cycle No Wait)

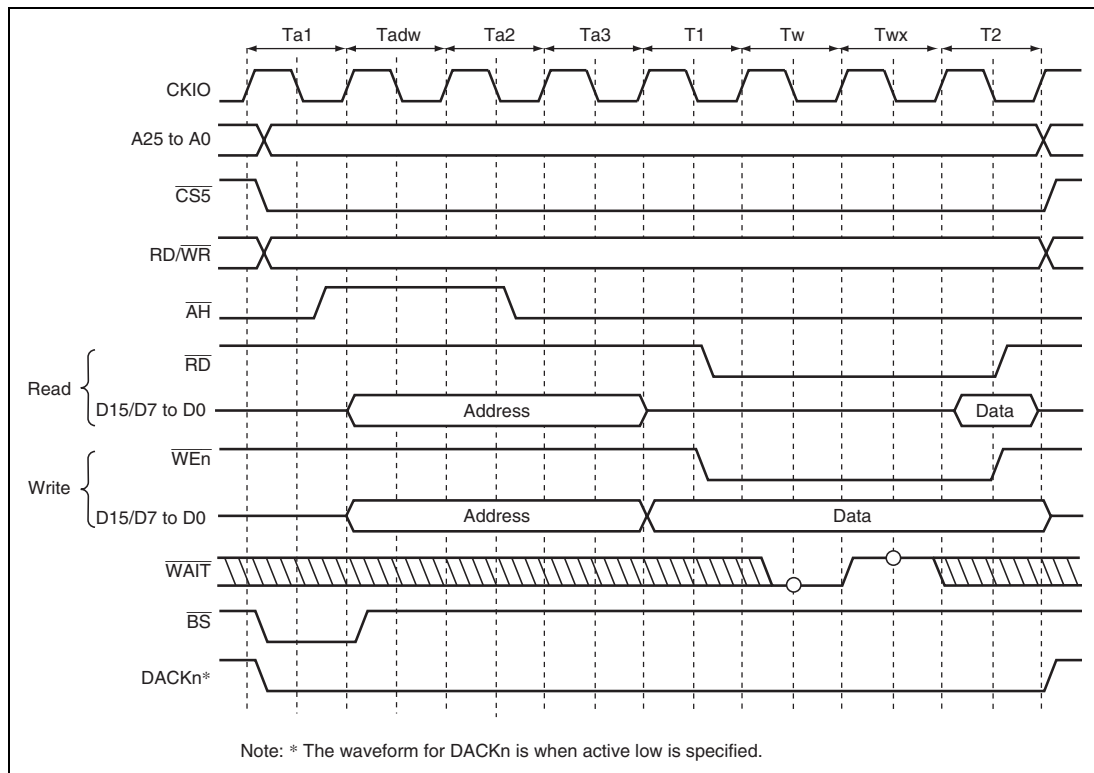

Figure 9.12 Access Timing for MPX Space
(Address Cycle Access Wait 1, Data Cycle Wait 1, External Wait 1)

9.5.6 SDRAM Interface

(1) SDRAM Direct Connection

The SDRAM that can be connected to this LSI is a product that has 11/12/13 bits of row address, 8/9/10 bits of column address, 4 or less banks, and uses the A10 pin for setting precharge mode in read and write command cycles.

The control signals for direct connection of SDRAM are $\overline{\text{RAS}}$, $\overline{\text{CAS}}$, $\text{RD}/\overline{\text{WR}}$, DQMU , DQML , CKE , $\overline{\text{CS2}}$, and $\overline{\text{CS3}}$. All the signals other than $\overline{\text{CS2}}$ and $\overline{\text{CS3}}$ are common to all areas, and signals other than CKE are valid only when $\overline{\text{CS2}}$ or $\overline{\text{CS3}}$ is asserted. SDRAM can be connected to up to 2 spaces. The data bus width of the area that is connected to SDRAM is 16 bits.

Burst read/single write (burst length 1) and burst read/burst write (burst length 1) are supported as the SDRAM operating mode.

Commands for SDRAM can be specified by $\overline{\text{RAS}}$, $\overline{\text{CAS}}$, $\text{RD}/\overline{\text{WR}}$, and specific address signals. These commands supports:

- NOP
- Auto-refresh (REF)
- Self-refresh (SELF)
- All banks pre-charge (PALL)
- Specified bank pre-charge (PRE)
- Bank active (ACTV)
- Read (READ)
- Read with pre-charge (READA)
- Write (WRIT)
- Write with pre-charge (WRITA)
- Write mode register (MRS, EMRS)

The byte to be accessed is specified by DQMU and DQML . Reading or writing is performed for a byte whose corresponding DQMx is low. For details on the relationship between DQMx and the byte to be accessed, see section 9.5.1, Endian/Access Size and Data Alignment.

Figure 9.13 shows an example of the connection of the SDRAM with the LSI.

Figure 9.13 Example of 16-Bit Data Width SDRAM Connection

(2) Address Multiplexing

An address multiplexing is specified so that SDRAM can be connected without external multiplexing circuitry according to the setting of bits BSZ[1:0] in CSnBCR and bits A2ROW[1:0], A2COL[1:0], A3ROW[1:0], and A3COL[1:0] in SDCR. Tables 9.9 to 9.11 show the relationship between the settings of bits BSZ[1:0], A2ROW[1:0], A2COL[1:0], A3ROW[1:0], and A3COL[1:0] and the bits output at the address pins. Do not specify those bits in the manner other than this table, otherwise the operation of this LSI is not guaranteed. A25 to A18 are not multiplexed and the original values of address are always output at these pins.

When the data bus width is 16 bits (BSZ1 and BSZ0 = B'10), A0 of SDRAM specifies a word address. Therefore, connect this A0 pin of SDRAM to the A1 pin of the LSI; the A1 pin of SDRAM to the A2 pin of the LSI, and so on.

Table 9.9 Relationship between BSZ[1:0], A2/3ROW[1:0], A2/3COL[1:0], and Address Multiplex Output (1)-1

Setting				
BSZ [1:0]	A2/3 ROW [1:0]	A2/3 COL [1:0]		
11 (16 bits)	00 (11 bits)	00 (8 bits)		
Output Pin of This LSI	Row Address Output Cycle	Column Address Output Cycle	SDRAM Pin	Function
A17	A25	A17		Unused
A16	A24	A16

(3) Burst Read

A burst read occurs in the following cases with this LSI.

- Access size in reading is larger than data bus width.
- 16-byte transfer in cache miss.
- 16-byte transfer in the direct memory access controller

This LSI always accesses the SDRAM with burst length 1. For example, read access of burst length 1 is performed consecutively 8 times to read 16-byte continuous data from the SDRAM that is connected to a 16-bit data bus. This access is called the burst read with the burst number 8.

Table 9.12 shows the relationship between the access size and the number of bursts.

Table 9.12 Relationship between Access Size and Number of Bursts

Bus Width	Access Size	Number of Bursts
16 bits	8 bits	1
	16 bits	1
	32 bits	2
	16 bytes	8

Figures 9.14 and 9.15 show a timing chart in burst read. In burst read, an ACTV command is output in the Tr cycle, the READ command is issued in the Tc1, Tc2, and Tc3 cycles, the READA command is issued in the Tc4 cycle, and the read data is received at the rising edge of the external clock (CKIO) in the Td1 to Td4 cycles. The Tap cycle is used to wait for the completion of an auto-precharge induced by the READA command in the SDRAM. In the Tap cycle, a new command will not be issued to the same bank. However, access to another CS space or another bank in the same SDRAM space is enabled. The number of Tap cycles is specified by the WTRP1 and WTRP0 bits in CS3WCR.

In this LSI, wait cycles can be inserted by specifying each bit in CS3WCR to connect the SDRAM in variable frequencies. Figure 9.15 shows an example in which wait cycles are inserted. The number of cycles from the Tr cycle where the ACTV command is output to the Tc1 cycle where the READ command is output can be specified using the WTRCD1 and WTRCD0 bits in CS3WCR. If the WTRCD1 and WTRCD0 bits specify one cycle or more, a Trw cycle where the NOP command is issued is inserted between the Tr cycle and Tc1 cycle. The number of cycles from the Tc1 cycle where the READ command is output to the Td1 cycle where the read data is latched can be specified for the CS2 and CS3 spaces independently, using the A2CL1 and A2CL0 bits in CS2WCR or the A3CL1 and A3CL0 bits in CS3WCR. The number of cycles from Tc1 to Td1 corresponds to the SDRAM CAS latency. The CAS latency for the SDRAM is normally defined as up to three cycles. However, the CAS latency in this LSI can be specified as 1 to 4 cycles. This CAS latency can be achieved by connecting a latch circuit between this LSI and the SDRAM.

A Tde cycle is an idle cycle required to transfer the read data into this LSI and occurs once for every burst read or every single read.

Figure 9.14 Burst Read Basic Timing (CAS Latency 1, Auto Pre-Charge)

Figure 9.15 Burst Read Wait Specification Timing
(CAS Latency 2, WTRCD[1:0] = 1 Cycle, Auto Pre-Charge)

(4) Single Read

A read access ends in one cycle when data exists in a cache-disabled space and the data bus width is larger than or equal to the access size. As the SDRAM is set to the burst read with the burst length 1, only the required data is output. A read access that ends in one cycle is called single read.

Figure 9.16 shows the single read basic timing.

Figure 9.16 Basic Timing for Single Read (CAS Latency 1, Auto Pre-Charge)

(5) Burst Write

A burst write occurs in the following cases in this LSI.

- Access size in writing is larger than data bus width.
- Write-back of the cache
- 16-byte transfer in the direct memory access controller

This LSI always accesses SDRAM with burst length 1. For example, write access of burst length 1 is performed continuously 8 times to write 16-byte continuous data to the SDRAM that is connected to a 16-bit data bus. This access is called burst write with the burst number 8. The relationship between the access size and the number of bursts is shown in table 9.12. Figure 9.17 shows a timing chart for burst writes. In burst write, an ACTV command is output in the Tr cycle, the WRIT command is issued in the Tc1, Tc2, and Tc3 cycles, and the WRITA command is issued to execute an auto-precharge in the Tc4 cycle. In the write cycle, the write data is output simultaneously with the write command. After the write command with the auto-precharge is output, the Trw1 cycle that waits for the auto-precharge initiation is followed by the Tap cycle that waits for completion of the auto-precharge induced by the WRITA command in the SDRAM. Between the Trw1 and the Tap cycle, a new command will not be issued to the same bank. However, access to another CS space or another bank in the same SDRAM space is enabled. The number of Trw1 cycles is specified by the TRWL1 and TRWL0 bits in CS3WCR. The number of Tap cycles is specified by the WTRP1 and WTRP0 bits in CS3WCR.

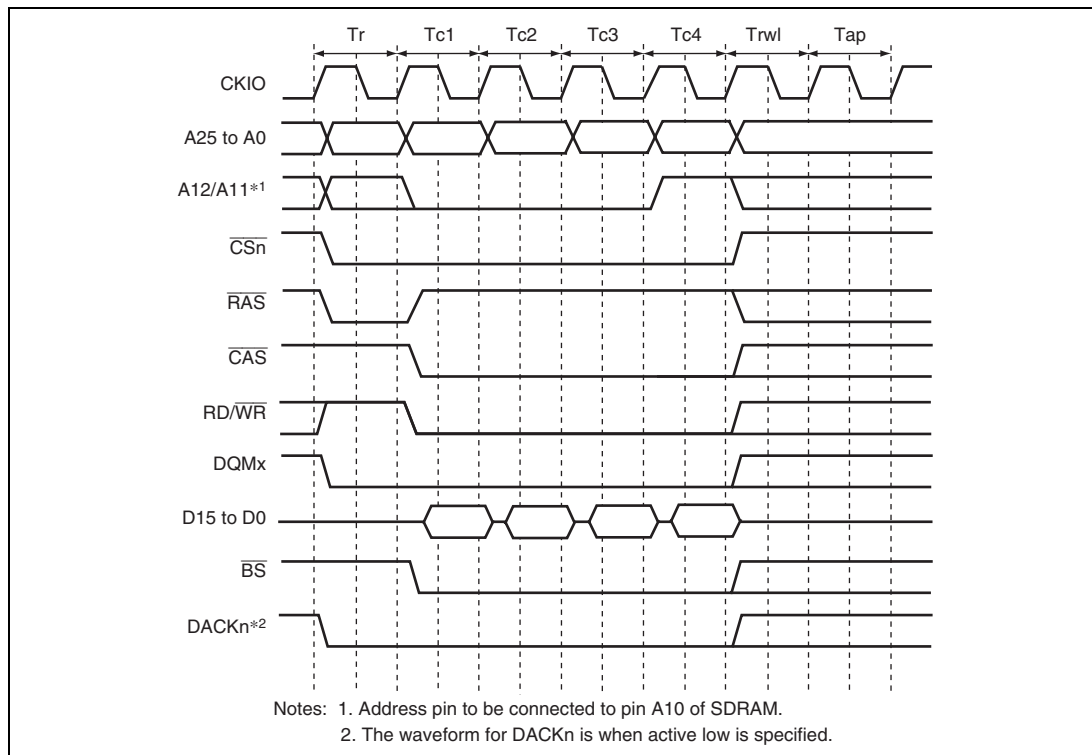

Figure 9.17 Basic Timing for Burst Write (Auto Pre-Charge)

(6) Single Write

A write access ends in one cycle when data is written in a cache-disabled space and the data bus width is larger than or equal to access size. As a single write or burst write with burst length 1 is set in SDRAM, only the required data is output. The write access that ends in one cycle is called single write. Figure 9.18 shows the single write basic timing.

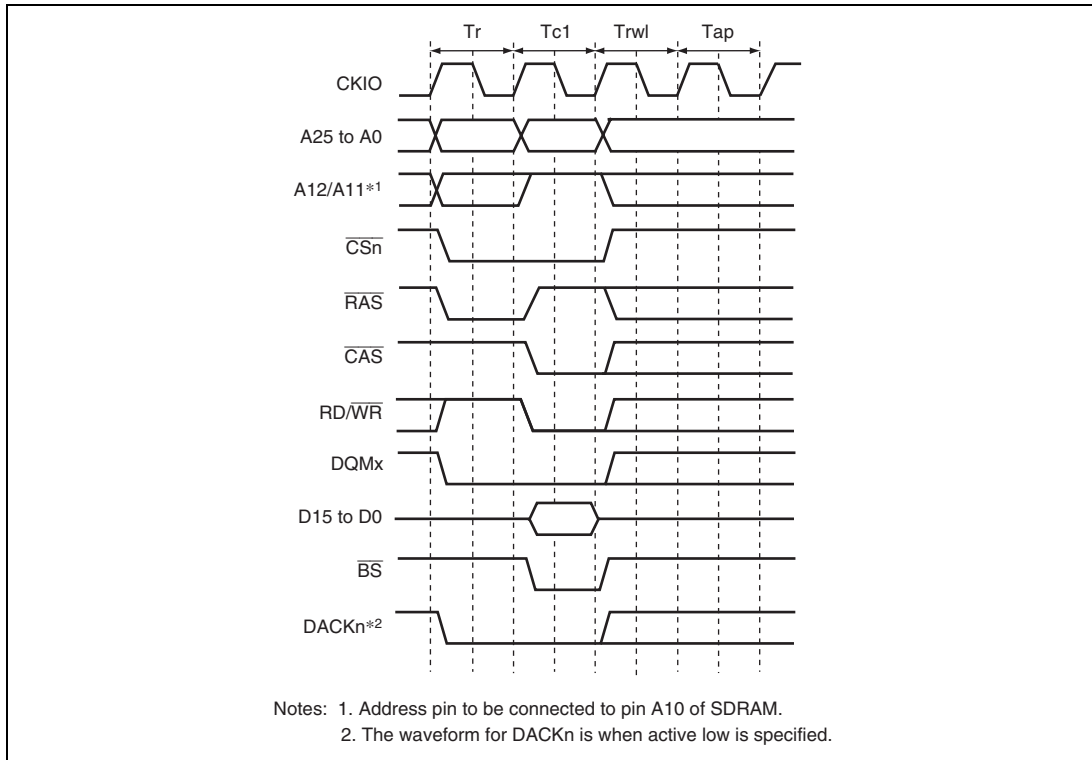

Figure 9.18 Single Write Basic Timing (Auto-Precharge)

(7) Bank Active

The SDRAM bank function can be used to support high-speed access to the same row address. When the BACTV bit in SDCR is 1, access is performed using commands without auto-precharge (READ or WRIT). This function is called bank-active function. This function is valid only for area 3. When area 3 is set to bank-active mode, area 2 should be set to normal space or SRAM with byte selection. When areas 2 and 3 are both set to SDRAM, auto precharge mode must be set.

When the bank-active function is used, precharging is not performed when the access ends. When accessing the same row address in the same bank, it is possible to issue the READ or WRIT command immediately, without issuing an ACTV command. As SDRAM is internally divided into several banks, it is possible to activate one row address in each bank. If the next access is to a different row address, a PRE command is first issued to precharge the relevant bank, then when precharging is completed, the access is performed by issuing an ACTV command followed by a READ or WRIT command. If this is followed by an access to a different row address, the access time will be longer because of the precharging performed after the access request is issued. The number of cycles between issuance of the PRE command and the ACTV command is determined by the WTRP1 and WTPR0 bits in CS3WCR.

In a write, when an auto-precharge is performed, a command cannot be issued to the same bank for a period of $Trwl + Tap$ cycles after issuance of the WRITA command. When bank active mode is used, READ or WRIT commands can be issued successively if the row address is the same. The number of cycles can thus be reduced by $Trwl + Tap$ cycles for each write.

There is a limit on $tRAS$, the time for placing each bank in the active state. If there is no guarantee that there will not be a cache hit and another row address will be accessed within the period in which this value is maintained by program execution, it is necessary to set auto-refresh and set the refresh cycle to no more than the maximum value of $tRAS$.

A burst read cycle without auto-precharge is shown in figure 9.19, a burst read cycle for the same row address in figure 9.20, and a burst read cycle for different row addresses in figure 9.21. Similarly, a single write cycle without auto-precharge is shown in figure 9.22, a single write cycle for the same row address in figure 9.23, and a single write cycle for different row addresses in figure 9.24.

In figure 9.20, a $Tnop$ cycle in which no operation is performed is inserted before the Tc cycle that issues the READ command. The $Tnop$ cycle is inserted to acquire two cycles of CAS latency for the DQMx signal that specifies the read byte in the data read from the SDRAM. If the CAS latency is specified as two cycles or more, the $Tnop$ cycle is not inserted because the two cycles of latency can be acquired even if the DQMx signal is asserted after the Tc cycle.

When bank active mode is set, if only access cycles to the respective banks in the area 3 space are considered, as long as access cycles to the same row address continue, the operation starts with the cycle in figure 9.19 or 9.22, followed by repetition of the cycle in figure 9.20 or 9.23. An access to a different area during this time has no effect. If there is an access to a different row address in the bank active state, the bus cycle in figure 9.21 or 9.24 is executed instead of that in figure 9.20 or 9.23. In bank active mode, too, all banks become inactive after a refresh cycle or after the bus is released as the result of bus arbitration.

Figure 9.24 Single Write Timing (Bank Active, Different Row Addresses in the Same Bank)

(8) Refreshing

This module has a function for controlling SDRAM refreshing. Auto-refreshing can be performed by clearing the RMODE bit to 0 and setting the RFSH bit to 1 in SDCR. A continuous refreshing can be performed by setting the RRC2 to RRC0 bits in RTCSR. If SDRAM is not accessed for a long period, self-refresh mode, in which the power consumption for data retention is low, can be activated by setting both the RMODE bit and the RFSH bit to 1.

(a) Auto-refreshing

Refreshing is performed at intervals determined by the input clock selected by bits CKS2 to CKS0 in RTCSR, and the value set by in RTCOR. The value of bits CKS2 to CKS0 in RTCOR should be set so as to satisfy the refresh interval stipulation for the SDRAM used. First make the settings for RTCOR, RTCNT, and the RMODE and RFSH bits in SDCR, and then make the CKS2 to CKS0 and RRC2 to RRC0 settings. When the clock is selected by bits CKS2 to CKS0, RTCNT starts counting up from the value at that time. The RTCNT value is constantly compared with the RTCOR value, and if the two values are the same, a refresh request is generated and an auto-refresh is performed for the number of times specified by the RRC2 to RRC0. At the same time, RTCNT is cleared to zero and the count-up is restarted.

Figure 9.25 shows the auto-refresh cycle timing. After starting the auto refreshing, PALL command is issued in the T_p cycle to make all the banks to pre-charged state from active state when some bank is being pre-charged. Then REF command is issued in the T_{rr} cycle after inserting idle cycles of which number is specified by the WTRP1 and WTRP0 bits in CS3WCR. A new command is not issued for the duration of the number of cycles specified by the WTRC1 and WTRC0 bits in CS3WCR after the T_{rr} cycle. The WTRC1 and WTRC0 bits must be set so as to satisfy the SDRAM refreshing cycle time stipulation (t_{RC}). An idle cycle is inserted between the T_p cycle and T_{rr} cycle when the setting value of the WTRP1 and WTRP0 bits in CS3WCR is longer than or equal to 1 cycle.

Figure 9.25 Auto-Refresh Timing

(b) Self-refreshing

Self-refresh mode is a kind of standby mode, in which the refresh timing and refresh addresses are generated within the SDRAM. Self-refreshing is activated by setting both the RMODE bit and the RFSH bit in SDCR to 1. After starting the self-refreshing, PALL command is issued in T_p cycle after the completion of the pre-charging bank. A SELF command is then issued after inserting idle cycles of which number is specified by the WTRP1 and WTRP0 bits in CS3WSR. SDRAM cannot be accessed while in the self-refresh state. Self-refresh mode is cleared by clearing the RMODE bit to 0. After self-refresh mode has been cleared, command issuance is disabled for the number of cycles specified by the WTRC1 and WTRC0 bits in CS3WCR.

Self-refresh timing is shown in figure 9.26. Settings must be made so that self-refresh clearing and data retention are performed correctly, and auto-refreshing is performed at the correct intervals. When self-refreshing is activated from the state in which auto-refreshing is set, auto-refreshing is restarted if the RFSH bit is set to 1 and the RMODE bit is cleared to 0 when self-refresh mode is cleared. If the transition from clearing of self-refresh mode to the start of auto-refreshing takes time, this time should be taken into consideration when setting the initial value of RTCNT. Making the RTCNT value 1 less than the RTCOR value will enable refreshing to be started immediately.

After self-refreshing has been set, the self-refresh state continues even if the chip standby state is entered using the LSI standby function, and is maintained even after recovery from standby mode due to an interrupt. Note that the necessary signals such as CKE must be driven even in standby state by setting the HIZCNT bit in CMNCR to 1.

When the multiplication rate for the PLL circuit is changed, the CKIO output will become unstable or will be fixed low. For details on the CKIO output, see section 5, Clock Pulse Generator. The contents of SDRAM can be retained by placing the SDRAM in the self-refresh state before changing the multiplication rate.

The self-refresh state is not cleared by a manual reset. In case of a power-on reset, the bus state controller's registers are initialized, and therefore the self-refresh state is cleared.

Figure 9.26 Self-Refresh Timing

(9) Relationship between Refresh Requests and Bus Cycles

If a refresh request occurs during bus cycle execution, the refresh cycle must wait for the bus cycle to be completed. If a refresh request occurs while the bus is released by the bus arbitration function, the refresh will not be executed until the bus mastership is acquired.

If the external bus does not return the bus for a period longer than the specified refresh interval, refresh cannot be executed and the SDRAM contents may be lost.

If a new refresh request occurs while waiting for the previous refresh request, the previous refresh request is deleted. To refresh correctly, a bus cycle longer than the refresh interval or the bus mastership occupation must be prevented from occurring.

If a bus mastership is requested during self-refresh, the bus will not be released until the refresh is completed.

(10) Power-Down Mode

If the PDOWN bit in SDCR is set to 1, the SDRAM is placed in power-down mode by bringing the CKE signal to the low level in the non-access cycle. This power-down mode can effectively lower the power consumption in the non-access cycle. However, please note that if an access occurs in power-down mode, a cycle of overhead occurs because a cycle is needed to assert the CKE in order to cancel the power-down mode.

Figure 9.27 shows the access timing in power-down mode.

Figure 9.27 Power-Down Mode Access Timing

(11) Power-On Sequence

In order to use SDRAM, mode setting must first be made for SDRAM after the pose interval specified for the SDRAM to be used after powering on. The pose interval should be obtained by a power-on reset generating circuit or software.

To perform SDRAM initialization correctly, the registers of this module must first be set, followed by a write to the SDRAM mode register. In SDRAM mode register setting, the address signal value at that time is latched by a combination of the \overline{CS}_n , \overline{RAS} , \overline{CAS} , and $\overline{RD}/\overline{WR}$ signals. If the value to be set is X, the bus state controller provides for value X to be written to the SDRAM mode register by performing a word write to address H'FFFC4000 + X for area 2 SDRAM, and to address H'FFFC5000 + X for area 3 SDRAM. In this operation the data is ignored, but the mode write is performed as a byte-size access. To set burst read/single write or burst read/burst write (CAS latency 2 to 3, wrap type = sequential, and burst length 1) supported by the LSI, arbitrary data is written in a byte-size access to the addresses shown in table 9.13. In this time 0 is output at the external address pins of A12 or later.

Table 9.13 Access Address in SDRAM Mode Register Write

- Setting for Area 2

Burst read/single write (burst length 1):

Data Bus Width	CAS Latency	Access Address	External Address Pin
16 bits	2	H'FFFC4440	H'0000440
	3	H'FFFC4460	H'0000460

Burst read/burst write (burst length 1):

Data Bus Width	CAS Latency	Access Address	External Address Pin
16 bits	2	H'FFFC4040	H'0000040
	3	H'FFFC4060	H'0000060

- Setting for Area 3

Burst read/single write (burst length 1):

Data Bus Width	CAS Latency	Access Address	External Address Pin
16 bits	2	H'FFFC5440	H'0000440
	3	H'FFFC5460	H'0000460

Burst read/burst write (burst length 1):

Data Bus Width	CAS Latency	Access Address	External Address Pin
16 bits	2	H'FFFC5040	H'0000040
	3	H'FFFC5060	H'0000060

Mode register setting timing is shown in figure 9.28. A PALL command (all bank pre-charge command) is firstly issued. A REF command (auto refresh command) is then issued 8 times. An MRS command (mode register write command) is finally issued. Idle cycles, of which number is specified by the WTRP1 and WTRP0 bits in CS3WCR, are inserted between the PALL and the first REF. Idle cycles, of which number is specified by the WTRC1 and WTRC0 bits in CS3WCR, are inserted between REF and REF, and between the 8th REF and MRS. One or more idle cycles are inserted between the MRS and a command to be issued next.

It is necessary to keep idle time of certain cycles for SDRAM before issuing PALL command after power-on. Refer to the manual of the SDRAM for the idle time to be needed. When the pulse width of the reset signal is longer than the idle time, mode register setting can be started immediately after the reset, but care should be taken when the pulse width of the reset signal is shorter than the idle time.

Figure 9.28 SDRAM Mode Write Timing (Based on JEDEC)

(12) Low-Power SDRAM

The low-power SDRAM can be accessed using the same protocol as the normal SDRAM.

The differences between the low-power SDRAM and normal SDRAM are that partial refresh takes place that puts only a part of the SDRAM in the self-refresh state during the self-refresh function, and that power consumption is low during refresh under user conditions such as the operating temperature. The partial refresh is effective in systems in which the data in a work area other than the specific area can be lost without severe repercussions. For details, please refer to the Data Sheet for the low-power SDRAM to be used.

The low-power SDRAM supports the extension mode register in addition to the mode registers as the normal SDRAM. This LSI supports issuing of the extension mode register write command (EMRS).

The EMRS command is issued according to the conditions specified in table below. For example, if data H'0YYYYYYY is written to address H'FFFC5XX0 in longword, the commands are issued to the CS3 space in the following sequence: PALL -> REF × 8 -> MRS -> EMRS. In this case, the MRS and EMRS issue addresses are H'0000XX0 and H'YYYYYYY, respectively. If data H'1YYYYYYY is written to address H'FFFC5XX0 in longword, the commands are issued to the CS3 space in the following sequence: PALL -> MRS -> EMRS.

Table 9.14 Output Addresses when EMRS Command Is Issued

Command to be Issued	Access Address	Access Data	Write Access Size	MRS Command Issue Address	EMRS Command Issue Address
CS2 MRS	H'FFFC4XX0	H'*****	16 bits	H'0000XX0	—
CS3 MRS	H'FFFC5XX0	H'*****	16 bits	H'0000XX0	—
CS2 MRS + EMRS (with refresh)	H'FFFC4XX0	H'0YYYYYYY	32 bits	H'0000XX0	H'YYYYYYY
CS3 MRS + EMRS (with refresh)	H'FFFC5XX0	H'0YYYYYYY	32 bits	H'0000XX0	H'YYYYYYY
CS2 MRS + EMRS (without refresh)	H'FFFC4XX0	H'1YYYYYYY	32 bits	H'0000XX0	H'YYYYYYY
CS3 MRS + EMRS (without refresh)	H'FFFC5XX0	H'1YYYYYYY	32 bits	H'0000XX0	H'YYYYYYY

Figure 9.29 EMRS Command Issue Timing

- Deep power-down mode

The low-power SDRAM supports the deep power-down mode as a low-power consumption mode. In the partial self-refresh function, self-refresh is performed on a specific area. In the deep power-down mode, self-refresh will not be performed on any memory area. This mode is effective in systems where all of the system memory areas are used as work areas.

If the RMODE bit in the SDCR is set to 1 while the DEEP and RFSH bits in the SDCR are set to 1, the low-power SDRAM enters the deep power-down mode. If the RMODE bit is cleared to 0, the CKE signal is pulled high to cancel the deep power-down mode. Before executing an access after returning from the deep power-down mode, the power-up sequence must be re-executed.

Figure 9.30 Deep Power-Down Mode Transition Timing

9.5.7 Burst ROM (Clocked Asynchronous) Interface

The burst ROM (clocked asynchronous) interface is used to access a memory with a high-speed read function using a method of address switching called the burst mode or page mode. In a burst ROM (clocked asynchronous) interface, basically the same access as the normal space is performed, but the 2nd and subsequent access cycles are performed only by changing the address, without negating the \overline{RD} signal at the end of the 1st cycle. In the 2nd and subsequent access cycles, addresses are changed at the falling edge of the CKIO.

For the 1st access cycle, the number of wait cycles specified by the W3 to W0 bits in CSnWCR is inserted. For the 2nd and subsequent access cycles, the number of wait cycles specified by the BW1 and BW0 bits in CSnWCR is inserted.

In the access to the burst ROM (clocked asynchronous), the \overline{BS} signal is asserted only to the first access cycle. An external wait input is valid only to the first access cycle.

In the single access or write access that does not perform the burst operation in the burst ROM (clocked asynchronous) interface, access timing is same as a normal space.

Table 9.15 lists a relationship between bus width, access size, and the number of bursts. Figure 9.31 shows a timing chart.

Table 9.15 Relationship between Bus Width, Access Size, and Number of Bursts

Bus Width	Access Size	CSnWCR. BST[1:0] Bits	Number of Bursts	Access Count
8 bits	8 bits	Not affected	1	1
	16 bits	Not affected	2	1
	32 bits	Not affected	4	1
	16 bytes	00	16	1
		01	4	4

Bus Width	Access Size	CSnWCR. BST[1:0] Bits	Number of Bursts	Access Count	
16 bits	8 bits	Not affected	1	1	
	16 bits	Not affected	1	1	
	32 bits	Not affected	2	1	
	16 bytes	00		8	1
		01		2	4
		10*		4	2
				2, 4, 2	3

Note: * When the bus width is 16 bits, the access size is 16 bits, and the BST[1:0] bits in CSnWCR are 10, the number of bursts and access count depend on the access start address. At address H'xxx0 or H'xxx8, 4-4 burst access is performed. At address H'xxx4 or H'xxxC, 2-4-2 burst access is performed.

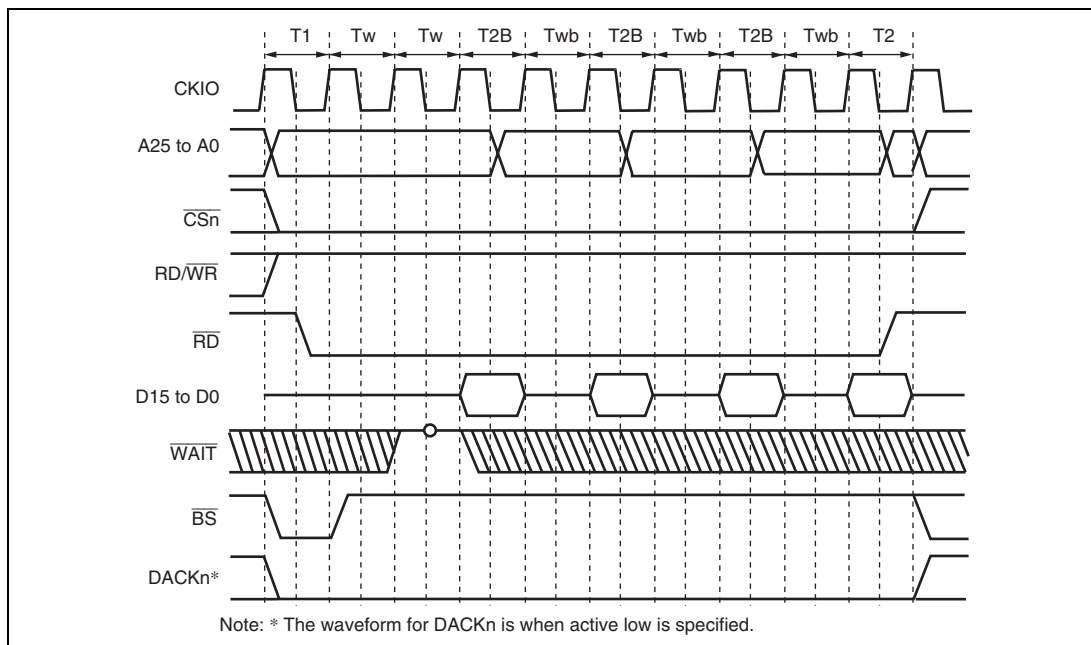

Figure 9.31 Burst ROM Access Timing (Clocked Asynchronous)
(Bus Width = 16Bits, 16-Byte Transfer (Number of Burst 4-4), Wait Cycles Inserted in First Access = 2, Wait Cycles Inserted in Second and Subsequent Access Cycles = 1)

9.5.8 SRAM Interface with Byte Selection

The SRAM interface with byte selection is a memory interface that outputs the byte selection signal (\overline{WEn}) in both read and write bus cycles. This interface has 16-bit data pins and accesses SRAMs having upper and lower byte selection pins, such as UB and LB.

When the BAS bit in CSnWCR is cleared to 0 (initial value), the write access timing of the SRAM interface with byte selection is the same as that for the normal space interface. While in read access of a byte-selection SRAM interface, the byte-selection signal is output from the \overline{WEn} pin, which is different from that for the normal space interface. The basic access timing is shown in figure 9.32. In write access, data is written to the memory according to the timing of the byte-selection pin (\overline{WEn}). For details, please refer to the Data Sheet for the corresponding memory.

If the BAS bit in CSnWCR is set to 1, the \overline{WEn} pin and RD/ \overline{WR} pin timings change. Figure 9.33 shows the basic access timing. In write access, data is written to the memory according to the timing of the write enable pin (RD/ \overline{WR}). The data hold timing from RD/ \overline{WR} negation to data write must be acquired by setting the HW1 and HW0 bits in CSnWCR. Figure 9.34 shows the access timing when a software wait is specified.

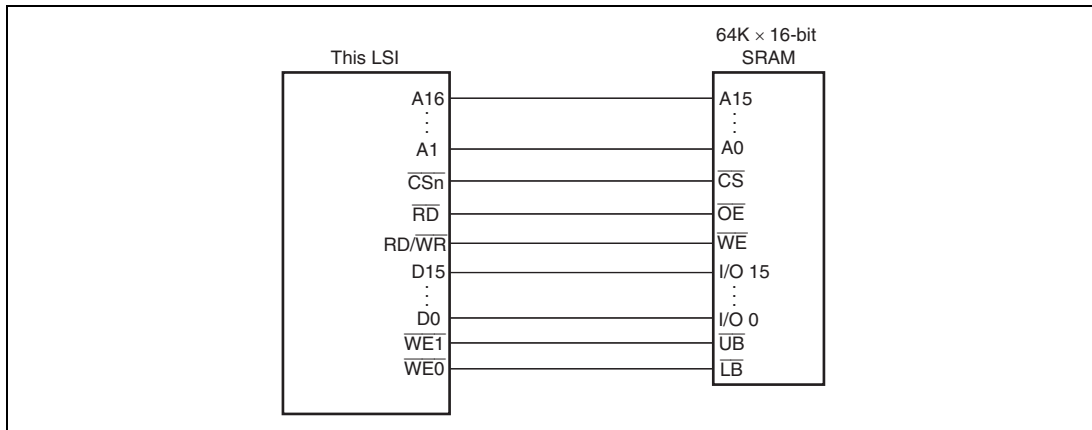

Figure 9.35 Example of Connection with 16-Bit Data-Width SRAM with Byte Selection

9.5.9 PCMCIA Interface

With this LSI, areas 5 and 6 can be used for the IC memory card and I/O card interface defined in the JEIDA specifications version 4.2 (PCMCIA2.1 Rev. 2.1) by specifying bits TYPE[2:0] in CSnBCR (n = 5 and 6) to B'101. In addition, the bits SA[1:0] in CSnWCR (n = 5 and 6) assign the upper or lower 32 Mbytes of each area to IC memory card or I/O card interface. For example, if the bits SA1 and SA0 in CS5WCR are set to 1 and cleared to 0, respectively, the upper 32 Mbytes of area 5 are used for IC memory card interface and the lower 32 Mbytes are used for I/O card interface.

When the PCMCIA interface is used, the bus size must be specified as 8 bits or 16 bits using the bits BSZ[1:0] in CS5BCR or CS6BCR.

Figure 9.36 shows an example of connection between this LSI and a PCMCIA card. To enable hot swapping (insertion and removal of the PCMCIA card with the system power turned on), tri-state buffers must be connected between the bus interface of this LSI and the PCMCIA card.

In the JEIDA and PCMCIA standards, operation in big endian mode is not clearly defined. Consequently, the provided PCMCIA interface in big endian mode is available only for this LSI.

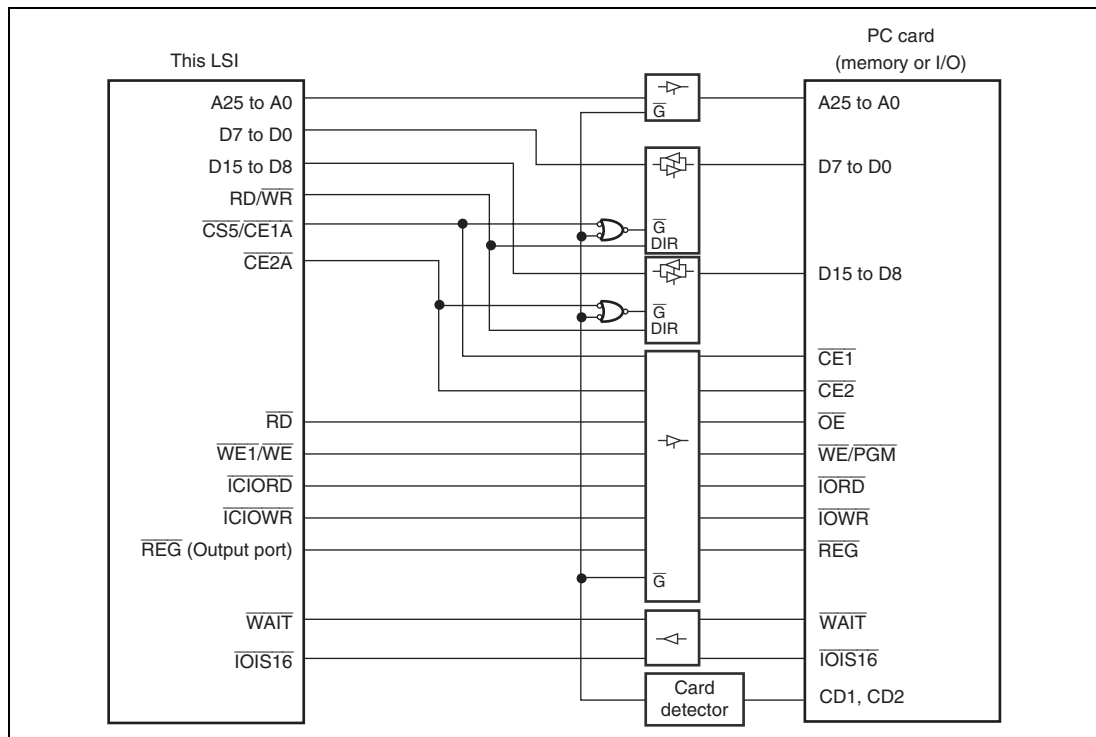

Figure 9.36 Example of PCMCIA Interface Connection

(1) Basic Timing for Memory Card Interface

Figure 9.37 shows the basic timing of the PCMCIA IC memory card interface. When areas 5 and 6 are specified as the PCMCIA interface, the bus is accessed with the IC memory card interface according to the SA[1:0] bit settings in CS5WCR and CS6WCR. If the external bus frequency (CKIO) increases, the setup times and hold times for the address pins (A25 to A0), card enable signals (CE1A, CE2A, CE1B, CE2B), and write data (D15 to D0) to the \overline{RD} and \overline{WE} signals become insufficient. To prevent this error, this LSI enables the setup times and hold times for areas 5 and 6 to be specified independently, using CS5WCR and CS6WCR. In the PCMCIA interface, as in the normal space interface, a software wait or hardware wait using the \overline{WAIT} pin can be inserted. Figure 9.38 shows the PCMCIA memory bus wait timing.

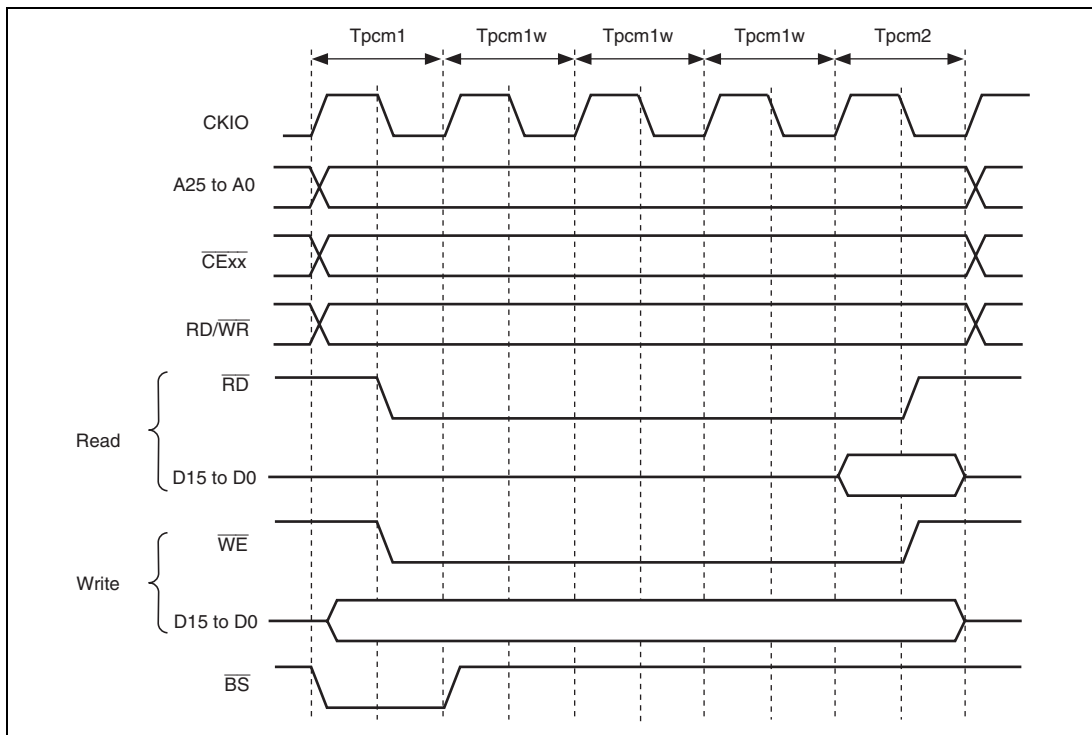

Figure 9.37 Basic Access Timing for PCMCIA Memory Card Interface

Figure 9.38 Wait Timing for PCMCIA Memory Card Interface
 (TED[3:0] = B'0010, PCW[3:0] = B'0000, TEH[3:0] = B'0001, Hardware Wait = 1)

A port is used to generate the \overline{REG} signal that switches between the common memory and attribute memory. As shown in the example in figure 9.39, when the total memory space necessary for the common memory and attribute memory is 32 Mbytes or less, pin A24 can be used as the \overline{REG} signal to allocate a 16-Mbyte common memory space and a 16-Mbyte attribute memory space.

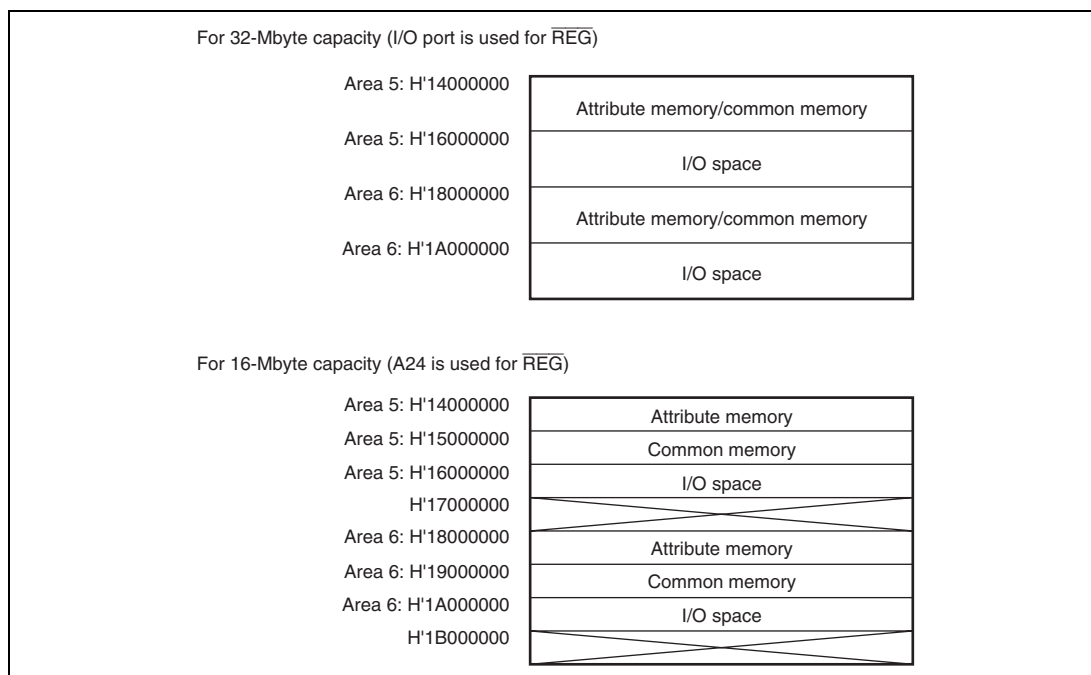

Figure 9.39 Example of PCMCIA Space Allocation
(CS5WCR.SA[1:0] = B'10, CS6WCR.SA[1:0] = B'10)

(2) Basic Timing for I/O Card Interface

Figures 9.40 and 9.41 show the basic timing for the PCMCIA I/O card interface.

When accessing an I/O card through the PCMCIA interface, be sure to access the space as cache-disabled.

Switching between I/O card and IC memory card interfaces in the respective address spaces is accomplished by the SA[1:0] bit settings in CS5WCR and CS6WCR.

The $\overline{\text{IOIS16}}$ pin can be used for dynamic adjustment of the width of the I/O bus in access to an I/O card via the PCMCIA interface when little endian mode has been selected. When the bus width of area 5 or 6 is set to 16 bits and the $\overline{\text{IOIS16}}$ signal is driven high during a cycle of word-unit access to the I/O card bus, the bus width will be recognized as 8 bits and only 8 bits of data will be accessed during the current cycle of the I/O card bus. Operation will automatically continue with access to the remaining 8 bits of data.

The $\overline{\text{IOIS16}}$ signal is sampled on falling edges of the CKIO in Tpci0 as well as all Tpci0w cycles for which the TED3 to TED0 bits are set to 1.5 cycles or more, and the $\overline{\text{CE2A}}$ and $\overline{\text{CE2B}}$ signals are updated after 1.5 cycles of the CKIO signal from the sampling point of Tpci0. Ensure that the $\overline{\text{IOIS16}}$ signal is defined at all sampling points and does not change along the way.

Set the TED3 to TED0 bits to satisfy the requirement of the PC card in use with regard to setup timing from $\overline{\text{ICIORD}}$ or $\overline{\text{ICIOWR}}$ to $\overline{\text{CE1}}$ or $\overline{\text{CE2}}$.

The basic waveforms for dynamic bus-size adjustment are shown in figure 9.41.

Since the $\overline{\text{IOIS16}}$ signal is not supported in big endian mode, the $\overline{\text{IOIS16}}$ signal should be fixed to the low level when big endian mode has been selected.

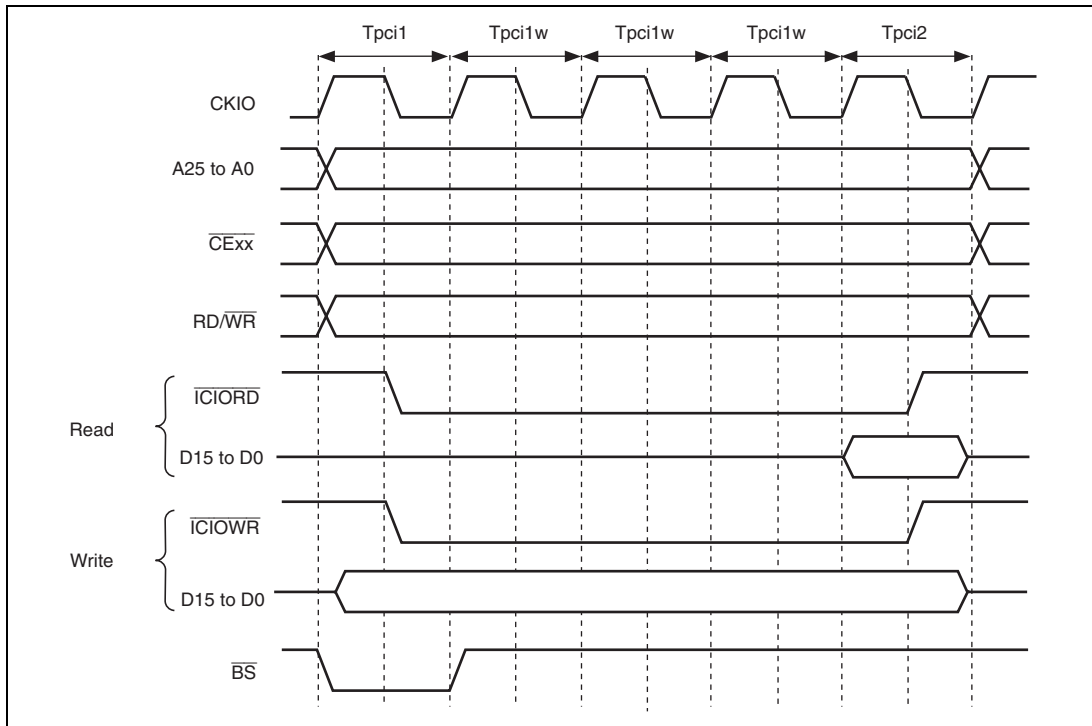

Figure 9.40 Basic Access Timing for PCMCIA I/O Card Interface

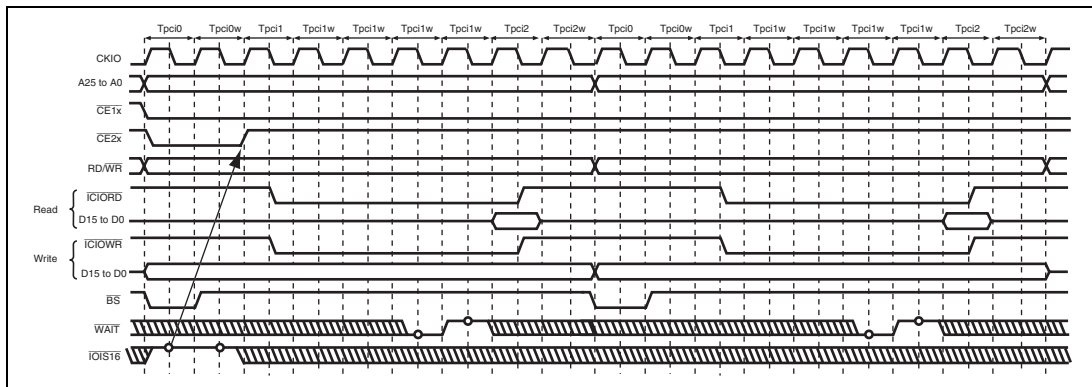

Figure 9.41 Dynamic Bus-Size Adjustment Timing for PCMCIA I/O Card Interface
 (TED[3:0] = B'0010, PCW[3:0] = B'0000, TEH[3:0] = B'0001, Hardware Wait = 1)

9.5.10 Burst ROM (Clocked Synchronous) Interface

The burst ROM (clocked synchronous) interface is supported to access a ROM with a synchronous burst function at high speed. The burst ROM interface accesses the burst ROM in the same way as a normal space. This interface is valid only for area 0.

In the first access cycle, wait cycles are inserted. In this case, the number of wait cycles to be inserted is specified by the W3 to W0 bits in CS0WCR. In the second and subsequent cycles, the number of wait cycles to be inserted is specified by the BW1 and BW0 bits in CS0WCR.

While the burst ROM (clocked synchronous) is accessed, the \overline{BS} signal is asserted only for the first access cycle and an external wait input is also valid for the first access cycle.

Since the bus width is 16 bits, the burst length must be specified as 8. The burst ROM interface does not support the 8-bit bus width for the burst ROM.

The burst ROM interface performs burst operations for all read access. For example, in a longword access over a 16-bit bus, valid 16-bit data is read two times and invalid 16-bit data is read six times. These invalid data read cycles increase the memory access time and degrade the program execution speed and DMA transfer speed. To prevent this problem, it is recommended using a 16-byte read by cache fill in the cache-enabled spaces or 16-byte read by the DMA. The burst ROM interface performs write access in the same way as normal space access.

Figure 9.42 Burst ROM Access Timing (Clocked Synchronous)
(Burst Length = 8, Wait Cycles Inserted in First Access = 2,
Wait Cycles Inserted in Second and Subsequent Access Cycles = 1)

9.5.11 Wait between Access Cycles

As the operating frequency of LSIs becomes higher, the off-operation of the data buffer often collides with the next data access when the read operation from devices with slow access speed is completed. As a result of these collisions, the reliability of the device is low and malfunctions may occur. A function that avoids data collisions by inserting idle (wait) cycles between continuous access cycles has been newly added.

The number of wait cycles between access cycles can be set by the WM bit in CSnWCR, bits IWW2 to IWW0, IWRWD2 to IWRWD0, IWRWS2 to IWRWS0, IWRRD2 to IWRRD0, and IWRRS2 to IWRRS 0 in CSnBCR, and bits DMAIW2 to DMAIW0 and DMAIWA in CMNCR. The conditions for setting the idle cycles between access cycles are shown below.

1. Continuous access cycles are write-read or write-write
2. Continuous access cycles are read-write for different spaces
3. Continuous access cycles are read-write for the same space
4. Continuous access cycles are read-read for different spaces
5. Continuous access cycles are read-read for the same space
6. Data output from an external device caused by DMA single address transfer is followed by data output from another device that includes this LSI (DMAIWA = 0)
7. Data output from an external device caused by DMA single address transfer is followed by any type of access (DMAIWA = 1)

For the specification of the number of idle cycles between access cycles described above, refer to the description of each register.

Besides the idle cycles between access cycles specified by the registers, idle cycles must be inserted to interface with the internal bus or to obtain the minimum pulse width for a multiplexed pin (\overline{WEn}). The following gives detailed information about the idle cycles and describes how to estimate the number of idle cycles.

The number of idle cycles on the external bus from \overline{CSn} negation to \overline{CSn} or \overline{CSm} assertion is described below. Here, \overline{CSn} and \overline{CSm} also include $\overline{CE2A}$ and $\overline{CE2B}$ for PCMCIA.

There are eight conditions that determine the number of idle cycles on the external bus as shown in table 9.16. The effects of these conditions are shown in figure 9.43.

Table 9.16 Conditions for Determining Number of Idle Cycles

No.	Condition	Description	Range	Note
[1]	DMAIW[2:0] in CMNCR	These bits specify the number of idle cycles for DMA single address transfer. This condition is effective only for single address transfer and generates idle cycles after the access is completed.	0 to 12	When 0 is specified for the number of idle cycles, the DACK signal may be asserted continuously. This causes a discrepancy between the number of cycles detected by the device with DACK and the direct memory access controller transfer count, resulting in a malfunction.
[2]	IW***[2:0] in CSnBCR	These bits specify the number of idle cycles for access other than single address transfer. The number of idle cycles can be specified independently for each combination of the previous and next cycles. For example, in the case where reading CS1 space followed by reading other CS space, the bits IWRRD[2:0] in CS1BCR should be set to B'100 to specify six or more idle cycles. This condition is effective only for access cycles other than single address transfer and generates idle cycles after the access is completed.	0 to 12	Do not set 0 for the number of idle cycles between memory types which are not allowed to be accessed successively.
[3]	SDRAM-related bits in CSnWCR	These bits specify precharge completion and startup wait cycles and idle cycles between commands for SDRAM access. This condition is effective only for SDRAM access and generates idle cycles after the access is completed	0 to 3	Specify these bits in accordance with the specification of the target SDRAM.

No.	Condition	Description	Range	Note
[4]	WM in CSnWCR	This bit enables or disables external $\overline{\text{WAIT}}$ pin input for the memory types other than SDRAM. When this bit is cleared to 0 (external $\overline{\text{WAIT}}$ enabled), one idle cycle is inserted to check the external $\overline{\text{WAIT}}$ pin input after the access is completed. When this bit is set to 1 (disabled), no idle cycle is generated.	0 or 1	
[5]	Read data transfer cycle	One idle cycle is inserted after a read access is completed. This idle cycle is not generated for the first or middle cycles in divided access cycles. This is neither generated when the HW[1:0] bits in CSnWCR are not B'00.	0 or 1	One idle cycle is always generated after a read cycle with SDRAM or PCMCIA interface.
[6]	Internal bus idle cycles, etc.	External bus access requests from the CPU or the direct memory access controller and their results are passed through the internal bus. The external bus enters idle state during internal bus idle cycles or while a bus other than the external bus is being accessed. This condition is not effective for divided access cycles, which are generated by the bus state controller when the access size is larger than the external data bus width.	0 or larger	The number of internal bus idle cycles may not become 0 depending on the $I\phi:B\phi$ clock ratio. Tables 9.17 and 9.18 show the relationship between the clock ratio and the minimum number of internal bus idle cycles.

No.	Condition	Description	Range	Note
[7]	Write data wait cycles	During write access, a write cycle is executed on the external bus only after the write data becomes ready. This write data wait period generates idle cycles before the write cycle. Note that when the previous cycle is a write cycle and the internal bus idle cycles are shorter than the previous write cycle, write data can be prepared in parallel with the previous write cycle and therefore, no idle cycle is generated (write buffer effect).	0 or 1	For write → write or write → read access cycles, successive access cycles without idle cycles are frequently available due to the write buffer effect described in the left column. If successive access cycles without idle cycles are not allowed, specify the minimum number of idle cycles between access cycles through CSnBCR.
[8]	Idle cycles between different memory types	To ensure the minimum pulse width on the signal-multiplexed pins, idle cycles may be inserted before access after memory types are switched. For some memory types, idle cycles are inserted even when memory types are not switched.	0 to 2.5	The number of idle cycles depends on the target memory types. See table 9.19.

In the above conditions, a total of four conditions, that is, condition [1] or [2] (either one is effective), condition [3] or [4] (either one is effective), a set of conditions [5] to [7] (these are generated successively, and therefore the sum of them should be taken as one set of idle cycles), and condition [8] are generated at the same time. The maximum number of idle cycles among these four conditions become the number of idle cycles on the external bus. To ensure the minimum idle cycles, be sure to make register settings for condition [1] or [2].

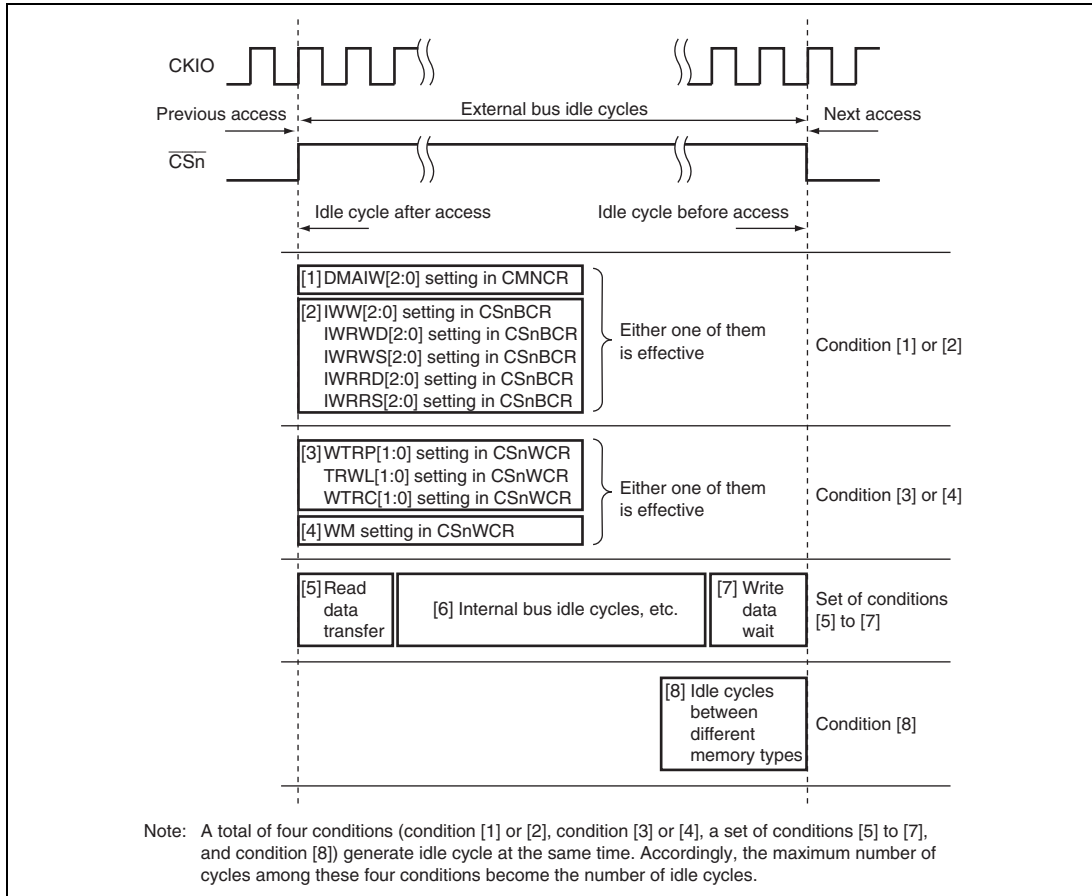

Figure 9.43 Idle Cycle Conditions

Table 9.17 Minimum Number of Idle Cycles on Internal Bus (CPU Operation)

CPU Operation	Clock Ratio (ϕ :B ϕ)					
	8:1	6:1	4:1	3:1	2:1	1:1
Write → write	1	1	2	2	2	3
Write → read	0	0	0	0	0	1
Read → write	1	1	2	2	2	3
Read → read	0	0	0	0	0	1

Table 9.18 Minimum Number of Idle Cycles on Internal Bus (Direct Memory Access Controller Operation)

Direct Memory Access Controller Operation	Transfer Mode	
	Dual Address	Single Address
Write → write	0	2
Write → read	0 or 2	0
Read → write	0	0
Read → read	0	2

- Notes:
1. The write → write and read → read columns in dual address transfer indicate the cycles in the divided access cycles.
 2. For the write → read cycles in dual address transfer, 0 means different channels are activated successively and 2 means when the same channel is activated successively.
 3. The write → read and read → write columns in single address transfer indicate the case when different channels are activated successively. The "write" means transfer from a device with DACK to external memory and the "read" means transfer from external memory to a device with DACK.

Table 9.19 Number of Idle Cycles Inserted between Access Cycles to Different Memory Types

Previous Cycle	Next Cycle							
	SRAM	Burst ROM (Asynchronous)	MPX- I/O	Byte		SDRAM	PCMCIA	Burst ROM (Synchronous)
				SRAM (BAS = 0)	SRAM (BAS = 1)			
SRAM	0	0	1	0	1	1	0	0
Burst ROM (asynchronous)	0	0	1	0	1	1	0	0
MPX-I/O	1	1	0	1	1	1	1	1
Byte SRAM (BAS = 0)	0	0	1	0	1	1	0	0
Byte SRAM (BAS = 1)	1	1	2	1	0	0	1	1
SDRAM	1	1	2	1	0	0	1	1
PCMCIA	0	0	1	0	1	1	0	0
Burst ROM (synchronous)	0	0	1	0	1	1	0	0

Figure 9.44 shows sample estimation of idle cycles between access cycles. In the actual operation, the idle cycles may become shorter than the estimated value due to the write buffer effect or may become longer due to internal bus idle cycles caused by stalling in the pipeline due to CPU instruction execution or CPU register conflicts. Please consider these errors when estimating the idle cycles.

Sample Estimation of Idle Cycles between Access Cycles

This example estimates the idle cycles for data transfer from the CS1 space to CS2 space by CPU access. Transfer is repeated in the following order: CS1 read → CS1 read → CS2 write → CS2 write → CS1 read → ...

- Conditions

The bits for setting the idle cycles between access cycles in CS1BCR and CS2BCR are all set to 0.

In CS1WCR and CS2WCR, the WM bit is set to 1 (external $\overline{\text{WAIT}}$ pin disabled) and the HW[1:0] bits are set to 00 (CS negation is not extended).

$t_{\phi:B\phi}$ is set to 4:1, and no other processing is done during transfer.

For both the CS1 and CS2 spaces, normal SRAM devices are connected, the bus width is 32 bits, and access size is also 32 bits.

The idle cycles generated under each condition are estimated for each pair of access cycles. In the following table, R indicates a read cycle and W indicates a write cycle.

Condition	R → R	R → W	W → W	W → R	Note
[1] or [2]	0	0	0	0	CSnBCR is set to 0.
[3] or [4]	0	0	0	0	The WM bit is set to 1.
[5]	1	1	0	0	Generated after a read cycle.
[6]	0	2	2	0	See the $t_{\phi:B\phi} = 4:1$ columns in table 9.17.
[7]	0	1	0	0	No idle cycle is generated for the second time due to the write buffer effect.
[5] + [6] + [7]	1	4	2	0	
[8]	0	0	0	0	Value for SRAM → SRAM access
Estimated idle cycles	1	4	2	0	Maximum value among conditions [1] or [2], [3] or [4], [5] + [6] + [7], and [8]
Actual idle cycles	1	4	2	1	The estimated value does not match the actual value in the W → R cycles because the internal idle cycles due to condition [6] is estimated as 0 but actually an internal idle cycle is generated due to execution of a loop condition check instruction.

Figure 9.44 Comparison between Estimated Idle Cycles and Actual Value

9.5.12 Bus Arbitration

The bus arbitration of this LSI has the bus mastership in the normal state and releases the bus mastership after receiving a bus request from another device.

Bus mastership is transferred at the boundary of bus cycles. Namely, bus mastership is released immediately after receiving a bus request when a bus cycle is not being performed. The release of bus mastership is delayed until the bus cycle is complete when a bus cycle is in progress. Even when from outside the LSI it looks like a bus cycle is not being performed, a bus cycle may be performing internally, started by inserting wait cycles between access cycles. Therefore, it cannot be immediately determined whether or not bus mastership has been released by looking at the \overline{CSn} signal or other bus control signals. The states that do not allow bus mastership release are shown below.

1. 16-byte transfer because of a cache miss
2. During write-back operation for the cache
3. Between the read and write cycles of a TAS instruction
4. Multiple bus cycles generated when the data bus width is smaller than the access size (for example, between bus cycles when longword access is made to a memory with a data bus width of 8 bits)
5. 16-byte transfer by the direct memory access controller
6. Setting the BLOCK bit in CMNCR to 1
7. During access to the external flash memory by the NAND flash memory controller

Moreover, by using DPRTY bit in CMNCR, whether the bus mastership request is received or not can be selected during burst transfer by the direct memory access controller.

The LSI has the bus mastership until a bus request is received from another device. Upon acknowledging the assertion (low level) of the external bus request signal \overline{BREQ} , the LSI releases the bus at the completion of the current bus cycle and asserts the \overline{BACK} signal. After the LSI acknowledges the negation (high level) of the \overline{BREQ} signal that indicates the external device has released the bus, it negates the \overline{BACK} signal and resumes the bus usage.

With the SDRAM interface, all bank pre-charge commands (PALLs) are issued when active banks exist and the bus is released after completion of a PALL command.

The bus sequence is as follows. The address bus and data bus are placed in a high-impedance state synchronized with the rising edge of CKIO. The bus mastership enable signal is asserted 0.5 cycles after the above timing, synchronized with the falling edge of CKIO. The bus control signals (\overline{BS} , \overline{CSn} , \overline{RAS} , \overline{CAS} , \overline{CKE} , \overline{DQMx} , \overline{WEn} , \overline{RD} , and $\overline{RD/WR}$) are placed in the high-impedance state at subsequent rising edges of CKIO. These bus control signals are driven high one or more cycles before they are placed in the high-impedance state. Bus request signals are sampled at the falling edge of CKIO. Note that \overline{CKE} , \overline{RAS} , and \overline{CAS} can be continued to be driven at the previous value even in the bus-released state by setting the HIZCNT bit in CMNCR.

The sequence for reclaiming the bus mastership from an external device is described below. 1.5 cycles after the negation of \overline{BREQ} is detected at the falling edge of CKIO, the bus control signals are driven high. The bus acknowledge signal is negated at the next falling edge of the clock. The fastest timing at which actual bus cycles can be resumed after bus control signal assertion is at the rising edge of the CKIO where address and data signals are driven. Figure 9.45 shows the bus arbitration timing.

When it is necessary to refresh SDRAM while releasing the bus mastership, the bus mastership should be returned. If the bus mastership is not returned for a specified refreshing period or longer, the contents of SDRAM cannot be guaranteed because a refreshing cannot be executed.

While releasing the bus mastership, the SLEEP instruction (to enter sleep mode, deep standby mode, or software standby mode), as well as a manual reset, cannot be executed until the LSI obtains the bus mastership.

The \overline{BREQ} input signal is ignored in software standby mode or deep standby mode and the \overline{BACK} output signal is placed in the high impedance state. If the bus mastership request is required in this state, the bus mastership must be released by pulling down the \overline{BACK} pin to enter software standby mode or deep standby mode.

The bus mastership release (\overline{BREQ} signal for high level negation) after the bus mastership request (\overline{BREQ} signal for low level assertion) must be performed after the bus usage permission (\overline{BACK} signal for low level assertion). If the \overline{BREQ} signal is negated before the \overline{BACK} signal is asserted, only one cycle of the \overline{BACK} signal is asserted depending on the timing of the \overline{BREQ} signal to be negated and this may cause a bus contention between the external device and the LSI.

Figure 9.45 Bus Arbitration Timing

9.5.13 Others

(1) Reset

This module can be initialized completely only at power-on reset. At power-on reset, all signals are negated and data output buffers are turned off regardless of the bus cycle state after the internal reset is synchronized with the internal clock. All control registers are initialized. In software standby, sleep, and manual reset, control registers of the bus state controller are not initialized. At manual reset, only the current bus cycle being executed is completed. Since the RTCNT continues counting up during manual reset signal assertion, a refresh request occurs to initiate the refresh cycle.

(2) Access from the Side of the LSI Internal Bus Master

There are three types of LSI internal buses: a CPU bus, internal bus, and peripheral bus. The CPU and cache memory are connected to the CPU bus. The bus state controller and internal bus masters other than the CPU are connected to the internal bus. Low-speed peripheral modules are connected to the peripheral bus. Internal memories other than the cache memory are connected bidirectionally to the CPU bus and internal bus. Access from the CPU bus to the internal bus is enabled but access from the internal bus to the CPU bus is disabled. This gives rise to the following problems.

On-chip bus masters such as the direct memory access controller other than the CPU can access internal memory other than the cache memory but cannot access the cache memory. If an on-chip bus master other than the CPU writes data to an external memory other than the cache, the contents of the external memory may differ from that of the cache memory. To prevent this problem, if the external memory whose contents is cached is written by an on-chip bus master other than the CPU, the corresponding cache memory should be purged by software.

In a cache-enabled space, if the CPU initiates read access, the cache is searched. If the cache stores data, the CPU latches the data and completes the read access. If the cache does not store data, the CPU performs four contiguous longword read cycles to perform cache fill operations via the internal bus. If a cache miss occurs in byte or word operand access or at a branch to an odd word boundary ($4n + 2$), the CPU performs four contiguous longword access cycles to perform a cache fill operation on the external interface. For a cache-disabled space, the CPU performs access according to the actual access addresses. For an instruction fetch to an even word boundary ($4n$), the CPU performs longword access. For an instruction fetch to an odd word boundary ($4n + 2$), the CPU performs word access.

For a read cycle of an on-chip peripheral module, the cycle is initiated through the internal bus and peripheral bus. The read data is sent to the CPU via the peripheral bus, internal bus, and CPU bus.

In a write cycle for the cache-enabled space, the write cycle operation differs according to the cache write methods.

In write-back mode, the cache is first searched. If data is detected at the address corresponding to the cache, the data is then re-written to the cache. In the actual memory, data will not be re-written until data in the corresponding address is re-written. If data is not detected at the address corresponding to the cache, the cache is modified. In this case, data to be modified is first saved to the internal buffer, 16-byte data including the data corresponding to the address is then read, and data in the corresponding access of the cache is finally modified. Following these operations, a write-back cycle for the saved 16-byte data is executed.

In write-through mode, the cache is first searched. If data is detected at the address corresponding to the cache, the data is re-written to the cache simultaneously with the actual write via the internal bus. If data is not detected at the address corresponding to the cache, the cache is not modified but an actual write is performed via the internal bus.

Since the bus state controller incorporates a one-stage write buffer, it can execute an access via the internal bus before the previous external bus cycle is completed in a write cycle. If the on-chip module is read or written after the external low-speed memory is written, the on-chip module can be accessed before the completion of the external low-speed memory write cycle.

In read cycles, the CPU is placed in the wait state until read operation has been completed. To continue the process after the data write to the device has been completed, perform a dummy read to the same address to check for completion of the write before the next process to be executed.

The write buffer of the bus state controller functions in the same way for an access by a bus master other than the CPU such as the direct memory access controller. Accordingly, to perform dual address DMA transfers, the next read cycle is initiated before the previous write cycle is completed. Note, however, that if both the DMA source and destination addresses exist in external memory space, the next read cycle will not be initiated until the previous write cycle is completed.

Changing the registers in this module while the write buffer is operating may disrupt correct write access. Therefore, do not change the registers in this module immediately after a write access. If this change becomes necessary, do it after executing a dummy read of the write data.

(3) On-Chip Peripheral Module Access

To access an on-chip module register, two or more peripheral module clock (P ϕ) cycles are required. Care must be taken in system design.

When the CPU writes data to the internal peripheral registers, the CPU performs the succeeding instructions without waiting for the completion of writing to registers.

For example, a case is described here in which the system is transferring to the software standby mode for power savings. To make this transition, the SLEEP instruction must be performed after setting the STBY bit in the STBCR register to 1. However a dummy read of the STBCR register is required before executing the SLEEP instruction. If a dummy read is omitted, the CPU executes the SLEEP instruction before the STBY bit is set to 1, thus the system enters sleep mode not software standby mode. A dummy read of the STBCR register is indispensable to complete writing to the STBY bit.

To reflect the change by internal peripheral registers while performing the succeeding instructions, execute a dummy read of registers to which write instruction is given and then perform the succeeding instructions.

(4) External Flash Memory Access by NAND Flash Memory Controller

In this product, a part of the external data bus is used also as data bus for the NAND flash memory controller. The use of the data bus is controlled by the NAND flash memory controller. Memory access by the NAND flash memory controller is started after the preceding access to the external device by this module is completed. If an access to the external device by this module occurs during the access by the NAND flash memory controller, it must wait until the completion of the access by the NAND flash memory controller.

When a memory access request by the NAND flash memory controller and an external bus release request conflict with each other, the request accepted first has higher priority. When the two requests occur at the same time, the access by the NAND flash memory controller has higher priority.

Auto-refresh operation and self-refresh operation are executed even during a memory access by the NAND flash memory controller.

Section 10 Direct Memory Access Controller

Direct Memory Access Controller can be used in place of the CPU to perform high-speed transfers between external devices that have DACK (transfer request acknowledge signal), external memory, on-chip memory, memory-mapped external devices, and on-chip peripheral modules.

10.1 Features

- Number of channels: 16 channels (channels 0 to 15) selectable
One channel (channel 0) can receive external requests.
- 4-Gbyte physical address space
- Data transfer unit is selectable: Byte, word (two bytes), longword (four bytes), and 16 bytes (longword \times 4)
- Maximum transfer count: 16,777,216 transfers (24 bits)
- Address mode: Dual address mode and single address mode are supported.
- Transfer requests
 - External request
 - On-chip peripheral module request
 - Auto request

The following modules can issue on-chip peripheral module requests.

- Serial communication interface with FIFO: 16 sources
- I²C bus interface 3: six sources
- A/D converter: one source
- Multi-function timer pulse unit 2: five sources
- Compare match timer: two sources
- USB 2.0 host/function module: two sources
- NAND flash memory controller: two sources
- Controller area network: two sources
- Serial sound interface: five sources
- Sampling rate converter: four sources
- Renesas SPDIF interface: two sources
- CD-ROM decoder: one source
- SD host interface: two sources
- Renesas serial peripheral interface: four sources
- Clock synchronous serial I/O with FIFO: two sources

- Motor control PWM timer: two sources
- Renesas quad serial peripheral interface: two sources
- Selectable bus modes
 - Cycle steal mode (normal mode or intermittent mode)
 - Burst mode
- Selectable channel priority levels: The channel priority levels are selectable between two fixed modes.
- Interrupt request: An interrupt request can be sent to the CPU on completion of half- or full-data transfer. Through the HE and HIE bits in CHCR, an interrupt is specified to be issued to the CPU when half of the initially specified DMA transfer is completed.
- External request detection: There are following four types of DREQ input detection.
 - Low level detection
 - High level detection
 - Rising edge detection
 - Falling edge detection
- Transfer request acknowledge and transfer end signals: Active levels for DACK and TEND can be set independently.
- Support of reload functions in DMA transfer information registers: DMA transfer using the same information as the current transfer can be repeated automatically without specifying the information again. Modifying the reload registers during DMA transfer enables next DMA transfer to be done using different transfer information. The reload function can be enabled or disabled independently in each channel or reload register.

Figure 10.1 shows the block diagram of this module.

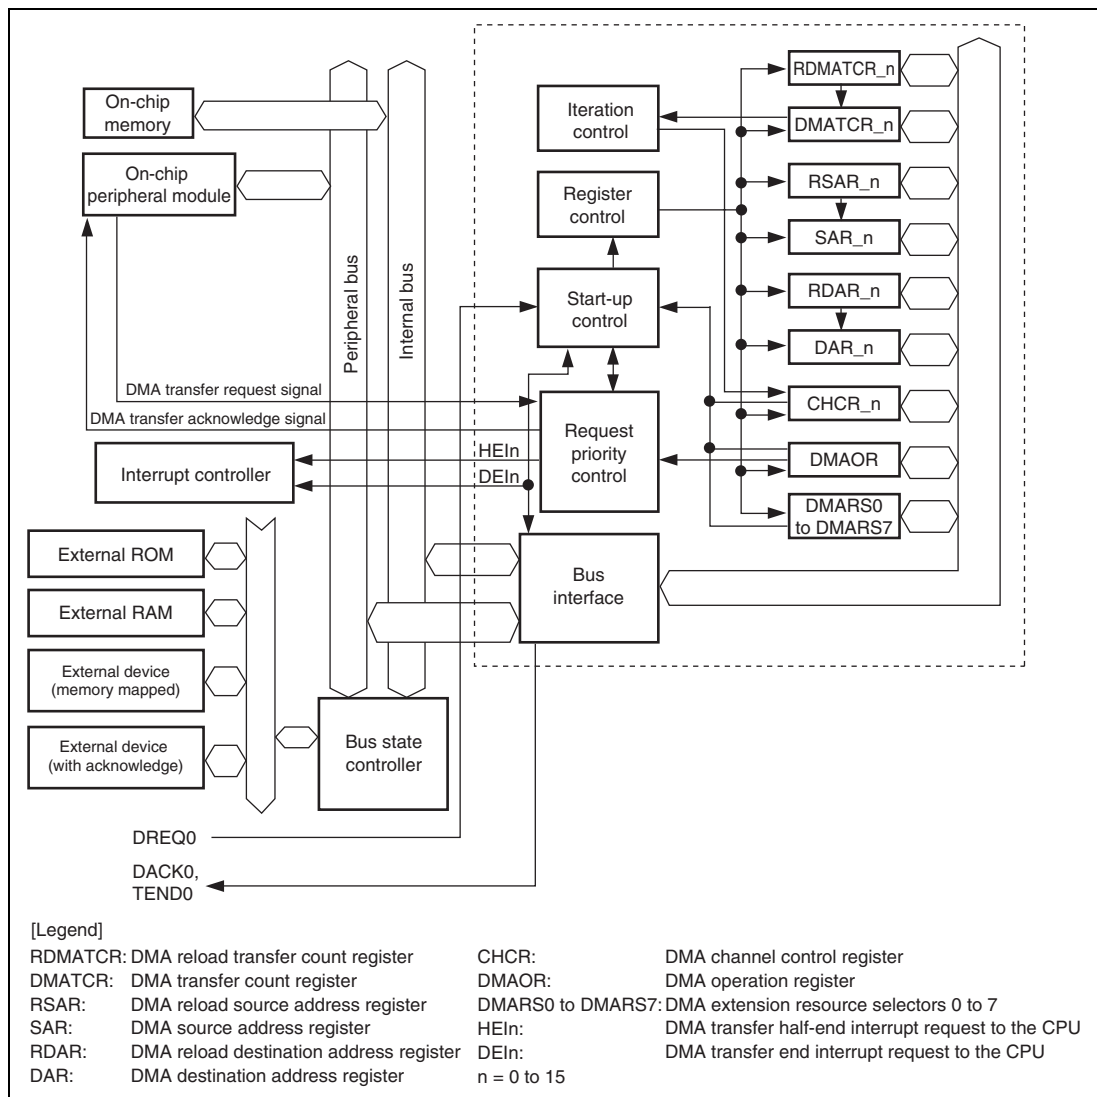

Figure 10.1 Block Diagram

10.2 Input/Output Pins

Table 10.1 lists the pin configuration of this module. This module has pins for one channel (channel 0) for external bus use.

Table 10.1 Pin Configuration

Channel Name	Abbreviation	I/O	Function	
0	DMA transfer request	DREQ0	I	DMA transfer request input from an external device to channel 0
	DMA transfer request acknowledge	DACK0	O	DMA transfer request acknowledge output from channel 0 to an external device
	DMA transfer end	TEND0	O	DMA transfer end output for channel 0

10.3 Register Descriptions

This module has the registers listed in table 10.2. There are four control registers and three reload registers for each channel, and one common control register is used by all channels. In addition, there is one extension resource selector per two channels. Each channel number is expressed in the register names, as in SAR_0 for SAR in channel 0.

Table 10.2 Register Configuration

Channel	Register Name	Abbreviation	R/W	Initial Value	Address	Access Size
0	DMA source address register_0	SAR_0	R/W	H'00000000	H'FFFE1000	16, 32
	DMA destination address register_0	DAR_0	R/W	H'00000000	H'FFFE1004	16, 32

- Notes: 1. For the HE and TE bits in CHCR_n, only 0 can be written to clear the flags after 1 is read.
2. For the AE and NMIF bits in DMAOR, only 0 can be written to clear the flags after 1 is read.

10.3.1 DMA Source Address Registers (SAR)

The DMA source address registers (SAR) are 32-bit readable/writable registers that specify the source address of a DMA transfer. During a DMA transfer, these registers indicate the next source address. When the data of an external device with DACK is transferred in single address mode, SAR is ignored.

To transfer data in word (2-byte), longword (4-byte), or 16-byte unit, specify the address with 2-byte, 4-byte, or 16-byte address boundary respectively.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

10.3.2 DMA Destination Address Registers (DAR)

The DMA destination address registers (DAR) are 32-bit readable/writable registers that specify the destination address of a DMA transfer. During a DMA transfer, these registers indicate the next destination address. When the data of an external device with DACK is transferred in single address mode, DAR is ignored.

To transfer data in word (2-byte), longword (4-byte), or 16-byte unit, specify the address with 2-byte, 4-byte, or 16-byte address boundary respectively.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

10.3.3 DMA Transfer Count Registers (DMATCR)

The DMA transfer count registers (DMATCR) are 32-bit readable/writable registers that specify the number of DMA transfers. The transfer count is 1 when the setting is H'00000001, 16,777,215 when H'00FFFFFF is set, and 16,777,216 (the maximum) when H'00000000 is set. During a DMA transfer, these registers indicate the remaining transfer count.

The upper eight bits of DMATCR are always read as 0, and the write value should always be 0. To transfer data in 16 bytes, one 16-byte transfer (128 bits) counts one.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

10.3.4 DMA Channel Control Registers (CHCR)

The DMA channel control registers (CHCR) are 32-bit readable/writable registers that control the DMA transfer mode.

The DO, AM, AL, DL, DS, and TL bits which specify the DREQ, DACK, and TEND external pin functions can be read and written to in channel 0, but they are reserved in channels 1 to 15.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
31	TC	0	R/W	<p>Transfer Count Mode</p> <p>Specifies whether to transmit data once or for the count specified in DMATCR by one transfer request. This function is valid only in on-chip peripheral module request mode. Note that when this bit is set to 0, the TB bit must not be set to 1 (burst mode). When the serial communication interface with FIFO, the I²C bus interface 3, the serial sound interface, the sampling rate converter, the SD host interface, or the NAND flash memory controller, the USB 2.0 host/function module, the Resesas serial peripheral interface, and the clock synchronous serial I/O with FIFO are selected for the transfer request source, this bit (TC) must not be set to 1.</p> <p>0: Transmits data once by one transfer request 1: Transmits data for the count specified in DMATCR by one transfer request</p>
30	—	0	R	<p>Reserved</p> <p>This bit is always read as 0. The write value should always be 0.</p>
29	RLDSAR	0	R/W	<p>SAR Reload Function ON/OFF</p> <p>Enables (ON) or disables (OFF) the function to reload SAR and DMATCR.</p> <p>0: Disables (OFF) the function to reload SAR and DMATCR 1: Enables (ON) the function to reload SAR and DMATCR</p>
28	RLDDAR	0	R/W	<p>DAR Reload Function ON/OFF</p> <p>Enables (ON) or disables (OFF) the function to reload DAR and DMATCR.</p> <p>0: Disables (OFF) the function to reload DAR and DMATCR 1: Enables (ON) the function to reload DAR and DMATCR</p>
27	—	0	R	<p>Reserved</p> <p>This bit is always read as 0. The write value should always be 0.</p>

Bit	Bit Name	Initial Value	R/W	Description
26	DAF	0	R/W	<p>Fixed Destination Address 16-Byte Transfer</p> <p>Enabled when the transfer size (set in TS[1:0]) is 16 bytes and the destination address mode (set in DM[1:0]) is fixed address.</p> <p>0: 16 bytes of data are transferred from the address specified in DAR.</p> <p>1: Four bytes of data are transferred four times from the address specified in DAR. This function is exclusively for use with the CD-ROM decoder.</p>
25	SAF	0	R/W	<p>Fixed Source Address 16-Byte Transfer</p> <p>Enabled when the transfer size (set in TS[1:0]) is 16 bytes and the source address mode (set in SM[1:0]) is fixed address.</p> <p>0: 16 bytes of data are transferred from the address specified in SAR.</p> <p>1: Four bytes of data are transferred four times from the address specified in SAR. This function is exclusively for use with the CD-ROM decoder.</p>
24	—	0	R	<p>Reserved</p> <p>This bit is always read as 0. The write value should always be 0.</p>
23	DO	0	R/W	<p>DMA Overrun</p> <p>Selects whether DREQ is detected by overrun 0 or by overrun 1. This bit is valid only in level detection by CHCR_0. This bit is reserved in CHCR_1 to CHCR_15; it is always read as 0 and the write value should always be 0.</p> <p>0: Detects DREQ by overrun 0</p> <p>1: Detects DREQ by overrun 1</p>
22	TL	0	R/W	<p>Transfer End Level</p> <p>Specifies the TEND signal output is high active or low active. This bit is valid only in CHCR_0. This bit is reserved in CHCR_1 to CHCR_15; it is always read as 0 and the write value should always be 0.</p> <p>0: Low-active output from TEND</p> <p>1: High-active output from TEND</p>

Bit	Bit Name	Initial Value	R/W	Description
21	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
20	TEMASK	0	R/W	TE Set Mask Specifies that DMA transfer does not stop even if the TE bit is set to 1. If this bit is set to 1 along with the bit for SAR/DAR reload function, DMA transfer can be performed until the transfer request is cancelled. In auto request mode or when a rising/falling edge of the DREQ signal is detected in external request mode, the setting of this bit is ignored and DMA transfer stops if the TE bit is set to 1. Note that this function is enabled only when either the RLDSAR bit or the RLDDAR bit is set to 1. 0: DMA transfer stops if the TE bit is set 1: DMA transfer does not stop even if the TE bit is set
19	HE	0	R/(W)*	Half-End Flag This bit is set to 1 when the transfer count reaches half of the DMATCR value that was specified before transfer starts. If DMA transfer ends because of an NMI interrupt, a DMA address error, or clearing of the DE bit or the DME bit in DMAOR before the transfer count reaches half of the initial DMATCR value, the HE bit is not set to 1. If DMA transfer ends due to an NMI interrupt, a DMA address error, or clearing of the DE bit or the DME bit in DMAOR after the HE bit is set to 1, the bit remains set to 1. To clear the HE bit, write 0 to it after HE = 1 is read. 0: $DMATCR > (DMATCR \text{ set before transfer starts})/2$ during DMA transfer or after DMA transfer is terminated [Clearing condition] • Writing 0 after reading HE = 1. 1: $DMATCR \leq (DMATCR \text{ set before transfer starts})/2$

Bit	Bit Name	Initial Value	R/W	Description
18	HIE	0	R/W	<p>Half-End Interrupt Enable</p> <p>Specifies whether to issue an interrupt request to the CPU when the transfer count reaches half of the DMATCR value that was specified before transfer starts.</p> <p>When the HIE bit is set to 1, this module requests an interrupt to the CPU when the HE bit becomes 1.</p> <p>0: Disables an interrupt to be issued when $DMATCR = (DMATCR \text{ set before transfer starts})/2$</p> <p>1: Enables an interrupt to be issued when $DMATCR = (DMATCR \text{ set before transfer starts})/2$</p>
17	AM	0	R/W	<p>Acknowledge Mode</p> <p>Specifies whether DACK and TEND are output in data read cycle or in data write cycle in dual address mode.</p> <p>In single address mode, DACK and TEND are always output regardless of the specification by this bit.</p> <p>This bit is valid only in CHCR_0. This bit is reserved in CHCR_1 to CHCR_15; it is always read as 0 and the write value should always be 0.</p> <p>0: DACK and TEND output in read cycle (dual address mode)</p> <p>1: DACK and TEND output in write cycle (dual address mode)</p>
16	AL	0	R/W	<p>Acknowledge Level</p> <p>Specifies the DACK (acknowledge) signal output is high active or low active.</p> <p>This bit is valid only in CHCR_0. This bit is reserved in CHCR_1 to CHCR_15; it is always read as 0 and the write value should always be 0.</p> <p>0: Low-active output from DACK</p> <p>1: High-active output from DACK</p>

Bit	Bit Name	Initial Value	R/W	Description
15, 14	DM[1:0]	00	R/W	<p>Destination Address Mode</p> <p>These bits select whether the DMA destination address is incremented, decremented, or left fixed. (In single address mode, DM1 and DM0 bits are ignored when data is transferred to an external device with DACK.)</p> <p>00: Fixed destination address</p> <p>01: Destination address is incremented (+1 in byte-unit transfer, +2 in word-unit transfer, +4 in longword-unit transfer, +16 in 16-byte-unit transfer)</p> <p>10: Destination address is decremented (−1 in byte-unit transfer, −2 in word-unit transfer, −4 in longword-unit transfer, setting prohibited in 16-byte-unit transfer)</p> <p>11: Setting prohibited</p>
13, 12	SM[1:0]	00	R/W	<p>Source Address Mode</p> <p>These bits select whether the DMA source address is incremented, decremented, or left fixed. (In single address mode, SM1 and SM0 bits are ignored when data is transferred from an external device with DACK.)</p> <p>00: Fixed source address</p> <p>01: Source address is incremented (+1 in byte-unit transfer, +2 in word-unit transfer, +4 in longword-unit transfer, +16 in 16-byte-unit transfer)</p> <p>10: Source address is decremented (−1 in byte-unit transfer, −2 in word-unit transfer, −4 in longword-unit transfer, setting prohibited in 16-byte-unit transfer)</p> <p>11: Setting prohibited</p>

Bit	Bit Name	Initial Value	R/W	Description
2	IE	0	R/W	<p>Interrupt Enable</p> <p>Specifies whether or not an interrupt request is generated to the CPU at the end of the DMA transfer. Setting this bit to 1 generates an interrupt request (DEI) to the CPU when TE bit is set to 1.</p> <p>0: Disables an interrupt request 1: Enables an interrupt request</p>
1	TE	0	R/(W)*	<p>Transfer End Flag</p> <p>This bit is set to 1 when DMATCR becomes 0 and DMA transfer ends.</p> <p>The TE bit is not set to 1 in the following cases.</p> <ul style="list-style-type: none"> • DMA transfer ends due to an NMI interrupt or DMA address error before DMATCR becomes 0. • DMA transfer is ended by clearing the DE bit and DME bit in DMA operation register (DMAOR). <p>To clear the TE bit, write 0 after reading TE = 1.</p> <p>Even if the DE bit is set to 1 while the TEMASK bit is 0 and this bit is 1, transfer is not enabled.</p> <p>0: During the DMA transfer or DMA transfer has been terminated</p> <p>[Clearing condition]</p> <ul style="list-style-type: none"> • Writing 0 after reading TE = 1 <p>1: DMA transfer ends by the specified count (DMATCR = 0)</p>

Bit	Bit Name	Initial Value	R/W	Description
0	DE	0	R/W	<p>DMA Enable</p> <p>Enables or disables the DMA transfer. In auto request mode, DMA transfer starts by setting the DE bit and DME bit in DMAOR to 1. In this case, all of the bits TE, NMIF in DMAOR, and AE must be 0. In an external request or peripheral module request, DMA transfer starts if DMA transfer request is generated by the devices or peripheral modules after setting the bits DE and DME to 1. If the DREQ signal is detected by low/high level in external request mode, or in peripheral module request mode, the NMIF bit and the AE bit must be 0 if the TEMASK bit is 1. If the TEMASK bit is 0, the TE bit must also be 0. If the DREQ signal is detected by a rising/falling edge in external request mode, all of the bits TE, NMIF, and AE must be 0 as in the case of auto request mode. Clearing the DE bit to 0 can terminate the DMA transfer.</p> <p>0: DMA transfer disabled 1: DMA transfer enabled</p>

Note: * Only 0 can be written to clear the flag after 1 is read.

10.3.5 DMA Reload Source Address Registers (RSAR)

The DMA reload source address registers (RSAR) are 32-bit readable/writable registers.

When the SAR reload function is enabled, the RSAR value is written to the source address register (SAR) at the end of the current DMA transfer. In this case, a new value for the next DMA transfer can be preset in RSAR during the current DMA transfer. When the SAR reload function is disabled, RSAR is ignored.

To transfer data in word (2-byte), longword (4-byte), or 16-byte unit, specify the address with 2-byte, 4-byte, or 16-byte address boundary respectively.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-

10.3.6 DMA Reload Destination Address Registers (RDAR)

The DMA reload destination address registers (RDAR) are 32-bit readable/writable registers.

When the DAR reload function is enabled, the RDAR value is written to the destination address register (DAR) at the end of the current DMA transfer. In this case, a new value for the next DMA transfer can be preset in RDAR during the current DMA transfer. When the DAR reload function is disabled, RDAR is ignored.

To transfer data in word (2-byte), longword (4-byte), or 16-byte unit, specify the address with 2-byte, 4-byte, or 16-byte address boundary respectively.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-

10.3.7 DMA Reload Transfer Count Registers (RDMATCR)

The DMA reload transfer count registers (RDMATCR) are 32-bit readable/writable registers.

When the SAR/DAR reload function is enabled, the RDMATCR value is written to the transfer count register (DMATCR) at the end of the current DMA transfer. In this case, a new value for the next DMA transfer can be preset in RDMATCR during the current DMA transfer. When the SAR/DAR reload function is disabled, RDMATCR is ignored.

The upper eight bits of RDMATCR are always read as 0, and the write value should always be 0.

As in DMATCR, the transfer count is 1 when the setting is H'00000001, 16,777,215 when H'00FFFFFF is set, and 16,777,216 (the maximum) when H'00000000 is set. To transfer data in 16 bytes, one 16-byte transfer (128 bits) counts one.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-

R/W:	R	R	R/W	R/W	R	R	R/W	R/W	R	R	R	R	R	R/(W)*	R/(W)*	R/W

Note: * Only 0 can be written to clear the flag after 1 is read.

Bit	Bit Name	Initial Value	R/W	Description
15, 14	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
13, 12	CMS[1:0]	00	R/W	Cycle Steal Mode Select These bits select either normal mode or intermittent mode in cycle steal mode. It is necessary that the bus modes of all channels be set to cycle steal mode to make the intermittent mode valid. 00: Normal mode 01: Setting prohibited 10: Intermittent mode 16 Executes one DMA transfer for every 16 cycles of B ϕ clock. 11: Intermittent mode 64 Executes one DMA transfer for every 64 cycles of B ϕ clock.
11, 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
9, 8	PR[1:0]	00	R/W	<p>Priority Mode</p> <p>These bits select the priority level between channels when there are transfer requests for multiple channels simultaneously.</p> <p>00: Fixed mode 1: CH0 > CH1 > CH2 > CH3 > CH4 > CH5 > CH6 > CH7 > CH8 > CH9 > CH10 > CH11 > CH12 > CH13 > CH14 > CH15</p> <p>01: Fixed mode 2: CH0 > CH8 > CH1 > CH9 > CH2 > CH10 > CH3 > CH11 > CH4 > CH12 > CH5 > CH13 > CH6 > CH14 > CH7 > CH15</p> <p>10: Setting prohibited</p> <p>11: Setting prohibited</p>
7 to 3	—	All 0	R	<p>Reserved</p> <p>These bits are always read as 0. The write value should always be 0.</p>
2	AE	0	R/(W)*	<p>Address Error Flag</p> <p>Indicates whether an address error has occurred by this module. When this bit is set, even if the DE bit in CHCR and the DME bit in DMAOR are set to 1, DMA transfer is not enabled. This bit can only be cleared by writing 0 after reading 1.</p> <p>0: No address error occurred by this module</p> <p>1: Address error occurred by this module</p> <p>[Clearing condition]</p> <ul style="list-style-type: none"> Writing 0 after reading AE = 1

Bit	Bit Name	Initial Value	R/W	Description
1	NMIF	0	R/(W)*	<p>NMI Flag</p> <p>Indicates that an NMI interrupt occurred. When this bit is set, even if the DE bit in CHCR and the DME bit in DMAOR are set to 1, DMA transfer is not enabled. This bit can only be cleared by writing 0 after reading 1.</p> <p>When the NMI is input, the DMA transfer in progress can be done in one transfer unit. Even if the NMI interrupt is input while this module is not in operation, the NMIF bit is set to 1.</p> <p>0: No NMI interrupt 1: NMI interrupt occurred</p> <p>[Clearing condition] Writing 0 after reading NMIF = 1</p>
0	DME	0	R/W	<p>DMA Master Enable</p> <p>Enables or disables DMA transfer on all channels. If the DME bit and DE bit in CHCR are set to 1, DMA transfer is enabled.</p> <p>However, transfer is enabled only when the TE bit in CHCR of the transfer corresponding channel, the NMIF bit in DMAOR, and the AE bit are all cleared to 0. Clearing the DME bit to 0 can terminate the DMA transfer on all channels.</p> <p>0: DMA transfer is disabled on all channels 1: DMA transfer is enabled on all channels</p>

Note: * Only 0 can be written to clear the flag after 1 is read.

If the priority mode bits are modified after a DMA transfer, the channel priority is initialized. If fixed mode 2 is specified, the channel priority is specified as CH0 > CH8 > CH1 > CH9 > CH2 > CH10 > CH3 > CH11 > CH4 > CH12 > CH5 > CH13 > CH6 > CH14 > CH7 > CH15. If fixed mode 1 is specified, the channel priority is specified as CH0 > CH1 > CH2 > CH3 > CH4 > CH5 > CH6 > CH7 > CH8 > CH9 > CH10 > CH11 > CH12 > CH13 > CH14 > CH15.

The internal operation of this module for an address error is as follows:

- No address error: Read (source to interior of this module) → Write (interior of this module to destination)
- Address error in source address: Nop → Nop
- Address error in destination address: Read → Nop

10.3.9 DMA Extension Resource Selectors 0 to 7 (DMARS0 to DMARS7)

The DMA extension resource selectors (DMARS) are 16-bit readable/writable registers that specify the source of the DMA transfer request from peripheral modules in each channel. DMARS0 to DMARS7 are for channels 0 and 1, 2 and 3, 4 and 5, 6 and 7, 8 and 9, 10 and 11, 12 and 13, and 14 and 15, respectively. Table 10.3 shows the specifiable combinations.

DMARS can specify the following transfer request sources (The following modules can issue on-chip peripheral module requests):

- Serial communication interface with FIFO: 16 sources
- I²C bus interface 3: six sources
- A/D converter: one source
- Multi-function timer pulse unit 2: five sources
- Compare match timer: two sources
- USB 2.0 host/function module: two sources
- NAND flash memory controller: two sources
- Controller area network: two sources
- Serial sound interface: five sources
- Sampling rate converter: four sources
- Renesas SPDIF interface: two sources
- CD-ROM decoder: one source
- SD host interface: two sources
- Renesas serial peripheral interface: four sources
- Clock synchronous serial I/O with FIFO: two sources
- Motor control PWM timer: two sources
- Renesas quad serial peripheral interface: two sources

Two transfer request sources for the controller area network do not need to be specified by these registers, for they can be specified using the RS3 to RS0 bits in the DMA channel control register (CHCR).

Compare match timer Channel 0	H'FB	B'111110	B'11	—

Peripheral Module	Setting Value for One Channel ({MID, RID})	MID	RID	Function
Compare match timer Channel 1	H'FF	B'111111	B'11	—
Renesas quad serial peripheral interface	H'A1	B'101000	B'01	Transmit
	H'A2		B'10	Receive

When MID or RID other than the values listed in table 10.3 is set, the operation of this LSI is not guaranteed. The transfer request from DMARS is valid only when the resource select bits (RS3 to RS0) in CHCR0 to CHCR15 have been set to B'1000. Otherwise, even if DMARS has been set, the transfer request source is not accepted.

10.4 Operation

When there is a DMA transfer request, this module starts the transfer according to the predetermined channel priority order; when the transfer end conditions are satisfied, it ends the transfer. Transfers can be requested in three modes: auto request, external request, and on-chip peripheral module request. In bus mode, the burst mode or the cycle steal mode can be selected.

10.4.1 Transfer Flow

After the DMA source address registers (SAR), DMA destination address registers (DAR), DMA transfer count registers (DMATCR), DMA channel control registers (CHCR), DMA operation register (DMAOR), three reload registers (RSAR, RDAR, RDMATCR) and DMA extension resource selector (DMARS) are set for the target transfer conditions, this module transfers data according to the following procedure:

1. Checks to see if transfer is enabled ($DE = 1$, $DME = 1$, $TEMASK = 0$ or 1 ($TE = 0$ when $TEMASK = 0$), $AE = 0$, $NMIF = 0$).
2. When a transfer request comes and transfer is enabled, this module transfers one transfer unit of data (depending on the settings of the TS1 and TS0 bits). For an auto request, the transfer begins automatically when the DE bit and DME bit are set to 1. The DMATCR value will be decremented by 1 for each transfer. The actual transfer flows vary by address mode and bus mode.
3. When half of the specified transfer count is exceeded (when DMATCR reaches half of the initial value), an HEI interrupt is sent to the CPU if the HIE bit in CHCR is set to 1.
4. When transfer has been completed for the specified count (when DMATCR reaches 0) while the TEMASK bit is 0, the transfer ends normally. If the IE bit in CHCR is set to 1 at this time, a DEI interrupt is sent to the CPU. When DMATCR reaches 0 while the TEMASK bit is 1, the TE bit is set to 1 and then the values set in RSAR, RDAR and RDMATCR are reloaded in SAR, DAR and DMATCR, respectively to continue transfer operation until the DMA transfer request is cancelled.
5. When an address error in this module or an NMI interrupt is generated, the transfer is terminated. Transfers are also terminated when the DE bit in CHCR or the DME bit in DMAOR is cleared to 0.

Figure 10.2 is a flowchart of this procedure.

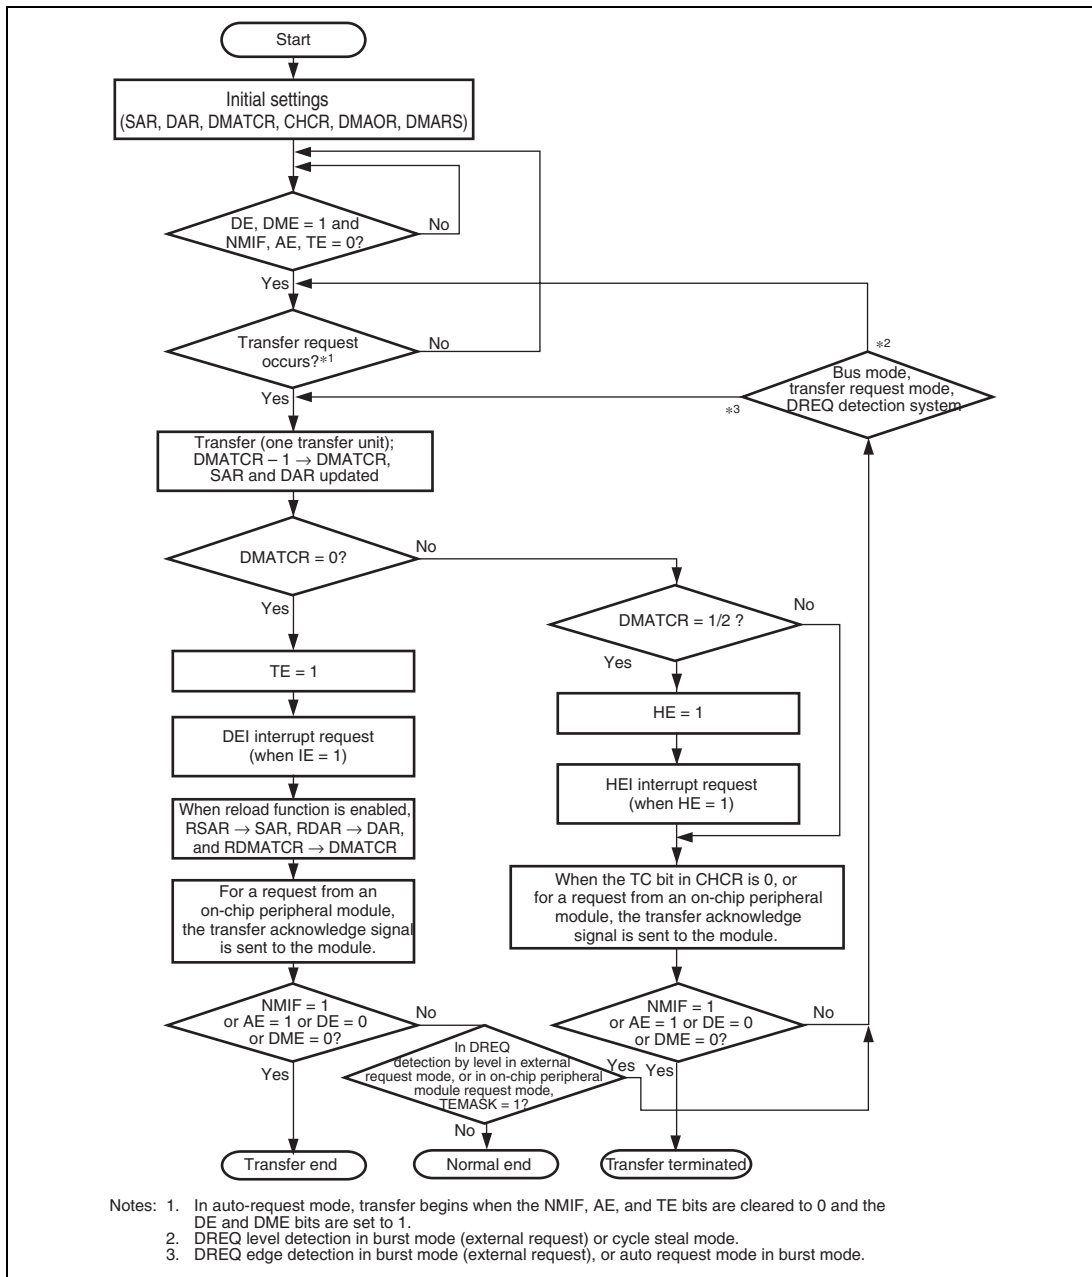

Figure 10.2 DMA Transfer Flowchart

10.4.2 DMA Transfer Requests

DMA transfer requests are basically generated in either the data transfer source or destination, but they can also be generated in external devices and on-chip peripheral modules that are neither the transfer source nor destination.

Transfers can be requested in three modes: auto request, external request, and on-chip peripheral module request. The request mode is selected by the RS[3:0] bits in CHCR_0 to CHCR_15 and DMARS0 to DMARS7.

(1) Auto-Request Mode

When there is no transfer request signal from an external source, as in a memory-to-memory transfer or a transfer between memory and an on-chip peripheral module unable to request a transfer, the auto-request mode allows this module to automatically generate a transfer request signal internally. When the DE bits in CHCR_0 to CHCR_15 and the DME bit in DMAOR are set to 1, the transfer begins so long as the TE bits in CHCR_0 to CHCR_15, and the AE and NMIF bits in DMAOR are 0.

(2) External Request Mode

In this mode a transfer is performed at the request signal (DREQ0) of an external device. Choose one of the modes shown in table 10.4 according to the application system. When the DMA transfer is enabled (DE = 1, DME = 1, TEMASK = 0 or 1 (TE = 0 when TEMASK = 0), AE = 0, NMIF = 0 for level detection; DE = 1, DME = 1, TE = 0, AE = 0, NMIF = 0 for edge detection), DMA transfer is performed upon a request at the DREQ input.

Table 10.4 Selecting External Request Modes with the RS Bits

RS[3]	RS[2]	RS[1]	RS[0]	Address Mode	Transfer Source	Transfer Destination
0	0	0	0	Dual address mode	Any	Any
0	0	1	0	Single address mode	External memory, memory-mapped external device	External device with DACK
			1		External device with DACK	External memory, memory-mapped external device

Choose to detect DREQ by either the edge or level of the signal input with the DL and DS bits in CHCR_0 as shown in table 10.5. The source of the transfer request does not have to be the data transfer source or destination. When DREQ is detected by a rising/falling edge and DMA transfer is performed in burst mode, the transfer continues until DMATCR reaches 0 by one DMA transfer request. In cycle steal mode, one DMA transfer is performed by one request.

Table 10.5 Selecting External Request Detection with DL and DS Bits

CHCR		
DL Bit	DS Bit	Detection of External Request
0	0	Low-level detection
	1	Falling-edge detection
1	0	High-level detection
	1	Rising-edge detection

When DREQ is accepted, the DREQ pin enters the request accept disabled state (non-sensitive period). After issuing acknowledge DACK signal for the accepted DREQ, the DREQ pin again enters the request accept enabled state.

When DREQ is used by level detection, there are following two cases by the timing to detect the next DREQ after outputting DACK.

- Overrun 0: Transfer is terminated after the same number of transfer has been performed as requests.
- Overrun 1: Transfer is terminated after transfers have been performed for (the number of requests plus 1) times.

The DO bit in CHCR selects this overrun 0 or overrun 1.

Table 10.6 Selecting External Request Detection with DO Bit

CHCR	
DO Bit	External Request
0	Overrun 0
1	Overrun 1

(3) On-Chip Peripheral Module Request

In this mode, the transfer is performed in response to the DMA transfer request signal from an on-chip peripheral module.

Table 10.7 lists the DMA transfer request signals sent from on-chip peripheral modules to this module.

If DMA transfer is enabled ($DE = 1$, $DME = 1$, $TEMASK = 0$ or 1 ($TE = 0$ when $TEMASK = 0$), $AE = 0$, and $NMIF = 0$) in on-chip peripheral module request mode, DMA transfer is started by a transfer request signal.

In on-chip peripheral module request mode, there are cases where transfer source or destination is fixed. For details, see table 10.7.

Table 10.7 Selecting On-Chip Peripheral Module Request Modes with RS3 to RS0 Bits

CHCR RS[3:0]	DMARS		DMA Transfer Request		Transfer Source	Transfer Destination	Bus Mode

10.4.3 Channel Priority

When this module receives simultaneous transfer requests on two or more channels, it selects a channel according to a predetermined priority order. Two modes (fixed mode 1 and fixed mode 2) are selected.

In these mode, the priority levels among the channels are as follows:

Fixed mode 1: CH0 > CH1 > CH2 > CH3 > CH4 > CH5 > CH6 > CH7 > CH8 > CH9 > CH10 > CH11 > CH12 > CH13 > CH14 > CH15

Fixed mode 2: CH0 > CH8 > CH1 > CH9 > CH2 > CH10 > CH3 > CH11 > CH4 > CH12 > CH5 > CH13 > CH6 > CH14 > CH7 > CH15

These are selected by the PR1 and PR0 bits in the DMA operation register (DMAOR).

10.4.4 DMA Transfer Types

DMA transfer has two types; single address mode transfer and dual address mode transfer. They depend on the number of bus cycles of access to the transfer source and destination. A data transfer timing depends on the bus mode, which is the cycle steal mode or burst mode. This module supports the transfers shown in table 10.8.

Table 10.8 Supported DMA Transfers

Transfer Source	Transfer Destination				
	External Device with DACK	External Memory	Memory-Mapped External Device	On-Chip Peripheral Module	On-Chip Memory
External device with DACK	Not available	Dual, single	Dual, single	Not available	Not available
External memory	Dual, single	Dual	Dual	Dual	Dual
Memory-mapped external device	Dual, single	Dual	Dual	Dual	Dual
On-chip peripheral module	Not available	Dual	Dual	Dual	Dual
On-chip memory	Not available	Dual	Dual	Dual	Dual

Notes: 1. Dual: Dual address mode
 2. Single: Single address mode
 3. 16-byte transfer is available only for on-chip peripheral modules that support longword access.

(1) Address Modes**(a) Dual Address Mode**

In dual address mode, both the transfer source and destination are accessed (selected) by an address. The transfer source and destination can be located externally or internally.

DMA transfer requires two bus cycles because data is read from the transfer source in a data read cycle and written to the transfer destination in a data write cycle. At this time, transfer data is temporarily stored in this module. In the transfer between external memories as shown in figure 10.3, data is read to this module from one external memory in a data read cycle, and then that data is written to the other external memory in a data write cycle.

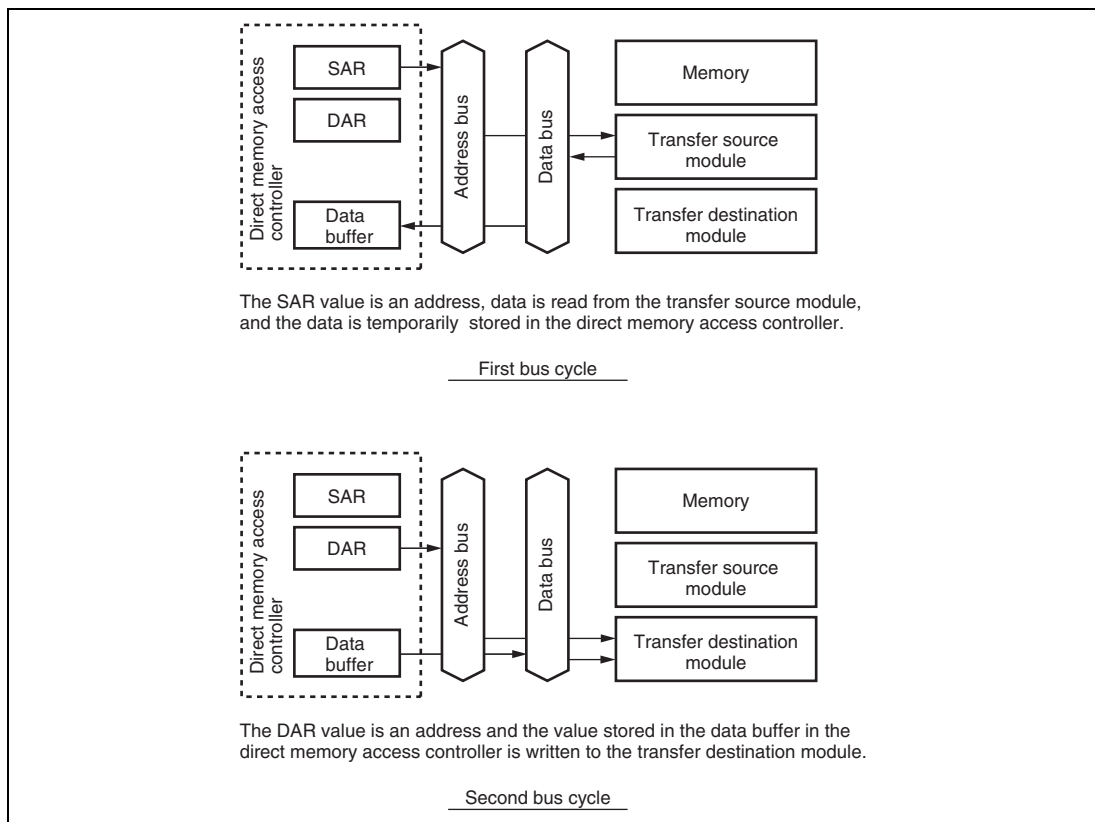

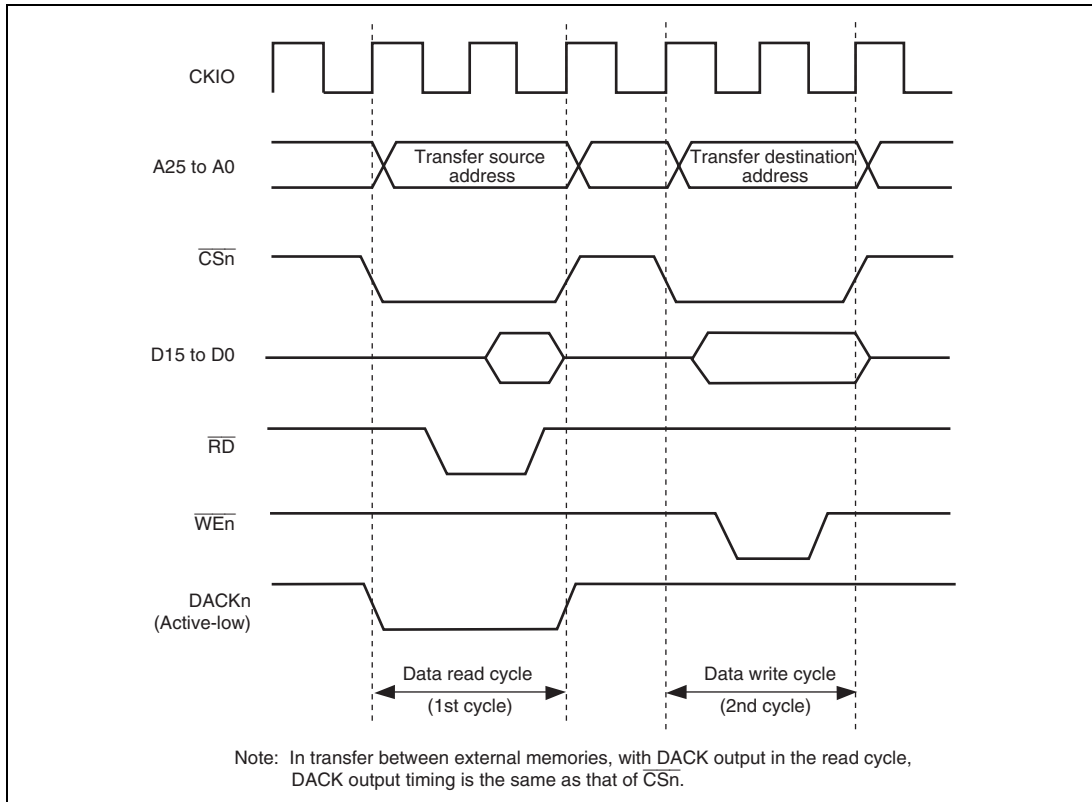

Figure 10.3 Data Flow of Dual Address Mode

Auto request, external request, and on-chip peripheral module request are available for the transfer request. DACK can be output in read cycle or write cycle in dual address mode. The AM bit in the channel control register (CHCR) can specify whether the DACK is output in read cycle or write cycle.

Figure 10.4 shows an example of DMA transfer timing in dual address mode.

**Figure 10.4 Example of DMA Transfer Timing in Dual Mode
(Transfer Source: Normal Memory, Transfer Destination: Normal Memory)**

(b) Single Address Mode

In single address mode, both the transfer source and destination are external devices, either of them is accessed (selected) by the DACK signal, and the other device is accessed by an address. In this mode, this module performs one DMA transfer in one bus cycle, accessing one of the external devices by outputting the DACK transfer request acknowledge signal to it, and at the same time outputting an address to the other device involved in the transfer. For example, in the case of transfer between external memory and an external device with DACK shown in figure 10.5, when the external device outputs data to the data bus, that data is written to the external memory in the same bus cycle.

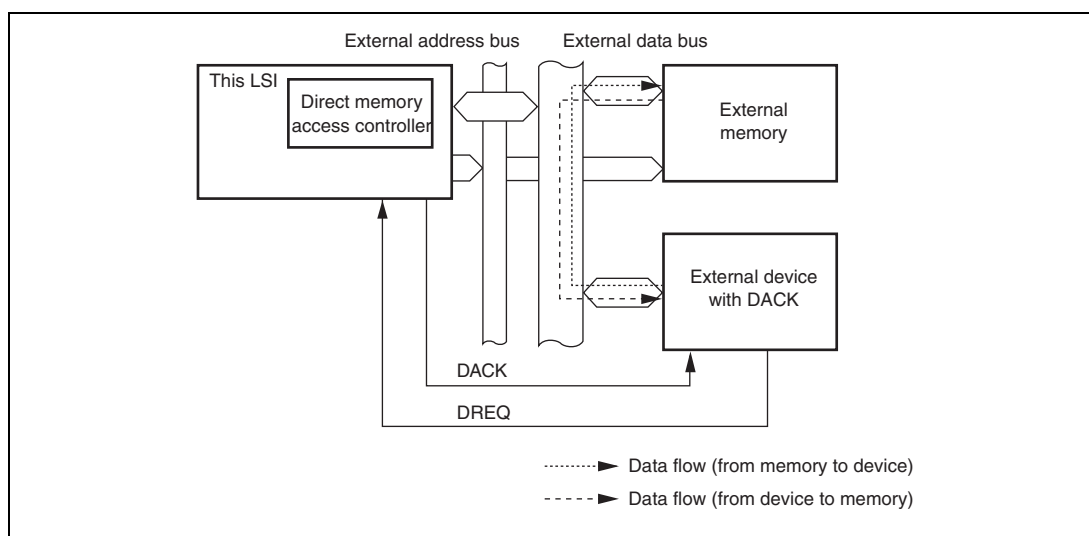

Figure 10.5 Data Flow in Single Address Mode

Two kinds of transfer are possible in single address mode: (1) transfer between an external device with DACK and a memory-mapped external device, and (2) transfer between an external device with DACK and external memory. In both cases, only the external request signal (DREQ) is used for transfer requests.

Figure 10.6 shows an example of DMA transfer timing in single address mode.

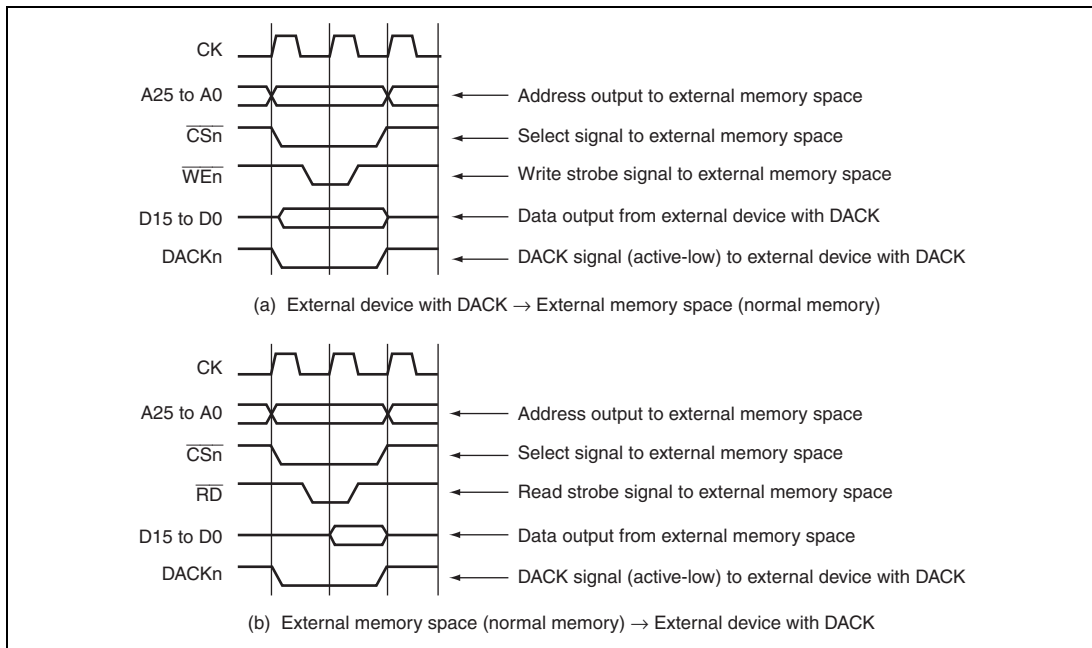

Figure 10.6 Example of DMA Transfer Timing in Single Address Mode

(2) Bus Modes

There are two bus modes; cycle steal and burst. Select the mode by the TB bits in the channel control registers (CHCR).

(a) Cycle Steal Mode

- Normal mode

In normal mode of cycle steal, the bus mastership is given to another bus master after a one-transfer-unit (byte, word, longword, or 16-byte unit) DMA transfer. When another transfer request occurs, the bus mastership is obtained from another bus master and a transfer is performed for one transfer unit. When that transfer ends, the bus mastership is passed to another bus master. This is repeated until the transfer end conditions are satisfied.

The cycle-steal normal mode can be used for any transfer section; transfer request source, transfer source, and transfer destination.

Figure 10.7 shows an example of DMA transfer timing in cycle-steal normal mode. Transfer conditions shown in the figure are;

— Dual address mode

— DREQ low level detection

**Figure 10.7 DMA Transfer Example in Cycle-Steal Normal Mode
(Dual Address, DREQ Low Level Detection)**

- Intermittent Mode 16 and Intermittent Mode 64

In intermittent mode of cycle steal, this module returns the bus mastership to other bus master whenever a unit of transfer (byte, word, longword, or 16 bytes) is completed. If the next transfer request occurs after that, this module obtains the bus mastership from other bus master after waiting for 16 or 64 cycles of $B\phi$ clock. This module then transfers data of one unit and returns the bus mastership to other bus master. These operations are repeated until the transfer end condition is satisfied. It is thus possible to make lower the ratio of bus occupation by DMA transfer than the normal mode of cycle steal.

When this module obtains again the bus mastership, DMA transfer may be postponed in case of entry updating due to cache miss.

The cycle-steal intermittent mode can be used for any transfer section; transfer request source, transfer source, and transfer destination. The bus modes, however, must be cycle steal mode in all channels.

Figure 10.8 shows an example of DMA transfer timing in cycle-steal intermittent mode.

Transfer conditions shown in the figure are;

— Dual address mode

— DREQ low level detection

**Figure 10.8 Example of DMA Transfer in Cycle-Steal Intermittent Mode
(Dual Address, DREQ Low Level Detection)**

(b) Burst Mode

In burst mode, once this module obtains the bus mastership, it does not release the bus mastership and continues to perform transfer until the transfer end condition is satisfied. In external request mode with low-level detection of the DREQ pin, however, when the DREQ pin is driven high, the bus mastership is passed to another bus master after the DMA transfer request that has already been accepted ends, even if the transfer end conditions have not been satisfied.

Figure 10.9 shows DMA transfer timing in burst mode.

**Figure 10.9 DMA Transfer Example in Burst Mode
(Dual Address, DREQ Low Level Detection)**

(3) Relationship between Request Modes and Bus Modes by DMA Transfer Category

Table 10.9 shows the relationship between request modes and bus modes by DMA transfer category.

Table 10.9 Relationship of Request Modes and Bus Modes by DMA Transfer Category

Address Mode	Transfer Category	Request Mode	Bus Mode	Transfer Size (Bits)	Usable Channels
Dual	External device with DACK and external memory	External	B/C	8/16/32/128	0
	External device with DACK and memory-mapped external device	External	B/C	8/16/32/128	0
	External memory and external memory	All* ⁴	B/C	8/16/32/128	0 to 15* ³
	External memory and memory-mapped external device	All* ⁴	B/C	8/16/32/128	0 to 15* ³
	Memory-mapped external device and memory-mapped external device	All* ⁴	B/C	8/16/32/128	0 to 15* ³
	External memory and on-chip peripheral module	All* ¹	B/C* ⁵	8/16/32/128* ²	0 to 15* ³
	Memory-mapped external device and on-chip peripheral module	All* ¹	B/C* ⁵	8/16/32/128* ²	0 to 15* ³
	On-chip peripheral module and on-chip peripheral module	All* ¹	B/C* ⁵	8/16/32/128* ²	0 to 15* ³
	On-chip memory and on-chip memory	All* ⁴	B/C	8/16/32/128	0 to 15* ³
	On-chip memory and memory-mapped external device	All* ⁴	B/C	8/16/32/128	0 to 15* ³
	On-chip memory and on-chip peripheral module	All* ¹	B/C* ⁵	8/16/32/128* ²	0 to 15* ³
On-chip memory and external memory	All* ⁴	B/C	8/16/32/128	0 to 15* ³	
Single	External device with DACK and external memory	External	B/C	8/16/32/128	0
	External device with DACK and memory-mapped external device	External	B/C	8/16/32/128	0

[Legend]

B: Burst

C: Cycle steal

Notes: 1. External requests, auto requests, and on-chip peripheral module requests are all available. However, in the case of internal module request, along with the exception of the multi-function timer pulse unit 2 and the compare match timer as the transfer request source, the requesting module must be designated as the transfer source or the transfer destination.

2. Access size permitted for the on-chip peripheral module register functioning as the transfer source or transfer destination.
3. If the transfer request is an external request, channel 0 is only available.
4. External requests, auto requests, and on-chip peripheral module requests are all available. In the case of on-chip peripheral module requests, however, the compare match timer and the multi-function timer pulse unit 2 are only available.
5. In the case of on-chip peripheral module request, only cycle steal except for the CD-ROM decoder, the multi-function timer pulse unit 2, and the compare match timer as the transfer request source.

(4) Bus Mode and Channel Priority

In priority fixed mode (CH0 > CH1), when channel 1 is transferring data in burst mode and a request arrives for transfer on channel 0, which has higher-priority, the data transfer on channel 0 will begin immediately. In this case, if the transfer on channel 0 is also in burst mode, the transfer on channel 1 will only resume on completion of the transfer on channel 0.

When channel 0 is in cycle steal mode, one transfer-unit of data on this channel, which has the higher priority, is transferred. Data is then transferred continuously to channel 1 without releasing the bus. The bus mastership will then switch between the two in this order: channel 0, channel 1, channel 0, channel 1, etc. That is, the CPU cycle after the data transfer in cycle steal mode is replaced with a burst-mode transfer cycle (priority execution of burst-mode cycle). An example of this is shown in figure 10.10.

When multiple channels are in burst mode, data transfer on the channel that has the highest priority is given precedence. When DMA transfer is being performed on multiple channels, the bus mastership is not released to another bus-master device until all of the competing burst-mode transfers have been completed.

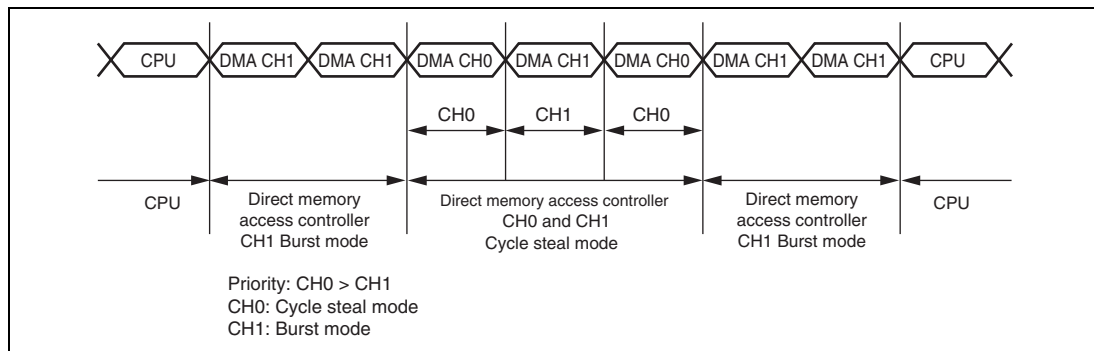

Figure 10.10 Bus State when Multiple Channels are Operating

10.4.5 Number of Bus Cycles and DREQ Pin Sampling Timing

(1) Number of Bus Cycles

When this module is the bus master, the number of bus cycles is controlled by the bus state controller in the same way as when the CPU is the bus master. For details, see section 9, Bus State Controller.

(2) DREQ Pin Sampling Timing

Figures 10.11 to 10.14 show the DREQ input sampling timings in each bus mode.

Figure 10.11 Example of DREQ Input Detection in Cycle Steal Mode Edge Detection

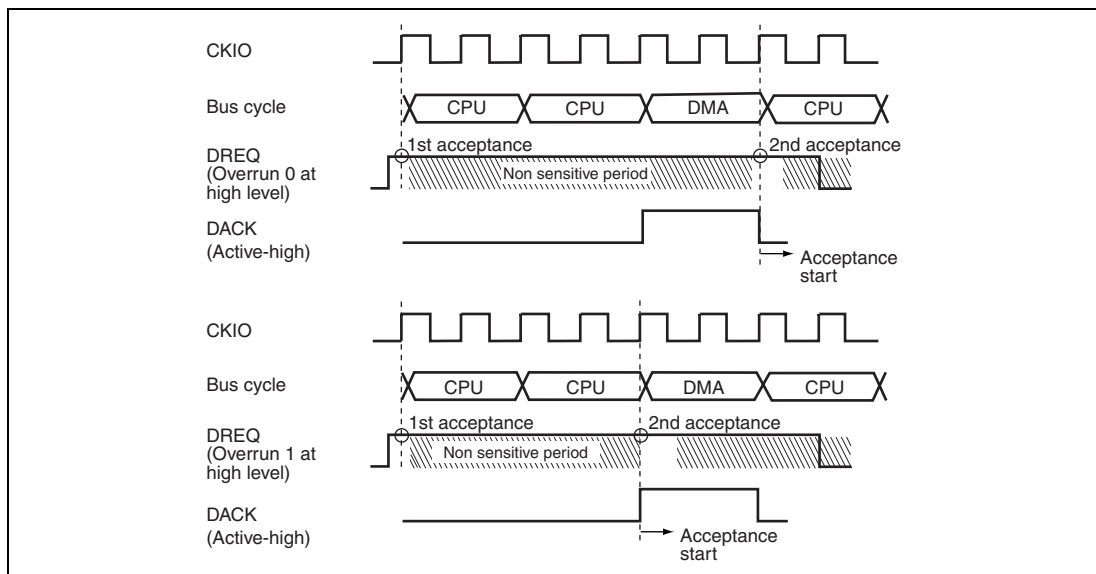

Figure 10.12 Example of DREQ Input Detection in Cycle Steal Mode Level Detection

Figure 10.13 Example of DREQ Input Detection in Burst Mode Edge Detection

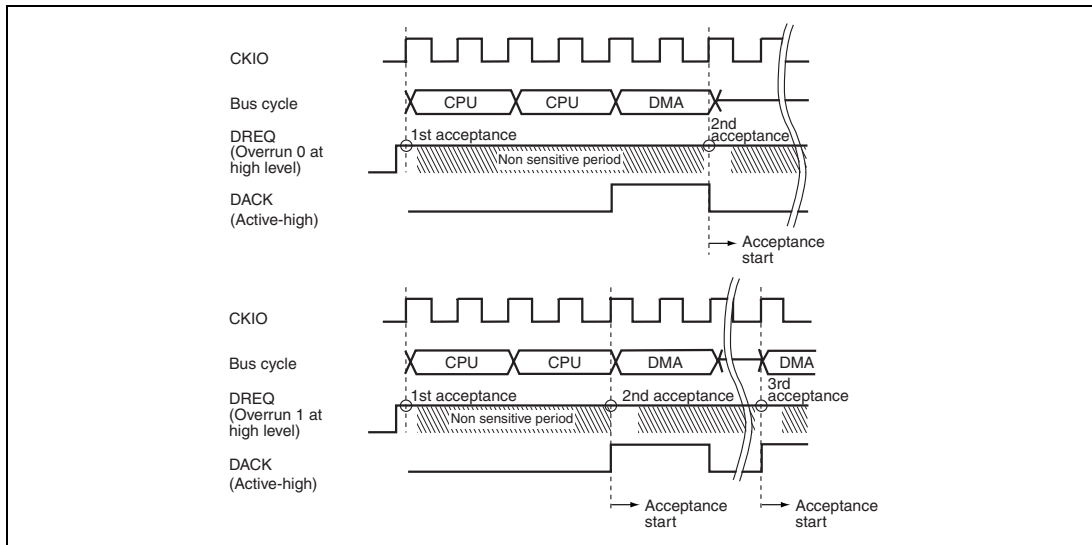

Figure 10.14 Example of DREQ Input Detection in Burst Mode Level Detection

Figure 10.15 shows the TEND output timing.

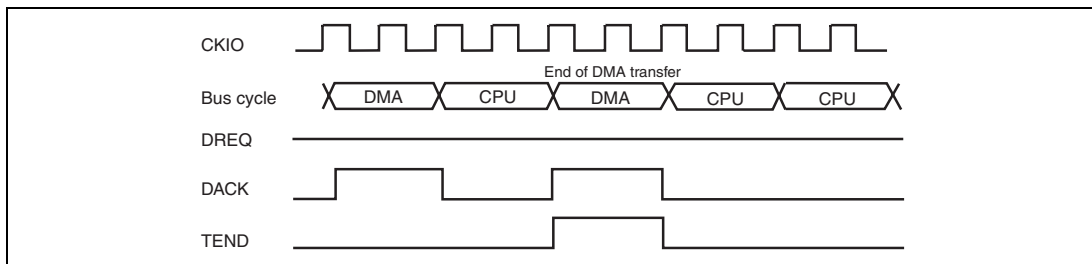

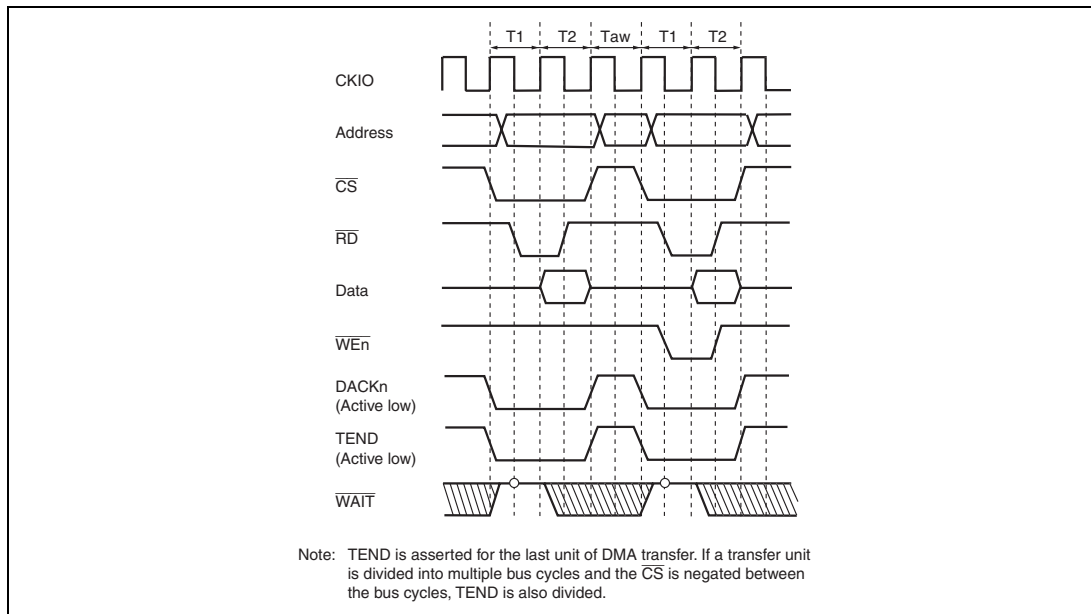

Figure 10.15 Example of DMA Transfer End Signal Timing (Cycle Steal Mode Level Detection)

The unit of the DMA transfer is divided into multiple bus cycles when 16-byte transfer is performed for an 8-bit or 16-bit external device or when word transfer is performed for an 8-bit external device. When a setting is made so that the DMA transfer size is divided into multiple bus cycles and the \overline{CS} signal is negated between bus cycles, note that DACK and TEND are divided like the \overline{CS} signal for data alignment as shown in figure 10.16. Figures 10.11 to 10.15 show the cases where DACK and TEND are not divided in the DMA transfer.

**Figure 10.16 Bus State Controller Normal Memory Access
(No Wait, Idle Cycle 1, Longword Access to 16-Bit Device)**

10.5 Usage Notes

10.5.1 Timing of DACK and TEND Outputs

When the external memory is the MPX-I/O, the DACK output is asserted with the timing of the data cycle. For details, see section 9.5.5, MPX-I/O Interface in section 9, Bus State Controller.

When the memory is other than the MPX-I/O, the DACK output is asserted with the same timing as the corresponding CS signal.

The TEND output does not depend on the type of memory and is always asserted with the same timing as the corresponding CS signal.

Section 11 Multi-Function Timer Pulse Unit 2

This LSI has an on-chip multi-function timer pulse unit 2 that comprises five 16-bit timer channels.

11.1 Features

- Maximum 16 pulse input/output lines
- Selection of eight counter input clocks for each channel
- The following operations can be set:
 - Waveform output at compare match
 - Input capture function
 - Counter clear operation
 - Multiple timer counters (TCNT) can be written to simultaneously
 - Simultaneous clearing by compare match and input capture is possible
 - Register simultaneous input/output is possible by synchronous counter operation
 - A maximum 12-phase PWM output is possible in combination with synchronous operation
- Buffer operation settable for channels 0, 3, and 4
- Phase counting mode settable independently for each of channels 1 and 2
- Cascade connection operation
- Fast access via internal 16-bit bus
- 28 interrupt sources
- Automatic transfer of register data
- A/D converter start trigger can be generated
- Module standby mode can be settable
- A total of six-phase waveform output, which includes complementary PWM output, and positive and negative phases of reset PWM output by interlocking operation of channels 3 and 4, is possible.
- AC synchronous motor (brushless DC motor) drive mode using complementary PWM output and reset PWM output is settable by interlocking operation of channels 0, 3, and 4, and the selection of two types of waveform outputs (chopping and level) is possible.
- In complementary PWM mode, interrupts at the crest and trough of the counter value and A/D converter start triggers can be skipped.

11.3.1 Timer Control Register (TCR)

The TCR registers are 8-bit readable/writable registers that control the TCNT operation for each channel. This module has a total of five TCR registers, one each for channels 0 to 4. TCR register settings should be conducted only when TCNT operation is stopped.

Bit	Bit Name	Initial Value	R/W	Description
7 to 5	CCLR[2:0]	000	R/W	Counter Clear 0 to 2 These bits select the TCNT counter clearing source. See tables 11.4 and 11.5 for details.
4, 3	CKEG[1:0]	00	R/W	Clock Edge 0 and 1 These bits select the input clock edge. When the input clock is counted using both edges, the input clock period is halved (e.g. $P\phi/4$ both edges = $P\phi/2$ rising edge). If phase counting mode is used on channels 1 and 2, this setting is ignored and the phase counting mode setting has priority. Internal clock edge selection is valid when the input clock is $P\phi/4$ or slower. When $P\phi/1$, or the overflow/underflow of another channel is selected for the input clock, although values can be written, counter operation compiles with the initial value. 00: Count at rising edge 01: Count at falling edge 1x: Count at both edges
2 to 0	TPSC[2:0]	000	R/W	Time Prescaler 0 to 2 These bits select the TCNT counter clock. The clock source can be selected independently for each channel. See tables 11.6 to 11.9 for details.

[Legend]

x: Don't care

Table 11.4 CCLR0 to CCLR2 (Channels 0, 3, and 4)

Channel	Bit 7 CCLR2	Bit 6 CCLR1	Bit 5 CCLR0	Description
0, 3, 4	0	0	0	TCNT clearing disabled
			1	TCNT cleared by TGRA compare match/input capture
			1	TCNT cleared by counter clearing for another channel performing synchronous clearing/synchronous operation* ¹
	1	0	0	TCNT clearing disabled
			1	TCNT cleared by TGRC compare match/input capture* ²
			1	TCNT cleared by counter clearing for another channel performing synchronous clearing/synchronous operation* ¹

Notes: 1. Synchronous operation is set by setting the SYNC bit in TSYR to 1.
 2. When TGRC or TGRD is used as a buffer register, TCNT is not cleared because the buffer register setting has priority, and compare match/input capture does not occur.

Table 11.5 CCLR0 to CCLR2 (Channels 1 and 2)

Channel	Bit 7 Reserved* ²	Bit 6 CCLR1	Bit 5 CCLR0	Description
1, 2	0	0	0	TCNT clearing disabled
			1	TCNT cleared by TGRA compare match/input capture
			1	TCNT cleared by counter clearing for another channel performing synchronous clearing/synchronous operation* ¹

Notes: 1. Synchronous operation is selected by setting the SYNC bit in TSYR to 1.
 2. Bit 7 is reserved in channels 1 and 2. It is always read as 0 and cannot be modified.

Table 11.6 TPSC0 to TPSC2 (Channel 0)

Channel	Bit 2 TPSC2	Bit 1 TPSC1	Bit 0 TPSC0	Description
0	0	0	0	Internal clock: counts on P ϕ /1
			1	Internal clock: counts on P ϕ /4
		1	0	Internal clock: counts on P ϕ /16
			1	Internal clock: counts on P ϕ /64
	1	0	0	External clock: counts on TCLKA pin input
			1	External clock: counts on TCLKB pin input
		1	0	External clock: counts on TCLKC pin input
			1	External clock: counts on TCLKD pin input

Table 11.7 TPSC0 to TPSC2 (Channel 1)

Channel	Bit 2 TPSC2	Bit 1 TPSC1	Bit 0 TPSC0	Description
1	0	0	0	Internal clock: counts on P ϕ /1
			1	Internal clock: counts on P ϕ /4
		1	0	Internal clock: counts on P ϕ /16
			1	Internal clock: counts on P ϕ /64
	1	0	0	External clock: counts on TCLKA pin input
			1	External clock: counts on TCLKB pin input
		1	0	Internal clock: counts on P ϕ /256
			1	Counts on TCNT_2 overflow/underflow

Note: This setting is ignored when channel 1 is in phase counting mode.

Table 11.8 TPSC0 to TPSC2 (Channel 2)

Channel	Bit 2 TPSC2	Bit 1 TPSC1	Bit 0 TPSC0	Description
2	0	0	0	Internal clock: counts on P ϕ /1
			1	Internal clock: counts on P ϕ /4
		1	0	Internal clock: counts on P ϕ /16
			1	Internal clock: counts on P ϕ /64
	1	0	0	External clock: counts on TCLKA pin input
			1	External clock: counts on TCLKB pin input
		1	0	External clock: counts on TCLKC pin input
			1	Internal clock: counts on P ϕ /1024

Note: This setting is ignored when channel 2 is in phase counting mode.

Table 11.9 TPSC0 to TPSC2 (Channels 3 and 4)

Channel	Bit 2 TPSC2	Bit 1 TPSC1	Bit 0 TPSC0	Description
3, 4	0	0	0	Internal clock: counts on P ϕ /1
			1	Internal clock: counts on P ϕ /4
		1	0	Internal clock: counts on P ϕ /16
			1	Internal clock: counts on P ϕ /64
	1	0	0	Internal clock: counts on P ϕ /256
			1	Internal clock: counts on P ϕ /1024
		1	0	External clock: counts on TCLKA pin input
			1	External clock: counts on TCLKB pin input

11.3.2 Timer Mode Register (TMDR)

The TMDR registers are 8-bit readable/writable registers that are used to set the operating mode of each channel. This module has five TMDR registers, one each for channels 0 to 4. TMDR register settings should be changed only when TCNT operation is stopped.

Bit:	7	6	5	4	3	2	1	0
	-	BFE	BFB	BFA	MD[3:0]			
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
6	BFE	0	R/W	Buffer Operation E Specifies whether TGRE_0 and TGRF_0 are to operate in the normal way or to be used together for buffer operation. TGRF compare match is generated when TGRF is used as the buffer register. In channels 1 to 4, this bit is reserved. It is always read as 0 and the write value should always be 0. 0: TGRE_0 and TGRF_0 operate normally 1: TGRE_0 and TGRF_0 used together for buffer operation

Bit	Bit Name	Initial Value	R/W	Description
5	BFB	0	R/W	<p>Buffer Operation B</p> <p>Specifies whether TGRB is to operate in the normal way, or TGRB and TGRD are to be used together for buffer operation. When TGRD is used as a buffer register, TGRD input capture/output compare is not generated in a mode other than complementary PWM. In channels 1 and 2, which have no TGRD, bit 5 is reserved. It is always read as 0 and cannot be modified.</p> <p>0: TGRB and TGRD operate normally 1: TGRB and TGRD used together for buffer operation</p>
4	BFA	0	R/W	<p>Buffer Operation A</p> <p>Specifies whether TGRA is to operate in the normal way, or TGRA and TGRC are to be used together for buffer operation. When TGRC is used as a buffer register, TGRC input capture/output compare is not generated in a mode other than complementary PWM. TGRC compare match is generated when in complementary PWM mode. When compare match for channel 4 occurs during the Tb period in complementary PWM mode, TGFC is set. Therefore, set the TGIEC bit in the timer interrupt enable register 4 (TIER_4) to 0.</p> <p>In channels 1 and 2, which have no TGRC, bit 4 is reserved. It is always read as 0 and cannot be modified.</p> <p>0: TGRA and TGRC operate normally 1: TGRA and TGRC used together for buffer operation</p>
3 to 0	MD[3:0]	0000	R/W	<p>Modes 0 to 3</p> <p>These bits are used to set the timer operating mode. See table 11.10 for details.</p>

Table 11.10 Setting of Operation Mode by Bits MD0 to MD3

Bit 3 MD3	Bit 2 MD2	Bit 1 MD1	Bit 0 MD0	Description	
0	0	0	0	Normal operation	
			1	Setting prohibited	
	1	0	1	0	PWM mode 1
				1	PWM mode 2* ¹
			1	0	Phase counting mode 1* ²
				1	Phase counting mode 2* ²
		1	0	0	Phase counting mode 3* ²
				1	Phase counting mode 4* ²
1	0	0	0	Reset synchronous PWM mode* ³	
			1	Setting prohibited	
		1	X	Setting prohibited	
			0	Setting prohibited	
	1	0	1	0	Complementary PWM mode 1 (transmit at crest)* ³
				1	Complementary PWM mode 2 (transmit at trough)* ³
		1	0	0	Complementary PWM mode 2 (transmit at trough)* ³
				1	Complementary PWM mode 2 (transmit at crest and trough)* ³

[Legend]

X: Don't care

- Notes:
- PWM mode 2 cannot be set for channels 3 and 4.
 - Phase counting mode cannot be set for channels 0, 3, and 4.
 - Reset synchronous PWM mode, complementary PWM mode can only be set for channel 3. When channel 3 is set to reset synchronous PWM mode or complementary PWM mode, the channel 4 settings become ineffective and automatically conform to the channel 3 settings. However, do not set channel 4 to reset synchronous PWM mode or complementary PWM mode. Reset synchronous PWM mode and complementary PWM mode cannot be set for channels 0, 1, and 2.

11.3.3 Timer I/O Control Register (TIOR)

The TIOR registers are 8-bit readable/writable registers that control the TGR registers. This module has a total of eight TIOR registers, two each for channels 0, 3, and 4, one each for channels 1 and 2.

TIOR should be set while TMDR is set in normal operation, PWM mode, or phase counting mode.

The initial output specified by TIOR is valid when the counter is stopped (the CST bit in TSTR is cleared to 0). Note also that, in PWM mode 2, the output at the point at which the counter is cleared to 0 is specified.

When TGRC or TGRD is designated for buffer operation, this setting is invalid and the register operates as a buffer register.

- TIORH_0, TIOR_1, TIOR_2, TIORH_3, TIORH_4

Bit	Bit Name	Initial Value	R/W	Description
7 to 4	IOB[3:0]	0000	R/W	I/O Control B0 to B3 Specify the function of TGRB. See the following tables. TIORH_0: Table 11.11 TIOR_1: Table 11.13 TIOR_2: Table 11.14 TIORH_3: Table 11.15 TIORH_4: Table 11.17
3 to 0	IOA[3:0]	0000	R/W	I/O Control A0 to A3 Specify the function of TGRA. See the following tables. TIORH_0: Table 11.19 TIOR_1: Table 11.21 TIOR_2: Table 11.22 TIORH_3: Table 11.23 TIORH_4: Table 11.25

- TIORL_0, TIORL_3, TIORL_4

Bit	Bit Name	Initial Value	R/W	Description
7 to 4	IOD[3:0]	0000	R/W	I/O Control D0 to D3 Specify the function of TGRD. See the following tables. TIORL_0: Table 11.12 TIORL_3: Table 11.16 TIORL_4: Table 11.18
3 to 0	IOC[3:0]	0000	R/W	I/O Control C0 to C3 Specify the function of TGRC. See the following tables. TIORL_0: Table 11.20 TIORL_3: Table 11.24 TIORL_4: Table 11.26

Table 11.11 TIORH_0 (Channel 0)

			1		Initial output is 0 0 output at compare match
			0		Initial output is 0 1 output at compare match
		1	0		Initial output is 0 Toggle output at compare match
			0		Output retained
			1		Initial output is 1 0 output at compare match
	1	0	0	Input capture register	Initial output is 1 1 output at compare match
			1		Initial output is 1 Toggle output at compare match
			0		Input capture at rising edge
		1	0		Input capture at falling edge
			0		Input capture at both edges
			X		

[Legend]

X: Don't care

Note: * After power-on reset, 0 is output until TIOR is set.

Table 11.26 TIORL_4 (Channel 4)

				Description		
Bit 3 IOC3	Bit 2 IOC2	Bit 1 IOC1	Bit 0 IOC0	TGRC_4 Function	TIOC4C Pin Function	
0	0	0	0	Output compare register*2	Output retained*1	
			1		Initial output is 0 0 output at compare match	
		1	0		Initial output is 0 1 output at compare match	
			1		Initial output is 0 Toggle output at compare match	
		1	0		0	Output retained
					1	Initial output is 1 0 output at compare match
	1	0	0	Initial output is 1 1 output at compare match		
			1	Initial output is 1 Toggle output at compare match		
	1	X	0	0	Input capture register*2	Input capture at rising edge
				1		Input capture at falling edge
			1	X		Input capture at both edges

[Legend]

X: Don't care

Notes: 1. After power-on reset, 0 is output until TIOR is set.

2. When the BFA bit in TMDR_4 is set to 1 and TGRC_4 is used as a buffer register, this setting is invalid and input capture/output compare is not generated.

11.3.4 Timer Interrupt Enable Register (TIER)

The TIER registers are 8-bit readable/writable registers that control enabling or disabling of interrupt requests for each channel. This module has six TIER registers, two for channel 0 and one each for channels 1 to 4.

- TIER_0, TIER_1, TIER_2, TIER_3, TIER_4

Bit:	7	6	5	4	3	2	1	0
	TTGE	TTGE2	TCIEU	TCIEV	TGIED	TGIEC	TGIEB	TGIEA
Initial value:	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7	TTGE	0	R/W	<p>A/D Converter Start Request Enable</p> <p>Enables or disables generation of A/D converter start requests by TGRA input capture/compare match.</p> <p>0: A/D converter start request generation disabled</p> <p>1: A/D converter start request generation enabled</p>
6	TTGE2	0	R/W	<p>A/D Converter Start Request Enable 2</p> <p>Enables or disables generation of A/D converter start requests by TCNT_4 underflow (trough) in complementary PWM mode.</p> <p>In channels 0 to 3, bit 6 is reserved. It is always read as 0 and the write value should always be 0.</p> <p>0: A/D converter start request generation by TCNT_4 underflow (trough) disabled</p> <p>1: A/D converter start request generation by TCNT_4 underflow (trough) enabled</p>
5	TCIEU	0	R/W	<p>Underflow Interrupt Enable</p> <p>Enables or disables interrupt requests (TCIU) by the TCFU flag when the TCFU flag in TSR is set to 1 in channels 1 and 2.</p> <p>In channels 0, 3, and 4, bit 5 is reserved. It is always read as 0 and the write value should always be 0.</p> <p>0: Interrupt requests (TCIU) by TCFU disabled</p> <p>1: Interrupt requests (TCIU) by TCFU enabled</p>

Bit	Bit Name	Initial Value	R/W	Description
4	TCIEV	0	R/W	<p>Overflow Interrupt Enable</p> <p>Enables or disables interrupt requests (TCIV) by the TCFV flag when the TCFV flag in TSR is set to 1.</p> <p>0: Interrupt requests (TCIV) by TCFV disabled</p> <p>1: Interrupt requests (TCIV) by TCFV enabled</p>
3	TGIED	0	R/W	<p>TGR Interrupt Enable D</p> <p>Enables or disables interrupt requests (TGID) by the TGFD bit when the TGFD bit in TSR is set to 1 in channels 0, 3, and 4.</p> <p>In channels 1 and 2, bit 3 is reserved. It is always read as 0 and the write value should always be 0.</p> <p>0: Interrupt requests (TGID) by TGFD bit disabled</p> <p>1: Interrupt requests (TGID) by TGFD bit enabled</p>
2	TGIEC	0	R/W	<p>TGR Interrupt Enable C</p> <p>Enables or disables interrupt requests (TGIC) by the TGFC bit when the TGFC bit in TSR is set to 1 in channels 0, 3, and 4.</p> <p>In channels 1 and 2, bit 2 is reserved. It is always read as 0 and the write value should always be 0.</p> <p>0: Interrupt requests (TGIC) by TGFC bit disabled</p> <p>1: Interrupt requests (TGIC) by TGFC bit enabled</p>
1	TGIEB	0	R/W	<p>TGR Interrupt Enable B</p> <p>Enables or disables interrupt requests (TGIB) by the TGFB bit when the TGFB bit in TSR is set to 1.</p> <p>0: Interrupt requests (TGIB) by TGFB bit disabled</p> <p>1: Interrupt requests (TGIB) by TGFB bit enabled</p>

11.3.5 Timer Status Register (TSR)

The TSR registers are 8-bit readable/writable registers that indicate the status of each channel. This module has six TSR registers, two for channel 0 and one each for channels 1 to 4.

- TSR_0, TSR_1, TSR_2, TSR_3, TSR_4

Bit:	7	6	5	4	3	2	1	0
	TCFD	-	TCFU	TCFV	TGFD	TGFC	TGFB	TGFA
Initial value:	1	1	0	0	0	0	0	0
R/W:	R	R	R/(W)*1	R/(W)*1	R/(W)*1	R/(W)*1	R/(W)*1	R/(W)*1

Note: 1. Writing 0 to this bit after reading it as 1 clears the flag and is the only allowed way.

Bit	Bit Name	Initial Value	R/W	Description
7	TCFD	1	R	Count Direction Flag Status flag that shows the direction in which TCNT counts in channels 1 to 4. In channel 0, bit 7 is reserved. It is always read as 1 and the write value should always be 1. 0: TCNT counts down 1: TCNT counts up
6	—	1	R	Reserved This bit is always read as 1. The write value should always be 1.
5	TCFU	0	R/(W)*1	Underflow Flag Status flag that indicates that TCNT underflow has occurred when channels 1 and 2 are set to phase counting mode. Only 0 can be written, for flag clearing. In channels 0, 3, and 4, bit 5 is reserved. It is always read as 0 and the write value should always be 0. [Clearing condition] <ul style="list-style-type: none"> • When 0 is written to TCFU after reading TCFU = 1*2 [Setting condition] <ul style="list-style-type: none"> • When the TCNT value underflows (changes from H'0000 to H'FFFF)

Bit	Bit Name	Initial Value	R/W	Description
4	TCFV	0	R/(W)* ¹	<p>Overflow Flag</p> <p>Status flag that indicates that TCNT overflow has occurred. Only 0 can be written, for flag clearing.</p> <p>[Clearing condition]</p> <ul style="list-style-type: none"> When 0 is written to TCFV after reading TCFV = 1*² <p>[Setting condition]</p> <ul style="list-style-type: none"> When the TCNT value overflows (changes from H'FFFF to H'0000) In channel 4, when the TCNT_4 value underflows (changes from H'0001 to H'0000) in complementary PWM mode, this flag is also set.
3	TGFD	0	R/(W)* ¹	<p>Input Capture/Output Compare Flag D</p> <p>Status flag that indicates the occurrence of TGRD input capture or compare match in channels 0, 3, and 4. Only 0 can be written, for flag clearing. In channels 1 and 2, bit 3 is reserved. It is always read as 0 and the write value should always be 0.</p> <p>[Clearing condition]</p> <ul style="list-style-type: none"> When 0 is written to TGFD after reading TGFD = 1*² <p>[Setting conditions]</p> <ul style="list-style-type: none"> When TCNT = TGRD and TGRD is functioning as output compare register When TCNT value is transferred to TGRD by input capture signal and TGRD is functioning as input capture register

Bit	Bit Name	Initial Value	R/W	Description
2	TGFC	0	R/(W)* ¹	<p>Input Capture/Output Compare Flag C</p> <p>Status flag that indicates the occurrence of TGRC input capture or compare match in channels 0, 3, and 4. Only 0 can be written, for flag clearing. In channels 1 and 2, bit 2 is reserved. It is always read as 0 and the write value should always be 0.</p> <p>[Clearing condition]</p> <ul style="list-style-type: none"> When 0 is written to TGFC after reading TGFC = 1*² <p>[Setting conditions]</p> <ul style="list-style-type: none"> When TCNT = TGRC and TGRC is functioning as output compare register When TCNT value is transferred to TGRC by input capture signal and TGRC is functioning as input capture register
1	TGFB	0	R/(W)* ¹	<p>Input Capture/Output Compare Flag B</p> <p>Status flag that indicates the occurrence of TGRB input capture or compare match. Only 0 can be written, for flag clearing.</p> <p>[Clearing condition]</p> <ul style="list-style-type: none"> When 0 is written to TGFB after reading TGFB = 1*² <p>[Setting conditions]</p> <ul style="list-style-type: none"> When TCNT = TGRB and TGRB is functioning as output compare register When TCNT value is transferred to TGRB by input capture signal and TGRB is functioning as input capture register

Bit	Bit Name	Initial Value	R/W	Description
0	TGFA	0	R/(W)* ¹	<p>Input Capture/Output Compare Flag A</p> <p>Status flag that indicates the occurrence of TGRA input capture or compare match. Only 0 can be written, for flag clearing.</p> <p>[Clearing conditions]</p> <ul style="list-style-type: none"> • When the direct memory access controller is activated by TGIA interrupt • When 0 is written to TGFA after reading TGFA = 1*² <p>[Setting conditions]</p> <ul style="list-style-type: none"> • When TCNT = TGRA and TGRA is functioning as output compare register • When TCNT value is transferred to TGRA by input capture signal and TGRA is functioning as input capture register

Notes: 1. Writing 0 to this bit after reading it as 1 clears the flag.
 2. If the next flag is set before TGFA is cleared to 0 after reading TGFA = 1, TGFA remains 1 even when 0 is written to. In this case, read TGFA = 1 again to clear TGFA to 0.

- TSR2_0

Bit:	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	TGFF	TGFE
Initial value:	1	1	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R/(W)* ¹	R/(W)* ¹

Note: 1. Writing 0 to this bit after reading it as 1 clears the flag and is the only allowed way.

Bit	Bit Name	Initial Value	R/W	Description
7, 6	—	All 1	R	Reserved These bits are always read as 1. The write value should always be 1.
5 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1	TGFF	0	R/(W)* ¹	Compare Match Flag F Status flag that indicates the occurrence of compare match between TCNT_0 and TGRF_0. [Clearing condition] <ul style="list-style-type: none"> • When 0 is written to TGFF after reading TGFF = 1*² [Setting condition] <ul style="list-style-type: none"> • When TCNT_0 = TGRF_0 and TGRF_0 is functioning as compare register
0	TGFE	0	R/(W)* ¹	Compare Match Flag E Status flag that indicates the occurrence of compare match between TCNT_0 and TGRE_0. [Clearing condition] <ul style="list-style-type: none"> • When 0 is written to TGFE after reading TGFE = 1*² [Setting condition] <ul style="list-style-type: none"> • When TCNT_0 = TGRE_0 and TGRE_0 is functioning as compare register

Notes: 1. Writing 0 to this bit after reading it as 1 clears the flag.
2. If the next flag is set before TGFA is cleared to 0 after reading TGFA = 1, TGFA remains 1 even when 0 is written to. In this case, read TGFA = 1 again to clear TGFA to 0.

11.3.6 Timer Buffer Operation Transfer Mode Register (TBTM)

The TBTM registers are 8-bit readable/writable registers that specify the timing for transferring data from the buffer register to the timer general register in PWM mode. This module has three TBTM registers, one each for channels 0, 3, and 4.

Bit:	7	6	5	4	3	2	1	0
	-	-	-	-	-	TTSE	TTSB	TTSA
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7 to 3	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
2	TTSE	0	R/W	Timing Select E Specifies the timing for transferring data from TGRF_0 to TGRE_0 when they are used together for buffer operation. In channels 3 and 4, bit 2 is reserved. It is always read as 0 and the write value should always be 0. 0: When compare match E occurs in channel 0 1: When TCNT_0 is cleared
1	TTSB	0	R/W	Timing Select B Specifies the timing for transferring data from TGRD to TGRB in each channel when they are used together for buffer operation. 0: When compare match B occurs in each channel 1: When TCNT is cleared in each channel
0	TTSA	0	R/W	Timing Select A Specifies the timing for transferring data from TGRC to TGRA in each channel when they are used together for buffer operation. 0: When compare match A occurs in each channel 1: When TCNT is cleared in each channel

11.3.7 Timer Input Capture Control Register (TICCR)

TICCR is an 8-bit readable/writable register that specifies input capture conditions when TCNT_1 and TCNT_2 are cascaded. This module has one TICCR in channel 1.

Bit:	7	6	5	4	3	2	1	0
	-	-	-	-	I2BE	I2AE	I1BE	I1AE
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7 to 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
3	I2BE	0	R/W	Input Capture Enable Specifies whether to include the TIOC2B pin in the TGRB_1 input capture conditions. 0: Does not include the TIOC2B pin in the TGRB_1 input capture conditions 1: Includes the TIOC2B pin in the TGRB_1 input capture conditions
2	I2AE	0	R/W	Input Capture Enable Specifies whether to include the TIOC2A pin in the TGRA_1 input capture conditions. 0: Does not include the TIOC2A pin in the TGRA_1 input capture conditions 1: Includes the TIOC2A pin in the TGRA_1 input capture conditions
1	I1BE	0	R/W	Input Capture Enable Specifies whether to include the TIOC1B pin in the TGRB_2 input capture conditions. 0: Does not include the TIOC1B pin in the TGRB_2 input capture conditions 1: Includes the TIOC1B pin in the TGRB_2 input capture conditions

Bit	Bit Name	Initial Value	R/W	Description
0	I1AE	0	R/W	Input Capture Enable Specifies whether to include the TIOC1A pin in the TGRA_2 input capture conditions. 0: Does not include the TIOC1A pin in the TGRA_2 input capture conditions 1: Includes the TIOC1A pin in the TGRA_2 input capture conditions

11.3.8 Timer A/D Converter Start Request Control Register (TADCR)

TADCR is a 16-bit readable/writable register that enables or disables A/D converter start requests and specifies whether to link A/D converter start requests with interrupt skipping operation. This module has one TADCR in channel 4.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	BF[1:0]	-	-	-	-	-	-	-	UT4AE	DT4AE	UT4BE	DT4BE	ITA3AE	ITA4VE	ITB3AE	ITB4VE
Initial value:	0	0	0	0	0	0	0	0	0	0*	0	0*	0*	0*	0*	0*
R/W:	R/W	R/W	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note: * Do not set to 1 when complementary PWM mode is not selected.

Bit	Bit Name	Initial Value	R/W	Description
15, 14	BF[1:0]	00	R/W	TADCOBRA_4/TADCOBRB_4 Transfer Timing Select Select the timing for transferring data from TADCOBRA_4 and TADCOBRB_4 to TADCORA_4 and TADCORB_4. For details, see table 11.27.
13 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
7	UT4AE	0	R/W	Up-Count TRG4AN Enable Enables or disables A/D converter start requests (TRG4AN) during TCNT_4 up-count operation. 0: A/D converter start requests (TRG4AN) disabled during TCNT_4 up-count operation 1: A/D converter start requests (TRG4AN) enabled during TCNT_4 up-count operation
6	DT4AE	0*	R/W	Down-Count TRG4AN Enable Enables or disables A/D converter start requests (TRG4AN) during TCNT_4 down-count operation. 0: A/D converter start requests (TRG4AN) disabled during TCNT_4 down-count operation 1: A/D converter start requests (TRG4AN) enabled during TCNT_4 down-count operation

Bit	Bit Name	Initial Value	R/W	Description
5	UT4BE	0	R/W	<p>Up-Count TRG4BN Enable</p> <p>Enables or disables A/D converter start requests (TRG4BN) during TCNT_4 up-count operation.</p> <p>0: A/D converter start requests (TRG4BN) disabled during TCNT_4 up-count operation</p> <p>1: A/D converter start requests (TRG4BN) enabled during TCNT_4 up-count operation</p>
4	DT4BE	0*	R/W	<p>Down-Count TRG4BN Enable</p> <p>Enables or disables A/D converter start requests (TRG4BN) during TCNT_4 down-count operation.</p> <p>0: A/D converter start requests (TRG4BN) disabled during TCNT_4 down-count operation</p> <p>1: A/D converter start requests (TRG4BN) enabled during TCNT_4 down-count operation</p>
3	ITA3AE	0*	R/W	<p>TGIA_3 Interrupt Skipping Link Enable</p> <p>Select whether to link A/D converter start requests (TRG4AN) with TGIA_3 interrupt skipping operation.</p> <p>0: Does not link with TGIA_3 interrupt skipping</p> <p>1: Links with TGIA_3 interrupt skipping</p>
2	ITA4VE	0*	R/W	<p>TCIV_4 Interrupt Skipping Link Enable</p> <p>Select whether to link A/D converter start requests (TRG4AN) with TCIV_4 interrupt skipping operation.</p> <p>0: Does not link with TCIV_4 interrupt skipping</p> <p>1: Links with TCIV_4 interrupt skipping</p>
1	ITB3AE	0*	R/W	<p>TGIA_3 Interrupt Skipping Link Enable</p> <p>Select whether to link A/D converter start requests (TRG4BN) with TGIA_3 interrupt skipping operation.</p> <p>0: Does not link with TGIA_3 interrupt skipping</p> <p>1: Links with TGIA_3 interrupt skipping</p>

Bit	Bit Name	Initial Value	R/W	Description
0	ITB4VE	0*	R/W	TCIV_4 Interrupt Skipping Link Enable Select whether to link A/D converter start requests (TRG4BN) with TCIV_4 interrupt skipping operation. 0: Does not link with TCIV_4 interrupt skipping 1: Links with TCIV_4 interrupt skipping

- Notes:
1. TADCR must not be accessed in eight bits; it should always be accessed in 16 bits.
 2. When interrupt skipping is disabled (the T3AEN and T4VEN bits in the timer interrupt skipping set register (TITCR) are cleared to 0 or the skipping count set bits (3ACOR and 4VCOR) in TITCR are cleared to 0), do not link A/D converter start requests with interrupt skipping operation (clear the ITA3AE, ITA4VE, ITB3AE, and ITB4VE bits in the timer A/D converter start request control register (TADCR) to 0).
 3. If link with interrupt skipping is enabled while interrupt skipping is disabled, A/D converter start requests will not be issued.
- * Do not set to 1 when complementary PWM mode is not selected.

Table 11.27 Setting of Transfer Timing by Bits BF1 and BF0

Bit 7	Bit 6	Description
BF1	BF0	
0	0	Does not transfer data from the cycle set buffer register to the cycle set register.
0	1	Transfers data from the cycle set buffer register to the cycle set register at the crest of the TCNT_4 count.* ¹
1	0	Transfers data from the cycle set buffer register to the cycle set register at the trough of the TCNT_4 count.* ²
1	1	Transfers data from the cycle set buffer register to the cycle set register at the crest and trough of the TCNT_4 count.* ²

- Notes:
1. Data is transferred from the cycle set buffer register to the cycle set register when the crest of the TCNT_4 count is reached in complementary PWM mode, when compare match occurs between TCNT_3 and TGRA_3 in reset-synchronized PWM mode, or when compare match occurs between TCNT_4 and TGRA_4 in PWM mode 1 or normal operation mode.
 2. These settings are prohibited when complementary PWM mode is not selected.

11.3.9 Timer A/D Converter Start Request Cycle Set Registers (TADCORA_4 and TADCORB_4)

TADCORA_4 and TADCORB_4 are 16-bit readable/writable registers. When the TCNT_4 count reaches the value in TADCORA_4 or TADCORB_4, a corresponding A/D converter start request will be issued.

TADCORA_4 and TADCORB_4 are initialized to H'FFFF.

Note: TADCORA_4 and TADCORB_4 must not be accessed in eight bits; they should always be accessed in 16 bits.

11.3.10 Timer A/D Converter Start Request Cycle Set Buffer Registers (TADCOBRA_4 and TADCOBRB_4)

TADCOBRA_4 and TADCOBRB_4 are 16-bit readable/writable registers. When the crest or trough of the TCNT_4 count is reached, these register values are transferred to TADCORA_4 and TADCORB_4, respectively.

TADCOBRA_4 and TADCOBRB_4 are initialized to H'FFFF.

Note: TADCOBRA_4 and TADCOBRB_4 must not be accessed in eight bits; they should always be accessed in 16 bits.

11.3.11 Timer Counter (TCNT)

The TCNT counters are 16-bit readable/writable counters. This module has five TCNT counters, one each for channels 0 to 4.

The TCNT counters must not be accessed in eight bits; they should always be accessed in 16 bits.

Note: The TCNT counters must not be accessed in eight bits; they should always be accessed in 16 bits.

11.3.12 Timer General Register (TGR)

The TGR registers are 16-bit readable/writable registers. This module has eighteen TGR registers, six for channel 0, two each for channels 1 and 2, four each for channels 3 and 4.

TGRA, TGRB, TGRC, and TGRD function as either output compare or input capture registers. TGRC and TGRD for channels 0, 3, and 4 can also be designated for operation as buffer registers. TGR buffer register combinations are TGRA and TGRC, and TGRB and TGRD.

TGRE_0 and TGRF_0 function as compare registers. When the TCNT_0 count matches the TGRE_0 value, an A/D converter start request can be issued. TGRF can also be designated for operation as a buffer register. TGR buffer register combination is TGRE and TGRF.

Note: The TGR registers must not be accessed in eight bits; they should always be accessed in 16 bits. TGR registers are initialized to H'FFFF.

11.3.13 Timer Start Register (TSTR)

TSTR is an 8-bit readable/writable register that selects operation/stoppage of TCNT for channels 0 to 4.

When setting the operating mode in TMDR or setting the count clock in TCR, first stop the TCNT counter.

Bit:	7	6	5	4	3	2	1	0
	CST4	CST3	-	-	-	CST2	CST1	CST0
Initial value:	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R	R	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7	CST4	0	R/W	Counter Start 4 and 3
6	CST3	0	R/W	These bits select operation or stoppage for TCNT. If 0 is written to the CST bit during operation with the TIOC pin designated for output, the counter stops but the TIOC pin output compare output level is retained. If TIOR is written to when the CST bit is cleared to 0, the pin output level will be changed to the set initial output value. 0: TCNT_4 and TCNT_3 count operation is stopped 1: TCNT_4 and TCNT_3 performs count operation
5 to 3	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
2	CST2	0	R/W	Counter Start 2 to 0
1	CST1	0	R/W	These bits select operation or stoppage for TCNT.
0	CST0	0	R/W	If 0 is written to the CST bit during operation with the TIOC pin designated for output, the counter stops but the TIOC pin output compare output level is retained. If TIOR is written to when the CST bit is cleared to 0, the pin output level will be changed to the set initial output value. 0: TCNT_2 to TCNT_0 count operation is stopped 1: TCNT_2 to TCNT_0 performs count operation

11.3.14 Timer Synchronous Register (TSYR)

TSYR is an 8-bit readable/writable register that selects independent operation or synchronous operation for the channel 0 to 4 TCNT counters. A channel performs synchronous operation when the corresponding bit in TSYR is set to 1.

Bit:	7	6	5	4	3	2	1	0
	SYNC4	SYNC3	-	-	-	SYNC2	SYNC1	SYNC0
Initial value:	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R	R	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7	SYNC4	0	R/W	Timer Synchronous operation 4 and 3
6	SYNC3	0	R/W	<p>These bits are used to select whether operation is independent of or synchronized with other channels.</p> <p>When synchronous operation is selected, the TCNT synchronous presetting of multiple channels, and synchronous clearing by counter clearing on another channel, are possible.</p> <p>To set synchronous operation, the SYNC bits for at least two channels must be set to 1. To set synchronous clearing, in addition to the SYNC bit, the TCNT clearing source must also be set by means of bits CCLR0 to CCLR2 in TCR.</p> <p>0: TCNT_4 and TCNT_3 operate independently (TCNT presetting/clearing is unrelated to other channels)</p> <p>1: TCNT_4 and TCNT_3 performs synchronous operation TCNT synchronous presetting/synchronous clearing is possible</p>
5 to 3	—	All 0	R	<p>Reserved</p> <p>These bits are always read as 0. The write value should always be 0.</p>

Bit	Bit Name	Initial Value	R/W	Description
2	SYNC2	0	R/W	Timer Synchronous operation 2 to 0
1	SYNC1	0	R/W	<p>These bits are used to select whether operation is independent of or synchronized with other channels.</p> <p>When synchronous operation is selected, the TCNT synchronous presetting of multiple channels, and synchronous clearing by counter clearing on another channel, are possible.</p> <p>To set synchronous operation, the SYNC bits for at least two channels must be set to 1. To set synchronous clearing, in addition to the SYNC bit, the TCNT clearing source must also be set by means of bits CCLR0 to CCLR2 in TCR.</p> <p>0: TCNT_2 to TCNT_0 operates independently (TCNT presetting /clearing is unrelated to other channels)</p> <p>1: TCNT_2 to TCNT_0 performs synchronous operation TCNT synchronous presetting/synchronous clearing is possible</p>
0	SYNC0	0	R/W	

11.3.15 Timer Read/Write Enable Register (TRWER)

TRWER is an 8-bit readable/writable register that enables or disables access to the registers and counters which have write-protection capability against accidental modification in channels 3 and 4.

Bit:	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	RWE
Initial value:	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
7 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	RWE	1	R/W	Read/Write Enable Enables or disables access to the registers which have write-protection capability against accidental modification. 0: Disables read/write access to the registers 1: Enables read/write access to the registers [Clearing condition] <ul style="list-style-type: none"> • When 0 is written to the RWE bit after reading RWE = 1

- Registers and counters having write-protection capability against accidental modification
22 registers: TCR_3, TCR_4, TMDR_3, TMDR_4, TIORH_3, TIORH_4, TIORL_3, TIORL_4, TIER_3, TIER_4, TGRA_3, TGRA_4, TGRB_3, TGRB_4, TOER, TOCR1, TOCR2, TGCR, TCDR, TDDR, TCNT_3, and TCNT4.

11.3.16 Timer Output Master Enable Register (TOER)

TOER is an 8-bit readable/writable register that enables/disables output settings for output pins TIOC4D, TIOC4C, TIOC3D, TIOC4B, TIOC4A, and TIOC3B. These pins do not output correctly if the TOER bits have not been set. Set TOER of CH3 and CH4 prior to setting TIOR of CH3 and CH4.

Bit:	7	6	5	4	3	2	1	0
	-	-	OE4D	OE4C	OE3D	OE4B	OE4A	OE3B
Initial value:	1	1	0	0	0	0	0	0
R/W:	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7, 6	—	All 1	R	Reserved These bits are always read as 1. The write value should always be 1.
5	OE4D	0	R/W	Master Enable TIOC4D This bit enables/disables the TIOC4D pin output for this module. 0: Output for this module is disabled (inactive level)* 1: Output for this module is enabled
4	OE4C	0	R/W	Master Enable TIOC4C This bit enables/disables the TIOC4C pin output for this module. 0: Output for this module is disabled (inactive level)* 1: Output for this module is enabled
3	OE3D	0	R/W	Master Enable TIOC3D This bit enables/disables the TIOC3D pin output for this module. 0: Output for this module is disabled (inactive level)* 1: Output for this module is enabled
2	OE4B	0	R/W	Master Enable TIOC4B This bit enables/disables the TIOC4B pin output for this module. 0: Output for this module is disabled (inactive level)* 1: Output for this module is enabled

Bit	Bit Name	Initial Value	R/W	Description
1	OE4A	0	R/W	<p>Master Enable TIOC4A</p> <p>This bit enables/disables the TIOC4A pin output for this module.</p> <p>0: Output for this module is disabled (inactive level)*</p> <p>1: Output for this module is enabled</p>
0	OE3B	0	R/W	<p>Master Enable TIOC3B</p> <p>This bit enables/disables the TIOC3B pin output for this module.</p> <p>0: Output for this module is disabled (inactive level)*</p> <p>1: Output for this module is enabled</p>

Note: * The inactive level is determined by the settings in timer output control registers 1 and 2 (TOCR1 and TOCR2). For details, refer to section 11.3.17, Timer Output Control Register 1 (TOCR1), and section 11.3.18, Timer Output Control Register 2 (TOCR2). Set these bits to 1 to enable output for this module in other than complementary PWM or reset-synchronized PWM mode. When these bits are set to 0, low level is output.

11.3.17 Timer Output Control Register 1 (TOCR1)

TOCR1 is an 8-bit readable/writable register that enables/disables PWM synchronized toggle output in complementary PWM mode/reset synchronized PWM mode, and controls output level inversion of PWM output.

Bit:	7	6	5	4	3	2	1	0
	-	PSYE	-	-	TOCL	TOCS	OLSN	OLSP
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R/W	R	R	R/(W)*3	R/W	R/W	R/W

Bit	Bit Name	Initial value	R/W	Description
7	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
6	PSYE	0	R/W	PWM Synchronous Output Enable This bit selects the enable/disable of toggle output synchronized with the PWM period. 0: Toggle output is disabled 1: Toggle output is enabled
5, 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial value	R/W	Description
3	TOCL	0	R/(W)* ³	<p>TOC Register Write Protection*¹</p> <p>This bit selects the enable/disable of write access to the TOCS, OLSN, and OLSP bits in TOCR1.</p> <p>0: Write access to the TOCS, OLSN, and OLSP bits is enabled</p> <p>1: Write access to the TOCS, OLSN, and OLSP bits is disabled</p>
2	TOCS	0	R/W	<p>TOC Select</p> <p>This bit selects either the TOCR1 or TOCR2 setting to be used for the output level in complementary PWM mode and reset-synchronized PWM mode.</p> <p>0: TOCR1 setting is selected</p> <p>1: TOCR2 setting is selected</p>
1	OLSN	0	R/W	<p>Output Level Select N*²</p> <p>This bit selects the reverse phase output level in reset-synchronized PWM mode/complementary PWM mode. See table 11.28.</p>
0	OLSP	0	R/W	<p>Output Level Select P*²</p> <p>This bit selects the positive phase output level in reset-synchronized PWM mode/complementary PWM mode. See table 11.29.</p>

Notes: 1. Setting the TOCL bit to 1 prevents accidental modification when the CPU goes out of control.

2. Clearing the TOCS0 bit to 0 makes this bit setting valid.

3. After power-on reset, 1 can be written only once. After 1 has been written, 0 cannot be written.

Table 11.28 Output Level Select Function

Bit 1	Function			
	OLSN	Initial Output	Active Level	Compare Match Output
Up Count				Down Count
0	High level	Low level	High level	Low level
1	Low level	High level	Low level	High level

Note: The reverse phase waveform initial output value changes to active level after elapse of the dead time after count start.

Table 11.29 Output Level Select Function

Bit 0	Function			
	OLSP	Initial Output	Active Level	Compare Match Output
Up Count				Down Count
0	High level	Low level	Low level	High level
1	Low level	High level	High level	Low level

Figure 11.2 shows an example of complementary PWM mode output (1 phase) when OLSN = 1, OLSP = 1.

Figure 11.2 Complementary PWM Mode Output Level Example

11.3.18 Timer Output Control Register 2 (TOCR2)

TOCR2 is an 8-bit readable/writable register that controls output level inversion of PWM output in complementary PWM mode and reset-synchronized PWM mode.

Bit:	7	6	5	4	3	2	1	0
	BF[1:0]	OLS3N	OLS3P	OLS2N	OLS2P	OLS1N	OLS1P	
Initial value:	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial value	R/W	Description
7, 6	BF[1:0]	00	R/W	<p>TOLBR Buffer Transfer Timing Select</p> <p>These bits select the timing for transferring data from TOLBR to TOCR2.</p> <p>For details, see table 11.30.</p>
5	OLS3N	0	R/W	<p>Output Level Select 3N*</p> <p>This bit selects the output level on TIOC4D in reset-synchronized PWM mode/complementary PWM mode. See table 11.31.</p>
4	OLS3P	0	R/W	<p>Output Level Select 3P*</p> <p>This bit selects the output level on TIOC4B in reset-synchronized PWM mode/complementary PWM mode. See table 11.32.</p>
3	OLS2N	0	R/W	<p>Output Level Select 2N*</p> <p>This bit selects the output level on TIOC4C in reset-synchronized PWM mode/complementary PWM mode. See table 11.33.</p>
2	OLS2P	0	R/W	<p>Output Level Select 2P*</p> <p>This bit selects the output level on TIOC4A in reset-synchronized PWM mode/complementary PWM mode. See table 11.34.</p>
1	OLS1N	0	R/W	<p>Output Level Select 1N*</p> <p>This bit selects the output level on TIOC3D in reset-synchronized PWM mode/complementary PWM mode. See table 11.35.</p>

Bit	Bit Name	Initial value	R/W	Description
0	OLS1P	0	R/W	Output Level Select 1P* This bit selects the output level on TIOC3B in reset-synchronized PWM mode/complementary PWM mode. See table 11.36.

Note: * Setting the TOCS bit in TOCR1 to 1 makes this bit setting valid.

Table 11.30 Setting of Bits BF1 and BF0

Bit 7	Bit 6	Description	
BF1	BF0	Complementary PWM Mode	Reset-Synchronized PWM Mode
0	0	Does not transfer data from the buffer register (TOLBR) to TOCR2.	Does not transfer data from the buffer register (TOLBR) to TOCR2.
0	1	Transfers data from the buffer register (TOLBR) to TOCR2 at the crest of the TCNT_4 count.	Transfers data from the buffer register (TOLBR) to TOCR2 when TCNT_3/TCNT_4 is cleared
1	0	Transfers data from the buffer register (TOLBR) to TOCR2 at the trough of the TCNT_4 count.	Setting prohibited
1	1	Transfers data from the buffer register (TOLBR) to TOCR2 at the crest and trough of the TCNT_4 count.	Setting prohibited

1	Low level	High level	High level	Low level

11.3.19 Timer Output Level Buffer Register (TOLBR)

TOLBR is an 8-bit readable/writable register that functions as a buffer for TOCR2 and specifies the PWM output level in complementary PWM mode and reset-synchronized PWM mode.

Bit:	7	6	5	4	3	2	1	0
	-	-	OLS3N	OLS3P	OLS2N	OLS2P	OLS1N	OLS1P
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial value	R/W	Description
7, 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
5	OLS3N	0	R/W	Specifies the buffer value to be transferred to the OLS3N bit in TOCR2.
4	OLS3P	0	R/W	Specifies the buffer value to be transferred to the OLS3P bit in TOCR2.
3	OLS2N	0	R/W	Specifies the buffer value to be transferred to the OLS2N bit in TOCR2.
2	OLS2P	0	R/W	Specifies the buffer value to be transferred to the OLS2P bit in TOCR2.
1	OLS1N	0	R/W	Specifies the buffer value to be transferred to the OLS1N bit in TOCR2.
0	OLS1P	0	R/W	Specifies the buffer value to be transferred to the OLS1P bit in TOCR2.

Figure 11.3 shows an example of the PWM output level setting procedure in buffer operation.

Figure 11.3 PWM Output Level Setting Procedure in Buffer Operation

11.3.20 Timer Gate Control Register (TGCR)

TGCR is an 8-bit readable/writable register that controls the waveform output necessary for brushless DC motor control in reset-synchronized PWM mode/complementary PWM mode. These register settings are ineffective for anything other than complementary PWM mode/reset-synchronized PWM mode.

Bit:	7	6	5	4	3	2	1	0
	-	BDC	N	P	FB	WF	VF	UF
Initial value:	1	0	0	0	0	0	0	0
R/W:	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial value	R/W	Description
7	—	1	R	Reserved This bit is always read as 1. The write value should always be 1.
6	BDC	0	R/W	Brushless DC Motor This bit selects whether to make the functions of this register (TGCR) effective or ineffective. 0: Ordinary output 1: Functions of this register are made effective

Bit	Bit Name	Initial value	R/W	Description
5	N	0	R/W	<p>Reverse Phase Output (N) Control</p> <p>This bit selects whether the level output or the reset-synchronized PWM/complementary PWM output while the reverse pins (TIOC3D, TIOC4C, and TIOC4D) are output.</p> <p>0: Level output 1: Reset synchronized PWM/complementary PWM output</p>
4	P	0	R/W	<p>Positive Phase Output (P) Control</p> <p>This bit selects whether the level output or the reset-synchronized PWM/complementary PWM output while the positive pin (TIOC3B, TIOC4A, and TIOC4B) are output.</p> <p>0: Level output 1: Reset synchronized PWM/complementary PWM output</p>
3	FB	0	R/W	<p>External Feedback Signal Enable</p> <p>This bit selects whether the switching of the output of the positive/reverse phase is carried out automatically with channel-0 TGRA, TGRB, TGRC input capture signals or by writing 0 or 1 to bits 2 to 0 in TGCR.</p> <p>0: Output switching is external input (Input sources are channel 0 TGRA, TGRB, TGRC input capture signal) 1: Output switching is carried out by software (setting values of UF, VF, and WF in TGCR).</p>
2	WF	0	R/W	Output Phase Switch 2 to 0
1	VF	0	R/W	These bits set the positive phase/negative phase output phase on or off state. The setting of these bits is valid only when the FB bit in this register is set to 1. In this case, the setting of bits 2 to 0 is a substitute for external input. See table 11.37.
0	UF	0	R/W	

Table 11.37 Output level Select Function

Bit 2	Bit 1	Bit 0	Function					
			TIOC3B	TIOC4A	TIOC4B	TIOC3D	TIOC4C	TIOC4D
WF	VF	UF	U Phase	V Phase	W Phase	U Phase	V Phase	W Phase
0	0	0	OFF	OFF	OFF	OFF	OFF	OFF
		1	ON	OFF	OFF	OFF	OFF	ON
	1	0	OFF	ON	OFF	ON	OFF	OFF
		1	OFF	ON	OFF	OFF	OFF	ON
1	0	0	OFF	OFF	ON	OFF	ON	OFF
		1	ON	OFF	OFF	OFF	ON	OFF
	1	0	OFF	OFF	ON	ON	OFF	OFF
		1	OFF	OFF	OFF	OFF	OFF	OFF

11.3.21 Timer Subcounter (TCNTS)

TCNTS is a 16-bit read-only counter that is used only in complementary PWM mode.

The initial value of TCNTS is H'0000.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Note: Accessing the TCNTS in 8-bit units is prohibited. Always access in 16-bit units.

11.3.22 Timer Dead Time Data Register (TDDR)

TDDR is a 16-bit register, used only in complementary PWM mode that specifies the TCNT_3 and TCNT_4 counter offset values. In complementary PWM mode, when the TCNT_3 and TCNT_4 counters are cleared and then restarted, the TDDR register value is loaded into the TCNT_3 counter and the count operation starts.

The initial value of TDDR is H'FFFF.

Note: Accessing the TDDR in 8-bit units is prohibited. Always access in 16-bit units.

11.3.23 Timer Cycle Data Register (TCDR)

TCDR is a 16-bit register used only in complementary PWM mode. Set half the PWM carrier sync value as the TCDR register value. This register is constantly compared with the TCNTS counter in complementary PWM mode, and when a match occurs, the TCNTS counter switches direction (decrement to increment).

The initial value of TCDR is H'FFFF.

Note: Accessing the TCDR in 8-bit units is prohibited. Always access in 16-bit units.

11.3.24 Timer Cycle Buffer Register (TCBR)

TCBR is a 16-bit register used only in complementary PWM mode. It functions as a buffer register for the TCDR register. The TCBR register values are transferred to the TCDR register with the transfer timing set in the TMDR register. The initial value of TCBR is H'FFFF.

Note: Accessing the TCBR in 8-bit units is prohibited. Always access in 16-bit units.

11.3.25 Timer Interrupt Skipping Set Register (TITCR)

TITCR is an 8-bit readable/writable register that enables or disables interrupt skipping and specifies the interrupt skipping count. This module has one TITCR.

Bit	Bit Name	Initial value	R/W	Description
7	T3AEN	0	R/W	T3AEN Enables or disables TGIA_3 interrupt skipping. 0: TGIA_3 interrupt skipping disabled 1: TGIA_3 interrupt skipping enabled
6 to 4	3ACOR[2:0]	000	R/W	These bits specify the TGIA_3 interrupt skipping count within the range from 0 to 7.* For details, see table 11.38.
3	T4VEN	0	R/W	T4VEN Enables or disables TCIV_4 interrupt skipping. 0: TCIV_4 interrupt skipping disabled 1: TCIV_4 interrupt skipping enabled

Bit	Bit Name	Initial value	R/W	Description
2 to 0	4VCOR[2:0]	000	R/W	These bits specify the TCIV_4 interrupt skipping count within the range from 0 to 7.* For details, see table 11.39.

Note: * When 0 is specified for the interrupt skipping count, no interrupt skipping will be performed. Before changing the interrupt skipping count, be sure to clear the T3AEN and T4VEN bits to 0 to clear the skipping counter (TICNT).

Table 11.38 Setting of Interrupt Skipping Count by Bits 3ACOR2 to 3ACOR0

Bit 6	Bit 5	Bit 4	Description
3ACOR2	3ACOR1	3ACOR0	
0	0	0	Does not skip TGIA_3 interrupts.
0	0	1	Sets the TGIA_3 interrupt skipping count to 1.
0	1	0	Sets the TGIA_3 interrupt skipping count to 2.
0	1	1	Sets the TGIA_3 interrupt skipping count to 3.
1	0	0	Sets the TGIA_3 interrupt skipping count to 4.
1	0	1	Sets the TGIA_3 interrupt skipping count to 5.
1	1	0	Sets the TGIA_3 interrupt skipping count to 6.
1	1	1	Sets the TGIA_3 interrupt skipping count to 7.

Table 11.39 Setting of Interrupt Skipping Count by Bits 4VCOR2 to 4VCOR0

Bit 2	Bit 1	Bit 0	Description
4VCOR2	4VCOR1	4VCOR0	
0	0	0	Does not skip TCIV_4 interrupts.
0	0	1	Sets the TCIV_4 interrupt skipping count to 1.
0	1	0	Sets the TCIV_4 interrupt skipping count to 2.
0	1	1	Sets the TCIV_4 interrupt skipping count to 3.
1	0	0	Sets the TCIV_4 interrupt skipping count to 4.
1	0	1	Sets the TCIV_4 interrupt skipping count to 5.
1	1	0	Sets the TCIV_4 interrupt skipping count to 6.
1	1	1	Sets the TCIV_4 interrupt skipping count to 7.

11.3.26 Timer Interrupt Skipping Counter (TITCNT)

TITCNT is an 8-bit readable/writable counter. This module has one TITCNT. TITCNT retains its value even after stopping the count operation of TCNT_3 and TCNT_4.

Bit:	7	6	5	4	3	2	1	0
	-	3ACNT[2:0]			-	4VCNT[2:0]		
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7	—	0	R	Reserved This bit is always read as 0.
6 to 4	3ACNT[2:0]	000	R	TGIA_3 Interrupt Counter While the T3AEN bit in TITCR is set to 1, the count in these bits is incremented every time a TGIA_3 interrupt occurs. [Clearing conditions] <ul style="list-style-type: none"> • When the 3ACNT2 to 3ACNT0 value in TITCNT matches the 3ACOR2 to 3ACOR0 value in TITCR • When the T3AEN bit in TITCR is cleared to 0 • When the 3ACOR2 to 3ACOR0 bits in TITCR are cleared to 0
3	—	0	R	Reserved This bit is always read as 0.
2 to 0	4VCNT[2:0]	000	R	TCIV_4 Interrupt Counter While the T4VEN bit in TITCR is set to 1, the count in these bits is incremented every time a TCIV_4 interrupt occurs. [Clearing conditions] <ul style="list-style-type: none"> • When the 4VCNT2 to 4VCNT0 value in TITCNT matches the 4VCOR2 to 4VCOR2 value in TITCR • When the T4VEN bit in TITCR is cleared to 0 • When the 4VCOR2 to 4VCOR2 bits in TITCR are cleared to 0

Note: To clear the TITCNT, clear the bits T3AEN and T4VEN in TITCR to 0.

11.3.27 Timer Buffer Transfer Set Register (TBTER)

TBTER is an 8-bit readable/writable register that enables or disables transfer from the buffer registers* used in complementary PWM mode to the temporary registers and specifies whether to link the transfer with interrupt skipping operation. This module has one TBTER.

Bit:	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	BTE[1:0]	
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1, 0	BTE[1:0]	00	R/W	These bits enable or disable transfer from the buffer registers* used in complementary PWM mode to the temporary registers and specify whether to link the transfer with interrupt skipping operation. For details, see table 11.40.

Note: * Applicable buffer registers:
TGRC_3, TGRD_3, TGRC_4, TGRD_4, and TCBR

Table 11.40 Setting of Bits BTE1 and BTE0

Bit 1	Bit 0	
BTE1	BTE0	Description
0	0	Enables transfer from the buffer registers to the temporary registers* ¹ and does not link the transfer with interrupt skipping operation.
0	1	Disables transfer from the buffer registers to the temporary registers.
1	0	Links transfer from the buffer registers to the temporary registers with interrupt skipping operation.* ²
1	1	Setting prohibited

- Notes:
1. Data is transferred according to the MD3 to MD0 bit setting in TMDR. For details, refer to section 11.4.8, Complementary PWM Mode.
 2. When interrupt skipping is disabled (the T3AEN and T4VEN bits are cleared to 0 in the timer interrupt skipping set register (TITCR) or the skipping count set bits (3ACOR and 4VCOR) in TITCR are cleared to 0)), be sure to disable link of buffer transfer with interrupt skipping (clear the BTE1 bit in the timer buffer transfer set register (TBTER) to 0). If link with interrupt skipping is enabled while interrupt skipping is disabled, buffer transfer will not be performed.

11.3.28 Timer Dead Time Enable Register (TDER)

TDER is an 8-bit readable/writable register that controls dead time generation in complementary PWM mode. This module has one TDER in channel 3. TDER must be modified only while TCNT stops.

Bit:	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	TDER
Initial value:	0	0	0	0	0	0	0	1
R/W:	R	R	R	R	R	R	R	R/(W)

Bit	Bit Name	Initial Value	R/W	Description
7 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	TDER	1	R/(W)	Dead Time Enable Specifies whether to generate dead time. 0: Does not generate dead time 1: Generates dead time* [Clearing condition] <ul style="list-style-type: none"> • When 0 is written to TDER after reading TDER = 1

Note: * TDDR must be set to 1 or a larger value.

11.3.29 Timer Waveform Control Register (TWCR)

TWCR is an 8-bit readable/writable register that controls the waveform when synchronous counter clearing occurs in TCNT_3 and TCNT_4 in complementary PWM mode and specifies whether to clear the counters at TGRA_3 compare match. The CCE bit and WRE bit in TWCR must be modified only while TCNT stops.

Bit:	7	6	5	4	3	2	1	0
	CCE	-	-	-	-	-	-	WRE
Initial value:	0*	0	0	0	0	0	0	0
R/W:	R/(W)	R	R	R	R	R	R	R/(W)

Note: * Do not set to 1 when complementary PWM mode is not selected.

Bit	Bit Name	Initial Value	R/W	Description
7	CCE	0*	R/(W)	Compare Match Clear Enable Specifies whether to clear counters at TGRA_3 compare match in complementary PWM mode. 0: Does not clear counters at TGRA_3 compare match 1: Clears counters at TGRA_3 compare match [Setting condition] <ul style="list-style-type: none"> • When 1 is written to CCE after reading CCE = 0
6 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
0	WRE	0	R/(W)	<p>Initial Output Suppression Enable</p> <p>Selects the waveform output when synchronous counter clearing occurs in complementary PWM mode. The initial output is suppressed only when synchronous clearing occurs within the Tb interval at the trough in complementary PWM mode. When synchronous clearing occurs outside this interval, the initial value specified in TOCR is output regardless of the WRE bit setting. The initial value is also output when synchronous clearing occurs in the Tb interval at the trough immediately after TCNT_3 and TCNT_4 start operation.</p> <p>For the Tb interval at the trough in complementary PWM mode, see figure 11.40.</p> <p>0: Outputs the initial value specified in TOCR 1: Suppresses initial output</p> <p>[Setting condition]</p> <ul style="list-style-type: none"> When 1 is written to WRE after reading WRE = 0

Note: * Do not set to 1 when complementary PWM mode is not selected.

11.3.30 Bus Master Interface

The timer counters (TCNT), general registers (TGR), timer subcounter (TCNTS), timer cycle buffer register (TCBR), timer dead time data register (TDDR), timer cycle data register (TCDR), timer A/D converter start request control register (TADCR), timer A/D converter start request cycle set registers (TADCOR), and timer A/D converter start request cycle set buffer registers (TADCOBR) are 16-bit registers. A 16-bit data bus to the bus master enables 16-bit read/writes. 8-bit read/write is not possible. Always access in 16-bit units.

All registers other than the above registers are 8-bit registers. These are connected to the CPU by a 16-bit data bus, so 16-bit read/writes and 8-bit read/writes are both possible.

11.4 Operation

11.4.1 Basic Functions

Each channel has a TCNT and TGR register. TCNT performs up-counting, and is also capable of free-running operation, cycle counting, and external event counting.

Each TGR can be used as an input capture register or output compare register.

Always select functions for external pins of this module using the general I/O ports.

(1) Counter Operation

When one of bits CST0 to CST4 in TSTR is set to 1, the TCNT counter for the corresponding channel begins counting. TCNT can operate as a free-running counter, periodic counter, for example.

(a) Example of Count Operation Setting Procedure

Figure 11.4 shows an example of the count operation setting procedure.

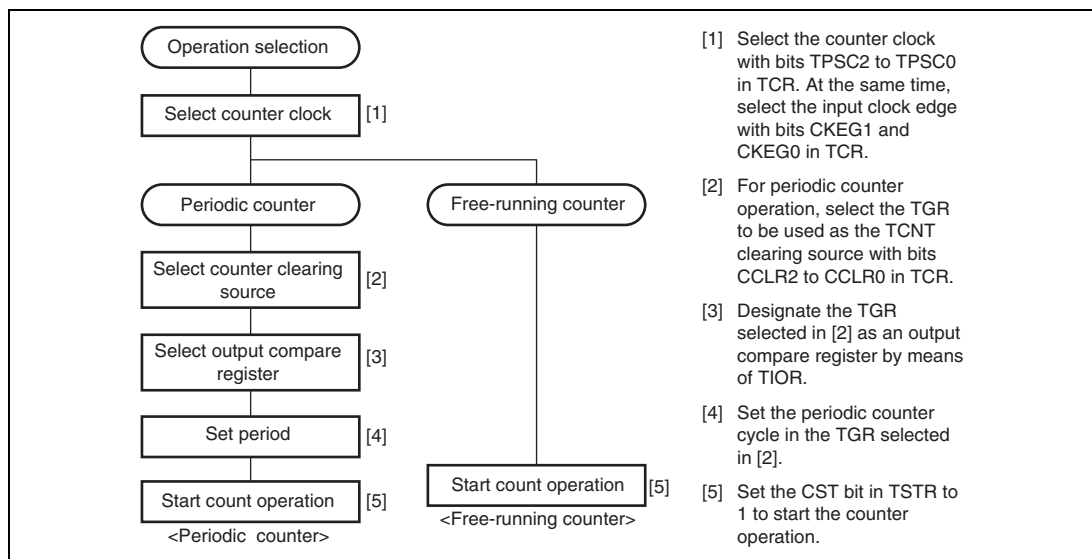

Figure 11.4 Example of Counter Operation Setting Procedure

(b) Free-Running Count Operation and Periodic Count Operation:

Immediately after a reset, the TCNT counters of this module are all designated as free-running counters. When the relevant bit in TSTR is set to 1 the corresponding TCNT counter starts up-count operation as a free-running counter. When TCNT overflows (from H'FFFF to H'0000), the TCFV bit in TSR is set to 1. If the value of the corresponding TCIEV bit in TIER is 1 at this point, this module requests an interrupt. After overflow, TCNT starts counting up again from H'0000.

Figure 11.5 illustrates free-running counter operation.

Figure 11.5 Free-Running Counter Operation

When compare match is selected as the TCNT clearing source, the TCNT counter for the relevant channel performs periodic count operation. The TGR register for setting the period is designated as an output compare register, and counter clearing by compare match is selected by means of bits CCLR0 to CCLR2 in TCR. After the settings have been made, TCNT starts up-count operation as a periodic counter when the corresponding bit in TSTR is set to 1. When the count value matches the value in TGR, the TGF bit in TSR is set to 1 and TCNT is cleared to H'0000.

If the value of the corresponding TGIE bit in TIER is 1 at this point, this module requests an interrupt. After a compare match, TCNT starts counting up again from H'0000.

Figure 11.6 illustrates periodic counter operation.

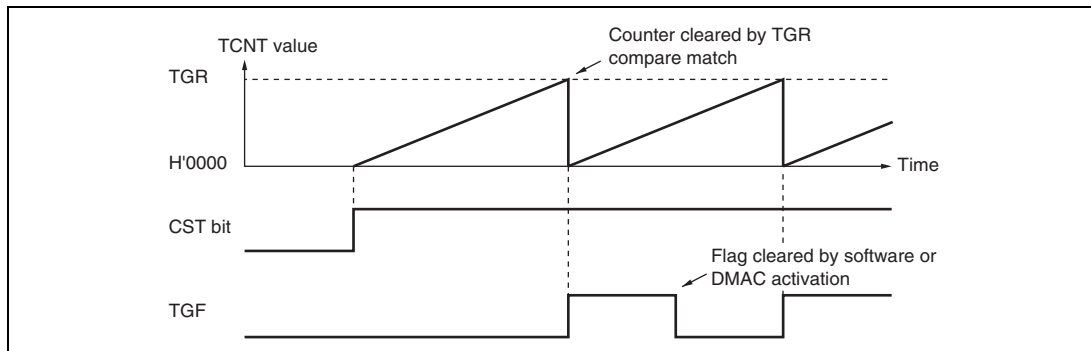

Figure 11.6 Periodic Counter Operation

(2) Waveform Output by Compare Match

This module can perform 0, 1, or toggle output from the corresponding output pin using compare match.

(a) Example of Setting Procedure for Waveform Output by Compare Match

Figure 11.7 shows an example of the setting procedure for waveform output by compare match

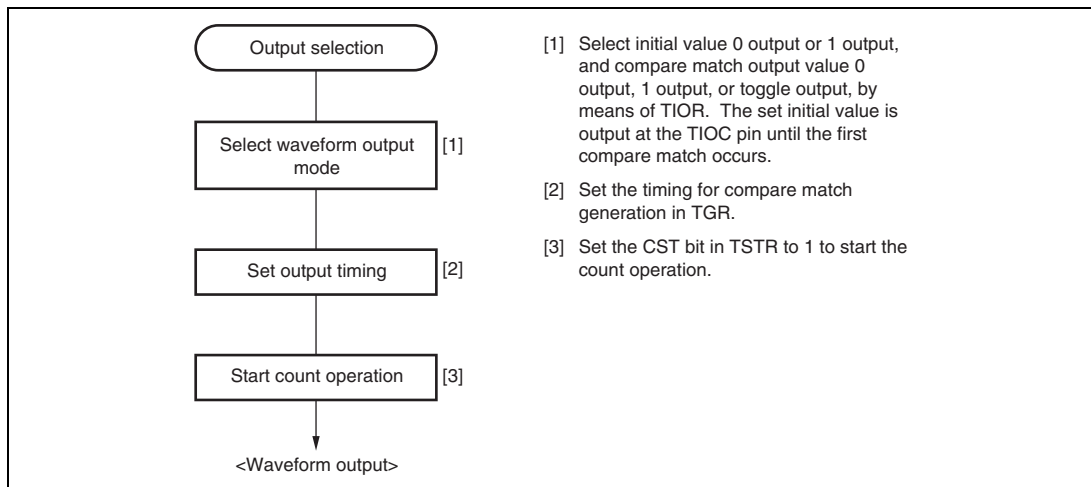

Figure 11.7 Example of Setting Procedure for Waveform Output by Compare Match

(b) Examples of Waveform Output Operation:

Figure 11.8 shows an example of 0 output/1 output.

In this example TCNT has been designated as a free-running counter, and settings have been made such that 1 is output by compare match A, and 0 is output by compare match B. When the set level and the pin level coincide, the pin level does not change.

Figure 11.8 Example of 0 Output/1 Output Operation

Figure 11.9 shows an example of toggle output.

In this example, TCNT has been designated as a periodic counter (with counter clearing on compare match B), and settings have been made such that the output is toggled by both compare match A and compare match B.

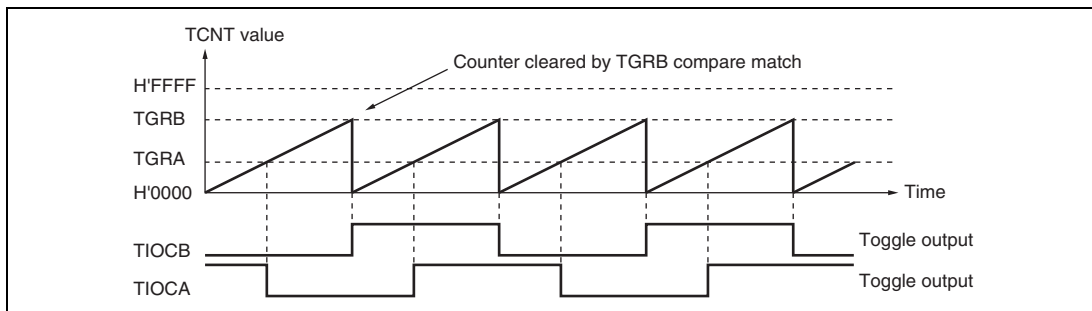

Figure 11.9 Example of Toggle Output Operation

(3) Input Capture Function

The TCNT value can be transferred to TGR on detection of the TIOC pin input edge.

Rising edge, falling edge, or both edges can be selected as the detected edge. For channels 0 and 1, it is also possible to specify another channel's counter input clock or compare match signal as the input capture source.

Note: When another channel's counter input clock is used as the input capture input for channels 0 and 1, Pφ/1 should not be selected as the counter input clock used for input capture input. Input capture will not be generated if Pφ/1 is selected.

(a) Example of Input Capture Operation Setting Procedure

Figure 11.10 shows an example of the input capture operation setting procedure.

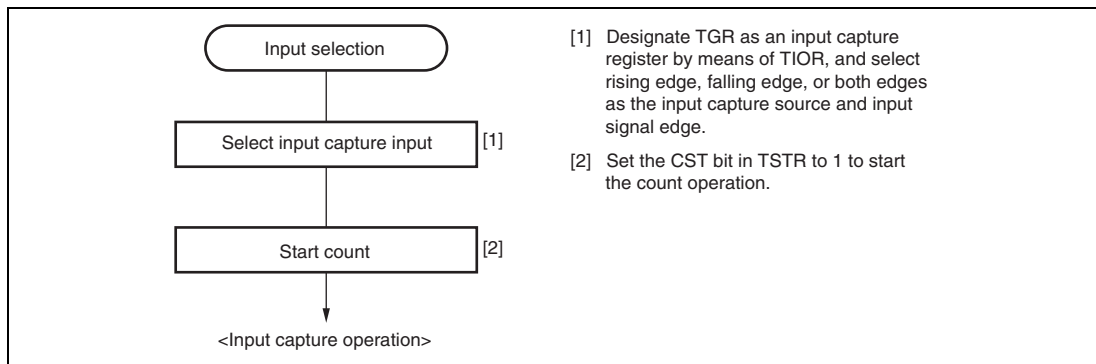

Figure 11.10 Example of Input Capture Operation Setting Procedure

(b) Example of Input Capture Operation

Figure 11.11 shows an example of input capture operation.

In this example both rising and falling edges have been selected as the TIOCA pin input capture input edge, the falling edge has been selected as the TIOCB pin input capture input edge, and counter clearing by TGRB input capture has been designated for TCNT.

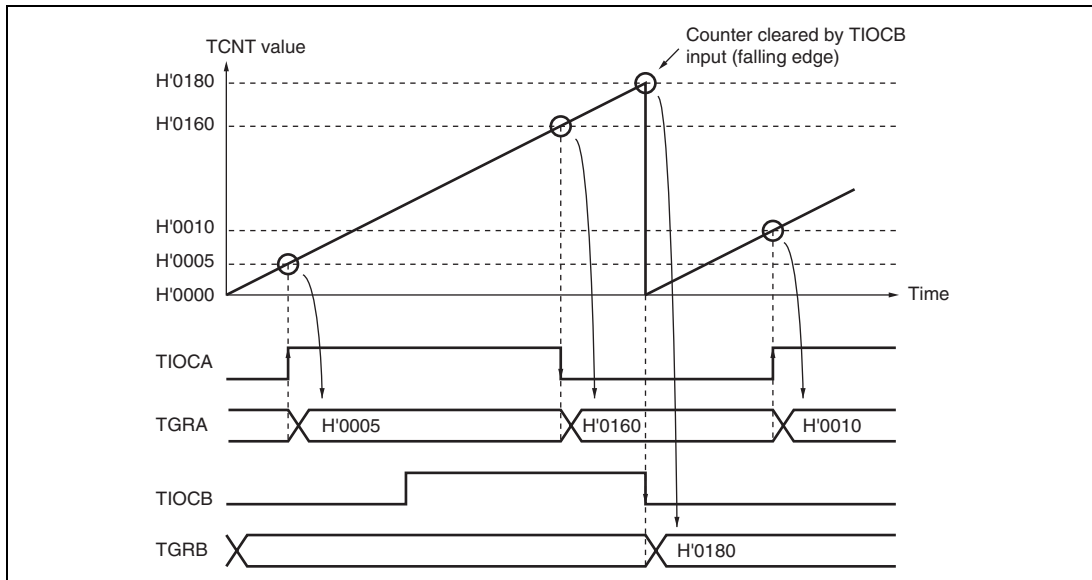

Figure 11.11 Example of Input Capture Operation

11.4.2 Synchronous Operation

In synchronous operation, the values in a number of TCNT counters can be rewritten simultaneously (synchronous presetting). Also, a number of TCNT counters can be cleared simultaneously by making the appropriate setting in TCR (synchronous clearing).

Synchronous operation enables TGR to be incremented with respect to a single time base.

Channels 0 to 4 can all be designated for synchronous operation. Channel 5 cannot be used for synchronous operation.

(1) Example of Synchronous Operation Setting Procedure

Figure 11.12 shows an example of the synchronous operation setting procedure.

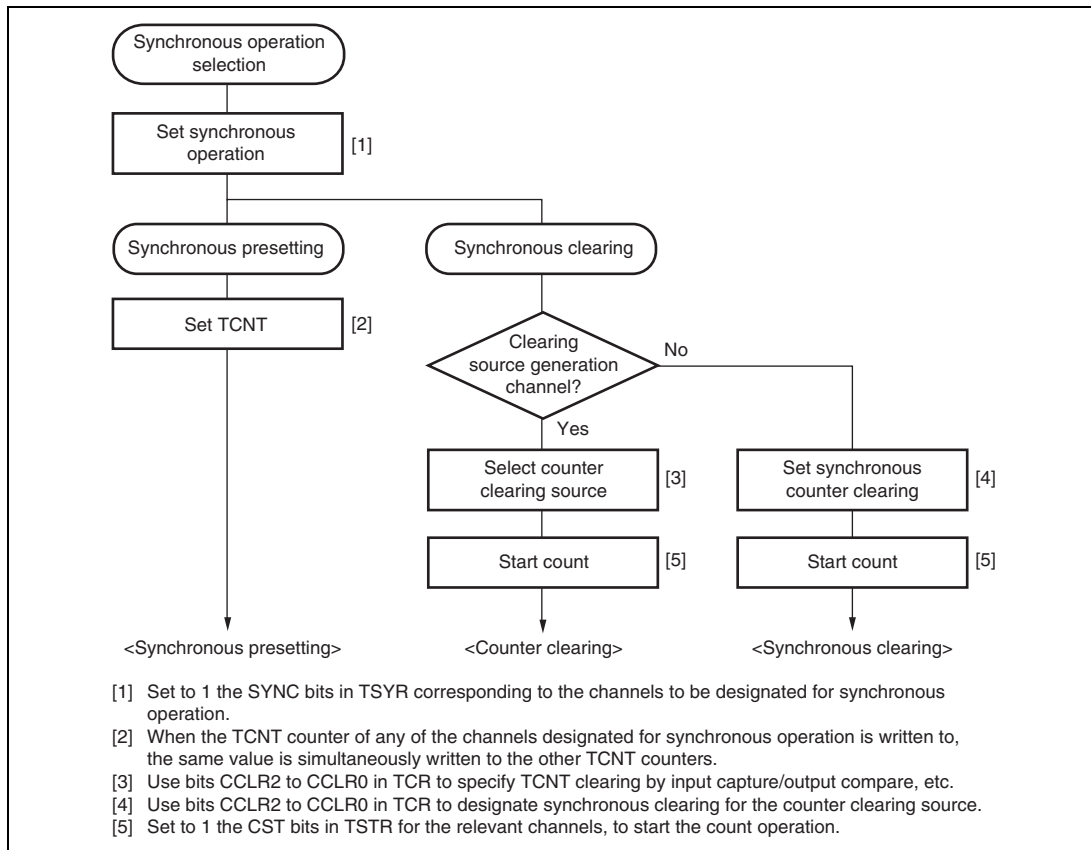

Figure 11.12 Example of Synchronous Operation Setting Procedure

(2) Example of Synchronous Operation

Figure 11.13 shows an example of synchronous operation.

In this example, synchronous operation and PWM mode 1 have been designated for channels 0 to 2, TGRB_0 compare match has been set as the channel 0 counter clearing source, and synchronous clearing has been set for the channel 1 and 2 counter clearing source.

Three-phase PWM waveforms are output from pins TIOC0A, TIOC1A, and TIOC2A. At this time, synchronous presetting, and synchronous clearing by TGRB_0 compare match, are performed for channel 0 to 2 TCNT counters, and the data set in TGRB_0 is used as the PWM cycle.

For details of PWM modes, see section 11.4.5, PWM Modes.

Figure 11.13 Example of Synchronous Operation

11.4.3 Buffer Operation

Buffer operation, provided for channels 0, 3, and 4, enables TGRC and TGRD to be used as buffer registers. In channel 0, TGRF can also be used as a buffer register.

Buffer operation differs depending on whether TGR has been designated as an input capture register or as a compare match register.

Note: TGRE_0 cannot be designated as an input capture register and can only operate as a compare match register.

Table 11.41 shows the register combinations used in buffer operation.

Table 11.41 Register Combinations in Buffer Operation

Channel	Timer General Register	Buffer Register
0	TGRA_0	TGRC_0
	TGRB_0	TGRD_0
	TGRE_0	TGRF_0
3	TGRA_3	TGRC_3
	TGRB_3	TGRD_3
4	TGRA_4	TGRC_4
	TGRB_4	TGRD_4

- When TGR is an output compare register

When a compare match occurs, the value in the buffer register for the corresponding channel is transferred to the timer general register.

This operation is illustrated in figure 11.14.

Figure 11.14 Compare Match Buffer Operation

- When TGR is an input capture register

When input capture occurs, the value in TCNT is transferred to TGR and the value previously held in the timer general register is transferred to the buffer register.

This operation is illustrated in figure 11.15.

Figure 11.15 Input Capture Buffer Operation

(1) Example of Buffer Operation Setting Procedure

Figure 11.16 shows an example of the buffer operation setting procedure.

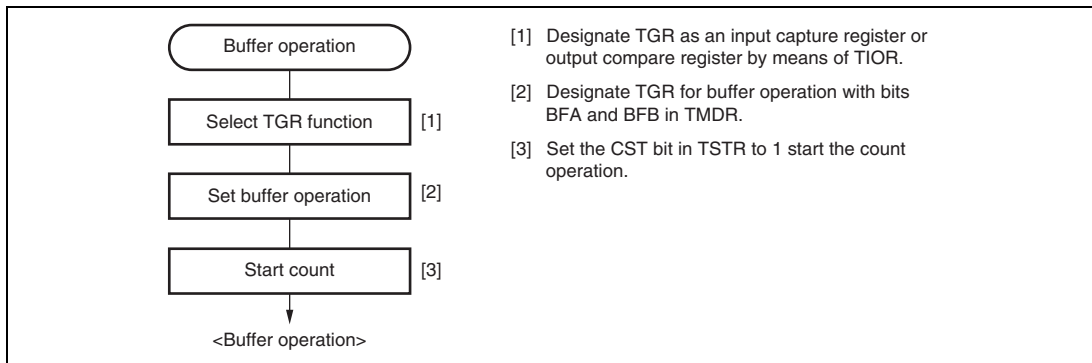

Figure 11.16 Example of Buffer Operation Setting Procedure

(2) Examples of Buffer Operation

(a) When TGR is an output compare register

Figure 11.17 shows an operation example in which PWM mode 1 has been designated for channel 0, and buffer operation has been designated for TGRA and TGRC. The settings used in this example are TCNT clearing by compare match B, 1 output at compare match A, and 0 output at compare match B. In this example, the TTSA bit in TBTM is cleared to 0.

As buffer operation has been set, when compare match A occurs the output changes and the value in buffer register TGRC is simultaneously transferred to timer general register TGRA. This operation is repeated each time that compare match A occurs.

For details of PWM modes, see section 11.4.5, PWM Modes.

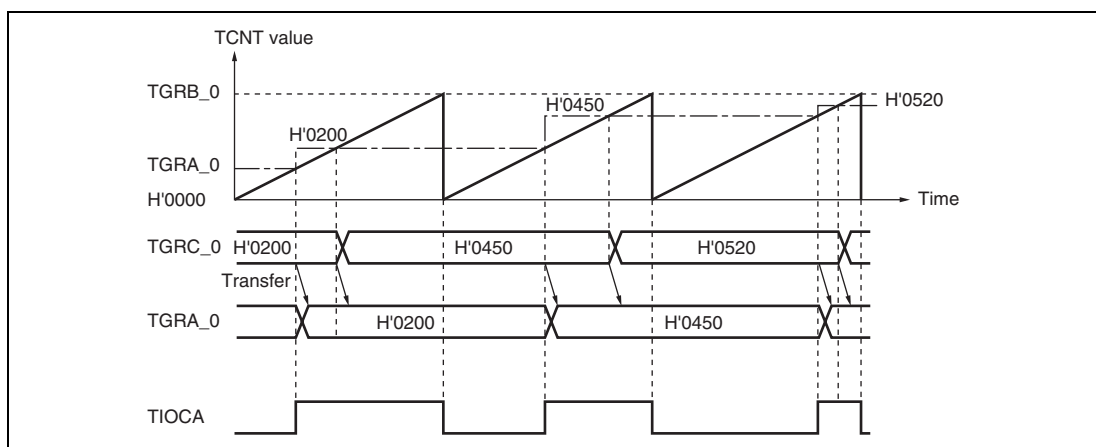

Figure 11.17 Example of Buffer Operation (1)

(b) When TGR is an input capture register

Figure 11.18 shows an operation example in which TGRA has been designated as an input capture register, and buffer operation has been designated for TGRA and TGRC.

Counter clearing by TGRA input capture has been set for TCNT, and both rising and falling edges have been selected as the TIOCA pin input capture input edge.

As buffer operation has been set, when the TCNT value is stored in TGRA upon the occurrence of input capture A, the value previously stored in TGRA is simultaneously transferred to TGRC.

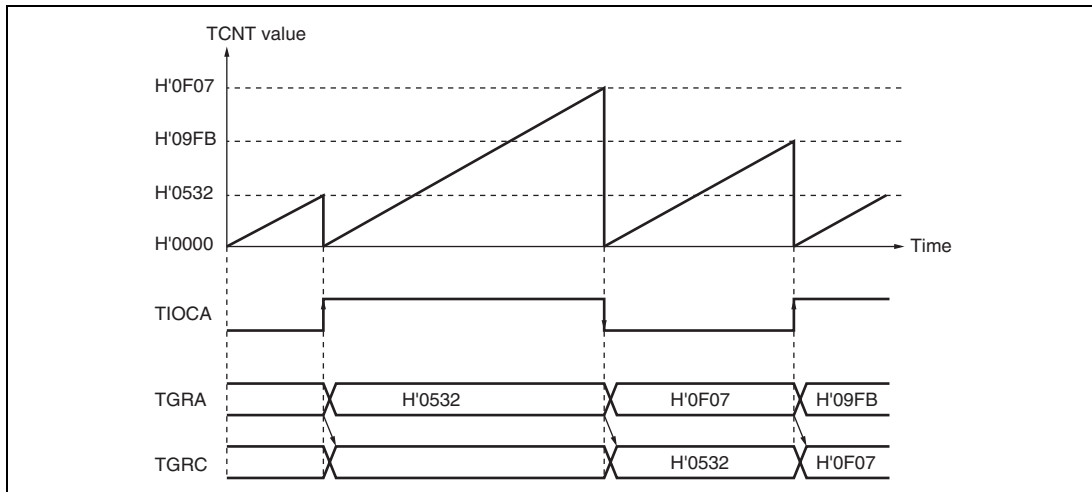

Figure 11.18 Example of Buffer Operation (2)

(3) Selecting Timing for Transfer from Buffer Registers to Timer General Registers in Buffer Operation

The timing for transfer from buffer registers to timer general registers can be selected in PWM mode 1 or 2 for channel 0 or in PWM mode 1 for channels 3 and 4 by setting the buffer operation transfer mode registers (TBTM_0, TBTM_3, and TBTM_4). Either compare match (initial setting) or TCNT clearing can be selected for the transfer timing. TCNT clearing as transfer timing is one of the following cases.

- When TCNT overflows (H'FFFF to H'0000)
- When H'0000 is written to TCNT during counting
- When TCNT is cleared to H'0000 under the condition specified in the CCLR2 to CCLR0 bits in TCR

Note: TBTM must be modified only while TCNT stops.

Figure 11.19 shows an operation example in which PWM mode 1 is designated for channel 0 and buffer operation is designated for TGRA_0 and TGRC_0. The settings used in this example are TCNT_0 clearing by compare match B, 1 output at compare match A, and 0 output at compare match B. The TTSA bit in TBTM_0 is set to 1.

Figure 11.19 Example of Buffer Operation When TCNT_0 Clearing is Selected for TGRC_0 to TGRA_0 Transfer Timing

11.4.4 Cascaded Operation

In cascaded operation, two 16-bit counters for different channels are used together as a 32-bit counter.

This function works by counting the channel 1 counter clock upon overflow/underflow of TCNT_2 as set in bits TPSC0 to TPSC2 in TCR.

Underflow occurs only when the lower 16-bit TCNT is in phase-counting mode.

Table 11.42 shows the register combinations used in cascaded operation.

Note: When phase counting mode is set for channel 1, the counter clock setting is invalid and the counters operate independently in phase counting mode.

Table 11.42 Cascaded Combinations

Combination	Upper 16 Bits	Lower 16 Bits
Channels 1 and 2	TCNT_1	TCNT_2

For simultaneous input capture of TCNT_1 and TCNT_2 during cascaded operation, additional input capture input pins can be specified by the input capture control register (TICCR). For input capture in cascade connection, refer to section 11.7.22, Simultaneous Capture of TCNT_1 and TCNT_2 in Cascade Connection.

Table 11.43 show the TICCRR setting and input capture input pins.

Table 11.43 TICCRR Setting and Input Capture Input Pins

Target Input Capture	TICCRR Setting	Input Capture Input Pins
Input capture from TCNT_1 to TGRA_1	I2AE bit = 0 (initial value)	TIOC1A
	I2AE bit = 1	TIOC1A, TIOC2A
Input capture from TCNT_1 to TGRB_1	I2BE bit = 0 (initial value)	TIOC1B
	I2BE bit = 1	TIOC1B, TIOC2B
Input capture from TCNT_2 to TGRA_2	I1AE bit = 0 (initial value)	TIOC2A
	I1AE bit = 1	TIOC2A, TIOC1A
Input capture from TCNT_2 to TGRB_2	I1BE bit = 0 (initial value)	TIOC2B
	I1BE bit = 1	TIOC2B, TIOC1B

(1) Example of Cascaded Operation Setting Procedure

Figure 11.20 shows an example of the setting procedure for cascaded operation.

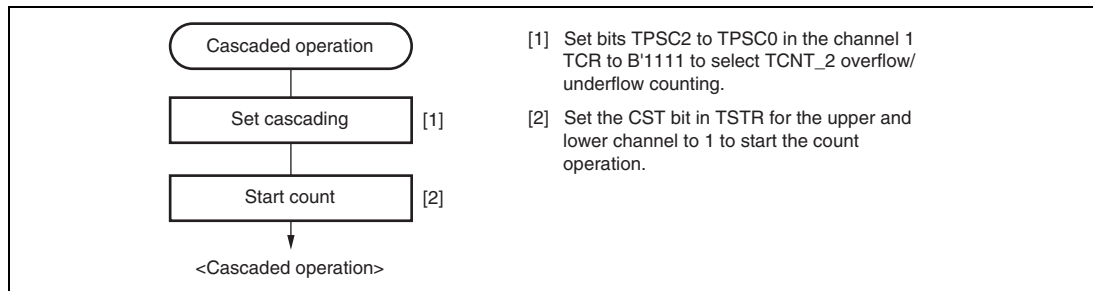

Figure 11.20 Cascaded Operation Setting Procedure

(2) Cascaded Operation Example (a)

Figure 11.21 illustrates the operation when TCNT_2 overflow/underflow counting has been set for TCNT_1 and phase counting mode has been designated for channel 2.

TCNT_1 is incremented by TCNT_2 overflow and decremented by TCNT_2 underflow.

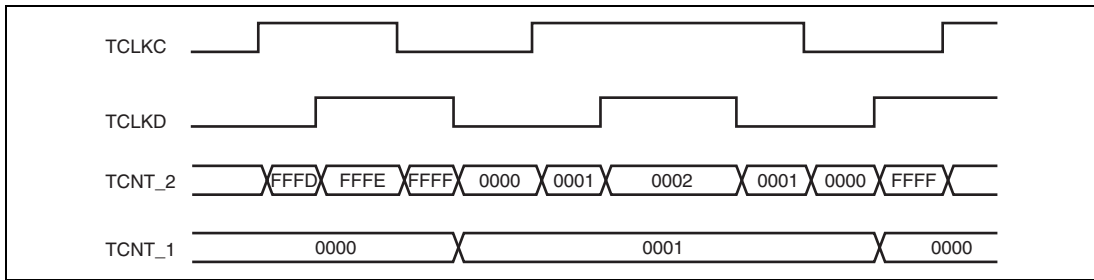

Figure 11.21 Cascaded Operation Example (a)

(3) Cascaded Operation Example (b)

Figure 11.22 illustrates the operation when TCNT_1 and TCNT_2 have been cascaded and the I2AE bit in TICCRA has been set to 1 to include the TIOC2A pin in the TGRA_1 input capture conditions. In this example, the IOA0 to IOA3 bits in TIOR_1 have selected the TIOC1A rising edge for the input capture timing while the IOA0 to IOA3 bits in TIOR_2 have selected the TIOC2A rising edge for the input capture timing.

Under these conditions, the rising edge of both TIOC1A and TIOC2A is used for the TGRA_1 input capture condition. For the TGRA_2 input capture condition, the TIOC2A rising edge is used.

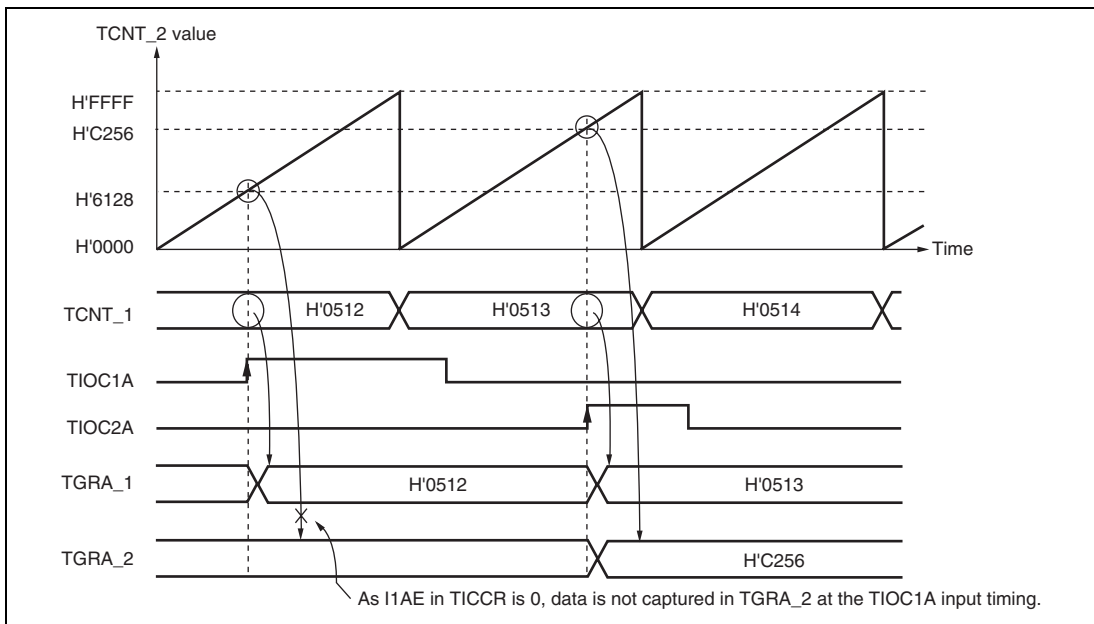

Figure 11.22 Cascaded Operation Example (b)

(4) Cascaded Operation Example (c)

Figure 11.23 illustrates the operation when TCNT_1 and TCNT_2 have been cascaded and the I2AE and I1AE bits in TICCR have been set to 1 to include the TIOC2A and TIOC1A pins in the TGRA_1 and TGRA_2 input capture conditions, respectively. In this example, the IOA0 to IOA3 bits in both TIOR_1 and TIOR_2 have selected both the rising and falling edges for the input capture timing. Under these conditions, the ORed result of TIOC1A and TIOC2A input is used for the TGRA_1 and TGRA_2 input capture conditions.

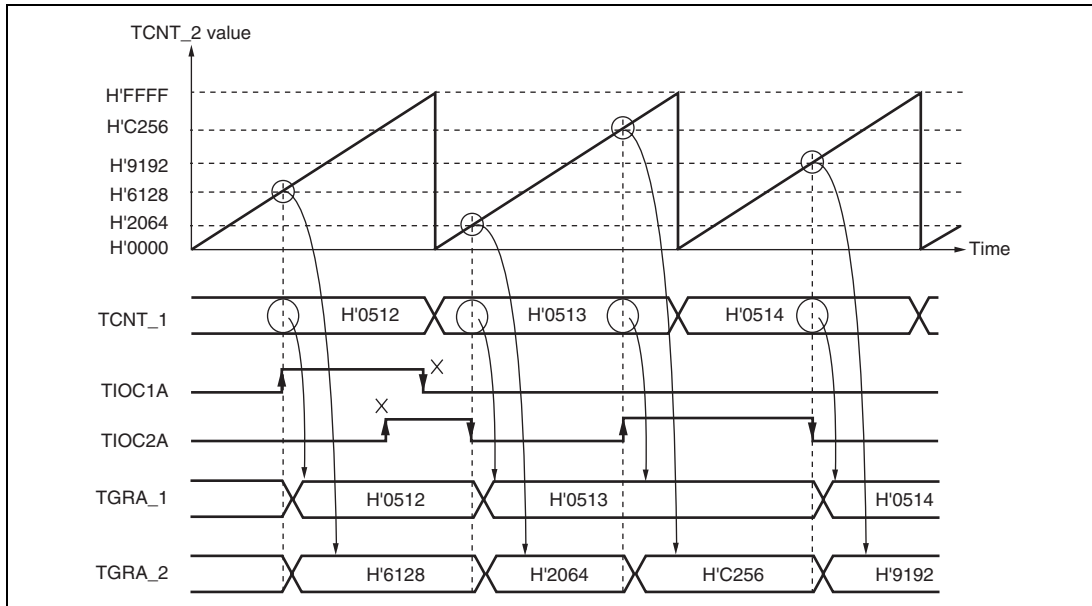

Figure 11.23 Cascaded Operation Example (c)

(5) Cascaded Operation Example (d)

Figure 11.24 illustrates the operation when TCNT_1 and TCNT_2 have been cascaded and the I2AE bit in TICCRR has been set to 1 to include the TIOC2A pin in the TGRA_1 input capture conditions. In this example, the IOA0 to IOA3 bits in TIOR_1 have selected TGRA_0 compare match or input capture occurrence for the input capture timing while the IOA0 to IOA3 bits in TIOR_2 have selected the TIOC2A rising edge for the input capture timing.

Under these conditions, as TIOR_1 has selected TGRA_0 compare match or input capture occurrence for the input capture timing, the TIOC2A edge is not used for TGRA_1 input capture condition although the I2AE bit in TICCRR has been set to 1.

Figure 11.24 Cascaded Operation Example (d)

11.4.5 PWM Modes

In PWM mode, PWM waveforms are output from the output pins. The output level can be selected as 0, 1, or toggle output in response to a compare match of each TGR.

TGR registers settings can be used to output a PWM waveform in the range of 0% to 100% duty.

Designating TGR compare match as the counter clearing source enables the period to be set in that register. All channels can be designated for PWM mode independently. Synchronous operation is also possible.

There are two PWM modes, as described below.

- PWM mode 1

PWM output is generated from the TIOCA and TIOCC pins by pairing TGRA with TGRB and TGRC with TGRD. The output specified by bits IOA0 to IOA3 and IOC0 to IOC3 in TIOR is output from the TIOCA and TIOCC pins at compare matches A and C, and the output specified by bits IOB0 to IOB3 and IOD0 to IOD3 in TIOR is output at compare matches B and D. The initial output value is the value set in TGRA or TGRC. If the set values of paired TGRs are identical, the output value does not change when a compare match occurs.

In PWM mode 1, a maximum 8-phase PWM output is possible.

- PWM mode 2

PWM output is generated using one TGR as the cycle register and the others as duty registers. The output specified in TIOR is performed by means of compare matches. Upon counter clearing by a synchronization register compare match, the output value of each pin is the initial value set in TIOR. If the set values of the cycle and duty registers are identical, the output value does not change when a compare match occurs.

In PWM mode 2, a maximum 8-phase PWM output is possible in combination use with synchronous operation.

The correspondence between PWM output pins and registers is shown in table 11.44.

Table 11.44 PWM Output Registers and Output Pins

Channel	Registers	Output Pins	
		PWM Mode 1	PWM Mode 2
0	TGRA_0	TIOC0A	TIOC0A
	TGRB_0		TIOC0B
	TGRC_0	TIOC0C	TIOC0C
	TGRD_0		TIOC0D
1	TGRA_1	TIOC1A	TIOC1A
	TGRB_1		TIOC1B
2	TGRA_2	TIOC2A	TIOC2A
	TGRB_2		TIOC2B
3	TGRA_3	TIOC3A	Cannot be set
	TGRB_3		Cannot be set
	TGRC_3	TIOC3C	Cannot be set
	TGRD_3		Cannot be set
4	TGRA_4	TIOC4A	Cannot be set
	TGRB_4		Cannot be set
	TGRC_4	TIOC4C	Cannot be set
	TGRD_4		Cannot be set

Note: In PWM mode 2, PWM output is not possible for the TGR register in which the period is set.

(1) Example of PWM Mode Setting Procedure

Figure 11.25 shows an example of the PWM mode setting procedure.

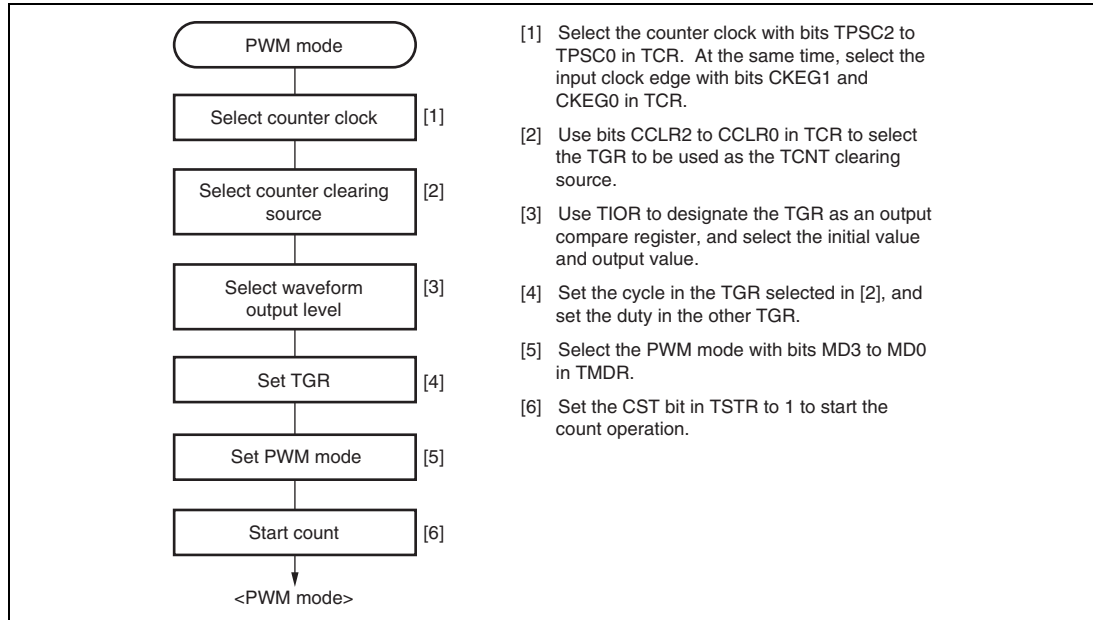

Figure 11.25 Example of PWM Mode Setting Procedure

(2) Examples of PWM Mode Operation

Figure 11.26 shows an example of PWM mode 1 operation.

In this example, TGRA compare match is set as the TCNT clearing source, 0 is set for the TGRA initial output value and output value, and 1 is set as the TGRB output value.

In this case, the value set in TGRA is used as the period, and the values set in the TGRB registers are used as the duty levels.

Figure 11.26 Example of PWM Mode Operation (1)

Figure 11.27 shows an example of PWM mode 2 operation.

In this example, synchronous operation is designated for channels 0 and 1, TGRB_1 compare match is set as the TCNT clearing source, and 0 is set for the initial output value and 1 for the output value of the other TGR registers (TGRA_0 to TGRD_0, TGRA_1), outputting a 5-phase PWM waveform.

In this case, the value set in TGRB_1 is used as the cycle, and the values set in the other TGRs are used as the duty levels.

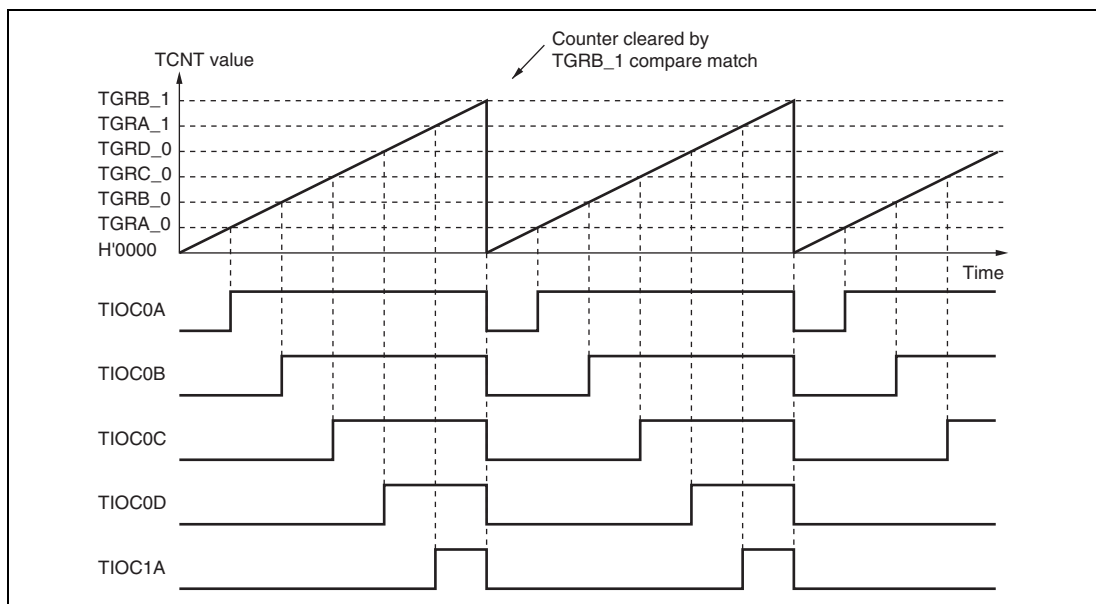

Figure 11.27 Example of PWM Mode Operation (2)

Figure 11.28 shows examples of PWM waveform output with 0% duty and 100% duty in PWM mode.

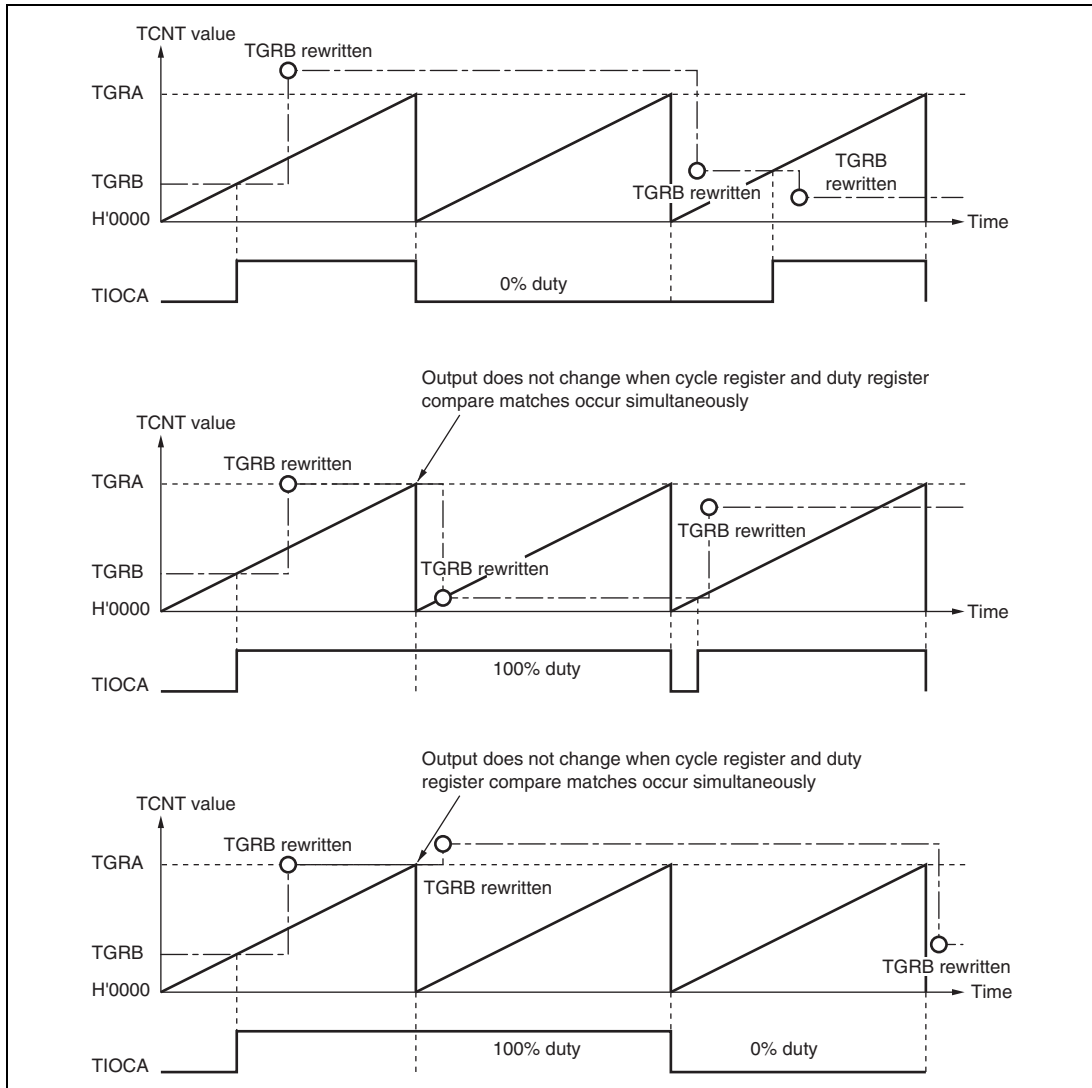

Figure 11.28 Example of PWM Mode Operation (3)

11.4.6 Phase Counting Mode

In phase counting mode, the phase difference between two external clock inputs is detected and TCNT is incremented/decremented accordingly. This mode can be set for channels 1 and 2.

When phase counting mode is set, an external clock is selected as the counter input clock and TCNT operates as an up/down-counter regardless of the setting of bits TPSC0 to TPSC2 and bits CKEG0 and CKEG1 in TCR. However, the functions of bits CCLR0 and CCLR1 in TCR, and of TIOR, TIER, and TGR, are valid, and input capture/compare match and interrupt functions can be used.

This can be used for two-phase encoder pulse input.

If overflow occurs when TCNT is counting up, the TCFV flag in TSR is set; if underflow occurs when TCNT is counting down, the TCFU flag is set.

The TCFD bit in TSR is the count direction flag. Reading the TCFD flag reveals whether TCNT is counting up or down.

Table 11.45 shows the correspondence between external clock pins and channels.

Table 11.45 Phase Counting Mode Clock Input Pins

Channels	External Clock Pins	
	A-Phase	B-Phase
When channel 1 is set to phase counting mode	TCLKA	TCLKB
When channel 2 is set to phase counting mode	TCLKC	TCLKD

(1) Example of Phase Counting Mode Setting Procedure

Figure 11.29 shows an example of the phase counting mode setting procedure.

Figure 11.29 Example of Phase Counting Mode Setting Procedure

(2) Examples of Phase Counting Mode Operation

In phase counting mode, TCNT counts up or down according to the phase difference between two external clocks. There are four modes, according to the count conditions.

(a) Phase counting mode 1

Figure 11.30 shows an example of phase counting mode 1 operation, and table 11.46 summarizes the TCNT up/down-count conditions.

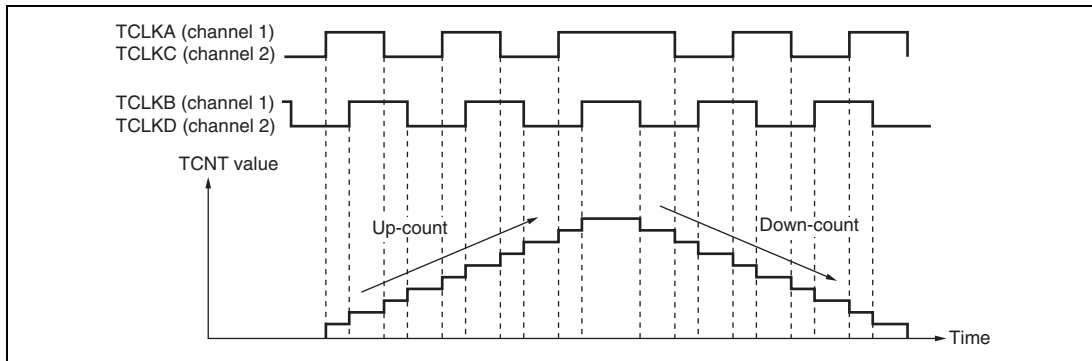

Figure 11.30 Example of Phase Counting Mode 1 Operation

Table 11.46 Up/Down-Count Conditions in Phase Counting Mode 1

TCLKA (Channel 1) TCLKC (Channel 2)	TCLKB (Channel 1) TCLKD (Channel 2)	Operation
High level		Up-count
Low level		
	Low level	Down-count
	High level	
High level		Down-count
Low level		
	High level	Up-count
	Low level

(3) Phase Counting Mode Application Example

Figure 11.34 shows an example in which channel 1 is in phase counting mode, and channel 1 is coupled with channel 0 to input servo motor 2-phase encoder pulses in order to detect position or speed.

Channel 1 is set to phase counting mode 1, and the encoder pulse A-phase and B-phase are input to TCLKA and TCLKB.

Channel 0 operates with TCNT counter clearing by TGRC_0 compare match; TGRA_0 and TGRC_0 are used for the compare match function and are set with the speed control period and position control period. TGRB_0 is used for input capture, with TGRB_0 and TGRD_0 operating in buffer mode. The channel 1 counter input clock is designated as the TGRB_0 input capture source, and the pulse widths of 2-phase encoder 4-multiplication pulses are detected.

TGRA_1 and TGRB_1 for channel 1 are designated for input capture, and channel 0 TGRA_0 and TGRC_0 compare matches are selected as the input capture source and store the up/down-counter values for the control periods.

This procedure enables the accurate detection of position and speed.

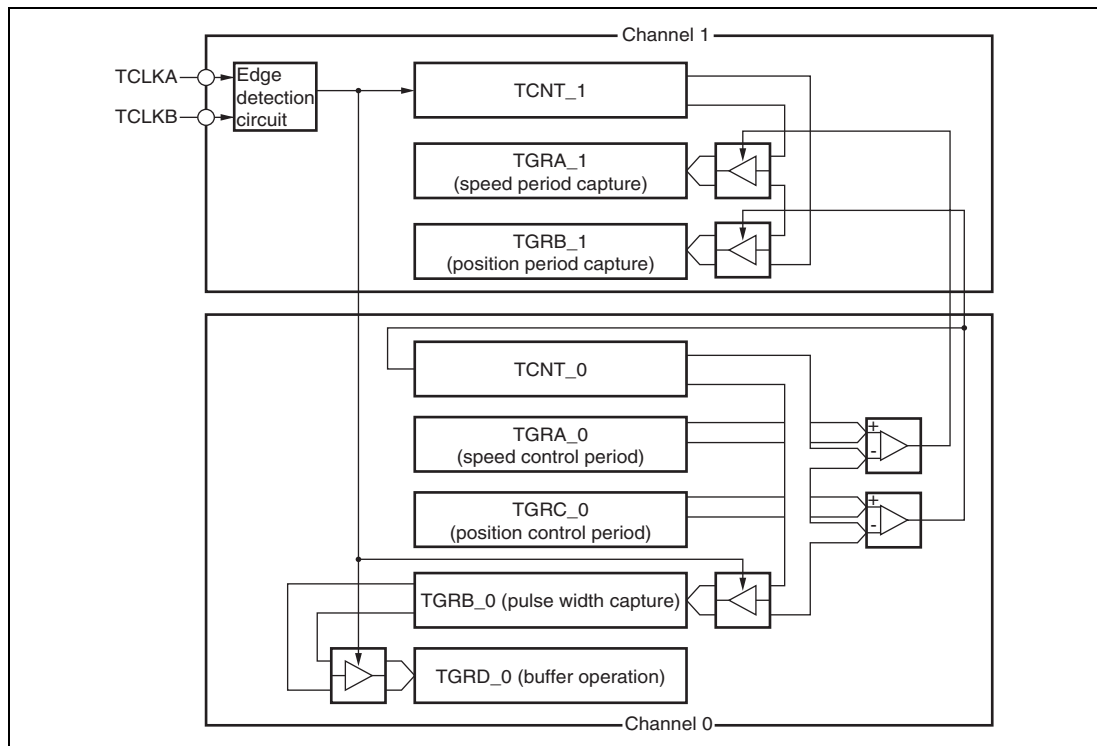

Figure 11.34 Phase Counting Mode Application Example

11.4.7 Reset-Synchronized PWM Mode

In the reset-synchronized PWM mode, three-phase output of positive and negative PWM waveforms that share a common wave transition point can be obtained by combining channels 3 and 4.

When set for reset-synchronized PWM mode, the TIOC3B, TIOC3D, TIOC4A, TIOC4C, TIOC4B, and TIOC4D pins function as PWM output pins and TCNT3 functions as an upcounter.

Table 11.50 shows the PWM output pins used. Table 11.51 shows the settings of the registers.

Table 11.50 Output Pins for Reset-Synchronized PWM Mode

Channel	Output Pin	Description
3	TIOC3B	PWM output pin 1
	TIOC3D	PWM output pin 1' (negative-phase waveform of PWM output 1)
4	TIOC4A	PWM output pin 2
	TIOC4C	PWM output pin 2' (negative-phase waveform of PWM output 2)
	TIOC4B	PWM output pin 3
	TIOC4D	PWM output pin 3' (negative-phase waveform of PWM output 3)

Table 11.51 Register Settings for Reset-Synchronized PWM Mode

Register	Description of Setting
TCNT_3	Initial setting of H'0000
TCNT_4	Initial setting of H'0000
TGRA_3	Set count cycle for TCNT_3
TGRB_3	Sets the turning point for PWM waveform output by the TIOC3B and TIOC3D pins
TGRA_4	Sets the turning point for PWM waveform output by the TIOC4A and TIOC4C pins
TGRB_4	Sets the turning point for PWM waveform output by the TIOC4B and TIOC4D pins

(1) Procedure for Selecting the Reset-Synchronized PWM Mode

Figure 11.35 shows an example of procedure for selecting the reset synchronized PWM mode.

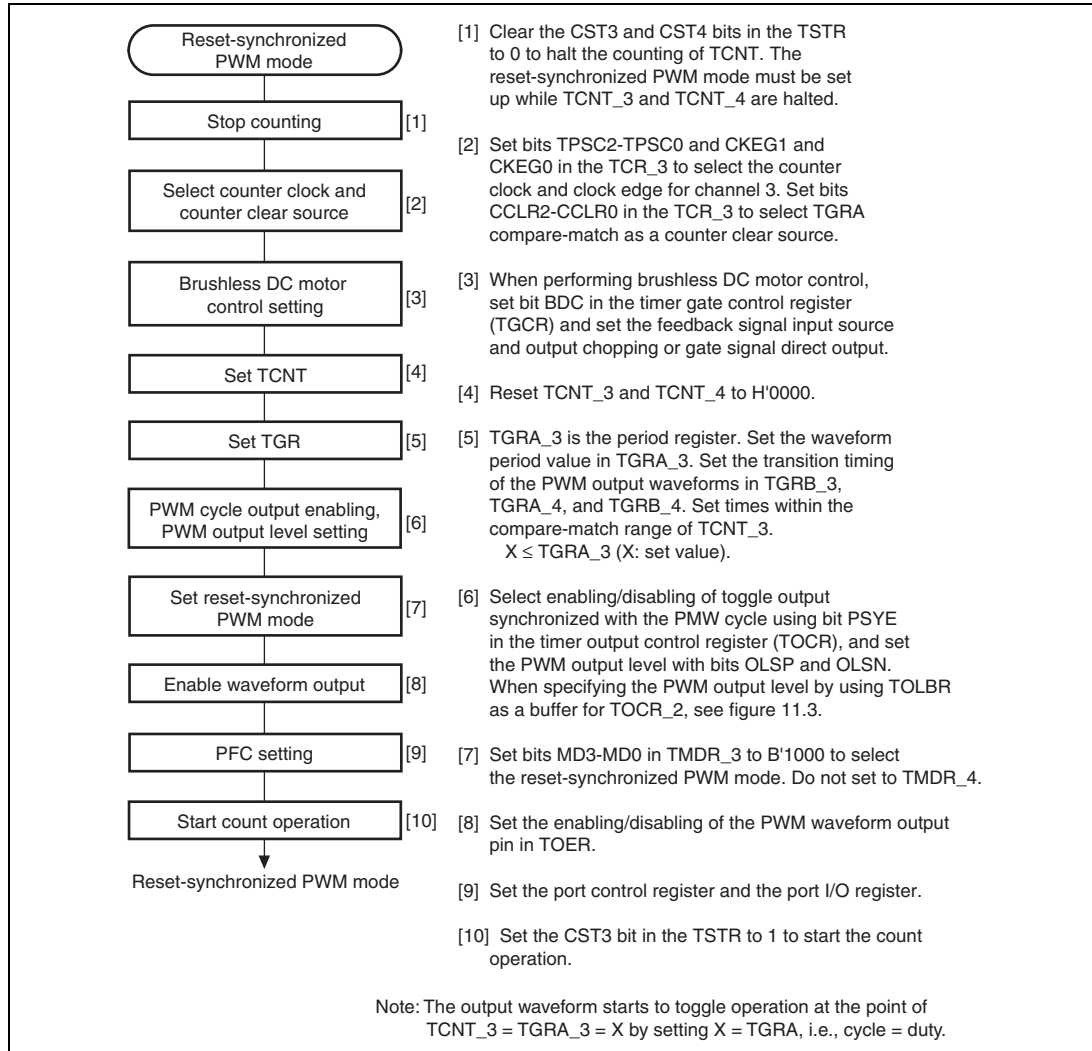

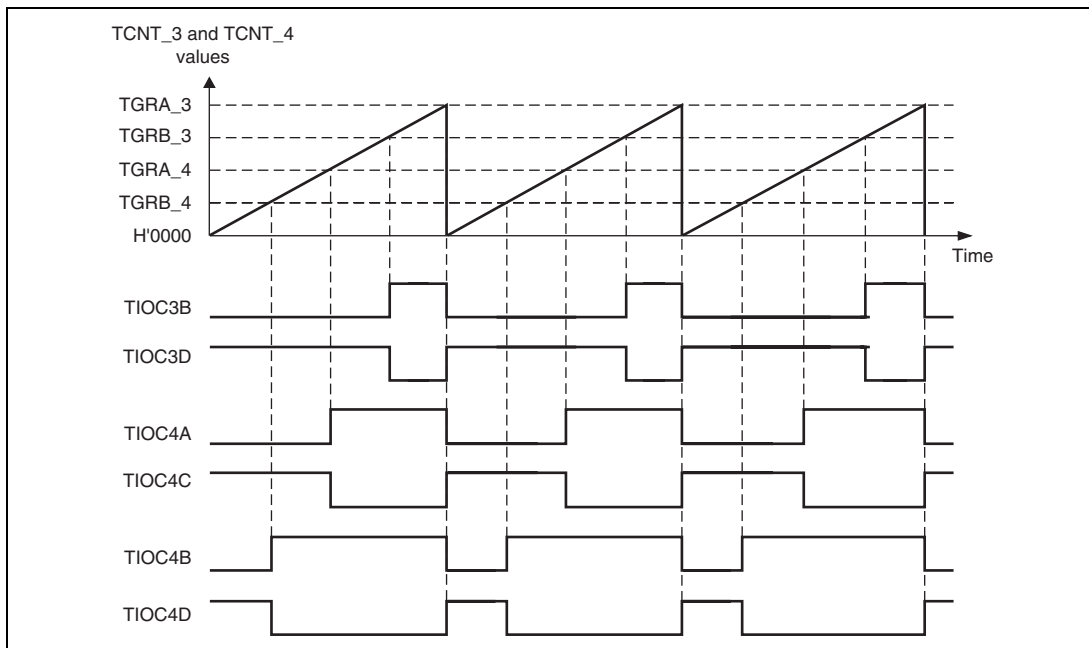

Figure 11.35 Procedure for Selecting Reset-Synchronized PWM Mode

(2) Reset-Synchronized PWM Mode Operation

Figure 11.36 shows an example of operation in the reset-synchronized PWM mode. TCNT_3 and TCNT_4 operate as upcounters. The counter is cleared when a TCNT_3 and TGRA_3 compare-match occurs, and then begins incrementing from H'0000. The PWM output pin output toggles with each occurrence of a TGRB_3, TGRA_4, TGRB_4 compare-match, and upon counter clears.

**Figure 11.36 Reset-Synchronized PWM Mode Operation Example
(When TOCR's OLSN = 1 and OLSP = 1)**

11.4.8 Complementary PWM Mode

In the complementary PWM mode, three-phase output of non-overlapping positive and negative PWM waveforms can be obtained by combining channels 3 and 4. PWM waveforms without non-overlapping interval are also available.

In complementary PWM mode, TIOC3B, TIOC3D, TIOC4A, TIOC4B, TIOC4C, and TIOC4D pins function as PWM output pins, the TIOC3A pin can be set for toggle output synchronized with the PWM period. TCNT_3 and TCNT_4 function as up/down counters.

Table 11.52 shows the PWM output pins used. Table 11.53 shows the settings of the registers used.

A function to directly cut off the PWM output by using an external signal is supported as a port function.

Table 11.52 Output Pins for Complementary PWM Mode

Channel	Output Pin	Description
3	TIOC3A	Toggle output synchronized with PWM period (or I/O port)
	TIOC3B	PWM output pin 1
	TIOC3C	I/O port*
	TIOC3D	PWM output pin 1' (non-overlapping negative-phase waveform of PWM output 1; PWM output without non-overlapping interval is also available)
4	TIOC4A	PWM output pin 2
	TIOC4B	PWM output pin 3
	TIOC4C	PWM output pin 2' (non-overlapping negative-phase waveform of PWM output 2; PWM output without non-overlapping interval is also available)
	TIOC4D	PWM output pin 3' (non-overlapping negative-phase waveform of PWM output 3; PWM output without non-overlapping interval is also available)

Note: * Avoid setting the TIOC3C pin as a timer I/O pin in the complementary PWM mode.

Table 11.53 Register Settings for Complementary PWM Mode

Channel	Counter/Register	Description	Read/Write from CPU
3	TCNT_3	Start of up-count from value set in dead time register	Maskable by TRWER setting*
	TGRA_3	Set TCNT_3 upper limit value (1/2 carrier cycle + dead time)	Maskable by TRWER setting*
	TGRB_3	PWM output 1 compare register	Maskable by TRWER setting*
	TGRC_3	TGRA_3 buffer register	Always readable/writable
	TGRD_3	PWM output 1/TGRB_3 buffer register	Always readable/writable
4	TCNT_4	Up-count start, initialized to H'0000	Maskable by TRWER setting*
	TGRA_4	PWM output 2 compare register	Maskable by TRWER setting*
	TGRB_4	PWM output 3 compare register	Maskable by TRWER setting*
	TGRC_4	PWM output 2/TGRA_4 buffer register	Always readable/writable
	TGRD_4	PWM output 3/TGRB_4 buffer register	Always readable/writable
	Timer dead time data register (TDDR)	Set TCNT_4 and TCNT_3 offset value (dead time value)	Maskable by TRWER setting*
	Timer cycle data register (TCDR)	Set TCNT_4 upper limit value (1/2 carrier cycle)	Maskable by TRWER setting*
	Timer cycle buffer register (TCBR)	TCDR buffer register	Always readable/writable
	Subcounter (TCNTS)	Subcounter for dead time generation	Read-only
	Temporary register 1 (TEMP1)	PWM output 1/TGRB_3 temporary register	Not readable/writable
	Temporary register 2 (TEMP2)	PWM output 2/TGRA_4 temporary register	Not readable/writable
	Temporary register 3 (TEMP3)	PWM output 3/TGRB_4 temporary register	Not readable/writable

Note: * Access can be enabled or disabled according to the setting of bit 0 (RWE) in TRWER (timer read/write enable register).

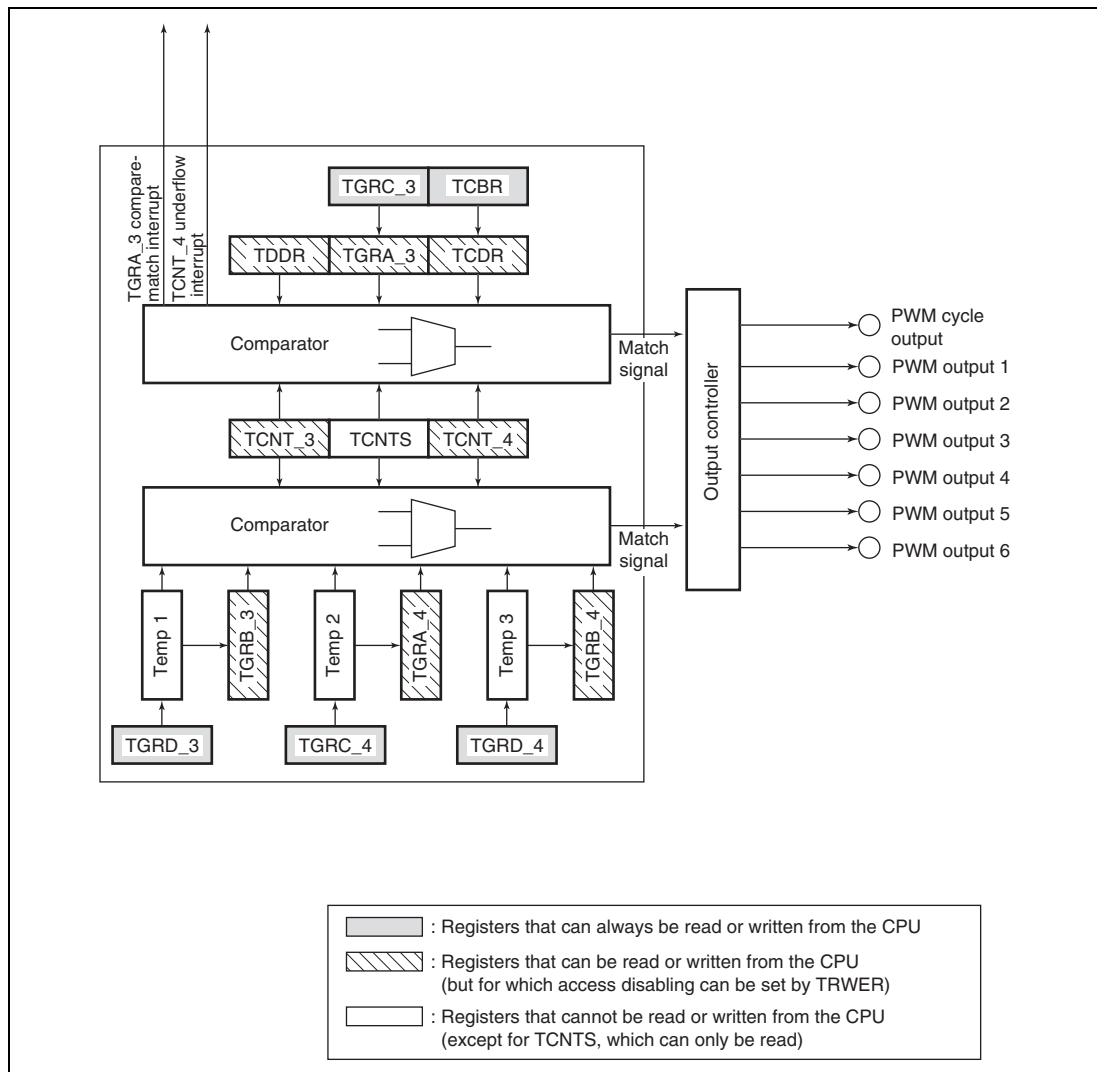

Figure 11.37 Block Diagram of Channels 3 and 4 in Complementary PWM Mode

(1) Example of Complementary PWM Mode Setting Procedure

An example of the complementary PWM mode setting procedure is shown in figure 11.38.

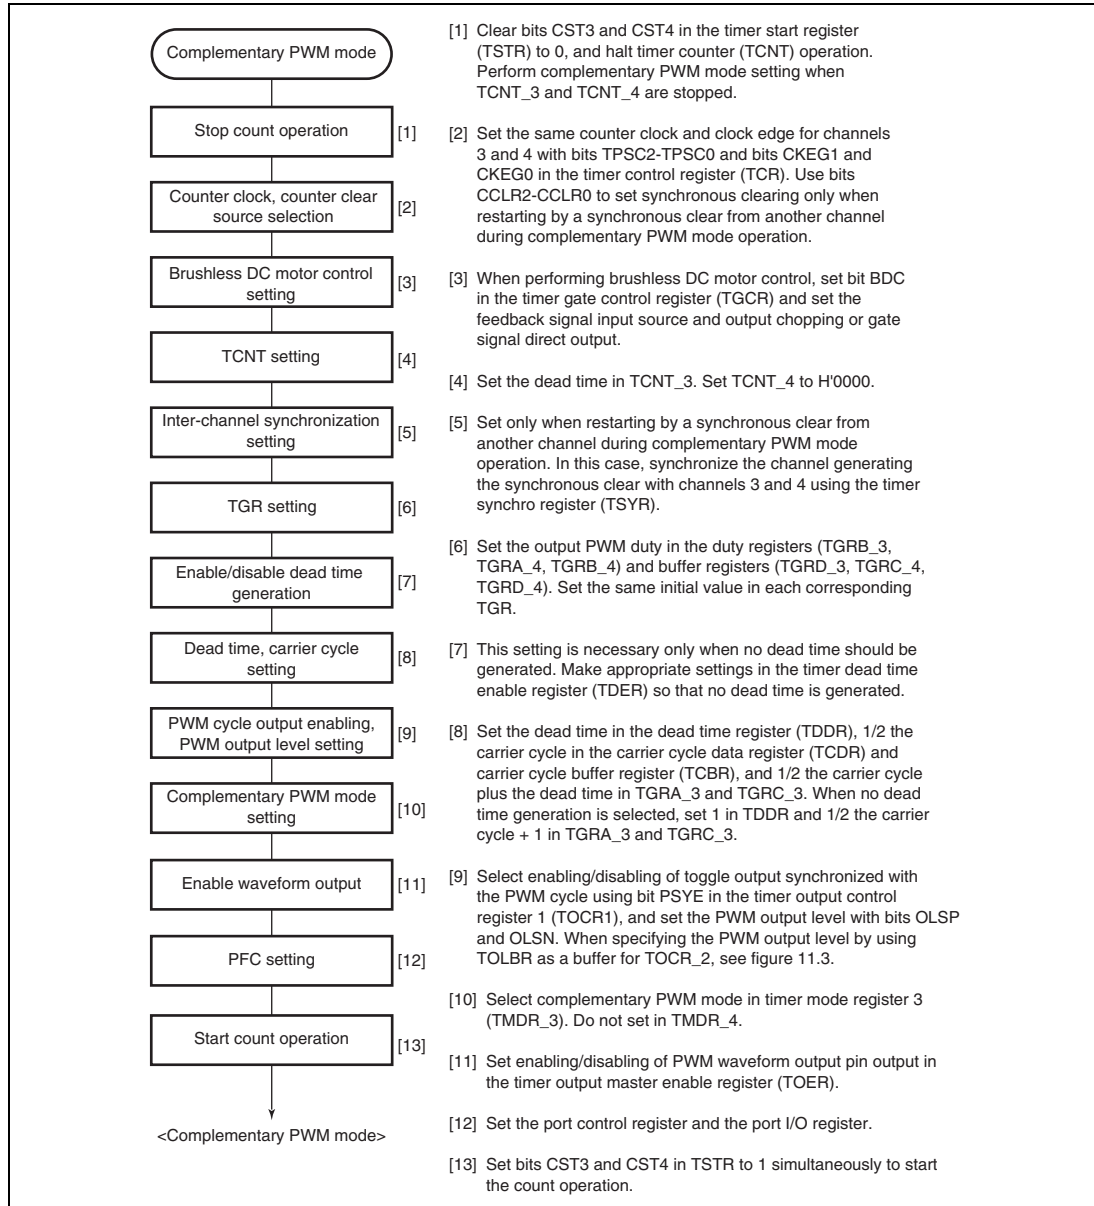

Figure 11.38 Example of Complementary PWM Mode Setting Procedure

(2) Outline of Complementary PWM Mode Operation

In complementary PWM mode, 6-phase PWM output is possible. Figure 11.39 illustrates counter operation in complementary PWM mode, and figure 11.40 shows an example of complementary PWM mode operation.

(a) Counter Operation

In complementary PWM mode, three counters—TCNT_3, TCNT_4, and TCNTS—perform up/down-count operations.

TCNT_3 is automatically initialized to the value set in TDDR when complementary PWM mode is selected and the CST bit in TSTR is 0.

When the CST bit is set to 1, TCNT_3 counts up to the value set in TGRA_3, then switches to down-counting when it matches TGRA_3. When the TCNT3 value matches TDDR, the counter switches to up-counting, and the operation is repeated in this way.

TCNT_4 is initialized to H'0000.

When the CST bit is set to 1, TCNT4 counts up in synchronization with TCNT_3, and switches to down-counting when it matches TCDR. On reaching H'0000, TCNT4 switches to up-counting, and the operation is repeated in this way.

TCNTS is a read-only counter. It need not be initialized.

When TCNT_3 matches TCDR during TCNT_3 and TCNT_4 up/down-counting, down-counting is started, and when TCNTS matches TCDR, the operation switches to up-counting. When TCNTS matches TGRA_3, it is cleared to H'0000.

When TCNT_4 matches TDDR during TCNT_3 and TCNT_4 down-counting, up-counting is started, and when TCNTS matches TDDR, the operation switches to down-counting. When TCNTS reaches H'0000, it is set with the value in TGRA_3.

TCNTS is compared with the compare register and temporary register in which the PWM duty is set during the count operation only.

Figure 11.39 Complementary PWM Mode Counter Operation

(b) Register Operation

In complementary PWM mode, nine registers are used, comprising compare registers, buffer registers, and temporary registers. Figure 11.40 shows an example of complementary PWM mode operation.

The registers which are constantly compared with the counters to perform PWM output are TGRB_3, TGRA_4, and TGRB_4. When these registers match the counter, the value set in bits OLSN and OLSP in the timer output control register (TOCR) is output.

The buffer registers for these compare registers are TGRD_3, TGRC_4, and TGRD_4.

Between a buffer register and compare register there is a temporary register. The temporary registers cannot be accessed by the CPU.

Data in a compare register is changed by writing the new data to the corresponding buffer register. The buffer registers can be read or written at any time.

The data written to a buffer register is constantly transferred to the temporary register in the T_a interval. Data is not transferred to the temporary register in the T_b interval. Data written to a buffer register in this interval is transferred to the temporary register at the end of the T_b interval.

The value transferred to a temporary register is transferred to the compare register when TCNTS for which the T_b interval ends matches TGRA_3 when counting up, or H'0000 when counting down. The timing for transfer from the temporary register to the compare register can be selected with bits MD3 to MD0 in the timer mode register (TMDR). Figure 11.40 shows an example in which the mode is selected in which the change is made in the trough.

In the t_b interval (t_{b1} in figure 11.40) in which data transfer to the temporary register is not performed, the temporary register has the same function as the compare register, and is compared with the counter. In this interval, therefore, there are two compare match registers for one-phase output, with the compare register containing the pre-change data, and the temporary register containing the new data. In this interval, the three counters—TCNT_3, TCNT_4, and TCNTS—and two registers—compare register and temporary register—are compared, and PWM output controlled accordingly.

Figure 11.40 Example of Complementary PWM Mode Operation

(c) Initialization

In complementary PWM mode, there are six registers that must be initialized. In addition, there is a register that specifies whether to generate dead time (it should be used only when dead time generation should be disabled).

Before setting complementary PWM mode with bits MD3 to MD0 in the timer mode register (TMDR), the following initial register values must be set.

TGRC_3 operates as the buffer register for TGRA_3, and should be set with 1/2 the PWM carrier cycle + dead time Td. The timer cycle buffer register (TCBR) operates as the buffer register for the timer cycle data register (TCDR), and should be set with 1/2 the PWM carrier cycle. Set dead time Td in the timer dead time data register (TDDR).

When dead time is not needed, the TDER bit in the timer dead time enable register (TDER) should be cleared to 0, TGRC_3 and TGRA_3 should be set to 1/2 the PWM carrier cycle + 1, and TDDR should be set to 1.

Set the respective initial PWM duty values in buffer registers TGRD_3, TGRC_4, and TGRD_4.

The values set in the five buffer registers excluding TDDR are transferred simultaneously to the corresponding compare registers when complementary PWM mode is set.

Set TCNT_4 to H'0000 before setting complementary PWM mode.

Table 11.54 Registers and Counters Requiring Initialization

Register/Counter	Set Value
TGRC_3	1/2 PWM carrier cycle + dead time Td (1/2 PWM carrier cycle + 1 when dead time generation is disabled by TDER)
TDDR	Dead time Td (1 when dead time generation is disabled by TDER)
TCBR	1/2 PWM carrier cycle
TGRD_3, TGRC_4, TGRD_4	Initial PWM duty value for each phase
TCNT_4	H'0000

Note: The TGRC_3 set value must be the sum of 1/2 the PWM carrier cycle set in TCBR and dead time Td set in TDDR. When dead time generation is disabled by TDER, TGRC_3 must be set to 1/2 the PWM carrier cycle + 1.

(d) PWM Output Level Setting

In complementary PWM mode, the PWM pulse output level is set with bits OLSN and OLSP in timer output control register 1 (TOCR1) or bits OLS1P to OLS3P and OLS1N to OLS3N in timer output control register 2 (TOCR2).

The output level can be set for each of the three positive phases and three negative phases of 6-phase output.

Complementary PWM mode should be cleared before setting or changing output levels.

(e) Dead Time Setting

In complementary PWM mode, PWM pulses are output with a non-overlapping relationship between the positive and negative phases. This non-overlap time is called the dead time.

The non-overlap time is set in the timer dead time data register (TDDR). The value set in TDDR is used as the TCNT_3 counter start value, and creates non-overlap between TCNT_3 and TCNT_4. Complementary PWM mode should be cleared before changing the contents of TDDR.

(f) Dead Time Suppressing

Dead time generation is suppressed by clearing the TDER bit in the timer dead time enable register (TDER) to 0. TDER can be cleared to 0 only when 0 is written to it after reading TDER = 1.

TGRA_3 and TGRC_3 should be set to 1/2 PWM carrier cycle + 1 and the timer dead time data register (TDDR) should be set to 1.

By the above settings, PWM waveforms without dead time can be obtained. Figure 11.41 shows an example of operation without dead time.

Figure 11.41 Example of Operation without Dead Time

(g) PWM Cycle Setting

In complementary PWM mode, the PWM pulse cycle is set in two registers—TGRA_3, in which the TCNT_3 upper limit value is set, and TCDR, in which the TCNT_4 upper limit value is set. The settings should be made so as to achieve the following relationship between these two registers:

With dead time: TGRA_3 set value = TCDR set value + TDDR set value

Without dead time: TGRA_3 set value = TCDR set value + 1

The TGRA_3 and TCDR settings are made by setting the values in buffer registers TGRC_3 and TCBR. The values set in TGRC_3 and TCBR are transferred simultaneously to TGRA_3 and TCDR in accordance with the transfer timing selected with bits MD3 to MD0 in the timer mode register (TMDR).

The updated PWM cycle is reflected from the next cycle when the data update is performed at the crest, and from the current cycle when performed in the trough. Figure 11.42 illustrates the operation when the PWM cycle is updated at the crest.

See (h) Register Data Updating, for the method of updating the data in each buffer register.

Figure 11.42 Example of PWM Cycle Updating

(h) Register Data Updating

In complementary PWM mode, the buffer register is used to update the data in a compare register. The update data can be written to the buffer register at any time. There are five PWM duty and carrier cycle registers that have buffer registers and can be updated during operation.

There is a temporary register between each of these registers and its buffer register. When subcounter TCNTS is not counting, if buffer register data is updated, the temporary register value is also rewritten. Transfer is not performed from buffer registers to temporary registers when TCNTS is counting; in this case, the value written to a buffer register is transferred after TCNTS halts.

The temporary register value is transferred to the compare register at the data update timing set with bits MD3 to MD0 in the timer mode register (TMDR). Figure 11.43 shows an example of data updating in complementary PWM mode. This example shows the mode in which data updating is performed at both the counter crest and trough.

When rewriting buffer register data, a write to TGRD_4 must be performed at the end of the update. Data transfer from the buffer registers to the temporary registers is performed simultaneously for all five registers after the write to TGRD_4.

A write to TGRD_4 must be performed after writing data to the registers to be updated, even when not updating all five registers, or when updating the TGRD_4 data. In this case, the data written to TGRD_4 should be the same as the data prior to the write operation.

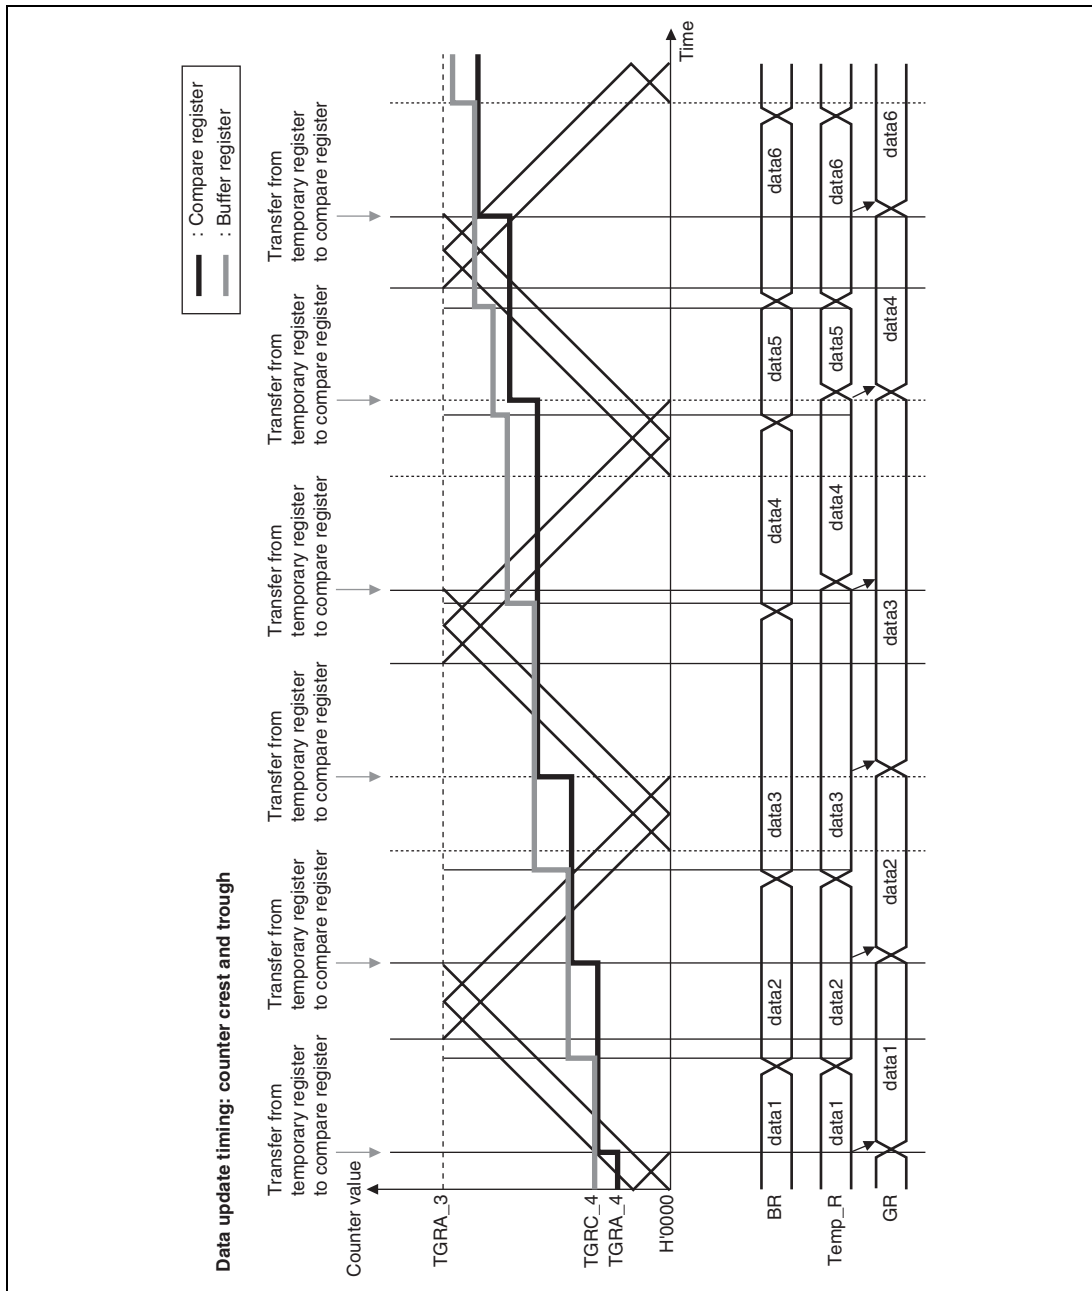

Figure 11.43 Example of Data Update in Complementary PWM Mode

(i) Initial Output in Complementary PWM Mode

In complementary PWM mode, the initial output is determined by the setting of bits OLSN and OLSP in timer output control register 1 (TOCR1) or bits OLS1N to OLS3N and OLS1P to OLS3P in timer output control register 2 (TOCR2).

This initial output is the PWM pulse non-active level, and is output from when complementary PWM mode is set with the timer mode register (TMDR) until TCNT_4 exceeds the value set in the dead time register (TDDR). Figure 11.44 shows an example of the initial output in complementary PWM mode.

An example of the waveform when the initial PWM duty value is smaller than the TDDR value is shown in figure 11.45.

Figure 11.44 Example of Initial Output in Complementary PWM Mode (1)

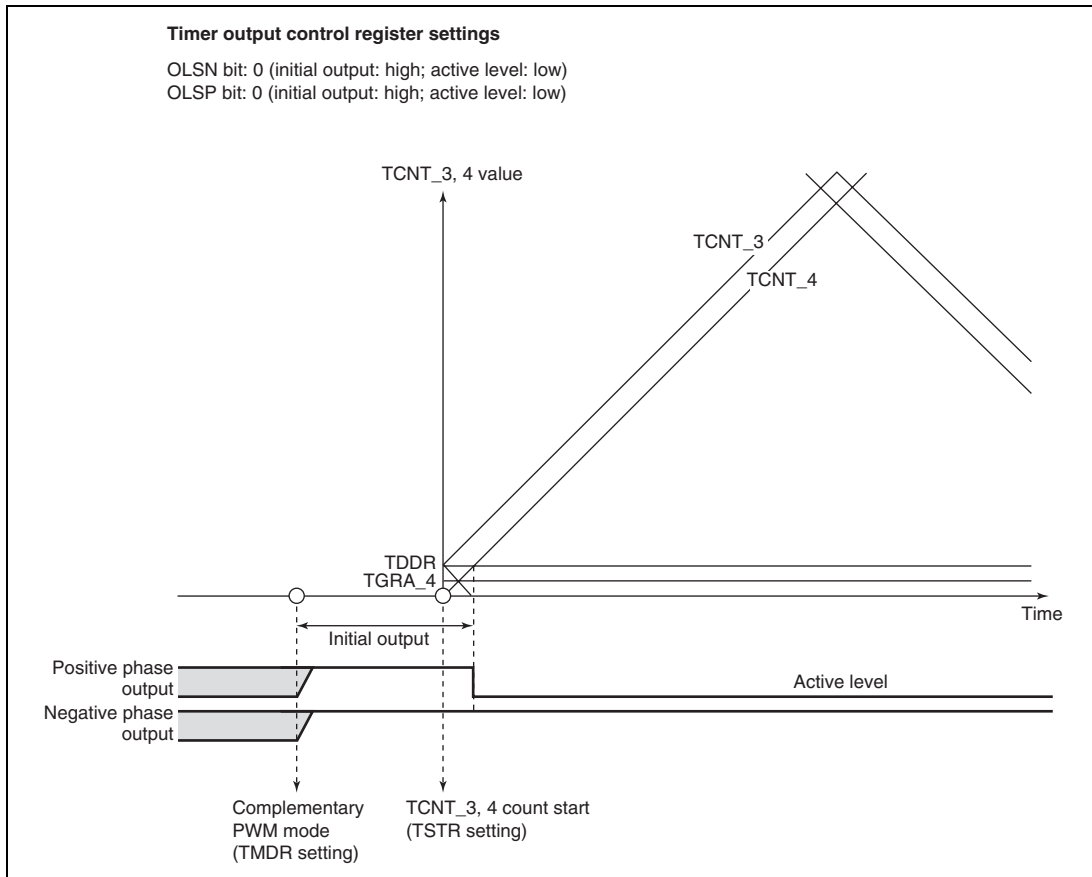

Figure 11.45 Example of Initial Output in Complementary PWM Mode (2)

(j) Complementary PWM Mode PWM Output Generation Method

In complementary PWM mode, 3-phase output is performed of PWM waveforms with a non-overlap time between the positive and negative phases. This non-overlap time is called the dead time.

A PWM waveform is generated by output of the output level selected in the timer output control register in the event of a compare-match between a counter and data register. While TCNTS is counting, data register and temporary register values are simultaneously compared to create consecutive PWM pulses from 0 to 100%. The relative timing of on and off compare-match occurrence may vary, but the compare-match that turns off each phase takes precedence to secure the dead time and ensure that the positive phase and negative phase on times do not overlap. Figures 11.46 to 11.48 show examples of waveform generation in complementary PWM mode.

The positive phase/negative phase off timing is generated by a compare-match with the solid-line counter, and the on timing by a compare-match with the dotted-line counter operating with a delay of the dead time behind the solid-line counter. In the T1 period, compare-match **a** that turns off the negative phase has the highest priority, and compare-matches occurring prior to **a** are ignored. In the T2 period, compare-match **c** that turns off the positive phase has the highest priority, and compare-matches occurring prior to **c** are ignored.

In normal cases, compare-matches occur in the order **a** → **b** → **c** → **d** (or **c** → **d** → **a'** → **b'**), as shown in figure 11.46.

If compare-matches deviate from the **a** → **b** → **c** → **d** order, since the time for which the negative phase is off is less than twice the dead time, the figure shows the positive phase is not being turned on. If compare-matches deviate from the **c** → **d** → **a'** → **b'** order, since the time for which the positive phase is off is less than twice the dead time, the figure shows the negative phase is not being turned on.

If compare-match **c** occurs first following compare-match **a**, as shown in figure 11.47, compare-match **b** is ignored, and the negative phase is turned off by compare-match **d**. This is because turning off of the positive phase has priority due to the occurrence of compare-match **c** (positive phase off timing) before compare-match **b** (positive phase on timing) (consequently, the waveform does not change since the positive phase goes from off to off).

Similarly, in the example in figure 11.48, compare-match **a'** with the new data in the temporary register occurs before compare-match **c**, but other compare-matches occurring up to **c**, which turns off the positive phase, are ignored. As a result, the negative phase is not turned on.

Thus, in complementary PWM mode, compare-matches at turn-off timings take precedence, and turn-on timing compare-matches that occur before a turn-off timing compare-match are ignored.

Figure 11.46 Example of Complementary PWM Mode Waveform Output (1)

Figure 11.51 Example of Complementary PWM Mode 0% and 100% Waveform Output (3)

Figure 11.52 Example of Complementary PWM Mode 0% and 100% Waveform Output (4)

Figure 11.53 Example of Complementary PWM Mode 0% and 100% Waveform Output (5)

(k) Complementary PWM Mode 0% and 100% Duty Output

In complementary PWM mode, 0% and 100% duty cycles can be output as required. Figures 11.49 to 11.53 show output examples.

100% duty output is performed when the data register value is set to H'0000. The waveform in this case has a positive phase with a 100% on-state. 0% duty output is performed when the data register value is set to the same value as TGRA_3. The waveform in this case has a positive phase with a 100% off-state.

On and off compare-matches occur simultaneously, but if a turn-on compare-match and turn-off compare-match for the same phase occur simultaneously, both compare-matches are ignored and the waveform does not change.

(l) Toggle Output Synchronized with PWM Cycle

In complementary PWM mode, toggle output can be performed in synchronization with the PWM carrier cycle by setting the PSYE bit to 1 in the timer output control register (TOCR). An example of a toggle output waveform is shown in figure 11.54.

This output is toggled by a compare-match between TCNT_3 and TGRA_3 and a compare-match between TCNT4 and H'0000.

The output pin for this toggle output is the TIOC3A pin. The initial output is 1.

Figure 11.54 Example of Toggle Output Waveform Synchronized with PWM Output

(m) Counter Clearing by Another Channel

In complementary PWM mode, by setting a mode for synchronization with another channel by means of the timer synchronous register (TSYR), and selecting synchronous clearing with bits CCLR2 to CCLR0 in the timer control register (TCR), it is possible to have TCNT_3, TCNT_4, and TCNTS cleared by another channel.

Figure 11.55 illustrates the operation.

Use of this function enables counter clearing and restarting to be performed by means of an external signal.

Figure 11.55 Counter Clearing Synchronized with Another Channel

(n) Output Waveform Control at Synchronous Counter Clearing in Complementary PWM Mode

Setting the WRE bit in TWCR to 1 suppresses initial output when synchronous counter clearing occurs in the T_b interval at the trough in complementary PWM mode and controls abrupt change in duty cycle at synchronous counter clearing.

Initial output suppression is applicable only when synchronous clearing occurs in the T_b interval at the trough as indicated by (10) or (11) in figure 11.56. When synchronous clearing occurs outside that interval, the initial value specified by the OLS bits in TOCR is output. Even in the T_b interval at the trough, if synchronous clearing occurs in the initial value output period (indicated by (1) in figure 11.56) immediately after the counters start operation, initial value output is not suppressed.

When using the initial output suppression function, make sure to set compare registers TGRB_3, TGRA_4, and TGRB_4 to a value twice or more the setting of dead time data register TDDR. If synchronous clearing occurs with the compare registers set to a value less than twice the setting of TDDR, the PWM output dead time may be too short (or nonexistent) or illegal active-level PWM negative-phase output may occur during the initial output suppression interval. For details, see section 11.7.23, Notes on Output Waveform Control During Synchronous Counter Clearing in Complementary PWM Mode.

Figure 11.56 Timing for Synchronous Counter Clearing

- Example of Procedure for Setting Output Waveform Control at Synchronous Counter Clearing in Complementary PWM Mode

An example of the procedure for setting output waveform control at synchronous counter clearing in complementary PWM mode is shown in figure 11.57.

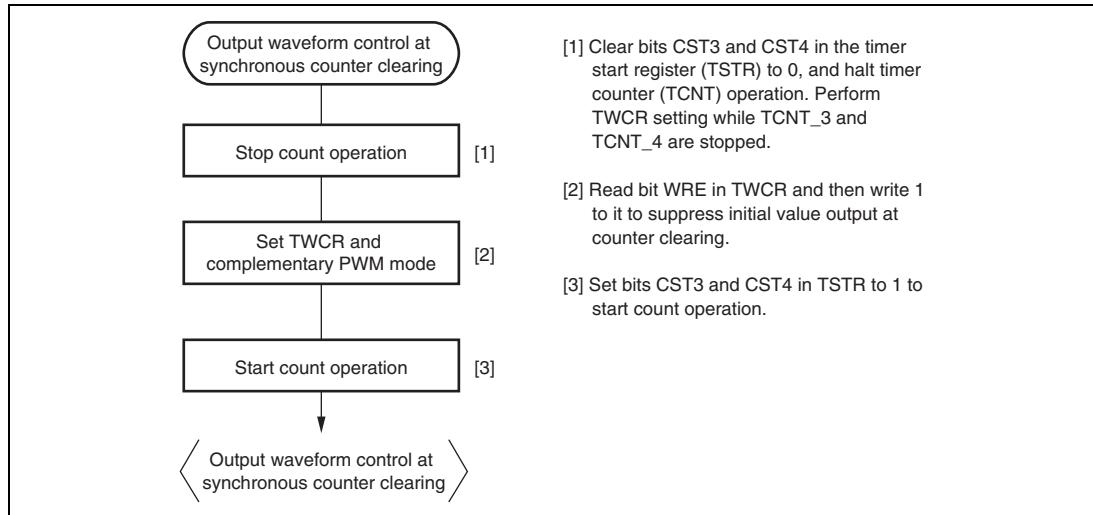

Figure 11.57 Example of Procedure for Setting Output Waveform Control at Synchronous Counter Clearing in Complementary PWM Mode

- Examples of Output Waveform Control at Synchronous Counter Clearing in Complementary PWM Mode

Figures 11.58 to 11.61 show examples of output waveform control in which this module operates in complementary PWM mode and synchronous counter clearing is generated while the WRE bit in TWCR is set to 1. In the examples shown in figures 11.58 to 11.61, synchronous counter clearing occurs at timing (3), (6), (8), and (11) shown in figure 11.56, respectively.

Figure 11.58 Example of Synchronous Clearing in Dead Time during Up-Counting (Timing (3) in Figure 11.56; Bit WRE of TWCR is 1)

**Figure 11.59 Example of Synchronous Clearing in Interval Tb at Crest

**Figure 11.61 Example of Synchronous Clearing in Interval Tb at Trough
(Timing (11) in Figure 11.56; Bit WRE of TWCR is 1)**

(o) Counter Clearing by TGRA_3 Compare Match

In complementary PWM mode, by setting the CCE bit in the timer waveform control register (TWCR), it is possible to have TCNT_3, TCNT_4, and TCNTS cleared by TGRA_3 compare match.

Figure 11.62 illustrates an operation example.

- Notes:
1. Use this function only in complementary PWM mode 1 (transfer at crest)
 2. Do not specify synchronous clearing by another channel (do not set the SYNC0 to SYNC4 bits in the timer synchronous register (TSYR) to 1).
 3. Do not set the PWM duty value to H'0000.
 4. Do not set the PSYE bit in timer output control register 1 (TOCR1) to 1.

Figure 11.62 Example of Counter Clearing Operation by TGRA_3 Compare Match

(p) Example of AC Synchronous Motor (Brushless DC Motor) Drive Waveform Output

In complementary PWM mode, a brushless DC motor can easily be controlled using the timer gate control register (TGCR). Figures 11.63 to 11.66 show examples of brushless DC motor drive waveforms created using TGCR.

When output phase switching for a 3-phase brushless DC motor is performed by means of external signals detected with a Hall element, etc., clear the FB bit in TGCR to 0. In this case, the external signals indicating the polarity position are input to channel 0 timer input pins TIOC0A, TIOC0B, and TIOC0C (set with the general I/O ports). When an edge is detected at pin TIOC0A, TIOC0B, or TIOC0C, the output on/off state is switched automatically.

When the FB bit is 1, the output on/off state is switched when the UF, VF, or WF bit in TGCR is cleared to 0 or set to 1.

The drive waveforms are output from the complementary PWM mode 6-phase output pins. With this 6-phase output, in the case of on output, it is possible to use complementary PWM mode output and perform chopping output by setting the N bit or P bit to 1. When the N bit or P bit is 0, level output is selected.

The 6-phase output active level (on output level) can be set with the OLSN and OLSP bits in the timer output control register (TOCR) regardless of the setting of the N and P bits.

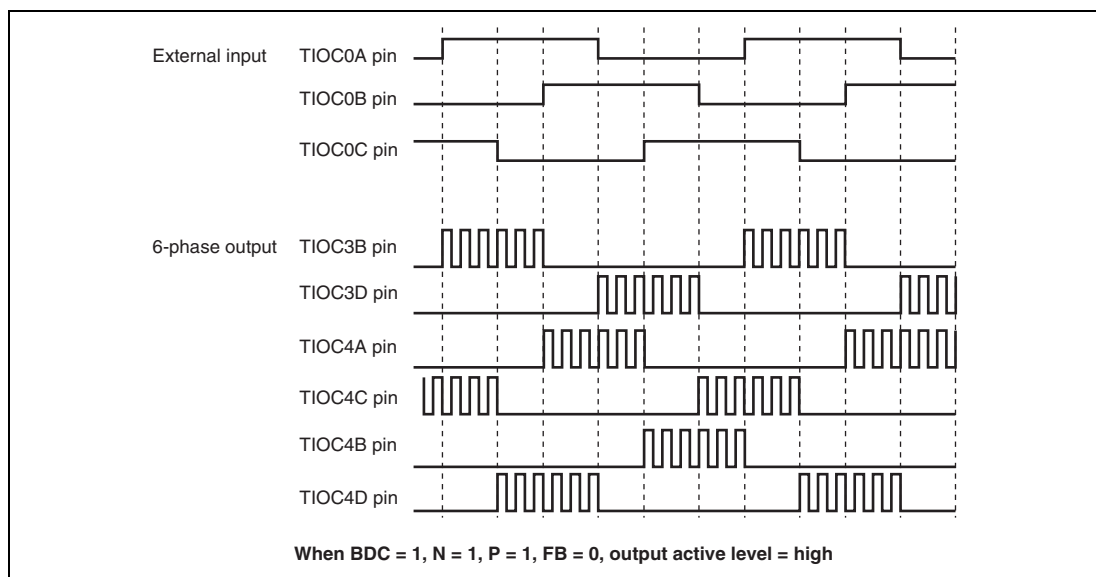

Figure 11.64 Example of Output Phase Switching by External Input (2)

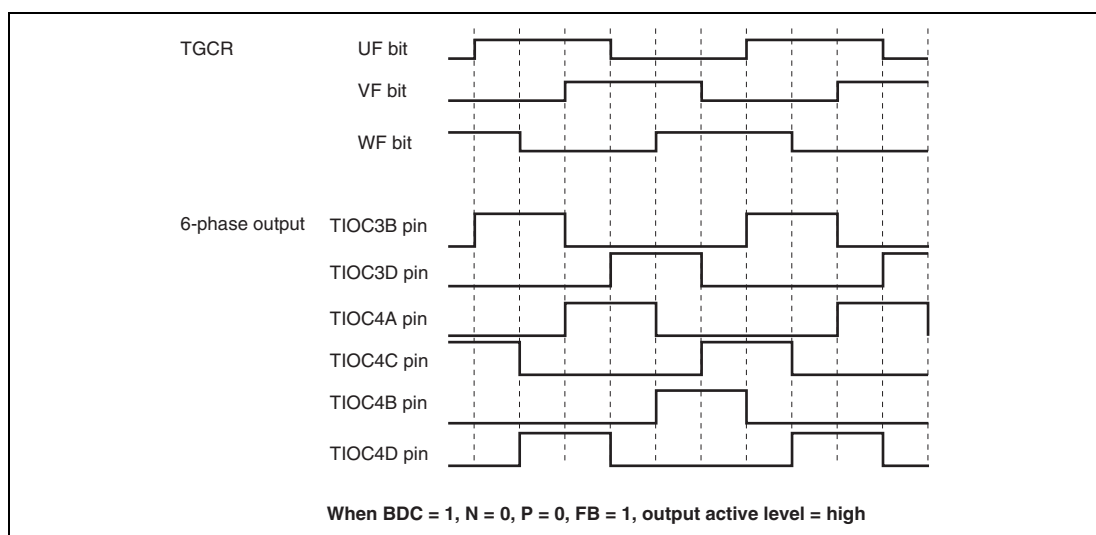

Figure 11.65 Example of Output Phase Switching by Means of UF, VF, WF Bit Settings (1)

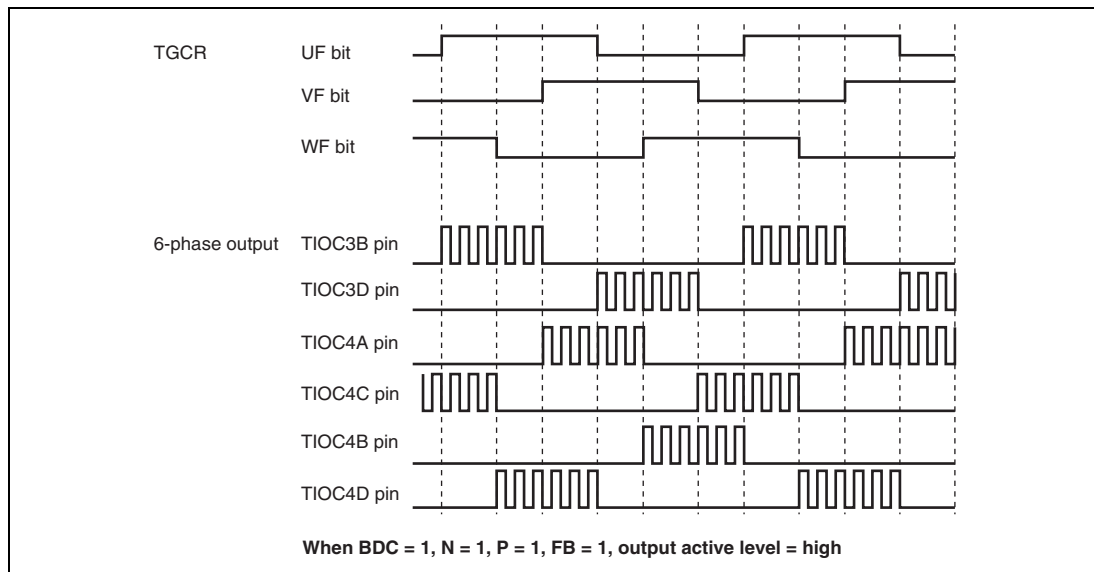

Figure 11.66 Example of Output Phase Switching by Means of UF, VF, WF Bit Settings (2)

(q) A/D Converter Start Request Setting

In complementary PWM mode, an A/D converter start request can be issued using a TGRA_3 compare-match, TCNT_4 underflow (trough), or compare-match on a channel other than channels 3 and 4.

When start requests using a TGRA_3 compare-match are specified, A/D conversion can be started at the crest of the TCNT_3 count.

A/D converter start requests can be set by setting the TTGE bit to 1 in the timer interrupt enable register (TIER). To issue an A/D converter start request at a TCNT_4 underflow (trough), set the TTGE2 bit in TIER_4 to 1.

(3) Interrupt Skipping in Complementary PWM Mode

Interrupts TGIA_3 (at the crest) and TCIV_4 (at the trough) in channels 3 and 4 can be skipped up to seven times by making settings in the timer interrupt skipping set register (TITCR).

Transfers from a buffer register to a temporary register or a compare register can be skipped in coordination with interrupt skipping by making settings in the timer buffer transfer register (TBTER). For the linkage with buffer registers, refer to description (c), Buffer Transfer Control Linked with Interrupt Skipping, below.

A/D converter start requests generated by the A/D converter start request delaying function can also be skipped in coordination with interrupt skipping by making settings in the timer A/D converter request control register (TADCR). For the linkage with the A/D converter start request delaying function, refer to section 11.4.9, A/D Converter Start Request Delaying Function.

The setting of the timer interrupt skipping setting register (TITCR) must be done while the TGIA_3 and TCIV_4 interrupt requests are disabled by the settings of TIER_3 and TIER_4 along with under the conditions in which TGFA_3 and TCFV_4 flag settings by compare match never occur. Before changing the skipping count, be sure to clear the T3AEN and T4VEN bits to 0 to clear the skipping counter.

(a) Example of Interrupt Skipping Operation Setting Procedure

Figure 11.67 shows an example of the interrupt skipping operation setting procedure. Figure 11.68 shows the periods during which interrupt skipping count can be changed.

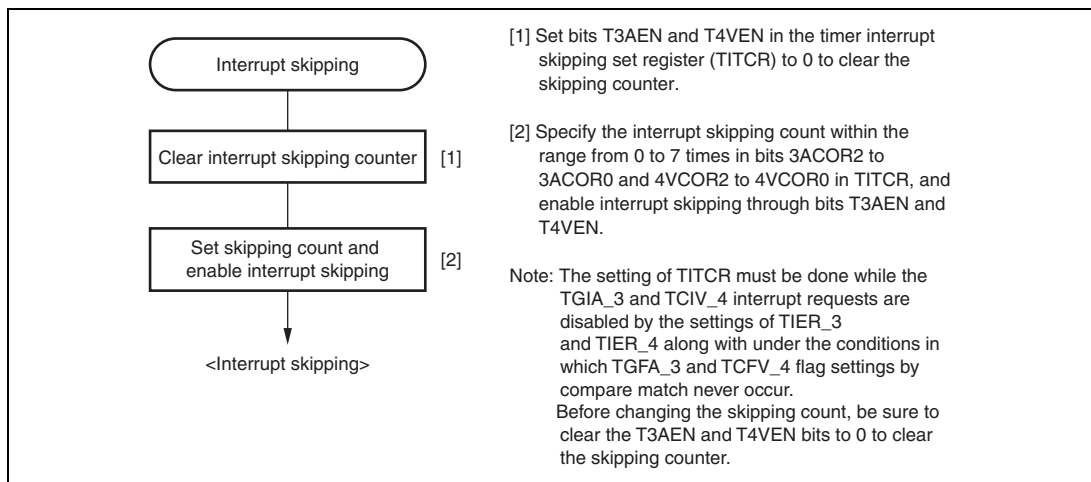

Figure 11.67 Example of Interrupt Skipping Operation Setting Procedure

Figure 11.68 Periods during which Interrupt Skipping Count can be Changed

(b) Example of Interrupt Skipping Operation

Figure 11.69 shows an example of TGIA_3 interrupt skipping in which the interrupt skipping count is set to three by the 3ACOR bit and the T3AEN bit is set to 1 in the timer interrupt skipping set register (TITCR).

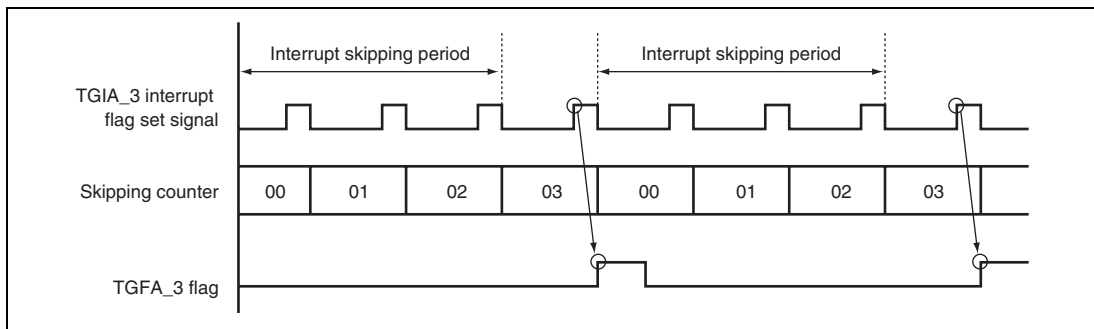

Figure 11.69 Example of Interrupt Skipping Operation

(c) Buffer Transfer Control Linked with Interrupt Skipping

In complementary PWM mode, whether to transfer data from a buffer register to a temporary register and whether to link the transfer with interrupt skipping can be specified with the BTE1 and BTE0 bits in the timer buffer transfer set register (TBTER).

Figure 11.70 shows an example of operation when buffer transfer is suppressed (BTE1 = 0 and BTE0 = 1). While this setting is valid, data is not transferred from the buffer register to the temporary register.

Figure 11.71 shows an example of operation when buffer transfer is linked with interrupt skipping (BTE1 = 1 and BTE0 = 0). While this setting is valid, data is not transferred from the buffer register to the temporary register outside the buffer transfer-enabled period. Depending on the rewrite timing from the interrupt generation to the buffer register, there are two types of the transfer timing such as from the buffer register to the temporary register and from the temporary register to the general register.

Note that the buffer transfer-enabled period depends on the T3AEN and T4VEN bit settings in the timer interrupt skipping set register (TITCR). Figure 11.72 shows the relationship between the T3AEN and T4VEN bit settings in TITCR and buffer transfer-enabled period.

Note: This function must always be used in combination with interrupt skipping. When interrupt skipping is disabled (the T3AEN and T4VEN bits in the timer interrupt skipping set register (TITCR) are cleared to 0 or the skipping count set bits (3ACOR and 4VCOR) in TITCR are cleared to 0), make sure that buffer transfer is not linked with interrupt skipping (clear the BTE1 bit in the timer buffer transfer set register (TBTER) to 0). If buffer transfer is linked with interrupt skipping while interrupt skipping is disabled, buffer transfer is never performed.

Figure 11.70 Example of Operation when Buffer Transfer is Suppressed (BTE1 = 0 and BTE0 = 1)

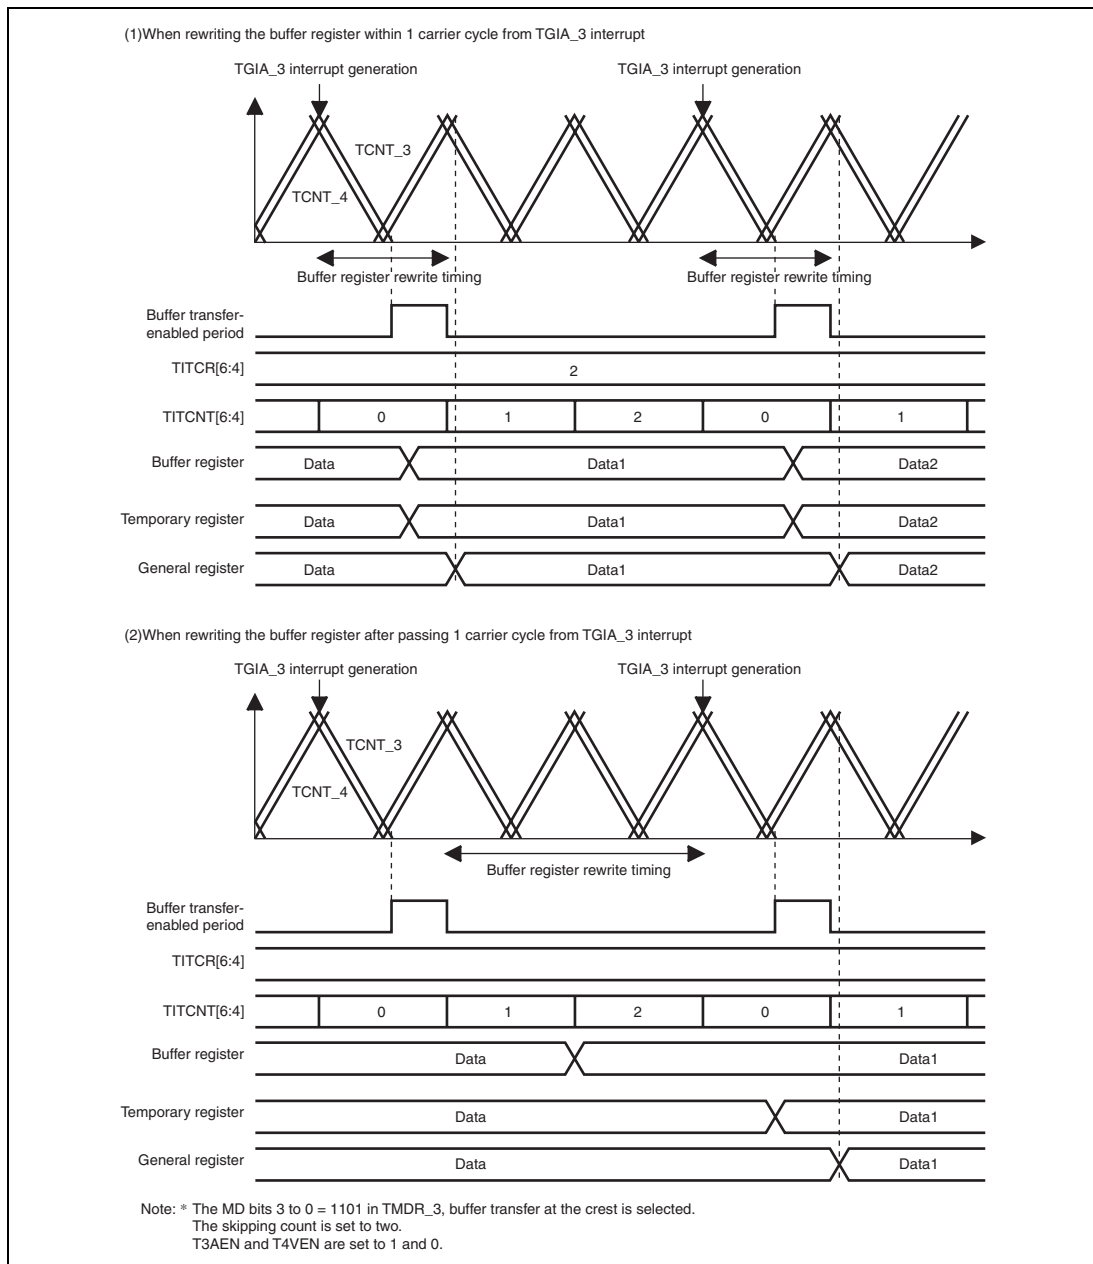

Figure 11.71 Example of Operation when Buffer Transfer is Linked with Interrupt Skipping (BTE1 = 1 and BTE0 = 0)

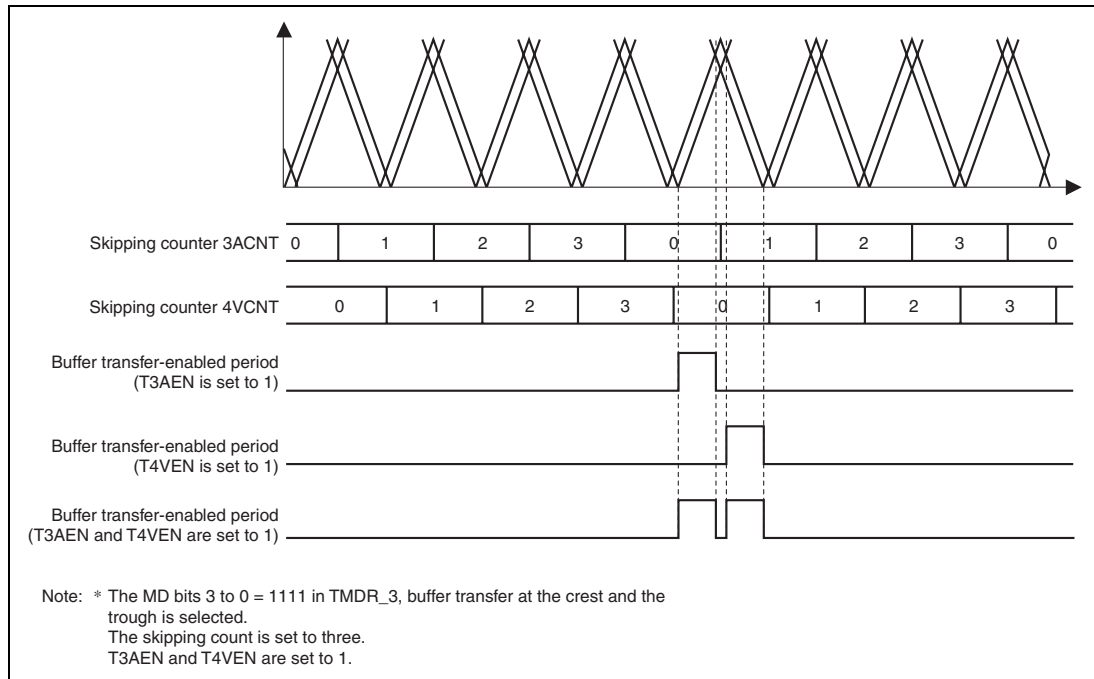

Figure 11.72 Relationship between Bits T3AEN and T4VEN in TITCR and Buffer Transfer-Enabled Period

(4) Complementary PWM Mode Output Protection Function

Complementary PWM mode output has the following protection function.

(a) Register and counter miswrite prevention function

With the exception of the buffer registers, which can be rewritten at any time, access by the CPU can be enabled or disabled for the mode registers, control registers, compare registers, and counters used in complementary PWM mode by means of the RWE bit in the timer read/write enable register (TRWER). The applicable registers are some (21 in total) of the registers in channels 3 and 4 shown in the following:

- TCR_3 and TCR_4, TMDR_3 and TMDR_4, TIORH_3 and TIORH_4, TIORL_3 and TIORL_4, TIER_3 and TIER_4, TCNT_3 and TCNT_4, TGRA_3 and TGRA_4, TGRB_3 and TGRB_4, TOER, TOCR, TGCR, TCDR, and TDDR.

This function enables miswriting due to CPU runaway to be prevented by disabling CPU access to the mode registers, control registers, and counters. When the applicable registers are read in the access-disabled state, undefined values are returned. Writing to these registers is ignored.

11.4.9 A/D Converter Start Request Delaying Function

A/D converter start requests can be issued in channel 4 by making settings in the timer A/D converter start request control register (TADCR), timer A/D converter start request cycle set registers (TADCORA_4 and TADCORB_4), and timer A/D converter start request cycle set buffer registers (TADCOBRA_4 and TADCOBRB_4).

The A/D converter start request delaying function compares TCNT_4 with TADCORA_4 or TADCORB_4, and when their values match, the function issues a respective A/D converter start request (TRG4AN or TRG4BN).

A/D converter start requests (TRG4AN and TRG4BN) can be skipped in coordination with interrupt skipping by setting the ITA3AE, ITA4VE, ITB3AE, and ITB4VE bits in TADCR.

- Example of Procedure for Specifying A/D Converter Start Request Delaying Function

Figure 11.73 shows an example of procedure for specifying the A/D converter start request delaying function.

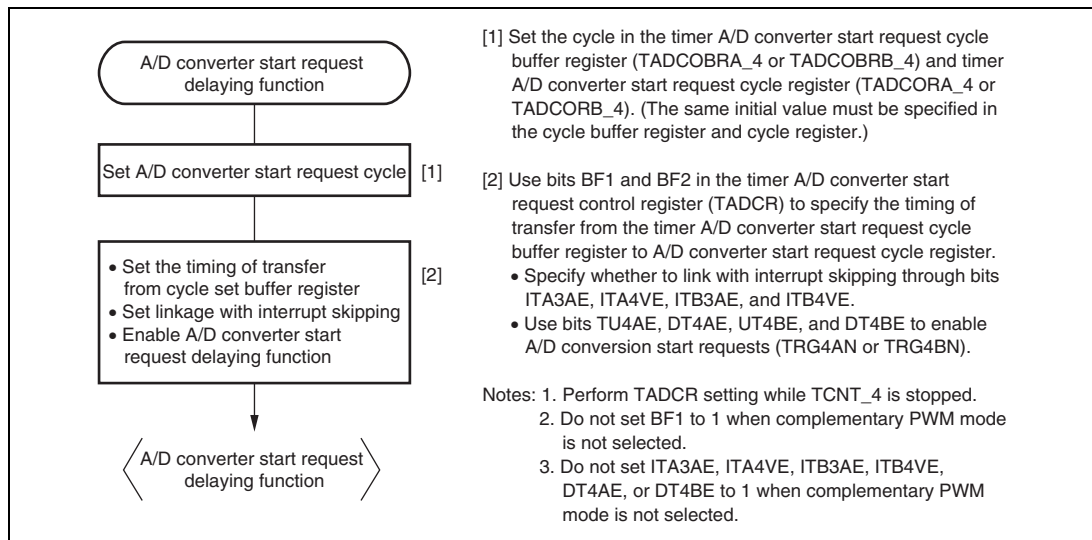

Figure 11.73 Example of Procedure for Specifying A/D Converter Start Request Delaying Function

- Basic Operation Example of A/D Converter Start Request Delaying Function

Figure 11.74 shows a basic example of A/D converter request signal (TRG4AN) operation when the trough of TCNT_4 is specified for the buffer transfer timing and an A/D converter start request signal is output during TCNT_4 down-counting.

Figure 11.74 Basic Example of A/D Converter Start Request Signal (TRG4AN) Operation

- Buffer Transfer

The data in the timer A/D converter start request cycle set registers (TADCORA_4 and TADCORB_4) is updated by writing data to the timer A/D converter start request cycle set buffer registers (TADCOBRA_4 and TADCOBRB_4). Data is transferred from the buffer registers to the respective cycle set registers at the timing selected with the BF1 and BF0 bits in the timer A/D converter start request control register (TADCR_4).

- A/D Converter Start Request Delaying Function Linked with Interrupt Skipping

A/D converter start requests (TRG4AN and TRG4BN) can be issued in coordination with interrupt skipping by making settings in the ITA3AE, ITA4VE, ITB3AE, and ITB4VE bits in the timer A/D converter start request control register (TADCR).

Figure 11.75 shows an example of A/D converter start request signal (TRG4AN) operation when TRG4AN output is enabled during TCNT_4 up counting and down counting and A/D converter start requests are linked with interrupt skipping.

Figure 11.76 shows another example of A/D converter start request signal (TRG4AN) operation when TRG4AN output is enabled during TCNT_4 up counting and A/D converter start requests are linked with interrupt skipping.

Note: This function must be used in combination with interrupt skipping.
 When interrupt skipping is disabled (the T3AEN and T4VEN bits in the timer interrupt skipping set register (TITCR) are cleared to 0 or the skipping count set bits (3ACOR and 4VCOR) in TITCR are cleared to 0), make sure that A/D converter start requests are not linked with interrupt skipping (clear the ITA3AE, ITA4VE, ITB3AE, and ITB4VE bits in the timer A/D converter start request control register (TADCR) to 0).

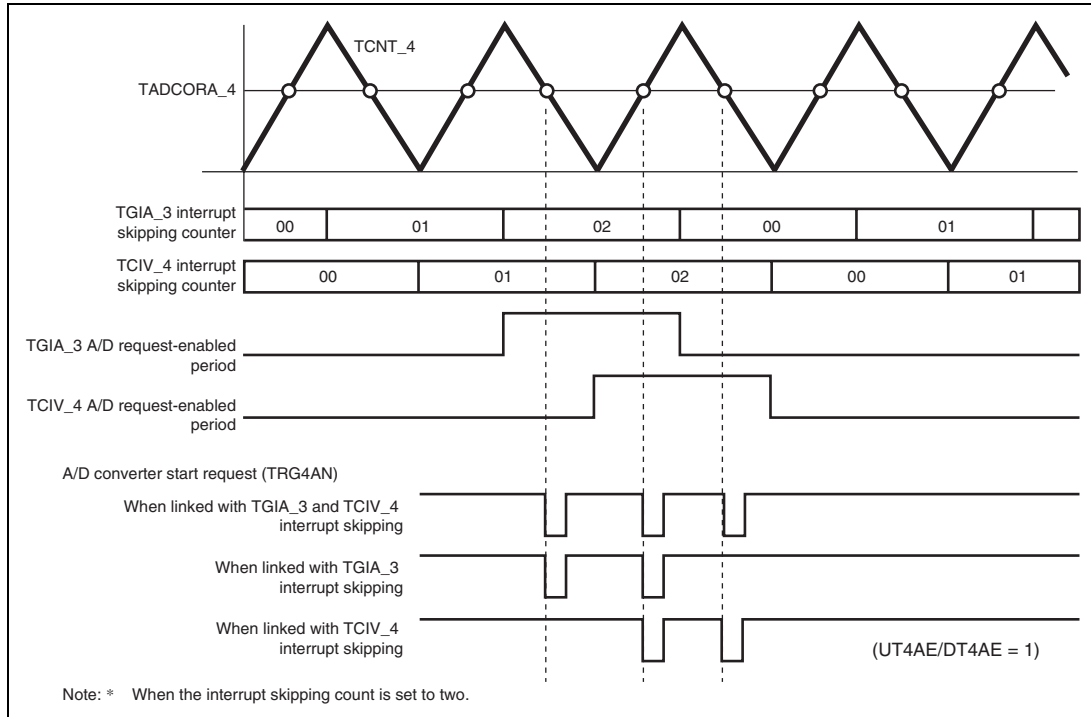

Figure 11.75 Example of A/D Converter Start Request Signal (TRG4AN) Operation Linked with Interrupt Skipping

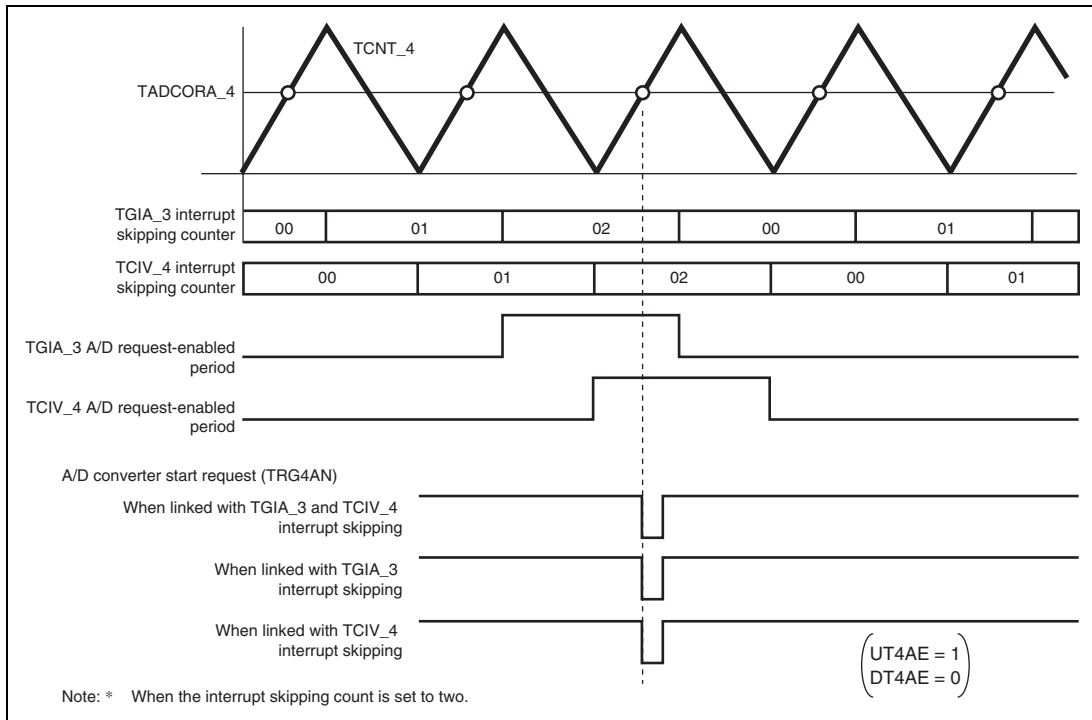

Figure 11.76 Example of A/D Converter Start Request Signal (TRG4AN) Operation Linked with Interrupt Skipping

11.4.10 TCNT Capture at Crest and/or Trough in Complementary PWM Operation

The TCNT value is captured in TGR at either the crest or trough or at both the crest and trough during complementary PWM operation. The timing for capturing in TGR can be selected by TIOR.

Figure 11.77 shows an example in which TCNT is used as a free-running counter without being cleared, and the TCNT value is captured in TGR at the specified timing (either crest or trough, or both crest and trough).

Figure 11.77 TCNT Capturing at Crest and/or Trough in Complementary PWM Operation

11.5 Interrupt Sources

11.5.1 Interrupt Sources and Priorities

This module has three kinds of interrupt sources; TGR input capture/compare match, TCNT overflow, and TCNT underflow. Each interrupt source has its own status flag and enable/disable bit, allowing the generation of interrupt request signals to be enabled or disabled individually.

When an interrupt request is generated, the corresponding status flag in TSR is set to 1. If the corresponding enable/disable bit in TIER is set to 1 at this time, an interrupt is requested. The interrupt request is cleared by clearing the status flag to 0.

Relative channel priorities can be changed by the interrupt controller, however the priority order within a channel is fixed. For details, see section 7, Interrupt Controller.

Table 11.55 lists the interrupt sources of this module.

Table 11.55 Interrupts of Multi-Function Timer Pulse Unit 2

Channel	Name	Interrupt Source	Interrupt Flag	Activation of Direct Memory Access Controller	Priority
0	TGIA_0	TGRA_0 input capture/compare match	TGFA_0	Possible	High ↑ ↓ Low
	TGIB_0	TGRB_0 input capture/compare match	TGFB_0	Not possible	
	TGIC_0	TGRC_0 input capture/compare match	TGFC_0	Not possible	
	TGID_0	TGRD_0 input capture/compare match	TGFD_0	Not possible	
	TCIV_0	TCNT_0 overflow	TCFV_0	Not possible	
	TGIE_0	TGRE_0 compare match	TGFE_0	Not possible	
	TGIF_0	TGRF_0 compare match	TGFF_0	Not possible	
1	TGIA_1	TGRA_1 input capture/compare match	TGFA_1	Possible	
	TGIB_1	TGRB_1 input capture/compare match	TGFB_1	Not possible	
	TCIV_1	TCNT_1 overflow	TCFV_1	Not possible	
	TCIU_1	TCNT_1 underflow	TCFU_1	Not possible	

Channel	Name	Interrupt Source	Interrupt Flag	Activation of Direct Memory Access Controller	Priority
2	TGIA_2	TGRA_2 input capture/compare match	TGFA_2	Possible	High ↑
	TGIB_2	TGRB_2 input capture/compare match	TGFB_2	Not possible	
	TCIV_2	TCNT_2 overflow	TCFV_2	Not possible	
	TCIU_2	TCNT_2 underflow	TCFU_2	Not possible	
3	TGIA_3	TGRA_3 input capture/compare match	TGFA_3	Possible	↓
	TGIB_3	TGRB_3 input capture/compare match	TGFB_3	Not possible	
	TGIC_3	TGRC_3 input capture/compare match	TGFC_3	Not possible	
	TGID_3	TGRD_3 input capture/compare match	TGFD_3	Not possible	
	TCIV_3	TCNT_3 overflow	TCFV_3	Not possible	
4	TGIA_4	TGRA_4 input capture/compare match	TGFA_4	Possible	Low
	TGIB_4	TGRB_4 input capture/compare match	TGFB_4	Not possible	
	TGIC_4	TGRC_4 input capture/compare match	TGFC_4	Not possible	
	TGID_4	TGRD_4 input capture/compare match	TGFD_4	Not possible	
	TCIV_4	TCNT_4 overflow/underflow	TCFV_4	Not possible	

Note: This table shows the initial state immediately after a reset. The relative channel priorities can be changed by the interrupt controller.

(1) Input Capture/Compare Match Interrupt

An interrupt is requested if the TGIE bit in TIER is set to 1 when the TGF flag in TSR is set to 1 by the occurrence of a TGR input capture/compare match on a particular channel. The interrupt request is cleared by clearing the TGF flag to 0. This module has eighteen input capture/compare match interrupts, six for channel 0, four each for channels 3 and 4, and two each for channels 1 and 2. The TGFE_0 and TGFF_0 flags in channel 0 are not set by the occurrence of an input capture.

(2) Overflow Interrupt

An interrupt is requested if the TCIEV bit in TIER is set to 1 when the TCFV flag in TSR is set to 1 by the occurrence of TCNT overflow on a channel. The interrupt request is cleared by clearing the TCFV flag to 0. This module has five overflow interrupts, one for each channel.

(3) Underflow Interrupt

An interrupt is requested if the TCIEU bit in TIER is set to 1 when the TCFU flag in TSR is set to 1 by the occurrence of TCNT underflow on a channel. The interrupt request is cleared by clearing the TCFU flag to 0. This module has two underflow interrupts, one each for channels 1 and 2.

11.5.2 Activation of Direct Memory Access Controller

The direct memory access controller can be activated by the TGRA input capture/compare match interrupt in each channel. For details, see section 10, Direct Memory Access Controller.

In this module, a total of five TGRA input capture/compare match interrupts can be used as direct memory access controller activation sources, one each for channels 0 to 4.

11.5.3 A/D Converter Activation

The A/D converter can be activated by one of the following three methods in this module. Table 11.56 shows the relationship between interrupt sources and A/D converter start request signals.

(1) A/D Converter Activation by TGRA Input Capture/Compare Match or at TCNT_4 Trough in Complementary PWM Mode

The A/D converter can be activated by the occurrence of a TGRA input capture/compare match in each channel. In addition, if complementary PWM operation is performed while the TTGE2 bit in TIER_4 is set to 1, the A/D converter can be activated at the trough of TCNT_4 count (TCNT_4 = H'0000).

A/D converter start request signal TRGAN is issued to the A/D converter under either one of the following conditions.

- When the TGFA flag in TSR is set to 1 by the occurrence of a TGRA input capture/compare match on a particular channel while the TTGE bit in TIER is set to 1
- When the TCNT_4 count reaches the trough (TCNT_4 = H'0000) during complementary PWM operation while the TTGE2 bit in TIER_4 is set to 1

When either condition is satisfied, if A/D converter start signal TRGAN from this module is selected as the trigger in the A/D converter, A/D conversion will start.

(2) A/D Converter Activation by Compare Match between TCNT_0 and TGRE_0

The A/D converter can be activated by generating A/D converter start request signal TRG0N when a compare match occurs between TCNT_0 and TGRE_0 in channel 0.

When the TGFE flag in TSR2_0 is set to 1 by the occurrence of a compare match between TCNT_0 and TGRE_0 in channel 0 while the TTGE2 bit in TIER2_0 is set to 1, A/D converter start request TGR0N is issued to the A/D converter. If A/D converter start signal TGR0N from this module is selected as the trigger in the A/D converter, A/D conversion will start.

(3) A/D Converter Activation by A/D Converter Start Request Delaying Function

The A/D converter can be activated by generating A/D converter start request signal TRG4AN or TRG4BN when the TCNT_4 count matches the TADCORA or TADCORB value if the UT4AE, DT4AE, UT4BE, or DT4BE bit in the A/D converter start request control register (TADCR) is set to 1. For details, refer to section 11.4.9, A/D Converter Start Request Delaying Function.

A/D conversion will start if A/D converter start signal TRG4AN from this module is selected as the trigger in the A/D converter when TRG4AN is generated or if TRG4BN from this module is selected as the trigger in the A/D converter when TRG4BN is generated.

Table 11.56 Interrupt Sources and A/D Converter Start Request Signals

Target Registers	Interrupt Source	A/D Converter Start Request Signal
TGRA_0 and TCNT_0	Input capture/compare match	TRGAN
TGRA_1 and TCNT_1		
TGRA_2 and TCNT_2		
TGRA_3 and TCNT_3		
TGRA_4 and TCNT_4		
TCNT_4		
TGRE_0 and TCNT_0	Compare match	TRG0N
TADCORA and TCNT_4		TRG4AN
TADCORB and TCNT_4		TRG4BN

11.6 Operation Timing

11.6.1 Input/Output Timing

(1) TCNT Count Timing

Figure 11.78 shows TCNT count timing in internal clock operation, and Figure 11.79 shows TCNT count timing in external clock operation (normal mode), and Figure 11.80 shows TCNT count timing in external clock operation (phase counting mode).

Figure 11.78 Count Timing in Internal Clock Operation

Figure 11.79 Count Timing in External Clock Operation

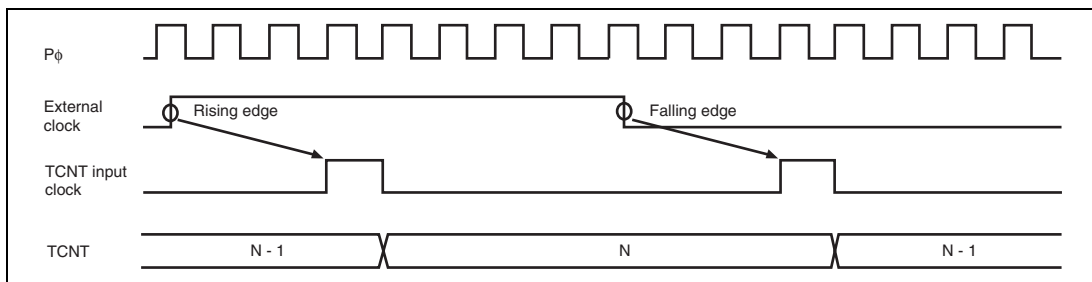

Figure 11.80 Count Timing in External Clock Operation (Phase Counting Mode)

(2) Output Compare Output Timing

A compare match signal is generated in the final state in which TCNT and TGR match (the point at which the count value matched by TCNT is updated). When a compare match signal is generated, the output value set in TIOR is output at the output compare output pin (TIOC pin). After a match between TCNT and TGR, the compare match signal is not generated until the TCNT input clock is generated.

Figure 11.81 shows output compare output timing (normal mode and PWM mode) and Figure 11.82 shows output compare output timing (complementary PWM mode and reset synchronous PWM mode).

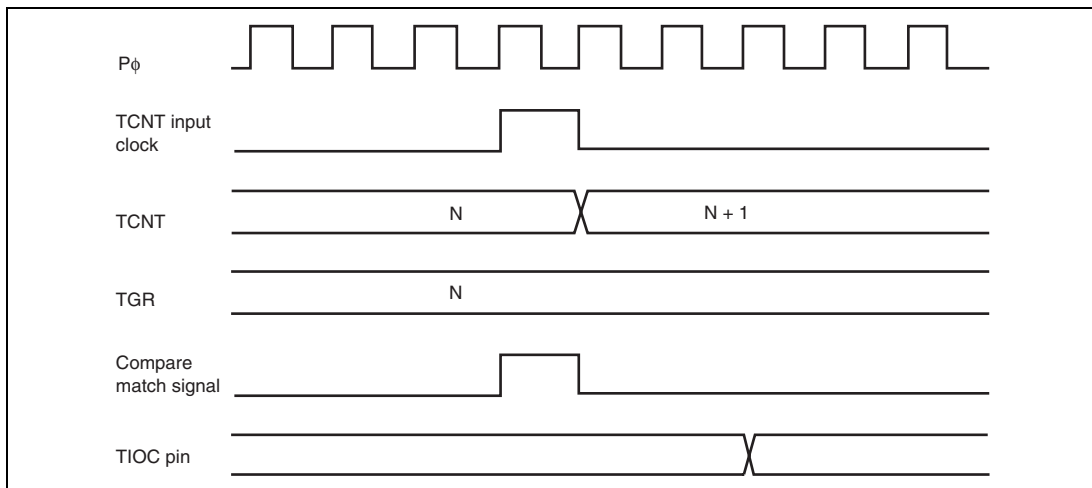

Figure 11.81 Output Compare Output Timing (Normal Mode/PWM Mode)

**Figure 11.82 Output Compare Output Timing
(Complementary PWM Mode/Reset Synchronous PWM Mode)**

(3) Input Capture Signal Timing

Figure 11.83 shows input capture signal timing.

Figure 11.83 Input Capture Input Signal Timing

(4) Timing for Counter Clearing by Compare Match/Input Capture

Figure 11.84 shows the timing when counter clearing on compare match is specified, and Figure 11.85 shows the timing when counter clearing on input capture is specified.

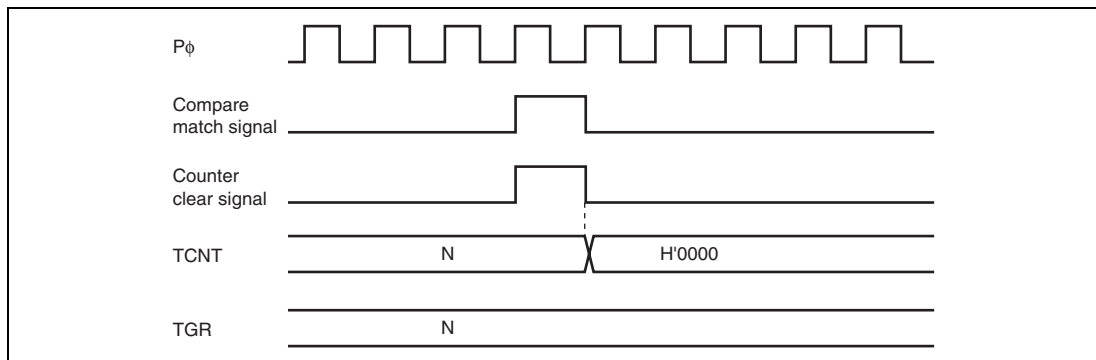

Figure 11.84 Counter Clear Timing (Compare Match)

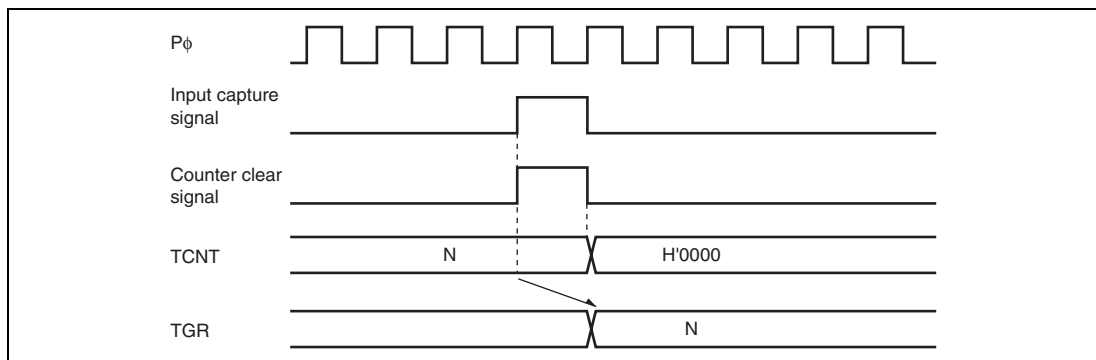

Figure 11.85 Counter Clear Timing (Input Capture)

(5) Buffer Operation Timing

Figures 11.86 to 11.88 show the timing in buffer operation.

Figure 11.86 Buffer Operation Timing (Compare Match)

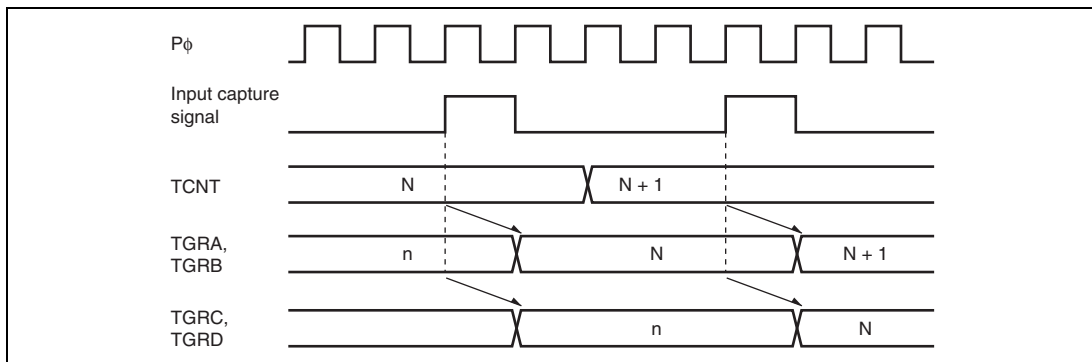

Figure 11.87 Buffer Operation Timing (Input Capture)

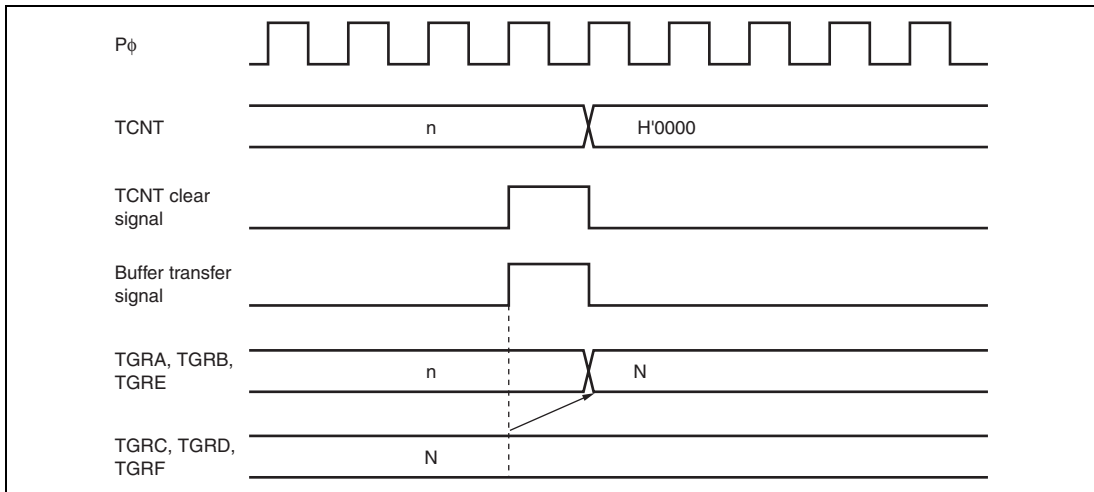

Figure 11.88 Buffer Transfer Timing (when TCNT Cleared)

(6) Buffer Transfer Timing (Complementary PWM Mode)

Figures 11.89 to 11.91 show the buffer transfer timing in complementary PWM mode.

Figure 11.89 Transfer Timing from Buffer Register to Temporary Register (TCNTS Stop)

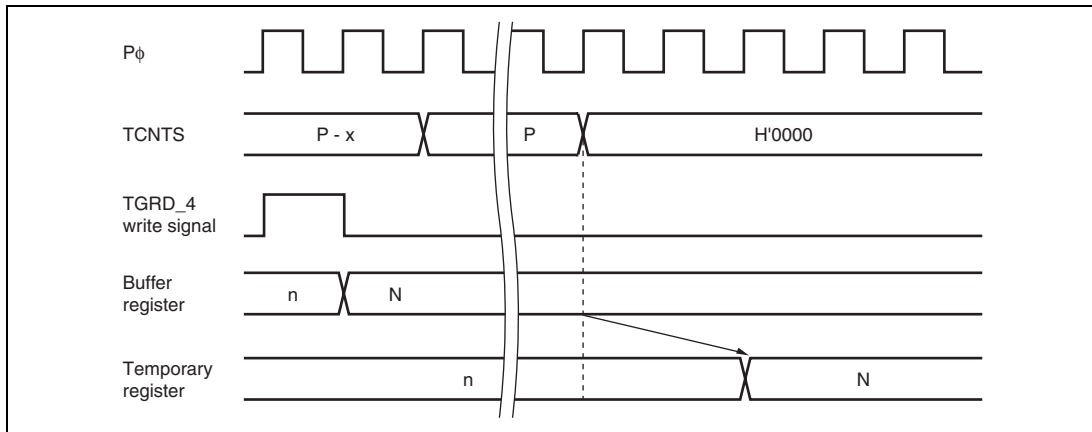

Figure 11.90 Transfer Timing from Buffer Register to Temporary Register (TCNTS Operating)

Figure 11.91 Transfer Timing from Temporary Register to Compare Register

11.6.2 Interrupt Signal Timing

(1) TGF Flag Setting Timing in Case of Compare Match

Figure 11.92 shows the timing for setting of the TGF flag in TSR on compare match, and TGI interrupt request signal timing.

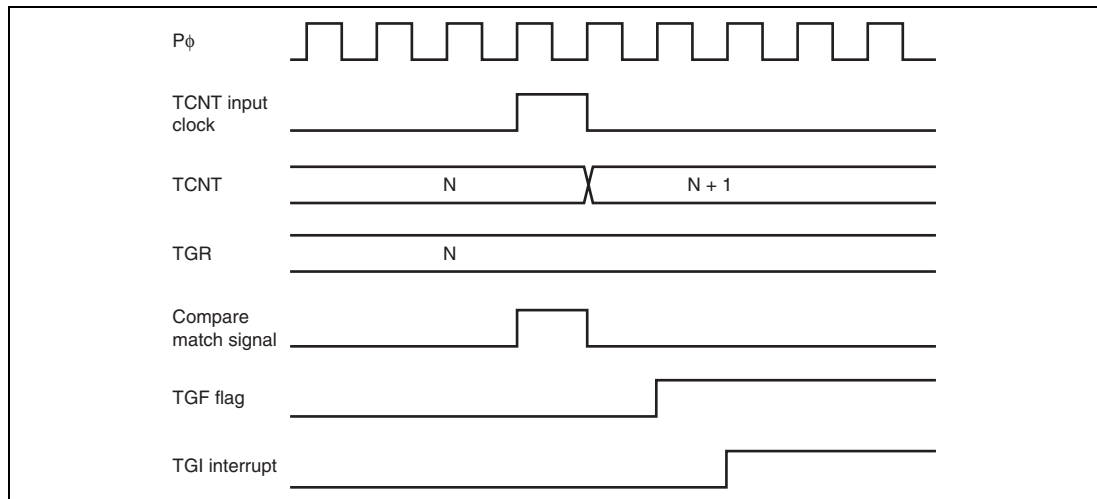

Figure 11.92 TGI Interrupt Timing (Compare Match)

(2) TGF Flag Setting Timing in Case of Input Capture

Figure 11.93 shows the timing for setting of the TGF flag in TSR on input capture, and TGI interrupt request signal timing.

Figure 11.93 TGI Interrupt Timing (Input Capture)

(3) TCFV Flag/TCFU Flag Setting Timing

Figure 11.94 shows the timing for setting of the TCFV flag in TSR on overflow, and TCIV interrupt request signal timing.

Figure 11.95 shows the timing for setting of the TCFU flag in TSR on underflow, and TCIU interrupt request signal timing.

Figure 11.94 TCIV Interrupt Setting Timing

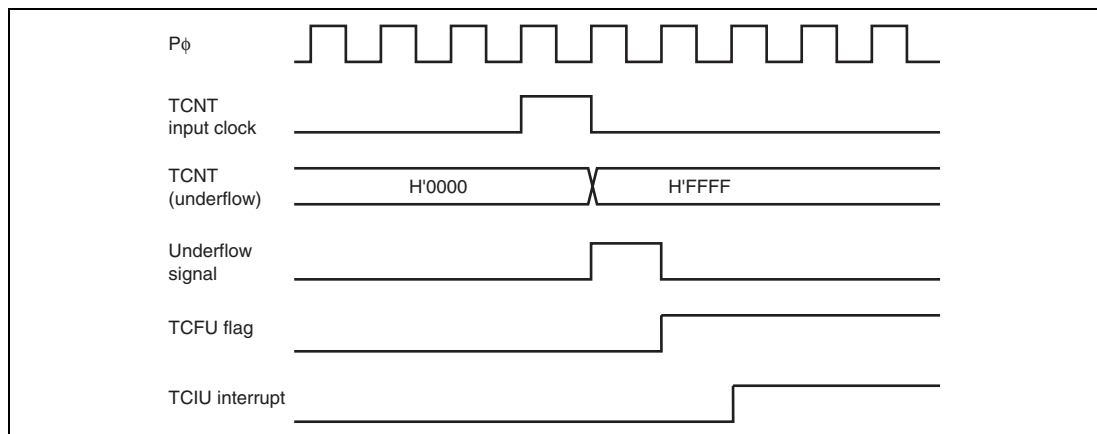

Figure 11.95 TCIU Interrupt Setting Timing

(4) Status Flag Clearing Timing

After a status flag is read as 1 by the CPU, it is cleared by writing 0 to it. When the direct memory access controller is activated, the flag is cleared automatically. Figure 11.96 shows the timing for status flag clearing by the CPU, and Figure 11.97 shows the timing for status flag clearing by the direct memory access controller.

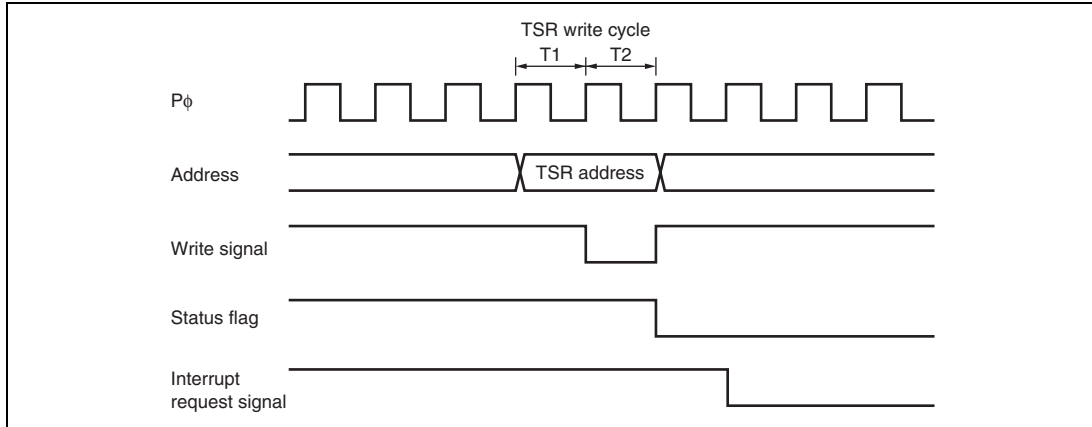

Figure 11.96 Timing for Status Flag Clearing by CPU

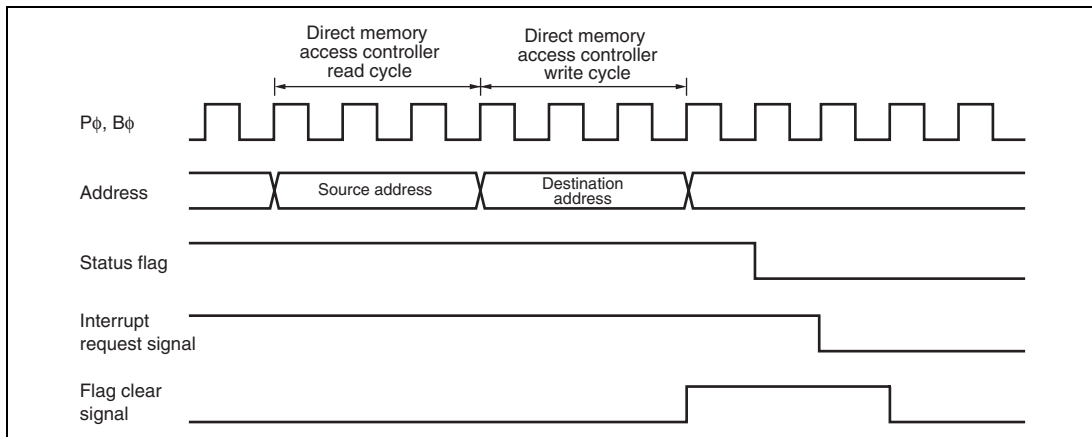

Figure 11.97 Timing for Status Flag Clearing by Direct Memory Access Controller Activation

11.7 Usage Notes

11.7.1 Module Standby Mode Setting

Operation of this module can be disabled or enabled using the standby control register. The initial setting is for the operation to be halted. Register access is enabled by clearing module standby mode. For details, refer to section 33, Power-Down Modes.

11.7.2 Input Clock Restrictions

The input clock pulse width must be at least 1.5 states in the case of single-edge detection, and at least 2.5 states in the case of both-edge detection. This module will not operate properly at narrower pulse widths.

In phase counting mode, the phase difference and overlap between the two input clocks must be at least 1.5 states, and the pulse width must be at least 2.5 states. Figure 11.98 shows the input clock conditions in phase counting mode.

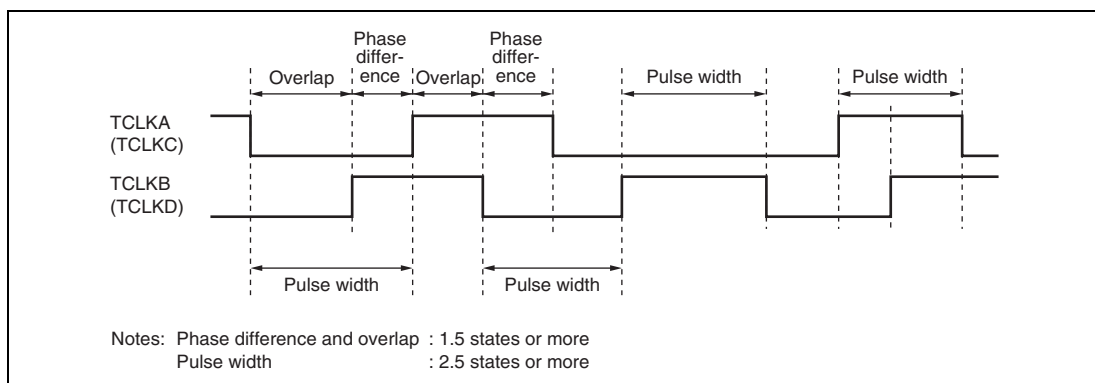

Figure 11.98 Phase Difference, Overlap, and Pulse Width in Phase Counting Mode

11.7.3 Caution on Period Setting

When counter clearing on compare match is set, TCNT is cleared in the final state in which it matches the TGR value (the point at which the count value matched by TCNT is updated). Consequently, the actual counter frequency is given by the following formula:

$$f = \frac{P\phi}{(N + 1)}$$

Where f: Counter frequency
 Pφ: Peripheral clock operating frequency
 N: TGR set value

11.7.4 Contention between TCNT Write and Clear Operations

If the counter clear signal is generated in the T2 state of a TCNT write cycle, TCNT clearing takes precedence and the TCNT write is not performed.

Figure 11.99 shows the timing in this case.

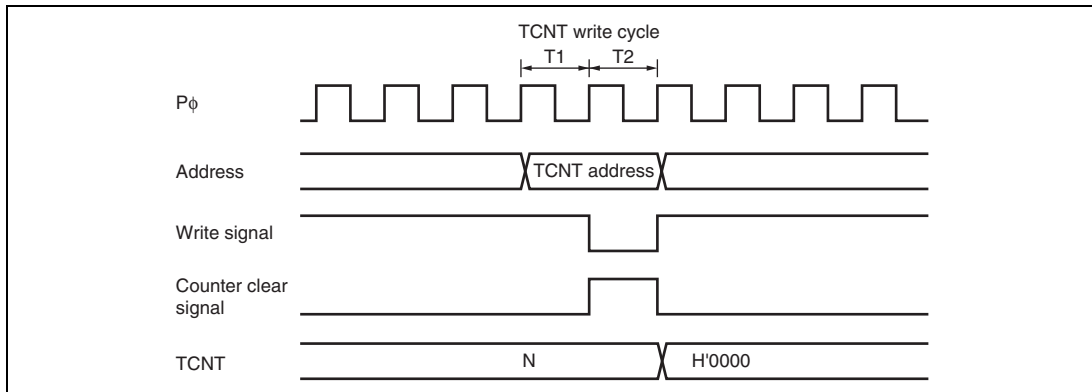

Figure 11.99 Contention between TCNT Write and Clear Operations

11.7.5 Contention between TCNT Write and Increment Operations

If incrementing occurs in the T2 state of a TCNT write cycle, the TCNT write takes precedence and TCNT is not incremented.

Figure 11.100 shows the timing in this case.

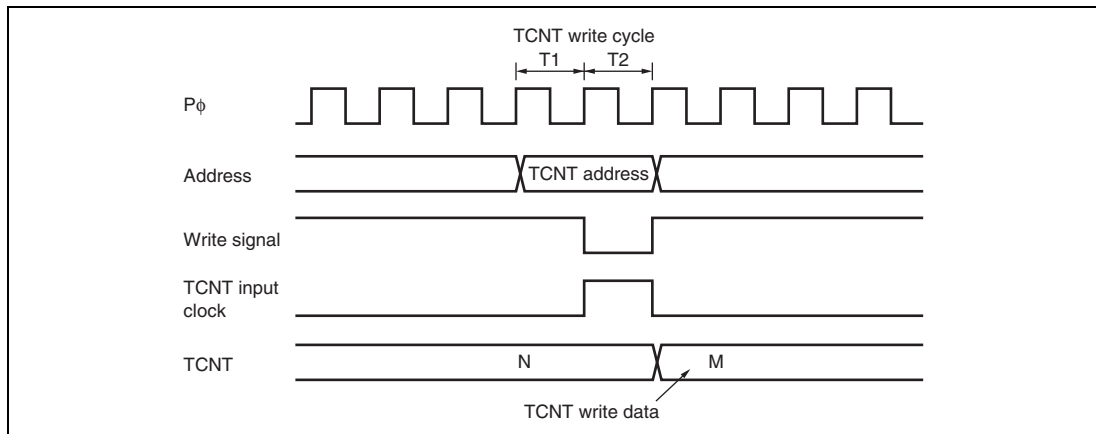

Figure 11.100 Contention between TCNT Write and Increment Operations

11.7.6 Contention between TGR Write and Compare Match

If a compare match occurs in the T2 state of a TGR write cycle, the TGR write is executed and the compare match signal is also generated.

Figure 11.101 shows the timing in this case.

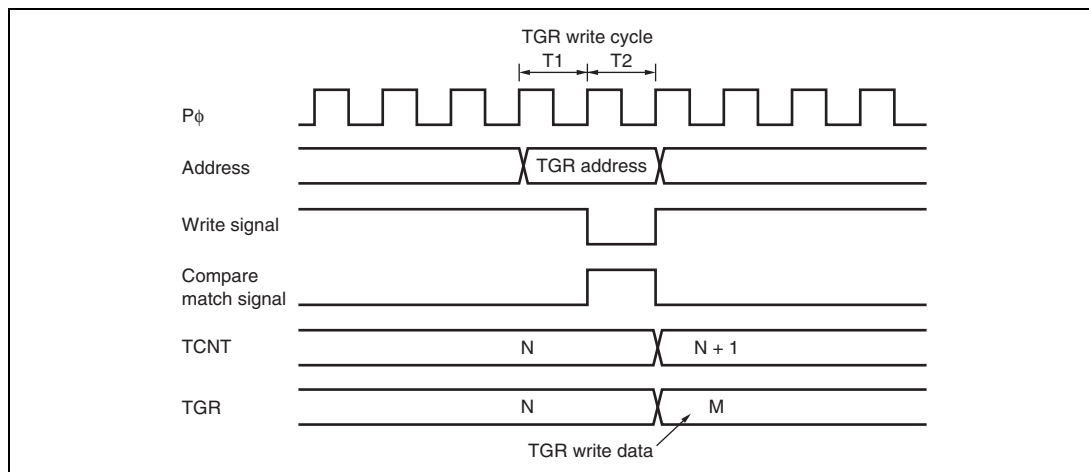

Figure 11.101 Contention between TGR Write and Compare Match

11.7.7 Contention between Buffer Register Write and Compare Match

If a compare match occurs in the T2 state of a TGR write cycle, the data that is transferred to TGR by the buffer operation is the data after write.

Figure 11.102 shows the timing in this case.

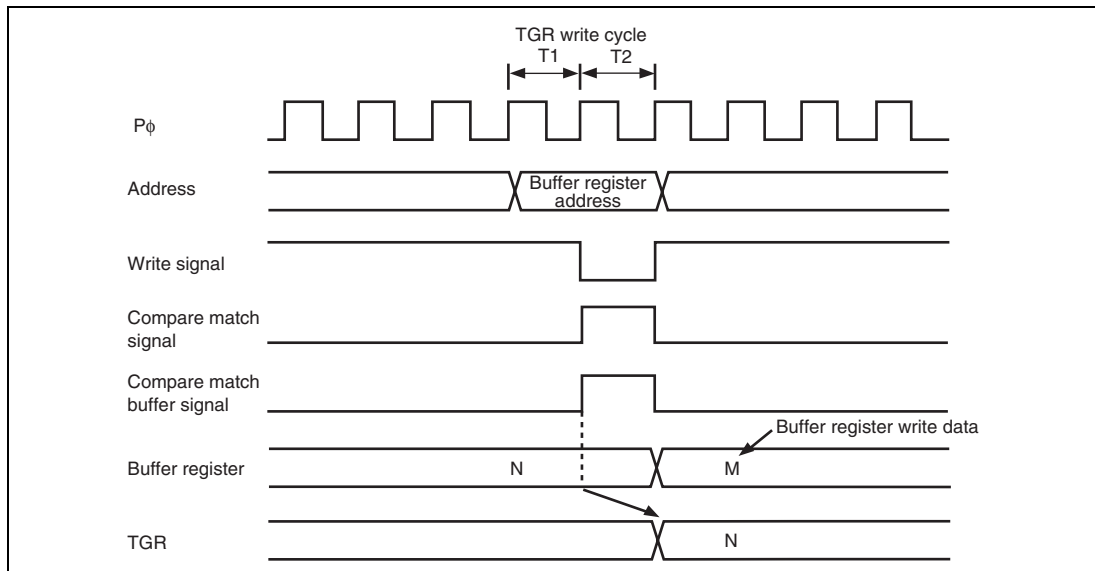

Figure 11.102 Contention between Buffer Register Write and Compare Match

11.7.8 Contention between Buffer Register Write and TCNT Clear

When the buffer transfer timing is set at the TCNT clear by the buffer transfer mode register (TBTM), if TCNT clear occurs in the T2 state of a TGR write cycle, the data that is transferred to TGR by the buffer operation is the data before write.

Figure 11.103 shows the timing in this case.

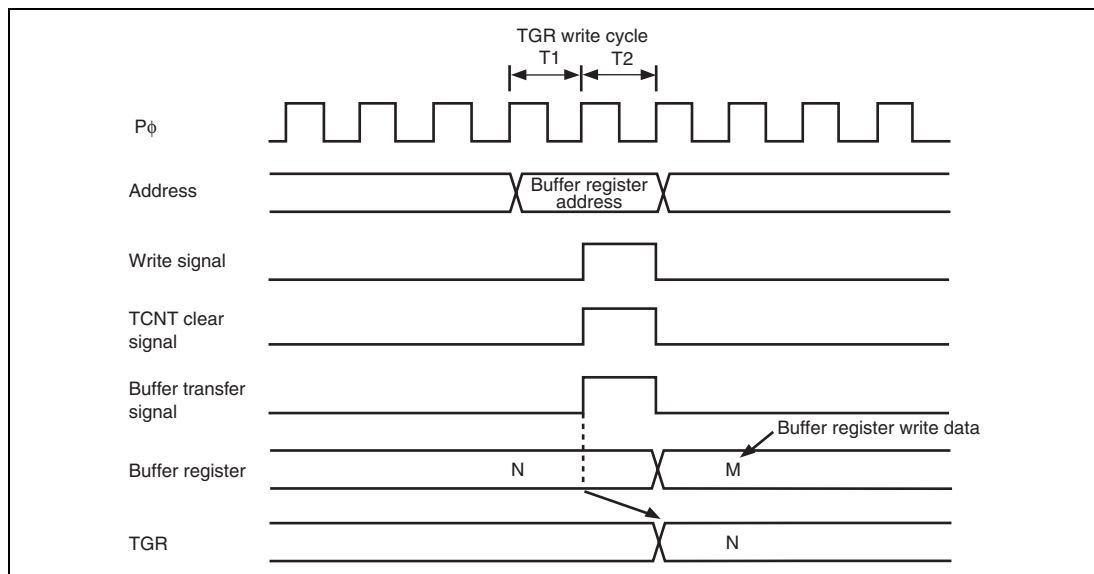

Figure 11.103 Contention between Buffer Register Write and TCNT Clear

11.7.9 Contention between TGR Read and Input Capture

If an input capture signal is generated in the T1 state of a TGR read cycle, the data that is read will be the data in the buffer before input capture transfer.

Figure 11.104 shows the timing in this case.

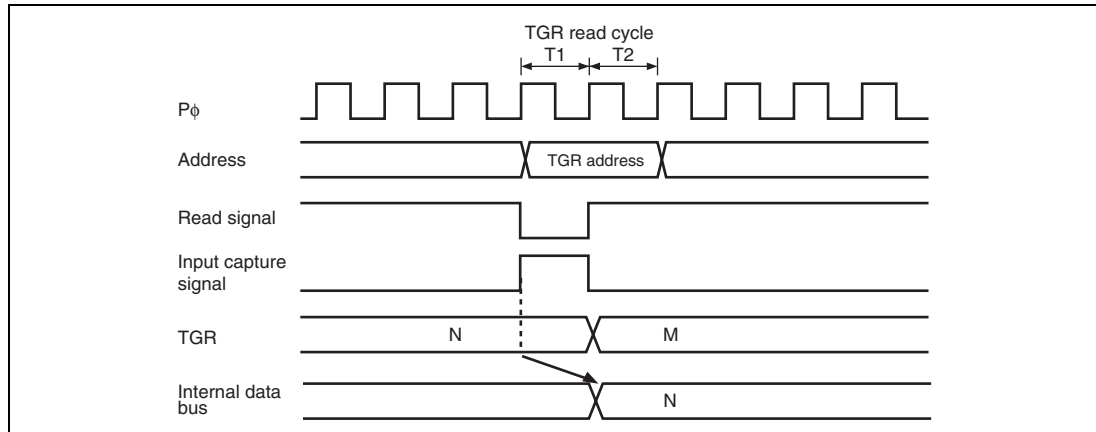

Figure 11.104 Contention between TGR Read and Input Capture

11.7.10 Contention between TGR Write and Input Capture

If an input capture signal is generated in the T2 state of a TGR write cycle, the input capture operation takes precedence and the write to TGR is not performed.

Figure 11.105 shows the timing in this case.

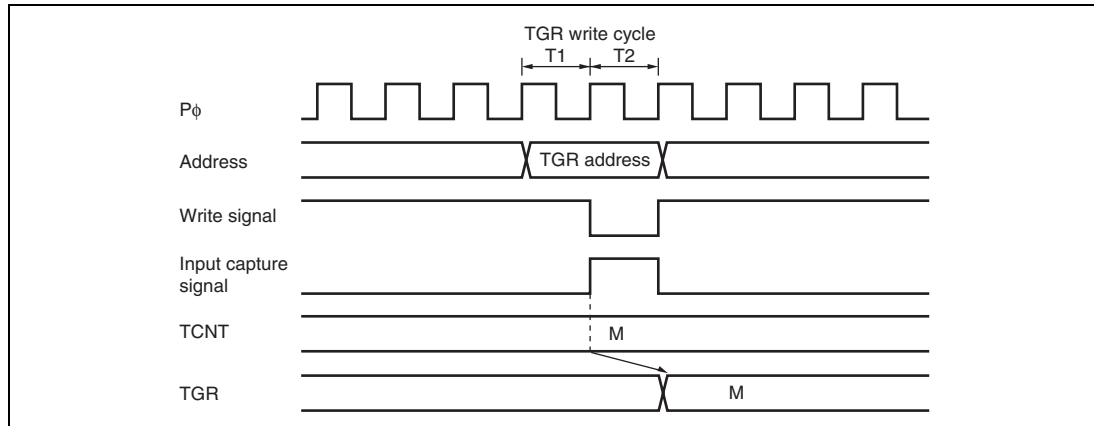

Figure 11.105 Contention between TGR Write and Input Capture

11.7.11 Contention between Buffer Register Write and Input Capture

If an input capture signal is generated in the T2 state of a buffer register write cycle, the buffer operation takes precedence and the write to the buffer register is not performed.

Figure 11.106 shows the timing in this case.

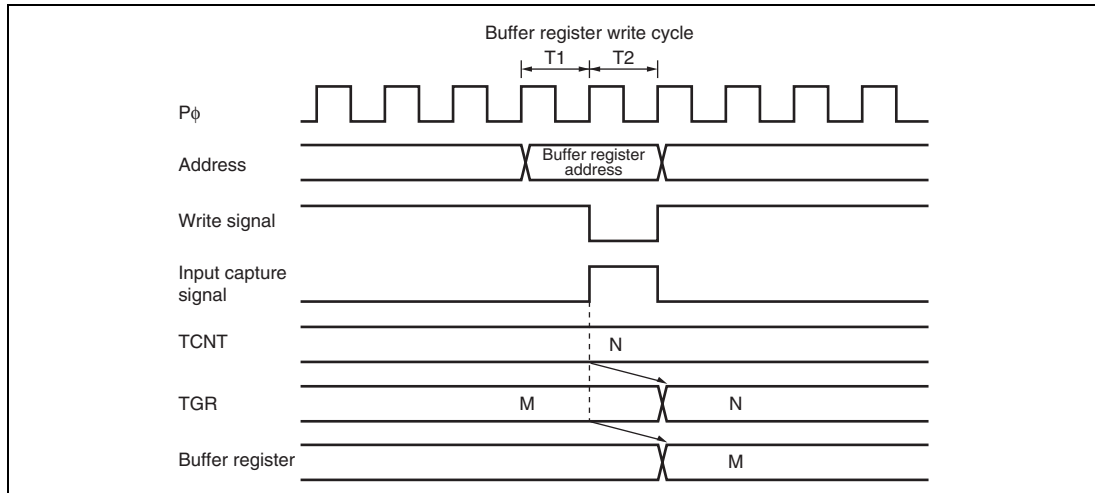

Figure 11.106 Contention between Buffer Register Write and Input Capture

11.7.12 TCNT2 Write and Overflow/Underflow Contention in Cascade Connection

With timer counters TCNT1 and TCNT2 in a cascade connection, when a contention occurs during TCNT₁ count (during a TCNT₂ overflow/underflow) in the T₂ state of the TCNT₂ write cycle, the write to TCNT₂ is conducted, and the TCNT₁ count signal is disabled. At this point, if there is match with TGRA₁ and the TCNT₁ value, a compare signal is issued. Furthermore, when the TCNT₁ count clock is selected as the input capture source of channel 0, TGRA₀ to D₀ carry out the input capture operation. In addition, when the compare match/input capture is selected as the input capture source of TGRB₁, TGRB₁ carries out input capture operation. The timing is shown in figure 11.107.

For cascade connections, be sure to synchronize settings for channels 1 and 2 when setting TCNT clearing.

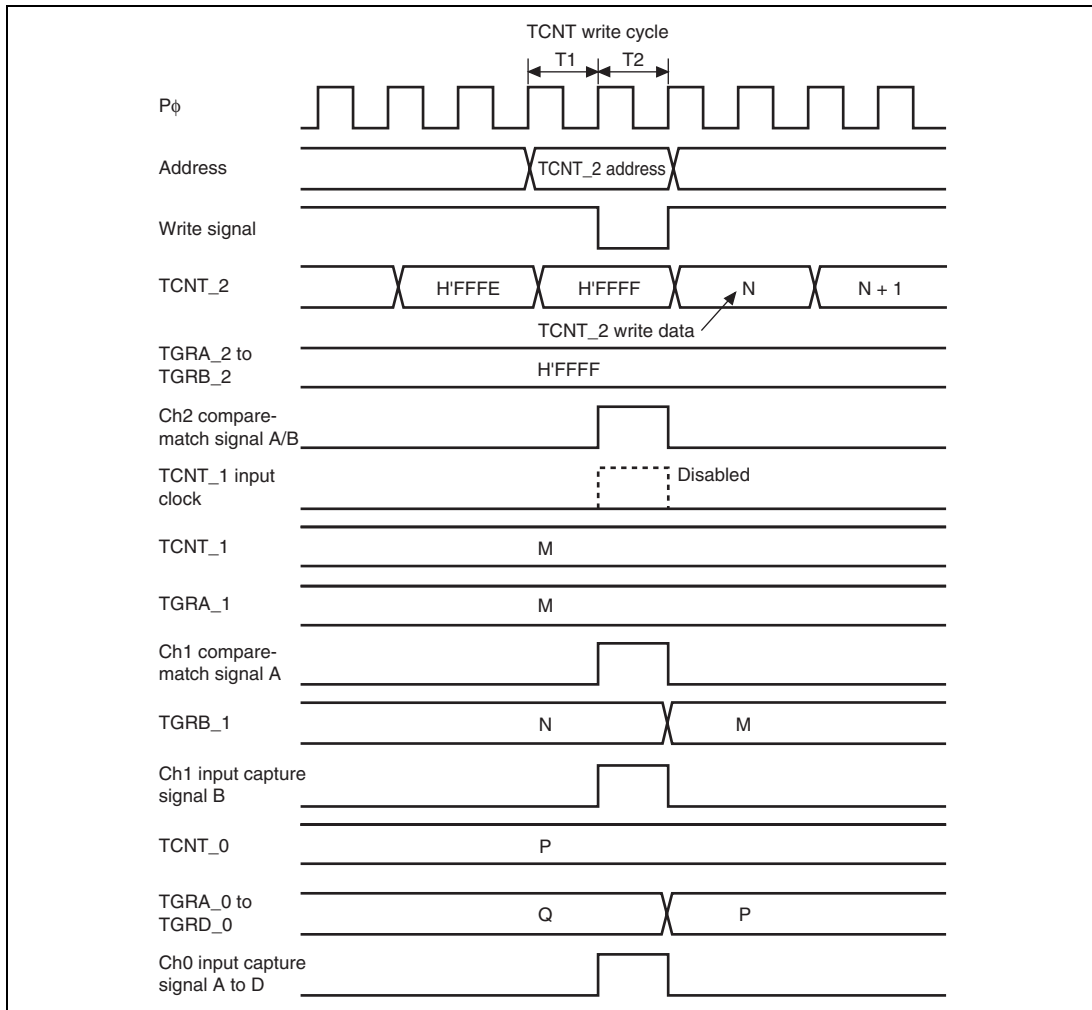

Figure 11.107 TCNT_2 Write and Overflow/Underflow Contention with Cascade Connection

11.7.13 Counter Value during Complementary PWM Mode Stop

When counting operation is suspended with TCNT_3 and TCNT_4 in complementary PWM mode, TCNT_3 has the timer dead time register (TDDR) value, and TCNT_4 is held at H'0000.

When restarting complementary PWM mode, counting begins automatically from the initialized state. This explanatory diagram is shown in figure 11.108.

When counting begins in another operating mode, be sure that TCNT_3 and TCNT_4 are set to the initial values.

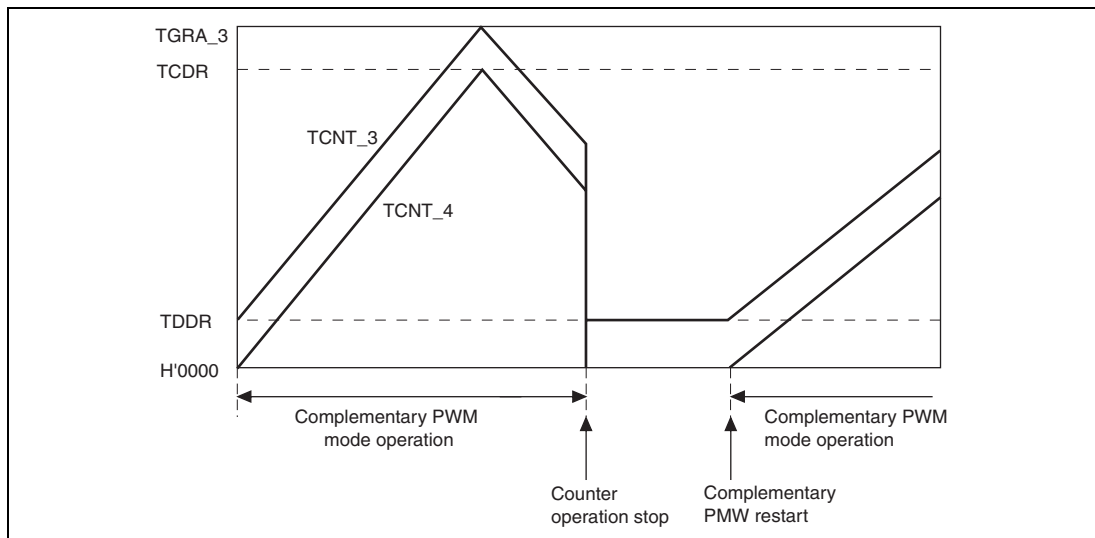

Figure 11.108 Counter Value during Complementary PWM Mode Stop

11.7.14 Buffer Operation Setting in Complementary PWM Mode

In complementary PWM mode, conduct rewrites by buffer operation for the PWM cycle setting register (TGRA_3), timer cycle data register (TCDR), and duty setting registers (TGRB_3, TGRA_4, and TGRB_4).

In complementary PWM mode, channel 3 and channel 4 buffers operate in accordance with bit settings BFA and BFB of TMDR_3. When TMDR_3's BFA bit is set to 1, TGRC_3 functions as a buffer register for TGRA_3. At the same time, TGRC_4 functions as the buffer register for TGRA_4, and TCBR functions as the TCDR's buffer register.

11.7.15 Reset Sync PWM Mode Buffer Operation and Compare Match Flag

When setting buffer operation for reset sync PWM mode, set the BFA and BFB bits of TMDR_4 to 0. The TIOC4C pin will be unable to produce its waveform output if the BFA bit of TMDR_4 is set to 1.

In reset sync PWM mode, the channel 3 and channel 4 buffers operate in accordance with the BFA and BFB bit settings of TMDR_3. For example, if the BFA bit of TMDR_3 is set to 1, TGRC_3 functions as the buffer register for TGRA_3. At the same time, TGRC_4 functions as the buffer register for TGRA_4.

The TGFC bit and TGFD bit of TSR_3 and TSR_4 are not set when TGRC_3 and TGRD_3 are operating as buffer registers.

Figure 11.109 shows an example of operations for TGR_3, TGR_4, TIOC3, and TIOC4, with TMDR_3's BFA and BFB bits set to 1, and TMDR_4's BFA and BFB bits set to 0.

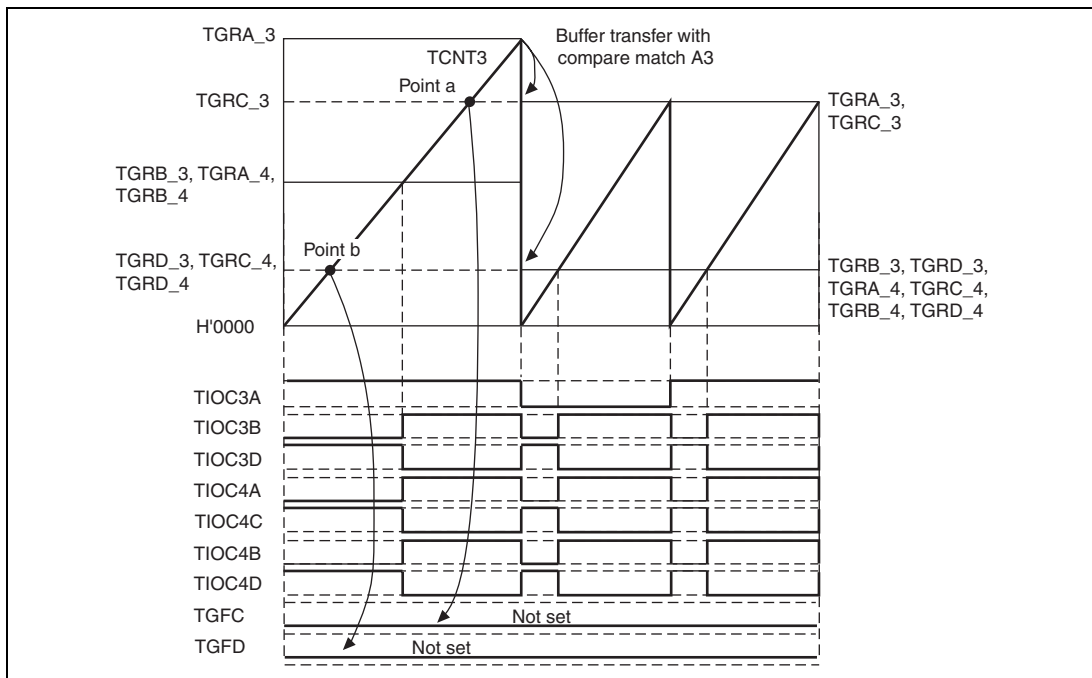

Figure 11.109 Buffer Operation and Compare-Match Flags in Reset Synchronous PWM Mode

11.7.16 Overflow Flags in Reset Synchronous PWM Mode

When set to reset synchronous PWM mode, TCNT_3 and TCNT_4 start counting when the CST3 bit of TSTR is set to 1. At this point, TCNT_4's count clock source and count edge obey the TCR_3 setting.

In reset synchronous PWM mode, with cycle register TGRA_3's set value at H'FFFF, when specifying TGR3A compare-match for the counter clear source, TCNT_3 and TCNT_4 count up to H'FFFF, then a compare-match occurs with TGRA_3, and TCNT_3 and TCNT_4 are both cleared. At this point, TSR's overflow flag TCFV bit is not set.

Figure 11.110 shows a TCFV bit operation example in reset synchronous PWM mode with a set value for cycle register TGRA_3 of H'FFFF, when a TGRA_3 compare-match has been specified without synchronous setting for the counter clear source.

Figure 11.110 Reset Synchronous PWM Mode Overflow Flag

11.7.17 Contention between Overflow/Underflow and Counter Clearing

If overflow/underflow and counter clearing occur simultaneously, the TCFV/TCFU flag in TSR is not set and TCNT clearing takes precedence.

Figure 11.111 shows the operation timing when a TGR compare match is specified as the clearing source, and when H'FFFF is set in TGR.

Figure 11.111 Contention between Overflow and Counter Clearing

11.7.18 Contention between TCNT Write and Overflow/Underflow

If there is an up-count or down-count in the T2 state of a TCNT write cycle, and overflow/underflow occurs, the TCNT write takes precedence and the TCFV/TCFU flag in TSR is not set.

Figure 11.112 shows the operation timing when there is contention between TCNT write and overflow.

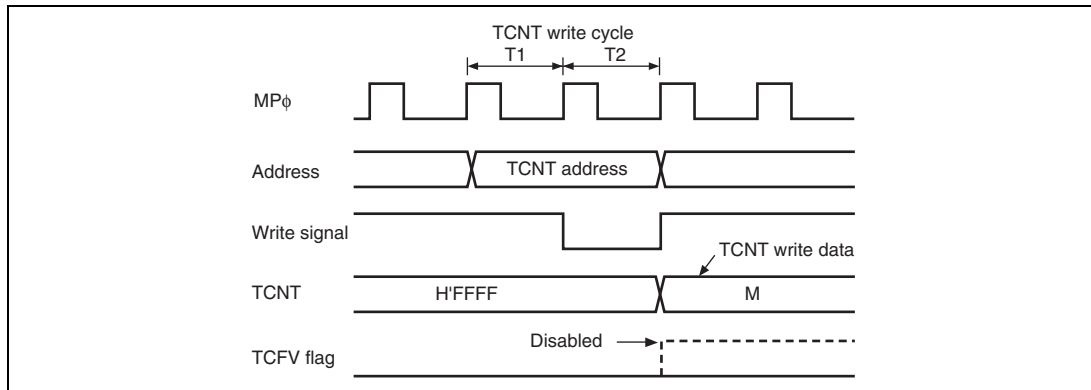

Figure 11.112 Contention between TCNT Write and Overflow

11.7.19 Cautions on Transition from Normal Operation or PWM Mode 1 to Reset-Synchronized PWM Mode

When making a transition from channel 3 or 4 normal operation or PWM mode 1 to reset-synchronized PWM mode, if the counter is halted with the output pins (TIOC3B, TIOC3D, TIOC4A, TIOC4C, TIOC4B, TIOC4D) in the high-level state, followed by the transition to reset-synchronized PWM mode and operation in that mode, the initial pin output will not be correct.

When making a transition from normal operation to reset-synchronized PWM mode, write H'11 to registers TIORH_3, TIORL_3, TIORH_4, and TIORL_4 to initialize the output pins to low level output, then set an initial register value of H'00 before making the mode transition.

When making a transition from PWM mode 1 to reset-synchronized PWM mode, first switch to normal operation, then initialize the output pins to low level output and set an initial register value of H'00 before making the transition to reset-synchronized PWM mode.

11.7.20 Output Level in Complementary PWM Mode and Reset-Synchronized PWM Mode

When channels 3 and 4 are in complementary PWM mode or reset-synchronized PWM mode, the PWM waveform output level is set with the OLSP and OLSN bits in the timer output control register (TOCR). In the case of complementary PWM mode or reset-synchronized PWM mode, TIOR should be set to H'00.

11.7.21 Interrupts in Module Standby Mode

If module standby mode is entered when an interrupt has been requested, it will not be possible to clear the CPU interrupt source or the direct memory access controller activation source. Interrupts should therefore be disabled before entering module standby mode.

11.7.22 Simultaneous Capture of TCNT_1 and TCNT_2 in Cascade Connection

When timer counters 1 and 2 (TCNT_1 and TCNT_2) are operated as a 32-bit counter in cascade connection, the cascade counter value cannot be captured successfully even if input-capture input is simultaneously done to TIOC1A and TIOC2A or to TIOC1B and TIOC2B. This is because the input timing of TIOC1A and TIOC2A or of TIOC1B and TIOC2B may not be the same when external input-capture signals to be input into TCNT_1 and TCNT_2 are taken in synchronization with the internal clock. For example, TCNT_1 (the counter for upper 16 bits) does not capture the count-up value by overflow from TCNT_2 (the counter for lower 16 bits) but captures the count value before the count-up. In this case, the values of TCNT_1 = H'FFF1 and TCNT_2 = H'0000 should be transferred to TGRA_1 and TGRA_2 or to TGRB_1 and TGRB_2, but the values of TCNT_1 = H'FFF0 and TCNT_2 = H'0000 are erroneously transferred.

11.7.23 Notes on Output Waveform Control During Synchronous Counter Clearing in Complementary PWM Mode

In complementary PWM mode, when output waveform control during synchronous counter clearing is enabled (WRE in the TWCR register set to 1), the following problems may occur when condition (1) or condition (2), below, is satisfied.

- Dead time for the PWM output pins may be too short (or nonexistent).
- Active-level output from the PWM negative-phase pins may occur outside the correct active-level output interval

Condition (1): When synchronous clearing occurs in the PWM output dead time interval within initial output suppression interval (10) (figure 11.113).

Condition (2): When synchronous clearing occurs within initial output suppression interval (10) or (11) and $TGRB_3 \leq TDDR$, $TGRA_4 \leq TDDR$, or $TGRB_4 \leq TDDR$ is true (figure 11.114)

Figure 11.113 Condition (1) Synchronous Clearing Example

Figure 11.114 Condition (2) Synchronous Clearing Example

The following workaround can be used to avoid these problems.

When using synchronous clearing, make sure to set compare registers TGRB_3, TGRA_4, and TGRB_4 to a value twice or more the setting of dead time data register TDDR.

11.8 Output Pin Initialization for Multi-Function Timer Pulse Unit 2

11.8.1 Operating Modes

This module has the following six operating modes. Waveform output is possible in all of these modes.

- Normal mode (channels 0 to 4)
- PWM mode 1 (channels 0 to 4)
- PWM mode 2 (channels 0 to 2)
- Phase counting modes 1 to 4 (channels 1 and 2)
- Complementary PWM mode (channels 3 and 4)
- Reset-synchronized PWM mode (channels 3 and 4)

The output pin initialization method for each of these modes is described in this section.

11.8.2 Reset Start Operation

The output pins of this module (TIOC*) are initialized low by a reset and in standby mode. Since the pin functions are selected using the general I/O ports, when the general I/O port is set, the pin states at that point are output to the ports. When this module output is selected by the general I/O port immediately after a reset, the initial output level, low, is output directly at the port. When the active level is low, the system will operate at this point, and therefore the general I/O port setting should be made after the initialization of the output pins is completed.

Note: Channel number and port notation are substituted for *.

11.8.3 Operation in Case of Re-Setting Due to Error during Operation, etc.

If an error occurs during operation of this module, the module output should be cut by the system. Cutoff is performed by switching the pin output to port output with the general I/O port and outputting the inverse of the active level. The pin initialization procedures for re-setting due to an error during operation, etc., and the procedures for restarting in a different mode after re-setting, are shown below.

This module has six operating modes, as stated above. There are thus 36 mode transition combinations, but some transitions are not available with certain channel and mode combinations. Possible mode transition combinations are shown in table 11.57.

Table 11.57 Mode Transition Combinations

Before	After					
	Normal	PWM1	PWM2	PCM	CPWM	RPWM
Normal	(1)	(2)	(3)	(4)	(5)	(6)
PWM1	(7)	(8)	(9)	(10)	(11)	(12)
PWM2	(13)	(14)	(15)	(16)	None	None
PCM	(17)	(18)	(19)	(20)	None	None
CPWM	(21)	(22)	None	None	(23) (24)	(25)
RPWM	(26)	(27)	None	None	(28)	(29)

[Legend]

Normal: Normal mode

PWM1: PWM mode 1

PWM2: PWM mode 2

PCM: Phase counting modes 1 to 4

CPWM: Complementary PWM mode

RPWM: Reset-synchronized PWM mode

11.8.4 Overview of Initialization Procedures and Mode Transitions in Case of Error during Operation, etc.

- When making a transition to a mode (Normal, PWM1, PWM2, PCM) in which the pin output level is selected by the timer I/O control register (TIOR) setting, initialize the pins by means of a TIOR setting.
- In PWM mode 1, since a waveform is not output to the TIOC*B (TIOC *D) pin, setting TIOR will not initialize the pins. If initialization is required, carry it out in normal mode, then switch to PWM mode 1.
- In PWM mode 2, since a waveform is not output to the cycle register pin, setting TIOR will not initialize the pins. If initialization is required, carry it out in normal mode, then switch to PWM mode 2.
- In normal mode or PWM mode 2, if TGRC and TGRD operate as buffer registers, setting TIOR will not initialize the buffer register pins. If initialization is required, clear buffer mode, carry out initialization, then set buffer mode again.
- In PWM mode 1, if either TGRC or TGRD operates as a buffer register, setting TIOR will not initialize the TGRC pin. To initialize the TGRC pin, clear buffer mode, carry out initialization, then set buffer mode again.
- When making a transition to a mode (CPWM, RPWM) in which the pin output level is selected by the timer output control register (TOCR) setting, switch to normal mode and perform initialization with TIOR, then restore TIOR to its initial value, and temporarily disable channel 3 and 4 output with the timer output master enable register (TOER). Then operate the unit in accordance with the mode setting procedure (TOCR setting, TMDR setting, TOER setting).

Note: Channel number is substituted for * indicated in this article.

Pin initialization procedures are described below for the numbered combinations in table 11.57. The active level is assumed to be low.

(1) Operation when Error Occurs during Normal Mode Operation, and Operation is Restarted in Normal Mode

Figure 11.115 shows an explanatory diagram of the case where an error occurs in normal mode and operation is restarted in normal mode after re-setting.

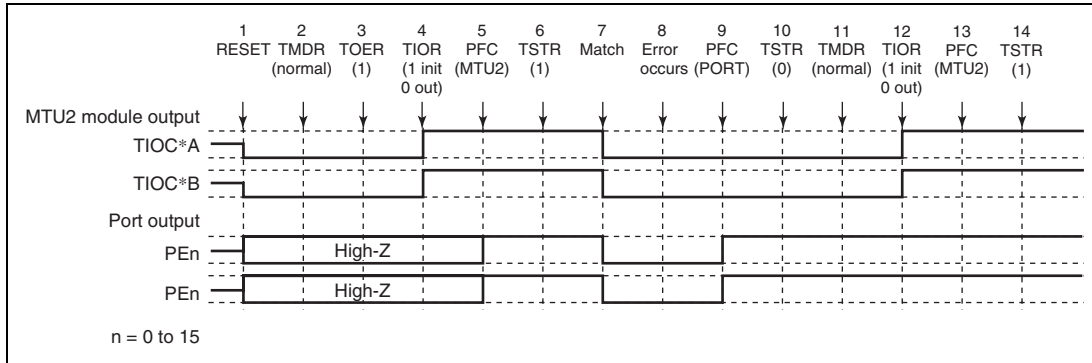

Figure 11.115 Error Occurrence in Normal Mode, Recovery in Normal Mode

1. After a reset, the module output is low and ports are in the high-impedance state.
2. After a reset, the TMDR setting is for normal mode.
3. For channels 3 and 4, enable output with TOER before initializing the pins with TIOR.
4. Initialize the pins with TIOR. (The example shows initial high output, with low output on compare-match occurrence.)
5. Set the multi-function timer pulse unit 2 output with the general I/O port.
6. The count operation is started by TSTR.
7. Output goes low on compare-match occurrence.
8. An error occurs.
9. Set port output with the general I/O port and output the inverse of the active level.
10. The count operation is stopped by TSTR.
11. Not necessary when restarting in normal mode.
12. Initialize the pins with TIOR.
13. Set the multi-function timer pulse unit 2 output with the general I/O port.
14. Operation is restarted by TSTR.

(2) Operation when Error Occurs during Normal Mode Operation, and Operation is Restarted in PWM Mode 1

Figure 11.116 shows an explanatory diagram of the case where an error occurs in normal mode and operation is restarted in PWM mode 1 after re-setting.

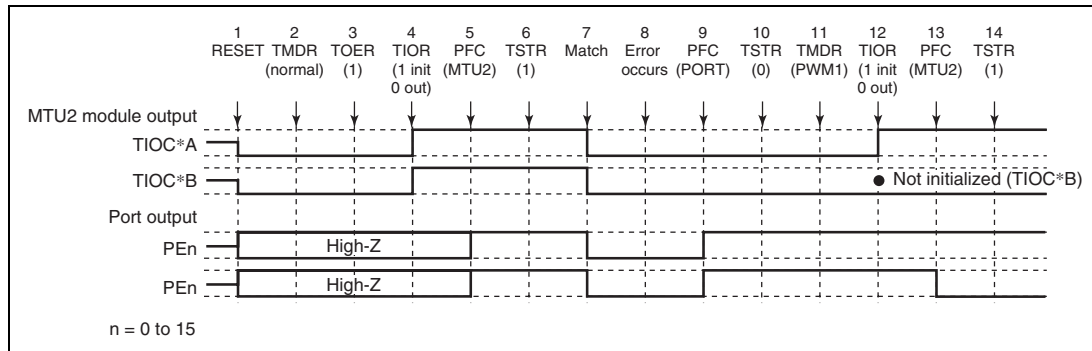

Figure 11.116 Error Occurrence in Normal Mode, Recovery in PWM Mode 1

1 to 10 are the same as in figure 11.115.

- Set PWM mode 1.
- Initialize the pins with TIOR. (In PWM mode 1, the TIOC*B side is not initialized. If initialization is required, initialize in normal mode, and then switch to PWM mode 1.)
- Set the multi-function timer pulse unit 2 output with the general I/O port.
- Operation is restarted by TSTR.

(3) Operation when Error Occurs during Normal Mode Operation, and Operation is Restarted in PWM Mode 2

Figure 11.117 shows an explanatory diagram of the case where an error occurs in normal mode and operation is restarted in PWM mode 2 after re-setting.

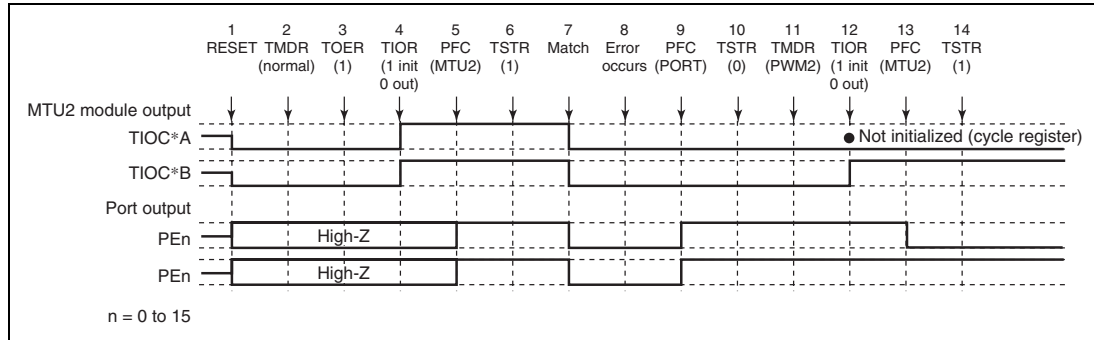

Figure 11.117 Error Occurrence in Normal Mode, Recovery in PWM Mode 2

1 to 10 are the same as in figure 11.115.

- Set PWM mode 2.
- Initialize the pins with TIOR. (In PWM mode 2, the cycle register pins are not initialized. If initialization is required, initialize in normal mode, and then switch to PWM mode 2.)
- Set the multi-function timer pulse unit 2 output with the general I/O port.
- Operation is restarted by TSTR.

Note: PWM mode 2 can only be set for channels 0 to 2, and therefore TOER setting is not necessary.

(4) Operation when Error Occurs during Normal Mode Operation, and Operation is Restarted in Phase Counting Mode

Figure 11.118 shows an explanatory diagram of the case where an error occurs in normal mode and operation is restarted in phase counting mode after re-setting.

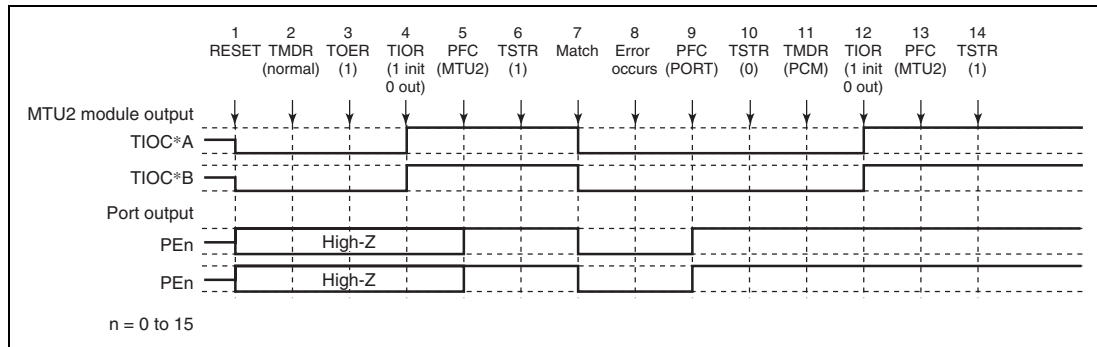

Figure 11.118 Error Occurrence in Normal Mode, Recovery in Phase Counting Mode

1 to 10 are the same as in figure 11.115.

11. Set phase counting mode.
12. Initialize the pins with TIOR.
13. Set the multi-function timer pulse unit 2 output with the general I/O port.
14. Operation is restarted by TSTR.

Note: Phase counting mode can only be set for channels 1 and 2, and therefore TOER setting is not necessary.

(5) Operation when Error Occurs during Normal Mode Operation, and Operation is Restarted in Complementary PWM Mode

Figure 11.119 shows an explanatory diagram of the case where an error occurs in normal mode and operation is restarted in complementary PWM mode after re-setting.

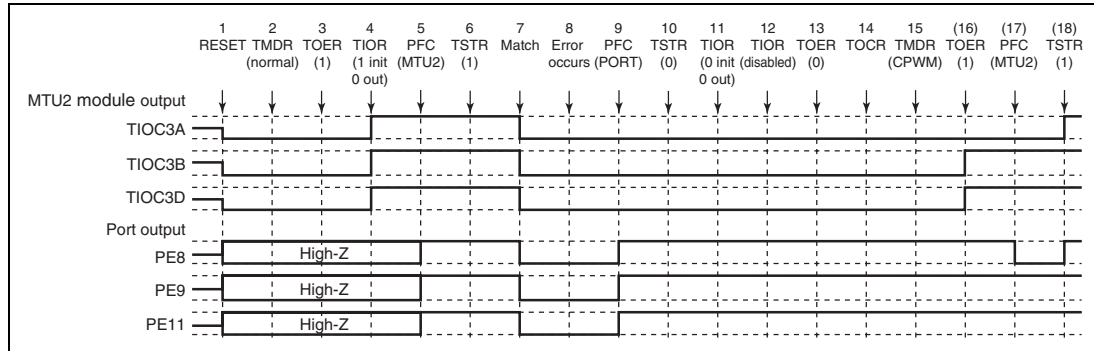

Figure 11.119 Error Occurrence in Normal Mode, Recovery in Complementary PWM Mode

1 to 10 are the same as in figure 11.115.

11. Initialize the normal mode waveform generation section with TIOR.
12. Disable operation of the normal mode waveform generation section with TIOR.
13. Disable channel 3 and 4 output with TOER.
14. Select the complementary PWM output level and cyclic output enabling/disabling with TOCR.
15. Set complementary PWM.
16. Enable channel 3 and 4 output with TOER.
17. Set the multi-function timer pulse unit 2 output with the general I/O port.
18. Operation is restarted by TSTR.

(6) Operation when Error Occurs during Normal Mode Operation, and Operation is Restarted in Reset-Synchronized PWM Mode

Figure 11.120 shows an explanatory diagram of the case where an error occurs in normal mode and operation is restarted in reset-synchronized PWM mode after re-setting.

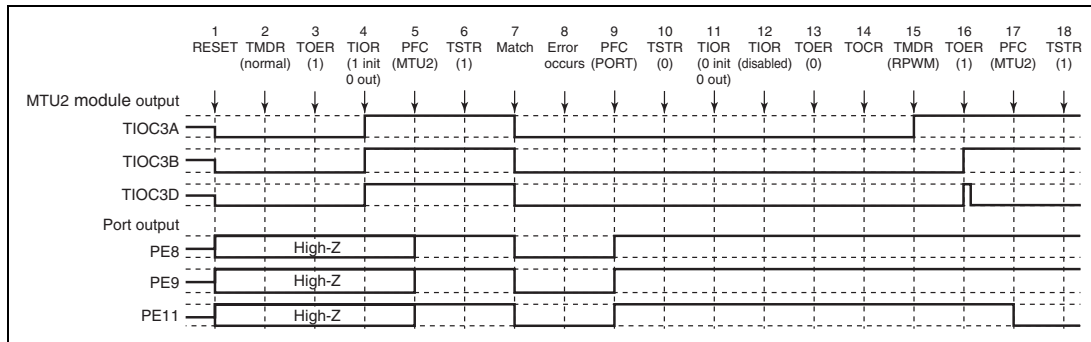

Figure 11.120 Error Occurrence in Normal Mode, Recovery in Reset-Synchronized PWM Mode

1 to 13 are the same as in figure 11.115.

14. Select the reset-synchronized PWM output level and cyclic output enabling/disabling with TOCR.
15. Set reset-synchronized PWM.
16. Enable channel 3 and 4 output with TOER.
17. Set the multi-function timer pulse unit 2 output with the general I/O port.
18. Operation is restarted by TSTR.

(7) Operation when Error Occurs during PWM Mode 1 Operation, and Operation is Restarted in Normal Mode

Figure 11.121 shows an explanatory diagram of the case where an error occurs in PWM mode 1 and operation is restarted in normal mode after re-setting.

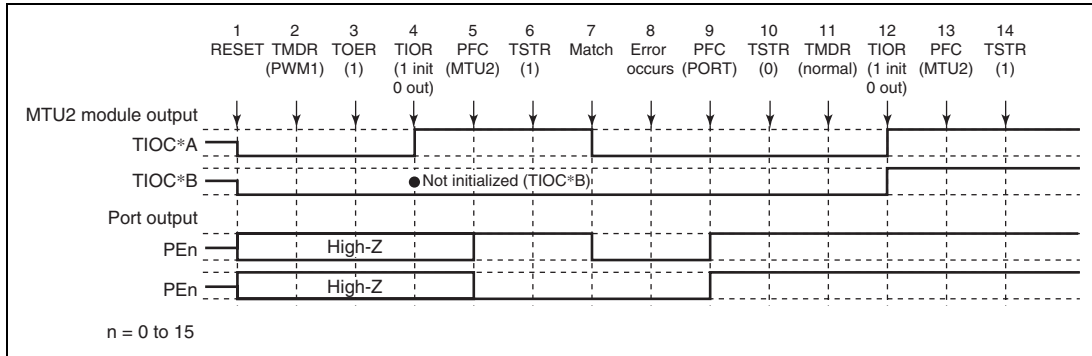

Figure 11.121 Error Occurrence in PWM Mode 1, Recovery in Normal Mode

1. After a reset, the module output is low and ports are in the high-impedance state.
2. Set PWM mode 1.
3. For channels 3 and 4, enable output with TOER before initializing the pins with TIOR.
4. Initialize the pins with TIOR. (The example shows initial high output, with low output on compare-match occurrence. In PWM mode 1, the TIOC*B side is not initialized.)
5. Set the multi-function timer pulse unit 2 output with the general I/O port.
6. The count operation is started by TSTR.
7. Output goes low on compare-match occurrence.
8. An error occurs.
9. Set port output with the general I/O port and output the inverse of the active level.
10. The count operation is stopped by TSTR.
11. Set normal mode.
12. Initialize the pins with TIOR.
13. Set the multi-function timer pulse unit 2 output with the general I/O port.
14. Operation is restarted by TSTR.

(8) Operation when Error Occurs during PWM Mode 1 Operation, and Operation is Restarted in PWM Mode 1

Figure 11.122 shows an explanatory diagram of the case where an error occurs in PWM mode 1 and operation is restarted in PWM mode 1 after re-setting.

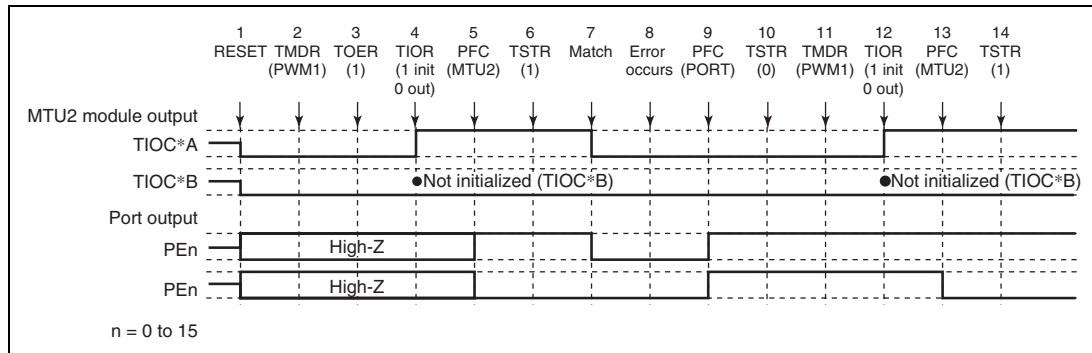

Figure 11.122 Error Occurrence in PWM Mode 1, Recovery in PWM Mode 1

1 to 10 are the same as in figure 11.121.

11. Not necessary when restarting in PWM mode 1.
12. Initialize the pins with TIOR. (In PWM mode 1, the TIOC*B side is not initialized.)
13. Set the multi-function timer pulse unit 2 output with the general I/O port.
14. Operation is restarted by TSTR.

(9) Operation when Error Occurs during PWM Mode 1 Operation, and Operation is Restarted in PWM Mode 2

Figure 11.123 shows an explanatory diagram of the case where an error occurs in PWM mode 1 and operation is restarted in PWM mode 2 after re-setting.

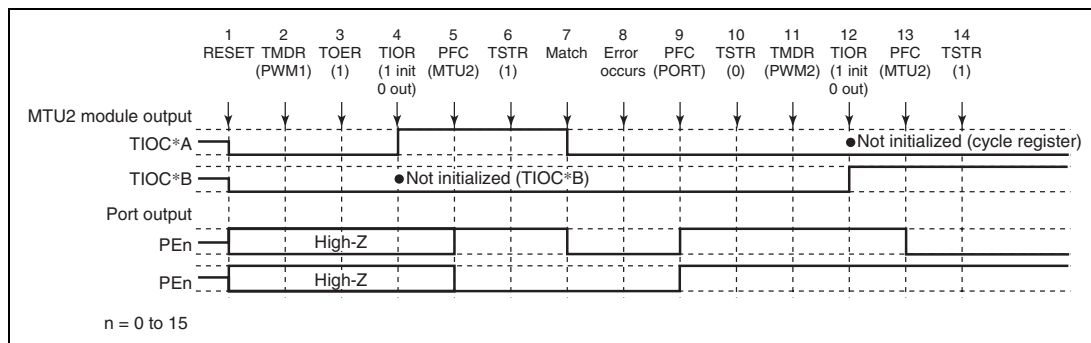

Figure 11.123 Error Occurrence in PWM Mode 1, Recovery in PWM Mode 2

1 to 10 are the same as in figure 11.121.

- 11. Set PWM mode 2.
- 12. Initialize the pins with TIOR. (In PWM mode 2, the cycle register pins are not initialized.)
- 13. Set the multi-function timer pulse unit 2 output with the general I/O port.
- 14. Operation is restarted by TSTR.

Note: PWM mode 2 can only be set for channels 0 to 2, and therefore TOER setting is not necessary.

(10) Operation when Error Occurs during PWM Mode 1 Operation, and Operation is Restarted in Phase Counting Mode

Figure 11.124 shows an explanatory diagram of the case where an error occurs in PWM mode 1 and operation is restarted in phase counting mode after re-setting.

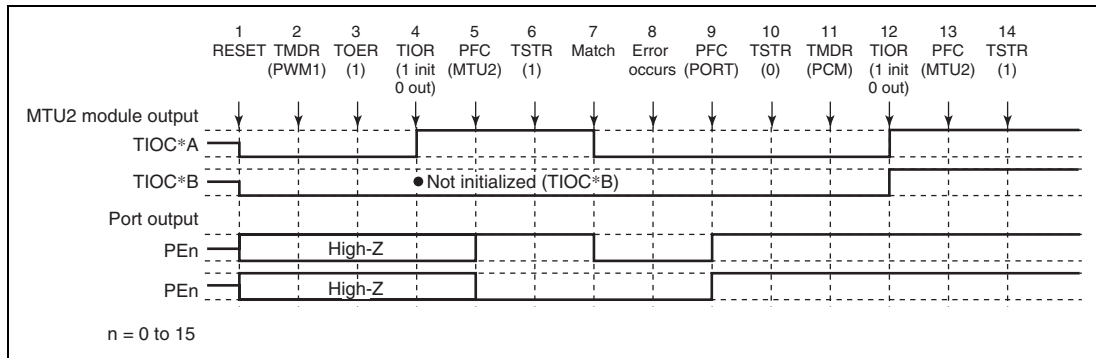

Figure 11.124 Error Occurrence in PWM Mode 1, Recovery in Phase Counting Mode

1 to 10 are the same as in figure 11.121.

- Set phase counting mode.
- Initialize the pins with TIOR.
- Set the multi-function timer pulse unit 2 output with the general I/O port.
- Operation is restarted by TSTR.

Note: Phase counting mode can only be set for channels 1 and 2, and therefore TOER setting is not necessary.

(11) Operation when Error Occurs during PWM Mode 1 Operation, and Operation is Restarted in Complementary PWM Mode

Figure 11.125 shows an explanatory diagram of the case where an error occurs in PWM mode 1 and operation is restarted in complementary PWM mode after re-setting.

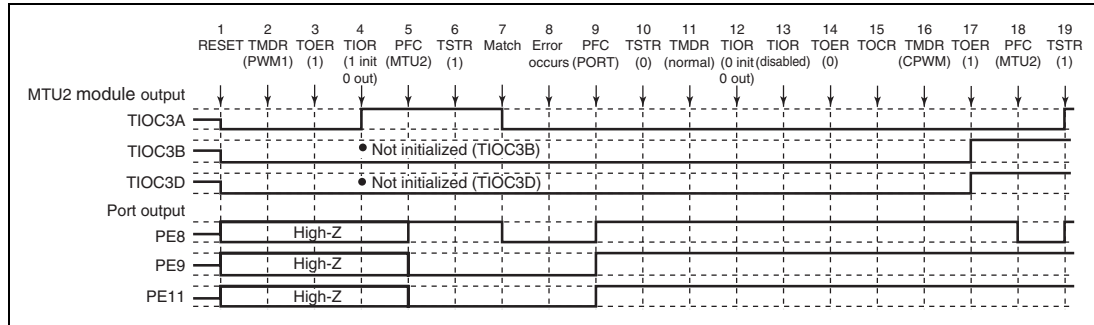

Figure 11.125 Error Occurrence in PWM Mode 1, Recovery in Complementary PWM Mode

1 to 10 are the same as in figure 11.121.

- Set normal mode for initialization of the normal mode waveform generation section.
- Initialize the PWM mode 1 waveform generation section with TIOR.
- Disable operation of the PWM mode 1 waveform generation section with TIOR.
- Disable channel 3 and 4 output with TOER.
- Select the complementary PWM output level and cyclic output enabling/disabling with TOCR.
- Set complementary PWM.
- Enable channel 3 and 4 output with TOER.
- Set the multi-function timer pulse unit 2 output with the general I/O port.
- Operation is restarted by TSTR.

(12) Operation when Error Occurs during PWM Mode 1 Operation, and Operation is Restarted in Reset-Synchronized PWM Mode

Figure 11.126 shows an explanatory diagram of the case where an error occurs in PWM mode 1 and operation is restarted in reset-synchronized PWM mode after re-setting.

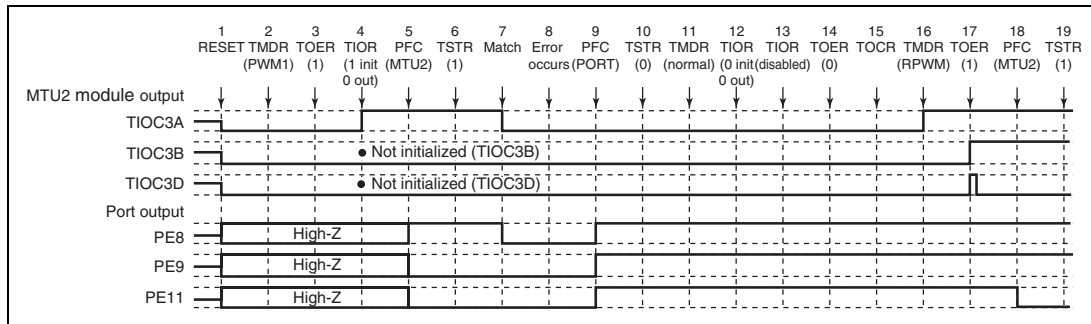

Figure 11.126 Error Occurrence in PWM Mode 1, Recovery in Reset-Synchronized PWM Mode

1 to 14 are the same as in figure 11.125.

15. Select the reset-synchronized PWM output level and cyclic output enabling/disabling with TOCR.
16. Set reset-synchronized PWM.
17. Enable channel 3 and 4 output with TOER.
18. Set the multi-function timer pulse unit 2 output with the general I/O port.
19. Operation is restarted by TSTR.

(13) Operation when Error Occurs during PWM Mode 2 Operation, and Operation is Restarted in Normal Mode

Figure 11.127 shows an explanatory diagram of the case where an error occurs in PWM mode 2 and operation is restarted in normal mode after re-setting.

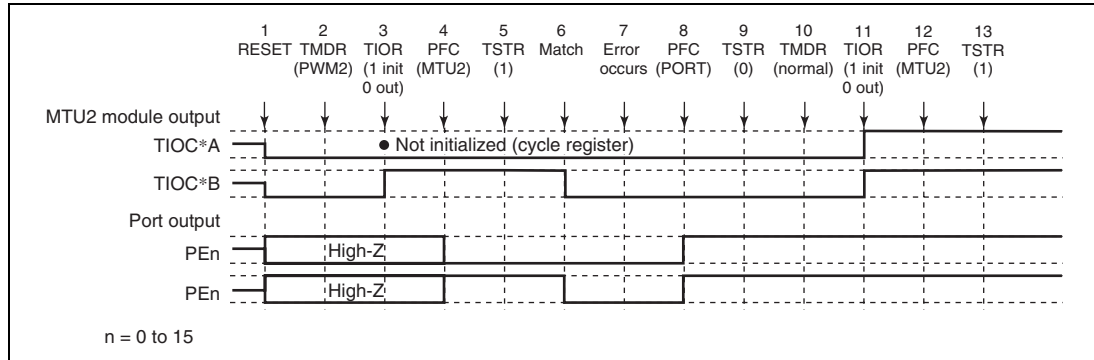

Figure 11.127 Error Occurrence in PWM Mode 2, Recovery in Normal Mode

1. After a reset, the module output is low and ports are in the high-impedance state.
2. Set PWM mode 2.
3. Initialize the pins with TIOR. (The example shows initial high output, with low output on compare-match occurrence. In PWM mode 2, the cycle register pins are not initialized. In the example, TIOC *A is the cycle register.)
4. Set the multi-function timer pulse unit 2 output with the general I/O port.
5. The count operation is started by TSTR.
6. Output goes low on compare-match occurrence.
7. An error occurs.
8. Set port output with the general I/O port and output the inverse of the active level.
9. The count operation is stopped by TSTR.
10. Set normal mode.
11. Initialize the pins with TIOR.
12. Set the multi-function timer pulse unit 2 output with the general I/O port.
13. Operation is restarted by TSTR.

(14) Operation when Error Occurs during PWM Mode 2 Operation, and Operation is Restarted in PWM Mode 1

Figure 11.128 shows an explanatory diagram of the case where an error occurs in PWM mode 2 and operation is restarted in PWM mode 1 after re-setting.

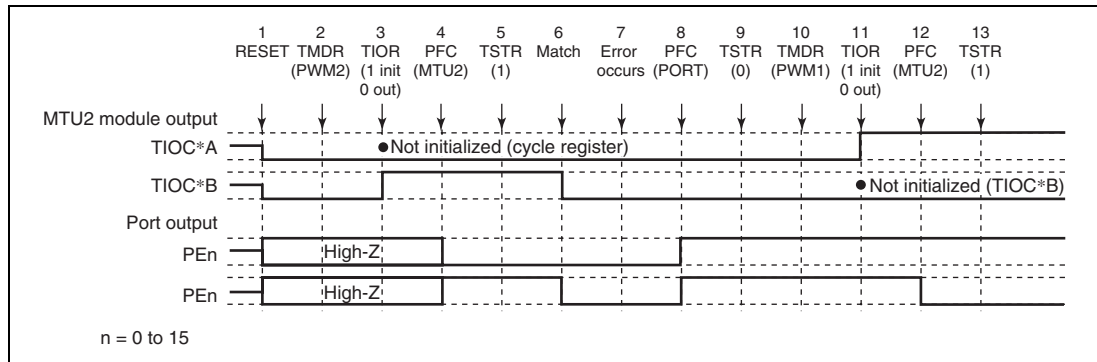

Figure 11.128 Error Occurrence in PWM Mode 2, Recovery in PWM Mode 1

1 to 9 are the same as in figure 11.127.

10. Set PWM mode 1.
11. Initialize the pins with TIOR. (In PWM mode 1, the TIOC*B side is not initialized.)
12. Set the multi-function timer pulse unit 2 output with the general I/O port.
13. Operation is restarted by TSTR.

(15) Operation when Error Occurs during PWM Mode 2 Operation, and Operation is Restarted in PWM Mode 2

Figure 11.129 shows an explanatory diagram of the case where an error occurs in PWM mode 2 and operation is restarted in PWM mode 2 after re-setting.

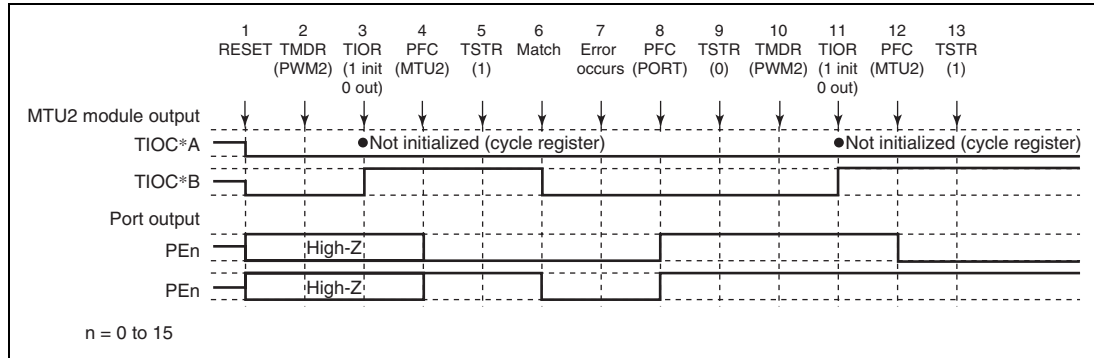

Figure 11.129 Error Occurrence in PWM Mode 2, Recovery in PWM Mode 2

1 to 9 are the same as in figure 11.127.

10. Not necessary when restarting in PWM mode 2.
11. Initialize the pins with TIOR. (In PWM mode 2, the cycle register pins are not initialized.)
12. Set the multi-function timer pulse unit 2 output with the general I/O port.
13. Operation is restarted by TSTR.

(16) Operation when Error Occurs during PWM Mode 2 Operation, and Operation is Restarted in Phase Counting Mode

Figure 11.130 shows an explanatory diagram of the case where an error occurs in PWM mode 2 and operation is restarted in phase counting mode after re-setting.

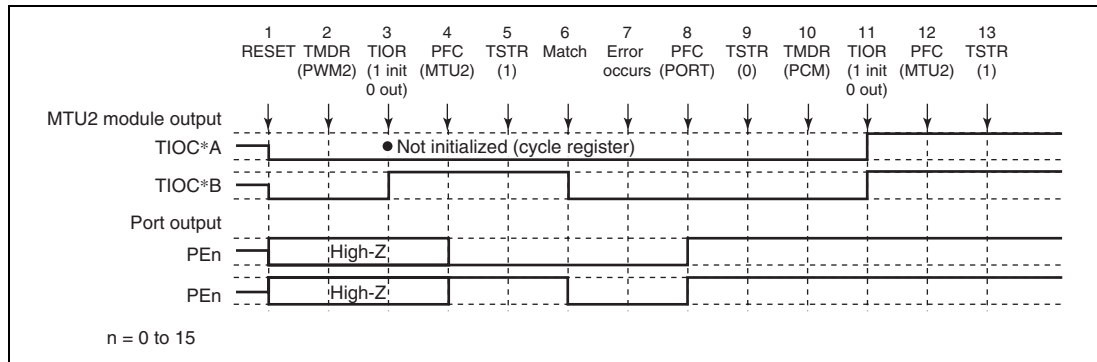

Figure 11.130 Error Occurrence in PWM Mode 2, Recovery in Phase Counting Mode

1 to 9 are the same as in figure 11.127.

10. Set phase counting mode.
11. Initialize the pins with TIOR.
12. Set the multi-function timer pulse unit 2 output with the general I/O port.
13. Operation is restarted by TSTR.

(17) Operation when Error Occurs during Phase Counting Mode Operation, and Operation is Restarted in Normal Mode

Figure 11.131 shows an explanatory diagram of the case where an error occurs in phase counting mode and operation is restarted in normal mode after re-setting.

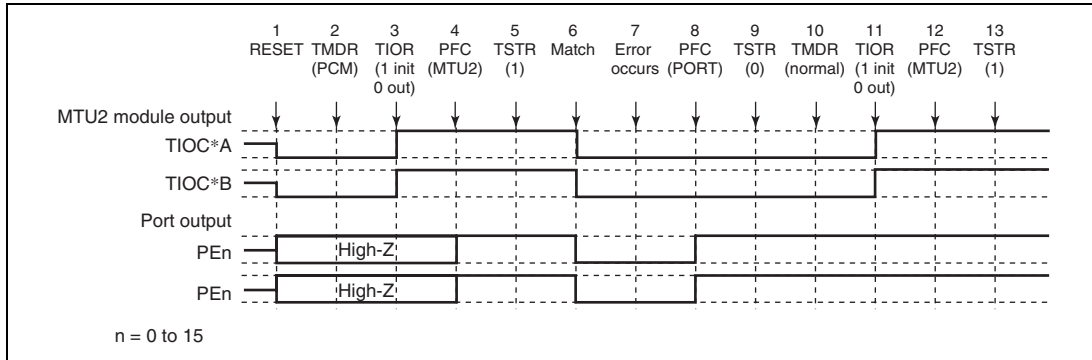

Figure 11.131 Error Occurrence in Phase Counting Mode, Recovery in Normal Mode

1. After a reset, the module output is low and ports are in the high-impedance state.
2. Set phase counting mode.
3. Initialize the pins with TIOR. (The example shows initial high output, with low output on compare-match occurrence.)
4. Set the multi-function timer pulse unit 2 output with the general I/O port.
5. The count operation is started by TSTR.
6. Output goes low on compare-match occurrence.
7. An error occurs.
8. Set port output with the general I/O port and output the inverse of the active level.
9. The count operation is stopped by TSTR.
10. Set in normal mode.
11. Initialize the pins with TIOR.
12. Set the multi-function timer pulse unit 2 output with the general I/O port.
13. Operation is restarted by TSTR.

(18) Operation when Error Occurs during Phase Counting Mode Operation, and Operation is Restarted in PWM Mode 1

Figure 11.132 shows an explanatory diagram of the case where an error occurs in phase counting mode and operation is restarted in PWM mode 1 after re-setting.

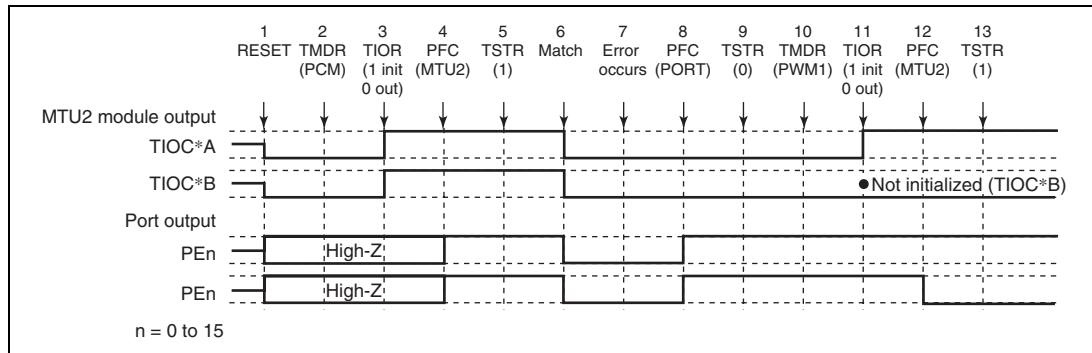

Figure 11.132 Error Occurrence in Phase Counting Mode, Recovery in PWM Mode 1

1 to 9 are the same as in figure 11.131.

10. Set PWM mode 1.

11. Initialize the pins with TIOR. (In PWM mode 1, the TIOC *B side is not initialized.)

12. Set the multi-function timer pulse unit 2 output with the general I/O port.

13. Operation is restarted by TSTR.

(19) Operation when Error Occurs during Phase Counting Mode Operation, and Operation is Restarted in PWM Mode 2

Figure 11.133 shows an explanatory diagram of the case where an error occurs in phase counting mode and operation is restarted in PWM mode 2 after re-setting.

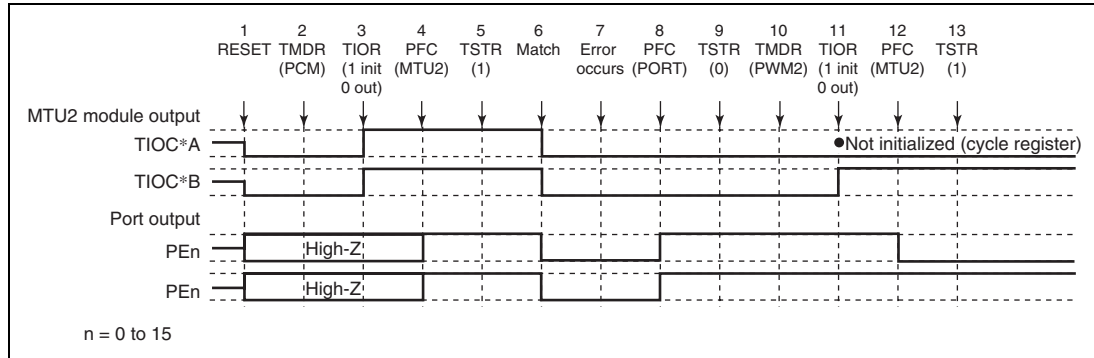

Figure 11.133 Error Occurrence in Phase Counting Mode, Recovery in PWM Mode 2

1 to 9 are the same as in figure 11.131.

10. Set PWM mode 2.

11. Initialize the pins with TIOR. (In PWM mode 2, the cycle register pins are not initialized.)

12. Set the multi-function timer pulse unit 2 output with the general I/O port.

13. Operation is restarted by TSTR.

(20) Operation when Error Occurs during Phase Counting Mode Operation, and Operation is Restarted in Phase Counting Mode

Figure 11.134 shows an explanatory diagram of the case where an error occurs in phase counting mode and operation is restarted in phase counting mode after re-setting.

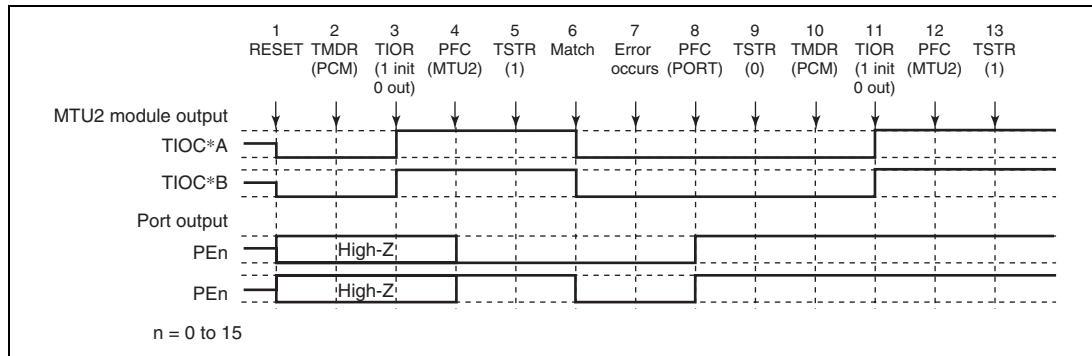

Figure 11.134 Error Occurrence in Phase Counting Mode, Recovery in Phase Counting Mode

1 to 9 are the same as in figure 11.131.

10. Not necessary when restarting in phase counting mode.

11. Initialize the pins with TIOR.

12. Set the multi-function timer pulse unit 2 output with the general I/O port.

13. Operation is restarted by TSTR.

(21) Operation when Error Occurs during Complementary PWM Mode Operation, and Operation is Restarted in Normal Mode

Figure 11.135 shows an explanatory diagram of the case where an error occurs in complementary PWM mode and operation is restarted in normal mode after re-setting.

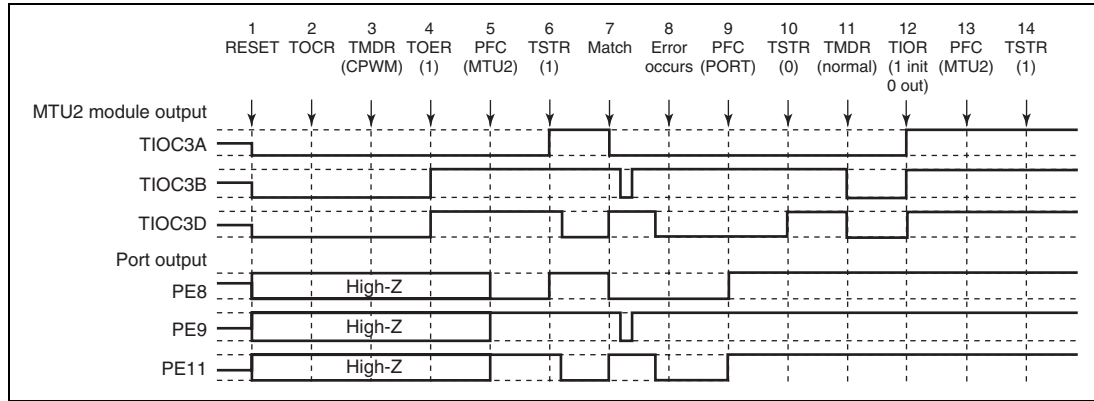

Figure 11.135 Error Occurrence in Complementary PWM Mode, Recovery in Normal Mode

1. After a reset, the module output is low and ports are in the high-impedance state.
2. Select the complementary PWM output level and cyclic output enabling/disabling with TOCR.
3. Set complementary PWM.
4. Enable channel 3 and 4 output with TOER.
5. Set the multi-function timer pulse unit 2 output with the general I/O port.
6. The count operation is started by TSTR.
7. The complementary PWM waveform is output on compare-match occurrence.
8. An error occurs.
9. Set port output with the general I/O port and output the inverse of the active level.
10. The count operation is stopped by TSTR. (This module outputs the same value as the complementary PWM output initial value.)
11. Set normal mode. (This module outputs a low-level signal.)
12. Initialize the pins with TIOR.
13. Set the multi-function timer pulse unit 2 output with the general I/O port.
14. Operation is restarted by TSTR.

(22) Operation when Error Occurs during Complementary PWM Mode Operation, and Operation is Restarted in PWM Mode 1

Figure 11.136 shows an explanatory diagram of the case where an error occurs in complementary PWM mode and operation is restarted in PWM mode 1 after re-setting.

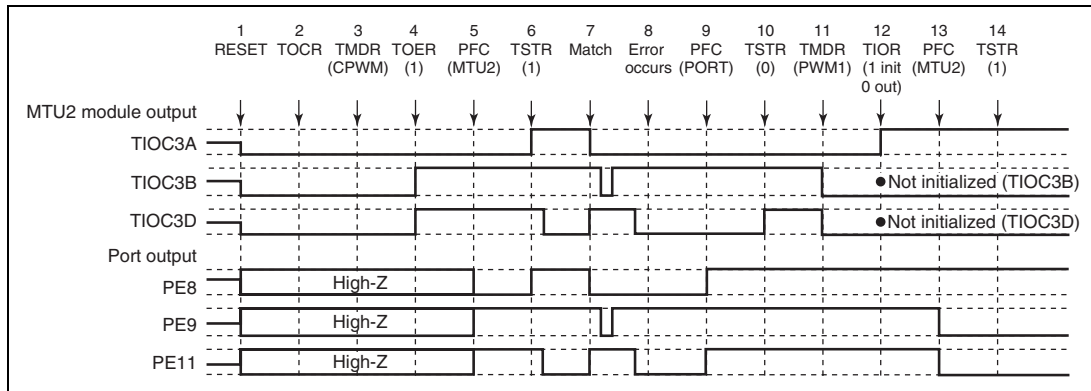

Figure 11.136 Error Occurrence in Complementary PWM Mode, Recovery in PWM Mode 1

1 to 10 are the same as in figure 11.135.

11. Set PWM mode 1. (This module outputs a low-level signal.)
12. Initialize the pins with TIOR. (In PWM mode 1, the TIOC *B side is not initialized.)
13. Set the multi-function timer pulse unit 2 output with the general I/O port.
14. Operation is restarted by TSTR.

(23) Operation when Error Occurs during Complementary PWM Mode Operation, and Operation is Restarted in Complementary PWM Mode

Figure 11.137 shows an explanatory diagram of the case where an error occurs in complementary PWM mode and operation is restarted in complementary PWM mode after re-setting (when operation is restarted using the cycle and duty settings at the time the counter was stopped).

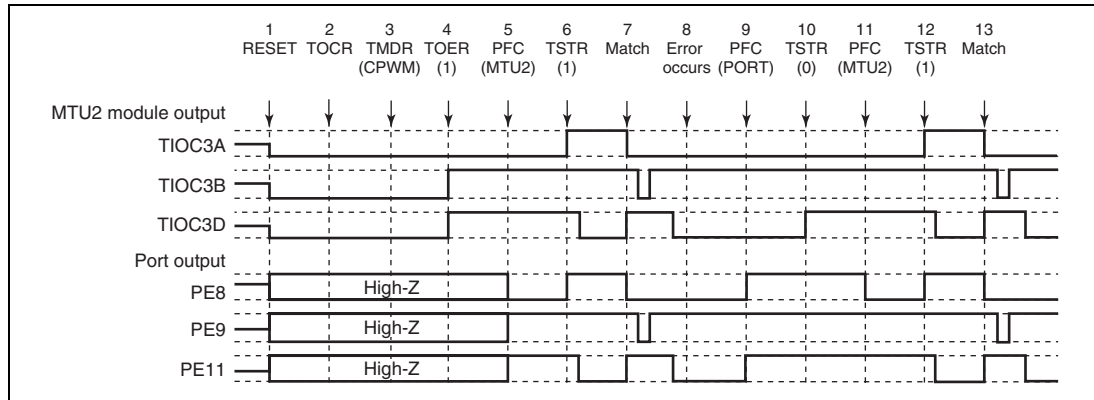

Figure 11.137 Error Occurrence in Complementary PWM Mode, Recovery in Complementary PWM Mode

1 to 10 are the same as in figure 11.135.

11. Set the multi-function timer pulse unit 2 output with the general I/O port.
12. Operation is restarted by TSTR.
13. The complementary PWM waveform is output on compare-match occurrence.

(24) Operation when Error Occurs during Complementary PWM Mode Operation, and Operation is Restarted in Complementary PWM Mode

Figure 11.138 shows an explanatory diagram of the case where an error occurs in complementary PWM mode and operation is restarted in complementary PWM mode after re-setting (when operation is restarted using completely new cycle and duty settings).

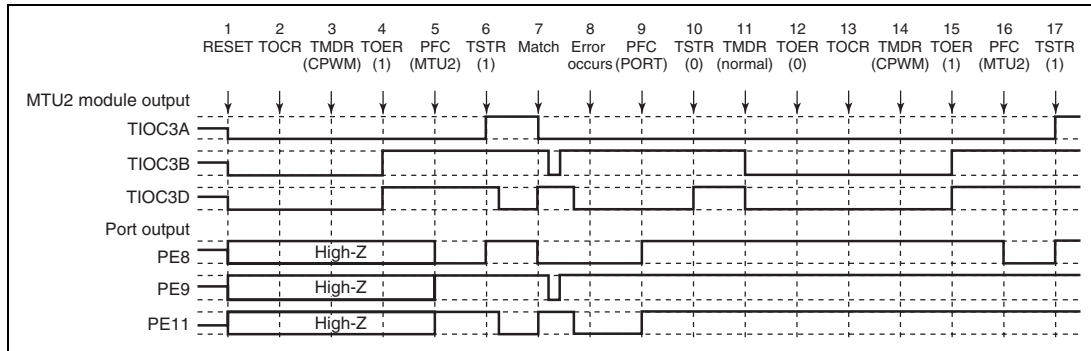

Figure 11.138 Error Occurrence in Complementary PWM Mode, Recovery in Complementary PWM Mode

1 to 10 are the same as in figure 11.135.

11. Set normal mode and make new settings. (This module outputs a low-level signal.)
12. Disable channel 3 and 4 output with TOER.
13. Select the complementary PWM mode output level and cyclic output enabling/disabling with TOCR.
14. Set complementary PWM.
15. Enable channel 3 and 4 output with TOER.
16. Set the multi-function timer pulse unit 2 output with the general I/O port.
17. Operation is restarted by TSTR.

(25) Operation when Error Occurs during Complementary PWM Mode Operation, and Operation is Restarted in Reset-Synchronized PWM Mode

Figure 11.139 shows an explanatory diagram of the case where an error occurs in complementary PWM mode and operation is restarted in reset-synchronized PWM mode.

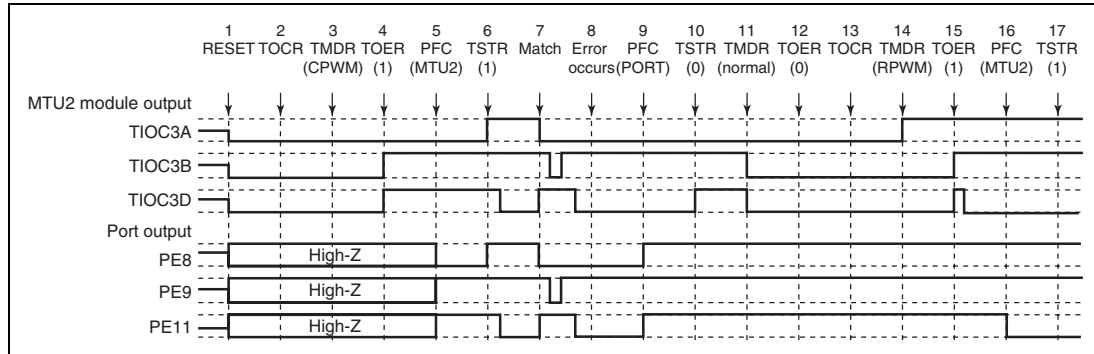

Figure 11.139 Error Occurrence in Complementary PWM Mode, Recovery in Reset-Synchronized PWM Mode

1 to 10 are the same as in figure 11.135.

11. Set normal mode. (This module outputs a low-level signal.)
12. Disable channel 3 and 4 output with TOER.
13. Select the reset-synchronized PWM mode output level and cyclic output enabling/disabling with TOCR.
14. Set reset-synchronized PWM.
15. Enable channel 3 and 4 output with TOER.
16. Set the multi-function timer pulse unit 2 output with the general I/O port.
17. Operation is restarted by TSTR.

(26) Operation when Error Occurs during Reset-Synchronized PWM Mode Operation, and Operation is Restarted in Normal Mode

Figure 11.140 shows an explanatory diagram of the case where an error occurs in reset-synchronized PWM mode and operation is restarted in normal mode after re-setting.

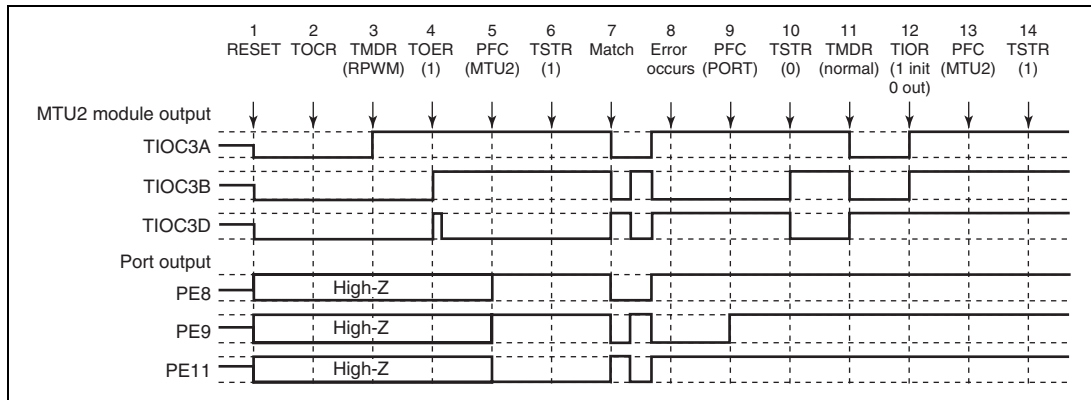

Figure 11.140 Error Occurrence in Reset-Synchronized PWM Mode, Recovery in Normal Mode

1. After a reset, the module output is low and ports are in the high-impedance state.
2. Select the reset-synchronized PWM output level and cyclic output enabling/disabling with TOCR.
3. Set reset-synchronized PWM.
4. Enable channel 3 and 4 output with TOER.
5. Set the multi-function timer pulse unit 2 output with the general I/O port.
6. The count operation is started by TSTR.
7. The reset-synchronized PWM waveform is output on compare-match occurrence.
8. An error occurs.
9. Set port output with the general I/O port and output the inverse of the active level.
10. The count operation is stopped by TSTR. (This module outputs the same value as the reset-synchronized PWM output initial value.)
11. Set normal mode. (The positive phase output from this module is low, and negative phase output is high.)
12. Initialize the pins with TIOR.
13. Set the multi-function timer pulse unit 2 output with the general I/O port.
14. Operation is restarted by TSTR.

(27) Operation when Error Occurs during Reset-Synchronized PWM Mode Operation, and Operation is Restarted in PWM Mode 1

Figure 11.141 shows an explanatory diagram of the case where an error occurs in reset-synchronized PWM mode and operation is restarted in PWM mode 1 after re-setting.

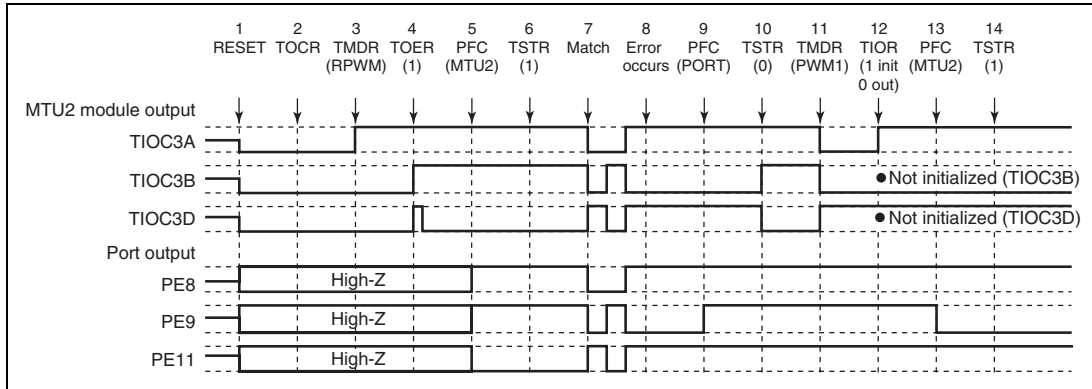

Figure 11.141 Error Occurrence in Reset-Synchronized PWM Mode, Recovery in PWM Mode 1

1 to 10 are the same as in figure 11.140.

11. Set PWM mode 1. (The positive phase output from this module is low, and negative phase output is high.)
12. Initialize the pins with TIOR. (In PWM mode 1, the TIOC *B side is not initialized.)
13. Set the multi-function timer pulse unit 2 output with the general I/O port.
14. Operation is restarted by TSTR.

(28) Operation when Error Occurs during Reset-Synchronized PWM Mode Operation, and Operation is Restarted in Complementary PWM Mode

Figure 11.142 shows an explanatory diagram of the case where an error occurs in reset-synchronized PWM mode and operation is restarted in complementary PWM mode after re-setting.

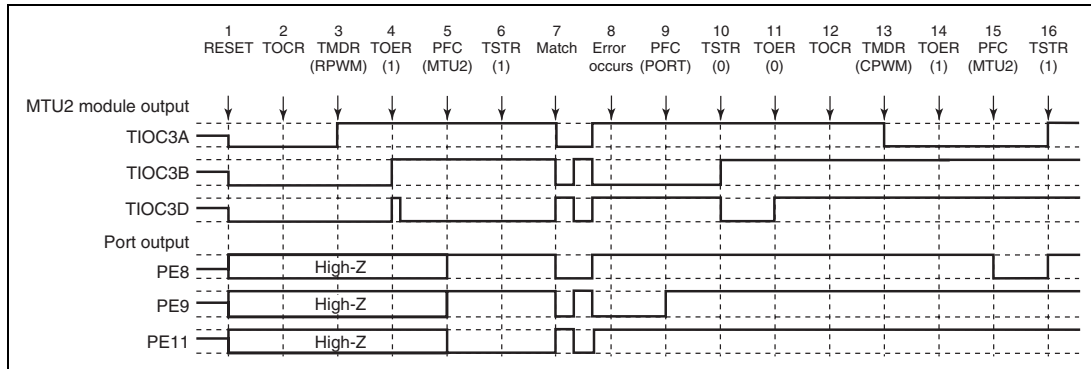

Figure 11.142 Error Occurrence in Reset-Synchronized PWM Mode, Recovery in Complementary PWM Mode

1 to 10 are the same as in figure 11.140.

11. Disable channel 3 and 4 output with TOER.
12. Select the complementary PWM output level and cyclic output enabling/disabling with TOCR.
13. Set complementary PWM. (The cyclic output pin of this module outputs a low-level signal.)
14. Enable channel 3 and 4 output with TOER.
15. Set the multi-function timer pulse unit 2 output with the general I/O port.
16. Operation is restarted by TSTR.

(29) Operation when Error Occurs during Reset-Synchronized PWM Mode Operation, and Operation is Restarted in Reset-Synchronized PWM Mode

Figure 11.143 shows an explanatory diagram of the case where an error occurs in reset-synchronized PWM mode and operation is restarted in reset-synchronized PWM mode after re-setting.

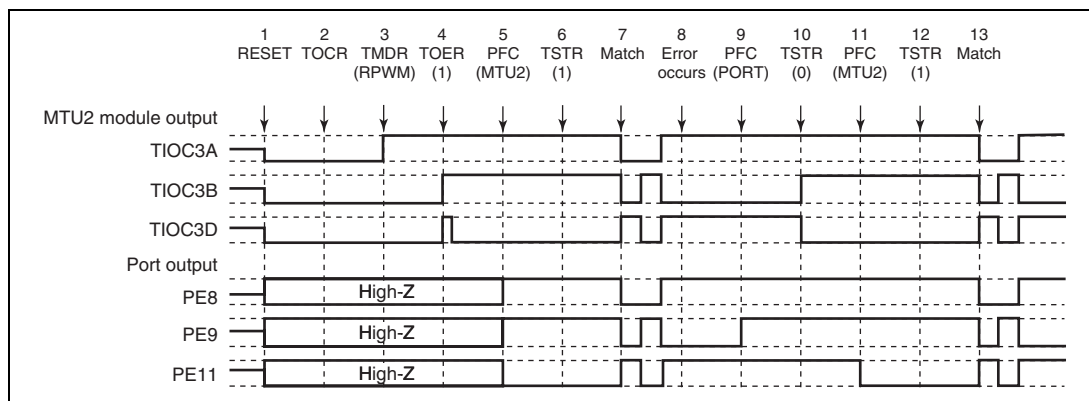

Figure 11.143 Error Occurrence in Reset-Synchronized PWM Mode, Recovery in Reset-Synchronized PWM Mode

1 to 10 are the same as in figure 11.140.

11. Set the multi-function timer pulse unit 2 output with the general I/O port.
12. Operation is restarted by TSTR.
13. The reset-synchronized PWM waveform is output on compare-match occurrence.

Section 12 Compare Match Timer

This LSI has an on-chip compare match timer module consisting of two-channel 16-bit timers. This module has a 16-bit counter, and can generate interrupts at set intervals.

12.1 Features

- Independent selection of four counter input clocks at two channels
Any of four internal clocks (P ϕ /8, P ϕ /32, P ϕ /128, and P ϕ /512) can be selected.
- Selection of DMA transfer request or interrupt request generation on compare match by direct memory access controller setting
- When not in use, this module can be stopped by halting its clock supply to reduce power consumption.

Figure 12.1 shows a block diagram.

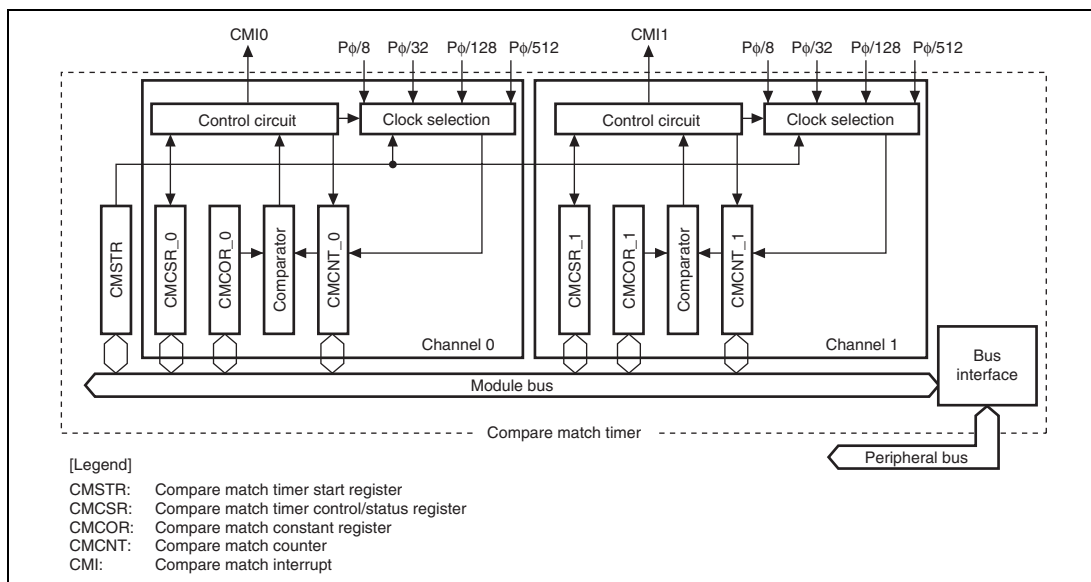

Figure 12.1 Block Diagram

12.2 Register Descriptions

Table 12.1 shows the register configuration.

Table 12.1 Register Configuration

Channel	Register Name	Abbreviation	R/W	Initial Value	Address	Access Size
Common	Compare match timer start register	CMSTR	R/W	H'0000	H'FFFE000	16
0	Compare match timer control/ status register_0	CMCSR_0	R/W	H'0000	H'FFFE002	16
	Compare match counter_0	CMCNT_0	R/W	H'0000	H'FFFE004	8, 16
	Compare match constant register_0	CMCOR_0	R/W	H'FFFF	H'FFFE006	8, 16
1	Compare match timer control/ status register_1	CMCSR_1	R/W	H'0000	H'FFFE008	16
	Compare match counter_1	CMCNT_1	R/W	H'0000	H'FFFE00A	8, 16
	Compare match constant register_1	CMCOR_1	R/W	H'FFFF	H'FFFE00C	8, 16

12.2.1 Compare Match Timer Start Register (CMSTR)

CMSTR is a 16-bit register that selects whether compare match counter (CMCNT) operates or is stopped.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	STR1	STR0
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1	STR1	0	R/W	Count Start 1 Specifies whether compare match counter_1 operates or is stopped. 0: Counting by CMCNT_1 is stopped 1: Counting by CMCNT_1 is started
0	STR0	0	R/W	Count Start 0 Specifies whether compare match counter_0 operates or is stopped. 0: Counting by CMCNT_0 is stopped 1: Counting by CMCNT_0 is started

12.2.2 Compare Match Timer Control/Status Register (CMCSR)

CMCSR is a 16-bit register that indicates compare match generation, enables or disables interrupts, and selects the counter input clock.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	CMF	CMIE	-	-	-	-	CKS[1:0]	
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/(W)*	R/W	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
7	CMF	0	R/(W)*	Compare Match Flag Indicates whether or not the values of CMCNT and CMCOR match. 0: CMCNT and CMCOR values do not match [Clearing condition] <ul style="list-style-type: none"> When 0 is written to CMF after reading CMF = 1 1: CMCNT and CMCOR values match
6	CMIE	0	R/W	Compare Match Interrupt Enable Enables or disables compare match interrupt (CMI) generation when CMCNT and CMCOR values match (CMF = 1). 0: Compare match interrupt (CMI) disabled 1: Compare match interrupt (CMI) enabled
5 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
1, 0	CKS[1:0]	00	R/W	Clock Select These bits select the clock to be input to CMCNT from four internal clocks obtained by dividing the peripheral clock ($P\phi$). When the STR bit in CMSTR is set to 1, CMCNT starts counting on the clock selected with bits CKS[1:0]. 00: $P\phi/8$ 01: $P\phi/32$ 10: $P\phi/128$ 11: $P\phi/512$

Note: * Only 0 can be written to clear the flag after 1 is read.

12.2.3 Compare Match Counter (CMCNT)

CMCNT is a 16-bit register used as an up-counter. When the counter input clock is selected with bits CKS[1:0] in CMCSR, and the STR bit in CMSTR is set to 1, CMCNT starts counting using the selected clock. When the value in CMCNT and the value in compare match constant register (CMCOR) match, CMCNT is cleared to H'0000 and the CMF flag in CMCSR is set to 1.

CMCNT is initialized to H'0000 by clearing any channels of the counter start bit from 1 to 0 in the compare match timer start register (CMSTR).

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

12.2.4 Compare Match Constant Register (CMCOR)

CMCOR is a 16-bit register that sets the interval up to a compare match with CMCNT.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Initial value:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

12.3 Operation

12.3.1 Interval Count Operation

When an internal clock is selected with the CKS[1:0] bits in CMCSR and the STR bit in CMSTR is set to 1, CMCNT starts incrementing using the selected clock. When the values in CMCNT and CMCOR match, CMCNT is cleared to H'0000 and the CMF flag in CMCSR is set to 1. When the CMIE bit in CMCSR is set to 1 at this time, a compare match interrupt (CMI) is requested. CMCNT then starts counting up again from H'0000.

Figure 12.2 shows the operation of the compare match counter.

Figure 12.2 Counter Operation

12.3.2 CMCNT Count Timing

One of four clocks ($P\phi/8$, $P\phi/32$, $P\phi/128$, and $P\phi/512$) obtained by dividing the peripheral clock ($P\phi$) can be selected with the CKS1 and CKS0 bits in CMCSR. Figure 12.3 shows the timing.

Figure 12.3 Count Timing

12.4 Interrupts

12.4.1 Interrupt Sources and DMA Transfer Requests

This module has channels and each of them to which a different vector address is allocated has a compare match interrupt. When both the compare match flag (CMF) and the interrupt enable bit (CMIE) are set to 1, the corresponding interrupt request is output. When the interrupt is used to activate a CPU interrupt, the priority of channels can be changed by the interrupt controller settings. For details, see section 7, Interrupt Controller.

Clear the CMF bit to 0 by the user exception handling routine. If this operation is not carried out, another interrupt will be generated. By setting the interrupt controller, the direct memory access controller can be activated when a compare match interrupt is requested. In this case, an interrupt is not issued to the CPU. If the setting to activate the direct memory access controller has not been made, an interrupt request is sent to the CPU. The CMF bit is automatically cleared to 0 when data is transferred by the direct memory access controller.

12.4.2 Timing of Compare Match Flag Setting

When CMCOR and CMCNT match, a compare match signal is generated at the last state in which the values match (the timing when the CMCNT value is updated to H'0000) and the CMF bit in CMCSR is set to 1. That is, after a match between CMCOR and CMCNT, the compare match signal is not generated until the next CMCNT counter clock input. Figure 12.4 shows the timing of CMF bit setting.

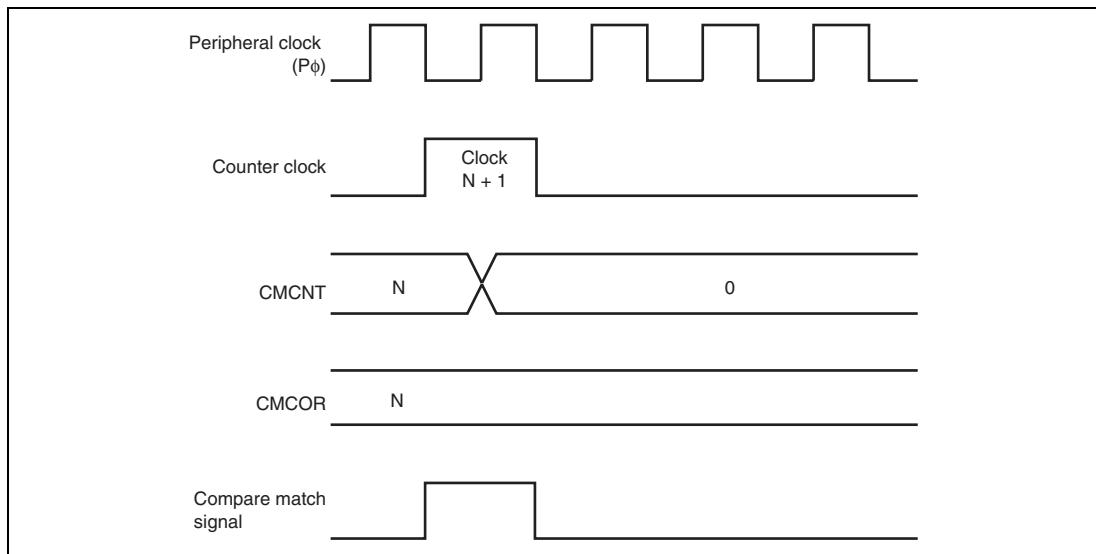

Figure 12.4 Timing of CMF Setting

12.4.3 Timing of Compare Match Flag Clearing

The CMF bit in CMCSR is cleared by first, reading as 1 then writing to 0. However, in the case of the direct memory access controller being activated, the CMF bit is automatically cleared to 0 when data is transferred by the direct memory access controller.

12.5 Usage Notes

12.5.1 Conflict between Write and Compare-Match Processes of CMCNT

When the compare match signal is generated in the T2 cycle while writing to CMCNT, clearing CMCNT has priority over writing to it. In this case, CMCNT is not written to. Figure 12.5 shows the timing to clear the CMCNT counter.

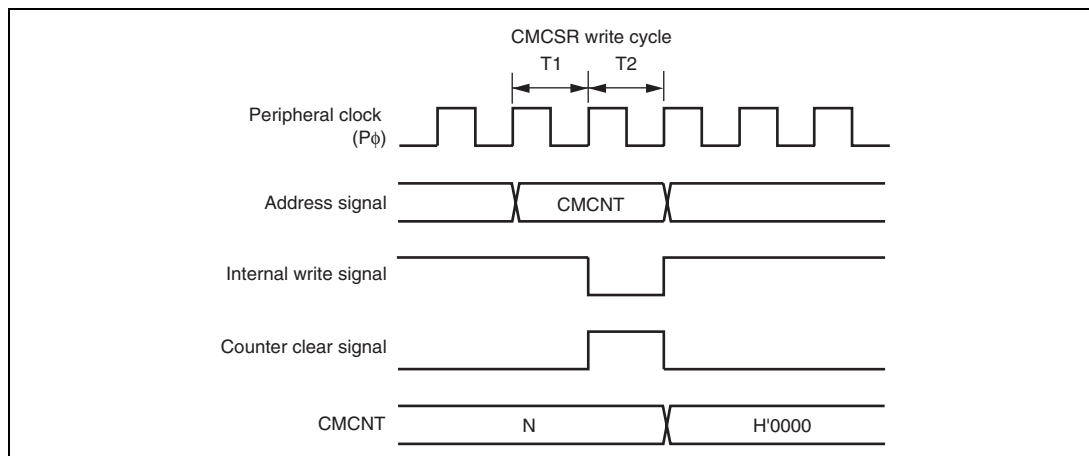

Figure 12.5 Conflict between Write and Compare Match Processes of CMCNT

12.5.2 Conflict between Word-Write and Count-Up Processes of CMCNT

Even when the count-up occurs in the T2 cycle while writing to CMCNT in words, the writing has priority over the count-up. In this case, the count-up is not performed. Figure 12.6 shows the timing to write to CMCNT in words.

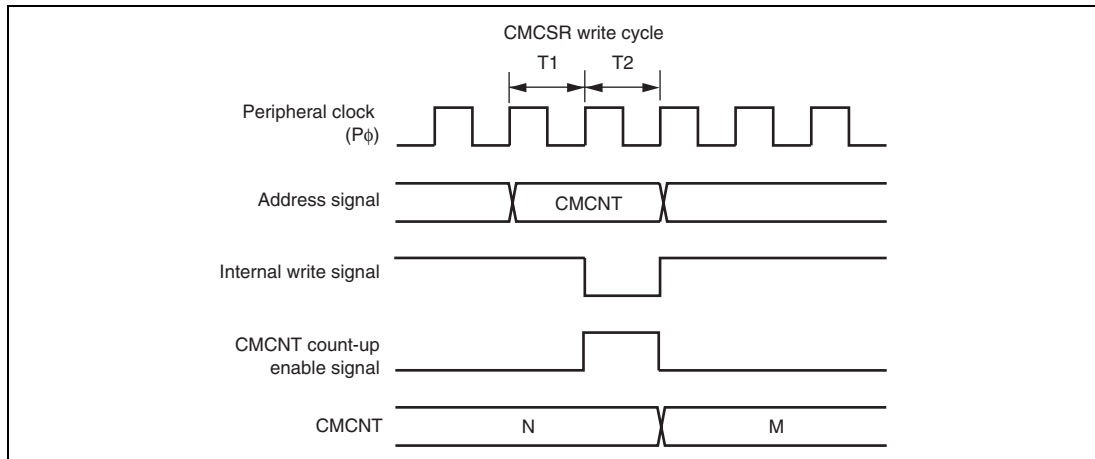

Figure 12.6 Conflict between Word-Write and Count-Up Processes of CMCNT

12.5.3 Conflict between Byte-Write and Count-Up Processes of CMCNT

Even when the count-up occurs in the T2 cycle while writing to CMCNT in bytes, the writing has priority over the count-up. In this case, the count-up is not performed. The byte data on the other side, which is not written to, is also not counted and the previous contents are retained.

Figure 12.7 shows the timing when the count-up occurs in the T2 cycle while writing to CMCNTH in bytes.

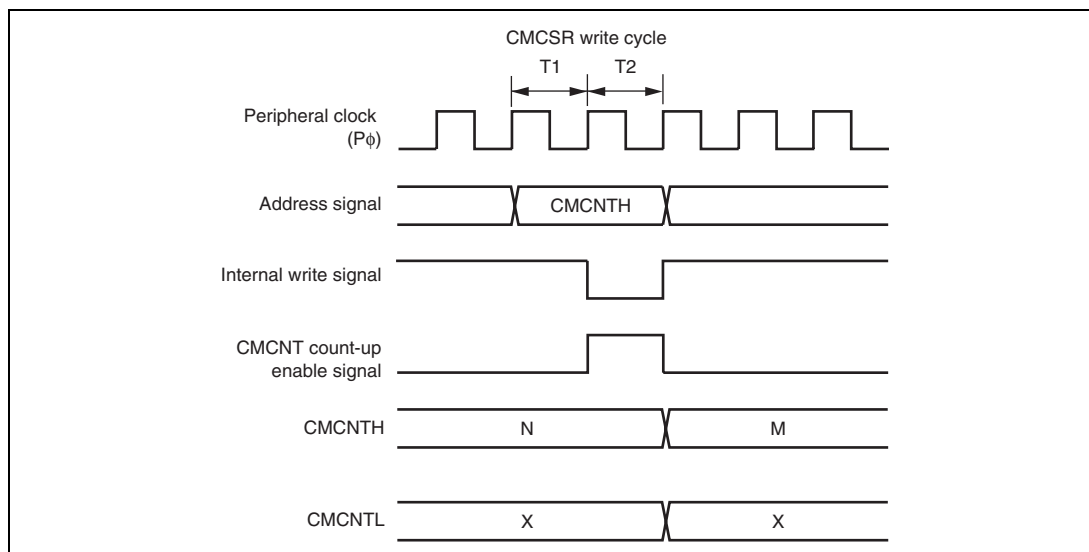

Figure 12.7 Conflict between Byte-Write and Count-Up Processes of CMCNT

12.5.4 Compare Match between CMCNT and CMCOR

Do not set the same value in CMCNT and CMCOR while CMCNT is not counting.

Section 13 Watchdog Timer

This LSI includes the watchdog timer, which externally outputs an overflow signal ($\overline{\text{WDTOVF}}$) on overflow of the counter when the value of the counter has not been updated because of a system malfunction. This module can simultaneously generate an internal reset signal for the entire LSI.

This module is a single channel timer that counts up the clock oscillation settling period when the system leaves software standby mode. It can also be used as a general watchdog timer or interval timer.

13.1 Features

- Can be used to ensure the clock oscillation settling time
This module is used in leaving software standby mode.
- Can switch between watchdog timer mode and interval timer mode.
- Outputs $\overline{\text{WDTOVF}}$ signal in watchdog timer mode
When the counter overflows in watchdog timer mode, the $\overline{\text{WDTOVF}}$ signal is output externally. It is possible to select whether to reset the LSI internally when this happens. Either the power-on reset or manual reset signal can be selected as the internal reset type.
- Interrupt generation in interval timer mode
An interval timer interrupt is generated when the counter overflows.
- Choice of eight counter input clocks
Eight clocks ($P\phi \times 1$ to $P\phi \times 1/16384$) that are obtained by dividing the peripheral clock can be selected.

Figure 13.1 shows a block diagram.

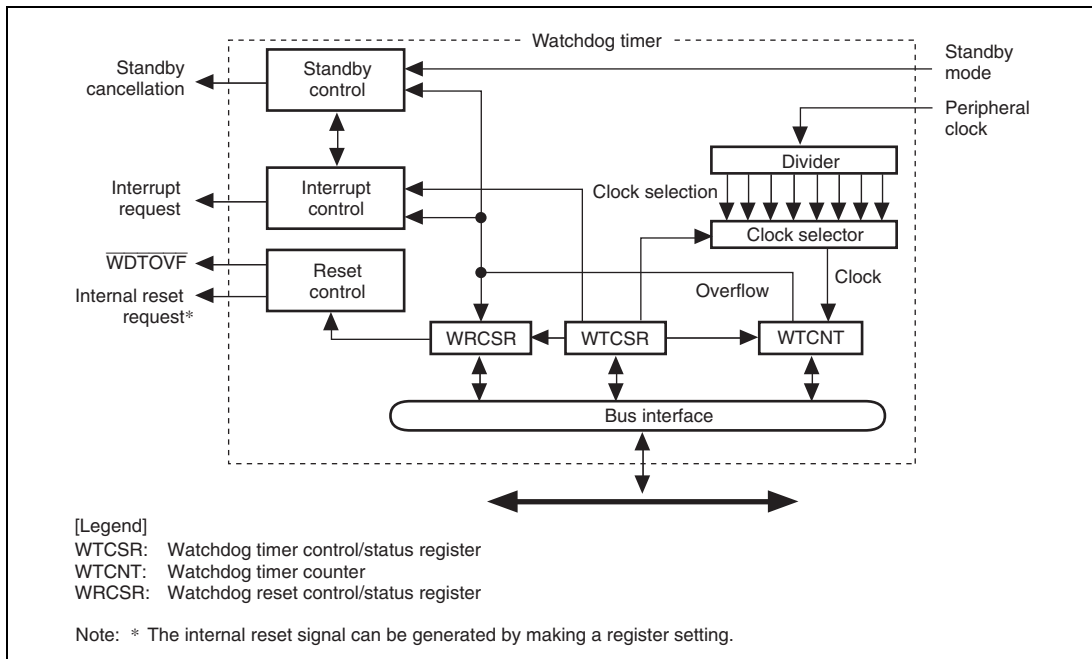

Figure 13.1 Block Diagram

13.2 Input/Output Pin

Table 13.1 shows the pin configuration.

Table 13.1 Pin Configuration

Pin Name	Symbol	I/O	Function
Watchdog timer overflow	$\overline{\text{WDTOVF}}$	Output	Outputs the counter overflow signal in watchdog timer mode

13.3 Register Descriptions

Table 13.2 shows the register configuration.

Table 13.2 Register Configuration

Register Name	Abbreviation	R/W	Initial Value	Address	Access Size
Watchdog timer counter	WTCNT	R/W	H'00	H'FFFE0002	16*
Watchdog timer control/status register	WTCSR	R/W	H'18	H'FFFE0000	16*
Watchdog reset control/status register	WRCSR	R/W	H'1F	H'FFFE0004	16*

Note: * For the access size, see section 13.3.4, Notes on Register Access.

13.3.1 Watchdog Timer Counter (WTCNT)

WTCNT is an 8-bit readable/writable register that is incremented by cycles of the selected clock signal. When an overflow occurs, it generates a watchdog timer overflow signal ($\overline{\text{WDTOVF}}$) in watchdog timer mode and an interrupt in interval timer mode.

Use word access to write to WTCNT, writing H'5A in the upper byte. Use byte access to read from WTCNT.

Note: The method for writing to WTCNT differs from that for other registers to prevent erroneous writes. See section 13.3.4, Notes on Register Access, for details.

13.3.2 Watchdog Timer Control/Status Register (WTCSR)

WTCSR is an 8-bit readable/writable register composed of bits to select the clock used for the count, overflow flags, and timer enable bit.

When used to count the clock oscillation settling time for canceling software standby mode, it retains its value after counter overflow.

Use word access to write to WTCSR, writing H'A5 in the upper byte. Use byte access to read from WTCSR.

Note: The method for writing to WTCSR differs from that for other registers to prevent erroneous writes. See section 13.3.4, Notes on Register Access, for details.

13.3.3 Watchdog Reset Control/Status Register (WRCSR)

WRCSR is an 8-bit readable/writable register that controls output of the internal reset signal generated by watchdog timer counter (WTCNT) overflow.

Note: The method for writing to WRCSR differs from that for other registers to prevent erroneous writes. See section 13.3.4, Notes on Register Access, for details.

Bit:	7	6	5	4	3	2	1	0
	WOVF	RSTE	RSTS	-	-	-	-	-
Initial value:	0	0	0	1	1	1	1	1
R/W:	R/(W)	R/W	R/W	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7	WOVF	0	R/(W)	Watchdog Timer Overflow Indicates that the WTCNT has overflowed in watchdog timer mode. This bit is not set in interval timer mode. 0: No overflow 1: WTCNT has overflowed in watchdog timer mode [Clearing condition] <ul style="list-style-type: none"> • When 0 is written to WOVF after reading WOVF
6	RSTE	0	R/W	Reset Enable Selects whether to generate a signal to reset the LSI internally if WTCNT overflows in watchdog timer mode. In interval timer mode, this setting is ignored. 0: Not reset when WTCNT overflows* 1: Reset when WTCNT overflows Note: * LSI not reset internally, but WTCNT and WTCSR reset within this module.
5	RSTS	0	R/W	Reset Select Selects the type of reset when the WTCNT overflows in watchdog timer mode. In interval timer mode, this setting is ignored. 0: Power-on reset 1: Manual reset
4 to 0	—	All 1	R	Reserved These bits are always read as 1. The write value should always be 1.

13.3.4 Notes on Register Access

The watchdog timer counter (WTCNT), watchdog timer control/status register (WTCSR), and watchdog reset control/status register (WRCSR) are more difficult to write to than other registers. The procedures for reading or writing to these registers are given below.

(1) Writing to WTCNT and WTCSR

These registers must be written by a word transfer instruction. They cannot be written by a byte or longword transfer instruction.

When writing to WTCNT, set the upper byte to H'5A and transfer the lower byte as the write data, as shown in figure 13.2. When writing to WTCSR, set the upper byte to H'A5 and transfer the lower byte as the write data. This transfer procedure writes the lower byte data to WTCNT or WTCSR.

Figure 13.2 Writing to WTCNT and WTCSR

(2) Writing to WRCSR

WRCSR must be written by a word access to address H'FFFE0004. It cannot be written by byte transfer or longword transfer instructions.

Procedures for writing 0 to WOVF (bit 7) and for writing to RSTE (bit 6) and RSTS (bit 5) are different, as shown in figure 13.3.

To write 0 to the WOVF bit, the write data must be H'A5 in the upper byte and H'00 in the lower byte. This clears the WOVF bit to 0. The RSTE and RSTS bits are not affected. To write to the RSTE and RSTS bits, the upper byte must be H'5A and the lower byte must be the write data. The values of bits 6 and 5 of the lower byte are transferred to the RSTE and RSTS bits, respectively. The WOVF bit is not affected.

Figure 13.3 Writing to WRCSR

(3) Reading from WTCNT, WTCSR, and WRCSR

WTCNT, WTCSR, and WRCSR are read in a method similar to other registers. WTCSR is allocated to address H'FFFE0000, WTCNT to address H'FFFE0002, and WRCSR to address H'FFFE0004. Byte transfer instructions must be used for reading from these registers.

13.4 Usage

13.4.1 Canceling Software Standby Mode

This module can be used to cancel software standby mode with an interrupt such as an NMI interrupt. The procedure is described below. (This module does not operate when resets are used for canceling, so keep the $\overline{\text{RES}}$ or $\overline{\text{MRES}}$ pin low until clock oscillation settles.)

1. Before making a transition to software standby mode, always clear the TME bit in WTCSR to 0. When the TME bit is 1, an erroneous reset or interval timer interrupt may be generated when the count overflows.
2. Set the type of count clock used in the CKS[2:0] bits in WTCSR and the initial value of the counter in WTCNT. These values should ensure that the time till count overflow is longer than the clock oscillation settling time.
3. After setting the STBY and DEEP bits of the standby control register 1 (STBCR1: see section 33, Power-Down Modes) to 1 and 0 respectively, the execution of a SLEEP instruction puts the system in software standby mode and clock operation then stops.
4. This module starts counting by detecting the edge change of the NMI signal.
5. When the module count overflows, the clock pulse generator starts supplying the clock and this LSI resumes operation. The WOVF flag in WRCSR is not set when this happens.

13.4.2 Using Watchdog Timer Mode

1. Set the WT/IT bit in WTCSR to 1, the type of count clock in the CKS[2:0] bits in WTCSR, whether this LSI is to be reset internally or not in the RSTE bit in WRCSR, the reset type if it is generated in the RSTS bit in WRCSR, and the initial value of the counter in WTCNT.
2. Set the TME bit in WTCSR to 1 to start the count in watchdog timer mode.
3. While operating in watchdog timer mode, rewrite the counter periodically to H'00 to prevent the counter from overflowing.
4. When the counter overflows, this module sets the WOVF flag in WRCSR to 1, and the $\overline{\text{WDTOVF}}$ signal is output externally (figure 13.4). The $\overline{\text{WDTOVF}}$ signal can be used to reset the system. The $\overline{\text{WDTOVF}}$ signal is output for $64 \times P\phi$ clock cycles.
5. If the RSTE bit in WRCSR is set to 1, a signal to reset the inside of this LSI can be generated simultaneously with the $\overline{\text{WDTOVF}}$ signal. Either power-on reset or manual reset can be selected for this interrupt by the RSTS bit in WRCSR. The internal reset signal is output for $128 \times P\phi$ clock cycles.
6. When an overflow reset of this module is generated simultaneously with a reset input on the $\overline{\text{RES}}$ pin, the $\overline{\text{RES}}$ pin reset takes priority, and the WOVF bit in WRCSR is cleared to 0.

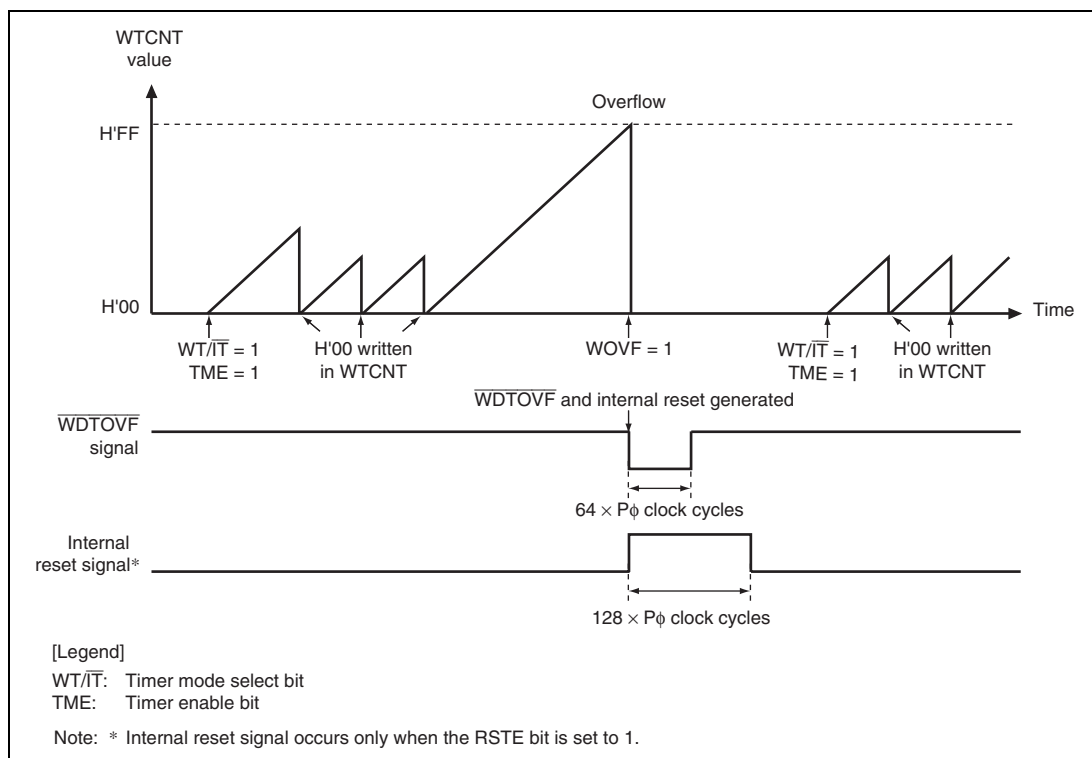

Figure 13.4 Operation in Watchdog Timer Mode

13.4.3 Using Interval Timer Mode

When operating in interval timer mode, interval timer interrupts are generated at every overflow of the counter. This enables interrupts to be generated at set periods.

1. Clear the $\overline{WT/IT}$ bit in WTCSR to 0, set the type of count clock in the CKS[2:0] bits in WTCSR, and set the initial value of the counter in WTCNT.
2. Set the TME bit in WTCSR to 1 to start the count in interval timer mode.
3. When the counter overflows, this module sets the IOVF bit in WTCSR to 1 and an interval timer interrupt request is sent to the interrupt controller. The counter then resumes counting.

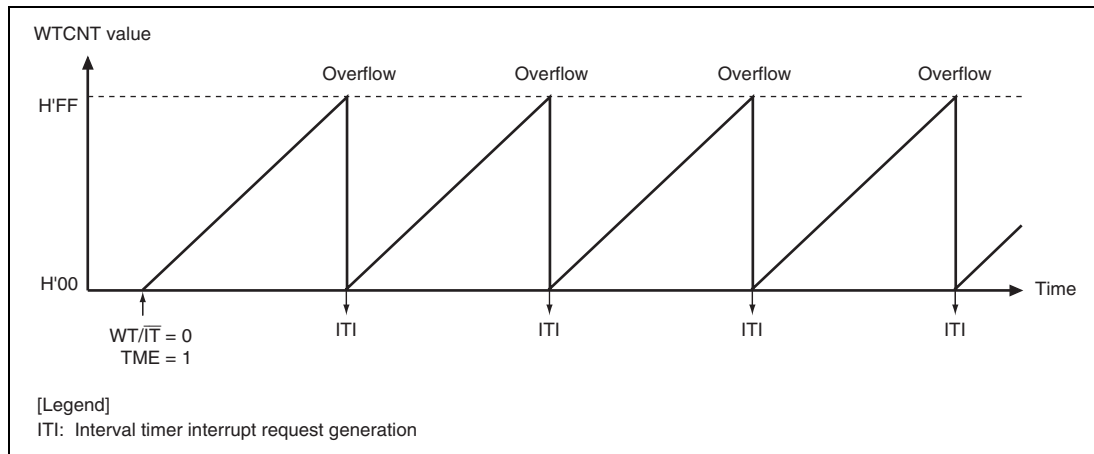

Figure 13.5 Operation in Interval Timer Mode

13.5 Usage Notes

Pay attention to the following points when using this module in either the interval timer or watchdog timer mode.

13.5.1 Timer Variation

After timer operation has started, the period from the power-on reset point to the first count up timing of WTCNT varies depending on the time period that is set by the TME bit of WTCSR. The shortest such time period is thus one cycle of the peripheral clock, $P\phi$, while the longest is the result of frequency division according to the value in the CKS[2:0] bits. The timing of subsequent incrementation is in accord with the selected frequency division ratio. Accordingly, this time difference is referred to as timer variation.

This also applies to the timing of the first incrementation after WTCNT has been written to during timer operation.

13.5.2 Prohibition against Setting H'FF to WTCNT

When the value in WTCNT reaches H'FF, this module assumes that an overflow has occurred. Accordingly, when H'FF is set in WTCNT, an interval timer interrupt or reset will occur immediately, regardless of the current clock selection by the CKS[2:0] bits.

13.5.3 Interval Timer Overflow Flag

When the value in WTCNT is H'FF, the IOVF flag in WTCSR cannot be cleared.

Only clear the IOVF flag when the value in WTCNT has either become H'00 or been changed to a value other than H'FF.

13.5.4 System Reset by $\overline{\text{WDTOVF}}$ Signal

If the $\overline{\text{WDTOVF}}$ signal is input to the $\overline{\text{RES}}$ pin of this LSI, this LSI cannot be initialized correctly.

Avoid input of the $\overline{\text{WDTOVF}}$ signal to the $\overline{\text{RES}}$ pin of this LSI through glue logic circuits. To reset the entire system with the $\overline{\text{WDTOVF}}$ signal, use the circuit shown in figure 13.6.

Figure 13.6 Example of System Reset Circuit Using $\overline{\text{WDTOVF}}$ Signal

13.5.5 Manual Reset in Watchdog Timer Mode

When a manual reset occurs in watchdog timer mode, the bus cycle is continued. If a manual reset occurs while the bus is released or during burst transfer by the direct memory access controller, manual reset exception handling will be pended until the CPU acquires the bus mastership.

Section 14 Realtime Clock

This LSI has a realtime clock and a 32.768-kHz crystal oscillator.

14.1 Features

- Clock and calendar functions (BCD format): Seconds, minutes, hours, date, day of the week, month, and year.
- 1-Hz to 64-Hz timer (binary format)
64-Hz counter indicates the state of the divider circuit between 64 Hz and 1 Hz
- Start/stop function
- 30-second adjust function
- Alarm interrupt: Frame comparison of seconds, minutes, hours, date, day of the week, month, and year can be used as conditions for the alarm interrupt
- Periodic interrupts: the interrupt cycle may be 1/256 second, 1/64 second, 1/16 second, 1/4 second, 1/2 second, 1 second, or 2 seconds
- Carry interrupt: a carry interrupt indicates when a carry occurs during a counter read
- Automatic leap year adjustment
- Any of the external clock signal dedicated for the clock function, the internal signal, or the USB clock input signal can be selected as the operating clock signal for the clock function.
- Recovery from deep standby mode can be performed by an alarm interrupt.

Figure 14.1 shows the block diagram.

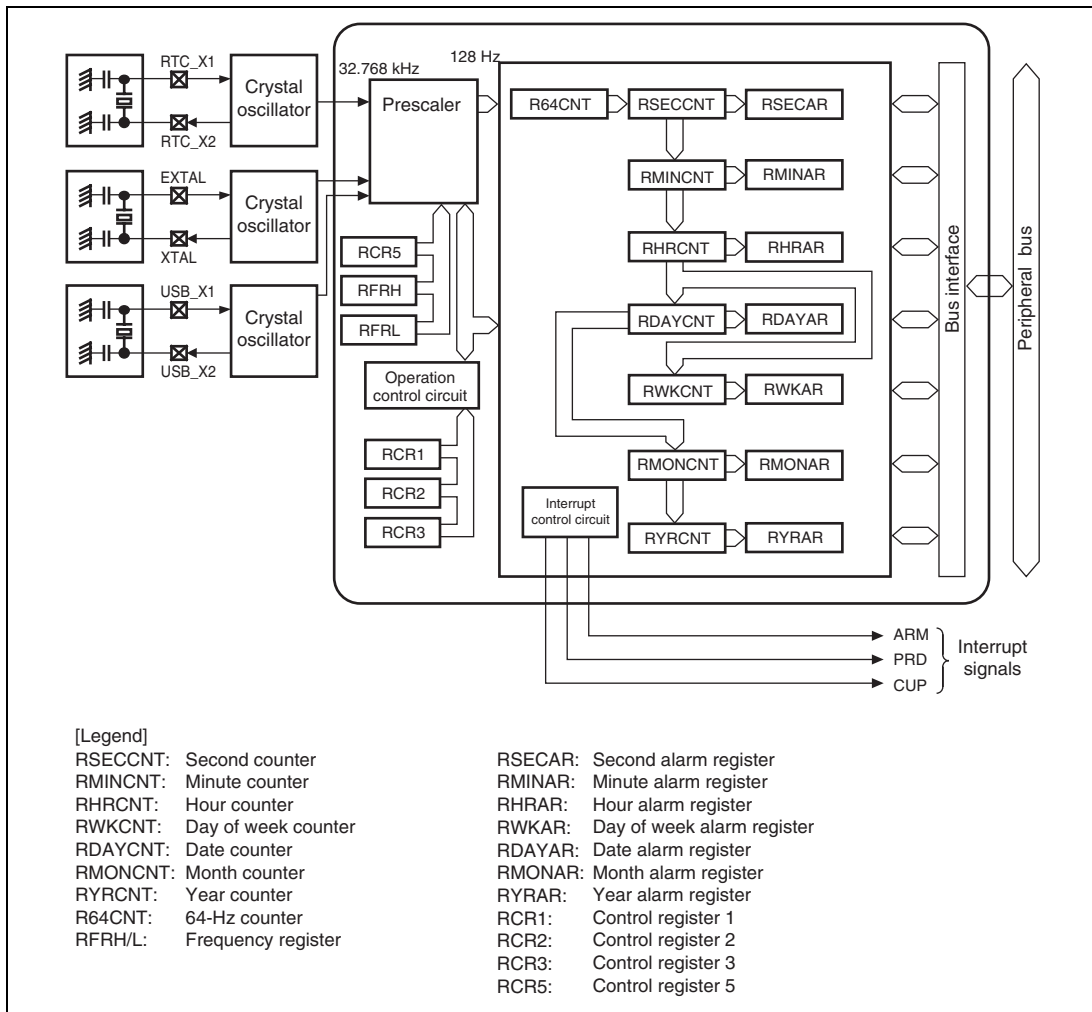

Figure 14.1 Block Diagram

14.2 Input/Output Pin

Table 14.1 shows the pin configuration.

Table 14.1 Pin Configuration

Pin Name	Symbol	I/O	Description
Realtime clock resonator crystal pin/ external clock	RTC_X1	Input	Connects 32.768-kHz crystal resonator for this module, and enables to input the external clock to the RTC_X1 pin.
	RTC_X2	Output	
Internal clock resonator crystal/ external clock	EXTAL	Input	Connects crystal resonator used for internal operation. For details, see section 5, Clock Pulse Generator.
	XTAL	Output	
USB clock resonator crystal/ external clock	USB_X1	Input	Connects crystal resonator for the USB. For details, see section 5, Clock Pulse Generator.
	USB_X2	Output	

14.3 Register Descriptions

Table 14.2 shows the register configuration.

Table 14.2 Register Configuration

Register Name	Abbreviation	R/W	Initial Value	Address	Access Size
64-Hz counter	R64CNT	R	H'xx	H'FFFE6000	8
Second counter	RSECCNT	R/W	H'xx	H'FFFE6002	8

14.3.1 64-Hz Counter (R64CNT)

R64CNT indicates the state of the divider circuit between 64 Hz and 1 Hz.

Reading this register, when carry from 128-Hz divider stage is generated, sets the CF bit in the control register 1 (RCR1) to 1 so that the carrying and reading 64 Hz counter are performed at the same time is indicated. In this case, the R64CNT should be read again after writing 0 to the CF bit in RCR1 since the read value is not valid.

After the RESET bit or ADJ bit in the control register 2 (RCR2) is set to 1, the divider circuit is initialized and R64CNT is initialized.

Bit:	7	6	5	4	3	2	1	0
	-	1Hz	2Hz	4Hz	8Hz	16Hz	32Hz	64Hz
Initial value:	0	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined
R/W:	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
6	1 Hz	Undefined	R	Indicate the state of the divider circuit between 64 Hz and 1 Hz.
5	2 Hz	Undefined	R	
4	4 Hz	Undefined	R	
3	8 Hz	Undefined	R	
2	16 Hz	Undefined	R	
1	32 Hz	Undefined	R	
0	64 Hz	Undefined	R	

14.3.2 Second Counter (RSECCNT)

RSECCNT is used for setting/counting in the BCD-coded second section. The count operation is performed by a carry for each second of the 64-Hz counter.

The assignable range is from 00 through 59 (practically in BCD), otherwise operation errors occur. Carry out write processing after stopping the count operation through the setting of the START bit in RCR2.

Bit:	7	6	5	4	3	2	1	0
	-	10 seconds			1 second			
Initial value:	0	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined
R/W:	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
6 to 4	10 seconds	Undefined	R/W	Counting Ten's Position of Seconds Counts on 0 to 5 for 60-seconds counting.
3 to 0	1 second	Undefined	R/W	Counting One's Position of Seconds Counts on 0 to 9 once per second. When a carry is generated, 1 is added to the ten's position.

14.3.3 Minute Counter (RMINCNT)

RMINCNT is used for setting/counting in the BCD-coded minute section. The count operation is performed by a carry for each minute of the second counter.

The assignable range is from 00 through 59 (practically in BCD), otherwise operation errors occur. Carry out write processing after stopping the count operation through the setting of the START bit in RCR2.

Bit:	7	6	5	4	3	2	1	0
	-	10 minutes			1 minute			
Initial value:	0	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined
R/W:	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
6 to 4	10 minutes	Undefined	R/W	Counting Ten's Position of Minutes Counts on 0 to 5 for 60-minutes counting.
3 to 0	1 minute	Undefined	R/W	Counting One's Position of Minutes Counts on 0 to 9 once per second. When a carry is generated, 1 is added to the ten's position.

14.3.4 Hour Counter (RHRCNT)

RHRCNT is used for setting/counting in the BCD-coded hour section. The count operation is performed by a carry for each 1 hour of the minute counter.

The assignable range is from 00 through 23 (practically in BCD), otherwise operation errors occur. Carry out write processing after stopping the count operation through the setting of the START bit in RCR2.

Bit:	7	6	5	4	3	2	1	0
	-	-	10 hours		1 hour			
Initial value:	0	0	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined
R/W:	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7, 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
5, 4	10 hours	Undefined	R/W	Counting Ten's Position of Hours Counts on 0 to 2 for ten's position of hours.
3 to 0	1 hour	Undefined	R/W	Counting One's Position of Hours Counts on 0 to 9 once per hour. When a carry is generated, 1 is added to the ten's position.

14.3.5 Day of Week Counter (RWKCNT)

RWKCNT is used for setting/counting day of week section. The count operation is performed by a carry for each day of the date counter.

The assignable range is from 0 through 6 (practically in BCD), otherwise operation errors occur. Carry out write processing after stopping the count operation through the setting of the START bit in RCR2.

Bit:	7	6	5	4	3	2	1	0
	-	-	-	-	-	Day		
Initial value:	0	0	0	0	0	Undefined	Undefined	Undefined
R/W:	R	R	R	R	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7 to 3	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
2 to 0	Day	Undefined	R/W	Day-of-Week Counting Day-of-week is indicated with a binary code. 000: Sunday 001: Monday 010: Tuesday 011: Wednesday 100: Thursday 101: Friday 110: Saturday 111: Reserved (setting prohibited)

14.3.6 Date Counter (RDAYCNT)

RDAYCNT is used for setting/counting in the BCD-coded date section. The count operation is performed by a carry for each day of the hour counter.

The assignable range is from 01 through 31 (practically in BCD), otherwise operation errors occur. Carry out write processing after stopping the count operation through the setting of the START bit in RCR2.

The range of date changes with each month and in leap years. Confirm the correct setting. Leap years are recognized by dividing the year counter (RYRCNT) values by 400, 100, and 4 and obtaining a fractional result of 0.

Bit:	7	6	5	4	3	2	1	0
	-	-	10 days	1 day				
Initial value:	0	0	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined
R/W:	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7, 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
5, 4	10 days	Undefined	R/W	Counting Ten's Position of Dates
3 to 0	1 day	Undefined	R/W	Counting One's Position of Dates Counts on 0 to 9 once per date. When a carry is generated, 1 is added to the ten's position.

14.3.7 Month Counter (RMONCNT)

RMONCNT is used for setting/counting in the BCD-coded month section. The count operation is performed by a carry for each month of the date counter.

The assignable range is from 01 through 12 (practically in BCD), otherwise operation errors occur. Carry out write processing after stopping the count operation through the setting of the START bit in RCR2.

Bit:	7	6	5	4	3	2	1	0
	-	-	-	10 months	1 month			
Initial value:	0	0	0	Undefined	Undefined	Undefined	Undefined	Undefined
R/W:	R	R	R	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	10 months	Undefined	R/W	Counting Ten's Position of Months
3 to 0	1 month	Undefined	R/W	Counting One's Position of Months Counts on 0 to 9 once per month. When a carry is generated, 1 is added to the ten's position.

14.3.8 Year Counter (RYRCNT)

RYRCNT is used for setting/counting in the BCD-coded year section. The count operation is performed by a carry for each year of the month counter.

The assignable range is from 0000 through 9999 (practically in BCD), otherwise operation errors occur. Carry out write processing after stopping the count operation through the setting of the START bit in RCR2.

Initial value: Undefined Undefined Undefined Undefined Undefined Undefined Undefined Undefined Undefined Undefined Undefined Undefined Undefined Undefined Undefined
 R/W: R/W R/W R/W R/W R/W R/W R/W R/W R/W R/W R/W R/W R/W R/W R/W R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 12	1000 years	Undefined	R/W	Counting Thousand's Position of Years
11 to 8	100 years	Undefined	R/W	Counting Hundred's Position of Years
7 to 4	10 years	Undefined	R/W	Counting Ten's Position of Years
3 to 0	1 year	Undefined	R/W	Counting One's Position of Years

14.3.9 Second Alarm Register (RSECAR)

RSECAR is an alarm register corresponding to the BCD-coded second counter RSECCNT. When the ENB bit is set to 1, a comparison with the RSECCNT value is performed. From among RSECAR/RMINAR/RHRAR/RWKAR/RDAYAR/RMONAR/RCR3, the counter and alarm register comparison is performed only on those with ENB bits set to 1, and if each of those coincides, an alarm flag of RCR1 is set to 1.

The assignable range is from 00 through 59 + ENB bits (practically in BCD), otherwise operation errors occur.

Bit	Bit Name	Initial Value	R/W	Description
7	ENB	Undefined	R/W	When this bit is set to 1, a comparison with the RSECCNT value is performed.
6 to 4	10 seconds	Undefined	R/W	Ten's position of seconds setting value
3 to 0	1 second	Undefined	R/W	One's position of seconds setting value

14.3.10 Minute Alarm Register (RMINAR)

RMINAR is an alarm register corresponding to the BCD-coded minute counter RMINCNT. When the ENB bit is set to 1, a comparison with the RMINCNT value is performed. From among RSECAR/RMINAR/RHRAR/RWKAR/RDAYAR/RMONAR/RCR3, the counter and alarm register comparison is performed only on those with ENB bits set to 1, and if each of those coincides, an alarm flag of RCR1 is set to 1.

The assignable range is from 00 through 59 + ENB bits (practically in BCD), otherwise operation errors occur.

Bit	Bit Name	Initial Value	R/W	Description
7	ENB	Undefined	R/W	When this bit is set to 1, a comparison with the RMINCNT value is performed.
6 to 4	10 minutes	Undefined	R/W	Ten's position of minutes setting value
3 to 0	1 minute	Undefined	R/W	One's position of minutes setting value

14.3.11 Hour Alarm Register (RHRAR)

RHRAR is an alarm register corresponding to the BCD-coded hour counter RHRCNT. When the ENB bit is set to 1, a comparison with the RHRCNT value is performed. From among RSECAR/RMINAR/RHRAR/RWKAR/RDAYAR/RMONAR/RCR3, the counter and alarm register comparison is performed only on those with ENB bits set to 1, and if each of those coincides, an alarm flag of RCR1 is set to 1.

The assignable range is from 00 through 23 + ENB bits (practically in BCD), otherwise operation errors occur.

Bit:	7	6	5	4	3	2	1	0
	ENB	-	10 hours	1 hour				
Initial value:	Undefined	0	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined
R/W:	R/W	R	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7	ENB	Undefined	R/W	When this bit is set to 1, a comparison with the RHRCNT value is performed.
6	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
5, 4	10 hours	Undefined	R/W	Ten's position of hours setting value
3 to 0	1 hour	Undefined	R/W	One's position of hours setting value

14.3.12 Day of Week Alarm Register (RWKAR)

RWKAR is an alarm register corresponding to the BCD-coded day of week counter RWKCNT. When the ENB bit is set to 1, a comparison with the RWKCNT value is performed. From among RSECAR/RMINAR/RHRAR/RWKAR/RDAYAR/RMONAR/RRCR3, the counter and alarm register comparison is performed only on those with ENB bits set to 1, and if each of those coincides, an alarm flag of RCR1 is set to 1.

The assignable range is from 0 through 6 + ENB bits (practically in BCD), otherwise operation errors occur.

Bit:	7	6	5	4	3	2	1	0
	ENB	-	-	-	-	Day		
Initial value:	Undefined	0	0	0	0	Undefined	Undefined	Undefined
R/W:	R/W	R	R	R	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7	ENB	Undefined	R/W	When this bit is set to 1, a comparison with the RWKCNT value is performed.
6 to 3	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
2 to 0	Day	Undefined	R/W	Day of Week Setting Value 000: Sunday 001: Monday 010: Tuesday 011: Wednesday 100: Thursday 101: Friday 110: Saturday 111: Reserved (setting prohibited)

14.3.13 Date Alarm Register (RDAYAR)

RDAYAR is an alarm register corresponding to the BCD-coded date counter RDAYCNT. When the ENB bit is set to 1, a comparison with the RDAYCNT value is performed. From among RSECAR/RMINAR/RHRAR/RWKAR/RDAYAR/RMONAR/RCR3, the counter and alarm register comparison is performed only on those with ENB bits set to 1, and if each of those coincides, an alarm flag of RCR1 is set to 1.

The assignable range is from 01 through 31 + ENB bits (practically in BCD), otherwise operation errors occur.

Bit:	7	6	5	4	3	2	1	0
	ENB	-	10 days	1 day				
Initial value:	Undefined	0	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined
R/W:	R/W	R	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7	ENB	Undefined	R/W	When this bit is set to 1, a comparison with the RDAYCNT value is performed.
6	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
5, 4	10 days	Undefined	R/W	Ten's position of dates setting value
3 to 0	1 day	Undefined	R/W	One's position of dates setting value

14.3.14 Month Alarm Register (RMONAR)

RMONAR is an alarm register corresponding to the BCD-coded month counter RMONCNT. When the ENB bit is set to 1, a comparison with the RMONCNT value is performed. From among RSECAR/RMINAR/RHRAR/RWKAR/RDAYAR/RMONAR/RCR3, the counter and alarm register comparison is performed only on those with ENB bits set to 1, and if each of those coincides, an alarm flag of RCR1 is set to 1.

The assignable range is from 01 through 12 + ENB bits (practically in BCD), otherwise operation errors occur.

Bit:	7	6	5	4	3	2	1	0
	ENB	-	-	10 months	1 month			
Initial value:	Undefined	0	0	Undefined	Undefined	Undefined	Undefined	Undefined
R/W:	R/W	R	R	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7	ENB	Undefined	R/W	When this bit is set to 1, a comparison with the RMONCNT value is performed.
6, 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	10 months	Undefined	R/W	Ten's position of months setting value
3 to 0	1 month	Undefined	R/W	One's position of months setting value

14.3.15 Year Alarm Register (RYRAR)

RYRAR is an alarm register corresponding to the year counter RYRCNT. The assignable range is from 0000 through 9999 (practically in BCD), otherwise operation errors occur.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	1000 years				100 years				10 years				1 year			

Initial value: Undefined Undefined Undefined Undefined Undefined Undefined Undefined Undefined Undefined Undefined Undefined Undefined Undefined Undefined Undefined
 R/W: R/W R/W R/W R/W R/W R/W R/W R/W R/W R/W R/W R/W R/W R/W R/W R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 12	1000 years	Undefined	R/W	Thousand's position of years setting value
11 to 8	100 years	Undefined	R/W	Hundred's position of years setting value
7 to 4	10 years	Undefined	R/W	Ten's position of years setting value
3 to 0	1 year	Undefined	R/W	One's position of years setting value

14.3.16 Control Register 1 (RCR1)

RCR1 is a register that affects carry flags and alarm flags. It also selects whether to generate interrupts for each flag.

The CF flag remains undefined until the divider circuit is reset (the RESET and ADJ bits in RCR2 are set to 1). When using the CF flag, make sure to reset the divider circuit beforehand.

The AF flag remains undefined until the value is set to an alarm register and a counter. When using the AF flag, make sure to set the alarm register and counter beforehand.

Bit:	7	6	5	4	3	2	1	0
	CF	-	-	CIE	AIE	-	-	AF
Initial value:	Undefined	0	0	0	0	0	0	Undefined
R/W:	R/W	R	R	R/W	R/W	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
7	CF	Undefined	R/W	<p>Carry Flag</p> <p>Status flag that indicates that a carry has occurred. CF is set to 1 when a count-up to 64-Hz occurs at the second counter carry or 64-Hz counter read. A count register value read at this time cannot be guaranteed; another read is required.</p> <p>0: No carry of 64-Hz counter by second counter or 64-Hz counter</p> <p>[Clearing condition]</p> <p>When 0 is written to CF</p> <p>1: Carry of 64-Hz counter by second counter or 64 Hz counter</p> <p>[Setting condition]</p> <p>When the second counter or 64-Hz counter is read during a carry occurrence by the 64-Hz counter, or 1 is written to CF.</p>
6, 5	—	All 0	R	<p>Reserved</p> <p>These bits are always read as 0. The write value should always be 0.</p>

Bit	Bit Name	Initial Value	R/W	Description
4	CIE	0	R/W	<p>Carry Interrupt Enable Flag</p> <p>When the carry flag (CF) is set to 1, the CIE bit enables interrupts.</p> <p>0: A carry interrupt is not generated when the CF flag is set to 1</p> <p>1: A carry interrupt is generated when the CF flag is set to 1</p>
3	AIE	0	R/W	<p>Alarm Interrupt Enable Flag</p> <p>When the alarm flag (AF) is set to 1, the AIE bit allows interrupts.</p> <p>0: An alarm interrupt is not generated when the AF flag is set to 1</p> <p>1: An alarm interrupt is generated when the AF flag is set to 1</p>
2, 1	—	All 0	R	<p>Reserved</p> <p>These bits are always read as 0. The write value should always be 0.</p>
0	AF	Undefined	R/W	<p>Alarm Flag</p> <p>The AF flag is set when the alarm time, which is set by an alarm register (ENB bit in RSECAR, RMINAR, RHRAR, RWKAR, RDAYAR, RMONAR, or RYRAR is set to 1), and counter match.</p> <p>0: Alarm register and counter not match</p> <p>[Clearing condition]</p> <p>When 0 is written to AF.</p> <p>1: Alarm register and counter match*</p> <p>[Setting condition]</p> <p>When alarm register (only a register with ENB bit set to 1) and counter match</p> <p>Note: * Writing 1 holds previous value.</p>

14.3.17 Control Register 2 (RCR2)

RCR2 is a register for periodic interrupt control, 30-second adjustment, divider circuit RESET, and count control.

RCR2 is initialized by a power-on reset or in deep standby mode. Bits other than the RTCEN and START bits are initialized by a manual reset.

Bit:	7	6	5	4	3	2	1	0
	PEF	PES[2:0]			RTCEN	ADJ	RESET	START
Initial value:	0	0	0	0	1	0	0	1
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7	PEF	0	R/W	<p>Periodic Interrupt Flag</p> <p>Indicates interrupt generation with the period designated by the PES2 to PES0 bits. When set to 1, PEF generates periodic interrupts.</p> <p>0: Interrupts not generated with the period designated by the bits PES2 to PES0.</p> <p>[Clearing condition]</p> <p>When 0 is written to PEF</p> <p>1: Interrupts generated with the period designated by the PES2 to PES0 bits.</p> <p>[Setting condition]</p> <p>When an interrupt is generated with the period designated by the bits PES0 to PES2 or when 1 is written to the PEF flag</p>

Bit	Bit Name	Initial Value	R/W	Description
6 to 4	PES[2:0]	000	R/W	<p>Interrupt Enable Flags</p> <p>These bits specify the periodic interrupt.</p> <p>000: No periodic interrupts generated</p> <p>001: Periodic interrupt generated every 1/256 second (However, when EXTAL is selected (RCKSEL[1:0] bits in RCR5 = 01) or USB_X1 is selected (RCKSEL[1:0] bits in RCR5 = 10), setting these bits to 001 generates periodic interrupt every 1/128 second.)</p> <p>010: Periodic interrupt generated every 1/64 second</p> <p>011: Periodic interrupt generated every 1/16 second</p> <p>100: Periodic interrupt generated every 1/4 second</p> <p>101: Periodic interrupt generated every 1/2 second</p> <p>110: Periodic interrupt generated every 1 second</p> <p>111: Periodic interrupt generated every 2 seconds</p>
3	RTCEN	1	R/W	<p>RTC_X1 Clock Control</p> <p>Controls the function of RTC_X1 pin.</p> <p>0: Halts the on-chip crystal oscillator/disables the external clock input.</p> <p>1: Runs the on-chip crystal oscillator/enables the external clock input.</p>
2	ADJ	0	R/W	<p>30-Second Adjustment</p> <p>When 1 is written to the ADJ bit, times of 29 seconds or less will be rounded to 00 seconds and 30 seconds or more to 1 minute. The divider circuit (prescaler and R64CNT) will be simultaneously reset. This bit always reads 0.</p> <p>0: Runs normally.</p> <p>1: 30-second adjustment.</p>

Bit	Bit Name	Initial Value	R/W	Description
1	RESET	0	R/W	Reset Writing 1 to this bit initializes the divider circuit, the R64CNT register, the alarm register, the RCR3 register, bits CF and AF in RCR1, and bit PEF in RCR2. In this case, the RESET bit is automatically reset to 0 after 1 is written to and the above registers are reset. Thus, there is no need to write 1 to this bit. This bit is always read as 0. 0: Runs normally. 1: Divider circuit is reset.
0	START	1	R/W	Start Halts and restarts the counter (clock). 0: Second/minute/hour/day/week/month/year counter halts. 1: Second/minute/hour/day/week/month/year counter runs normally.

14.3.18 Control Register 3 (RCR3)

When the ENB bit is set to 1, RCR3 performs a comparison with the RYRCNT. From among RSECAR/RMINAR/RHRAR/RWKAR/RDAYAR/RMONAR/RCR3, the counter and alarm register comparison is performed only on those with ENB bits set to 1, and if each of those coincides, an alarm flag of RCR1 is set to 1.

Bit:	7	6	5	4	3	2	1	0
	ENB	-	-	-	-	-	-	-
Initial value:	Undefined	0	0	0	0	0	0	0
R/W:	R/W	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7	ENB	Undefined	R/W	When this bit is set to 1, comparison of the year alarm register (RYRAR) and the year counter (RYRCNT) is performed.
6 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

14.3.19 Control Register 5 (RCR5)

When the RCKSEL[1:0] bits are set to 00, the RTC_X1 clock pulses are counted; when the RCKSEL[1:0] bits are set to 01, the EXTAL clock pulses are counted; and when the RCKSEL[1:0] bits are set to 10, the USB_X1 clock pulses are counted to implement the clock function.

Bit:	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	RCKSEL[1:0]	
Initial value:	0	0	0	0	0	0	Undefined	Undefined
R/W:	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1, 0	RCKSEL[1:0]	Undefined	R/W	Operation clock select Operation clock can be selected from RTC_X1, EXTAL, or USB_X1. The setting of these bits should not be switched during operation. 00: Selects RTC_X1. 01: Selects EXTAL. 10: Selects USB_X1. 11: Setting prohibited.

14.3.20 Frequency Register H/L (RFRH/L)

RFRH/L is a 16-bit readable/writable register.

The "frequency comparison value" is set in RFC[18:0] so that a 128-Hz clock is generated when the realtime clock operates at the EXTAL clock frequency.

Change the "frequency comparison value" according to the EXTAL clock frequency. The calculation method is shown below.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SEL64	-	-	-	-	-	-	-	-	-	-	-	-	RFC[18:16]		
Initial value:	Undefined	0	0	0	0	0	0	0	0	0	0	0	0	Undefined	Undefined	Undefined
R/W:	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RFC[15:0]															
Initial value:	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	SEL64	Undefined	R/W	64-Hz Divider Select Indicates the operating clock that the EXTAL clock frequency is dividable by 64-Hz and not dividable by 128-Hz. 0: EXTAL or USB_X1 clock frequency is dividable by 128-Hz. 1: EXTAL clock frequency is dividable by 64-Hz and not dividable by 128-Hz.
30 to 19	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
18 to 0	RFC[18:0]	Undefined	R/W	Frequency comparison value Sets the comparison value to generate operation clock from the EXTAL or USB_X1 clock frequency.

(1) Method for calculating "frequency comparison value".

- EXTAL or USB_X1 clock frequency is dividable by 128-Hz
 $RFC[18:0] = (\text{EXTAL or USB_X1 clock frequency}) / 128$
 Clear the SEL64 bit to 0 in this case.
- EXTAL clock frequency is dividable by 64-Hz and not dividable by 128-Hz
 $RFC[18:0] = (\text{EXTAL clock frequency}) / 64$
 Set the SEL64 bit to 1 in this case.

(2) Setting Example**Table 14.3 Setting Example**

	Clock Frequency	SEL64 Setting Value	RFC Setting Value
EXTAL	10MHz	0	H'1312D
	11MHz	1	H'29F63
	12MHz	0	H'16E36
USB_X1	48MHz	0	H'5B8D8

14.4 Operation

Usage of this module is shown below.

14.4.1 Initial Settings of Registers after Power-On

All the registers should be set after the power is turned on.

14.4.2 Setting Time

Figure 14.2 shows how to set the time when the clock is stopped.

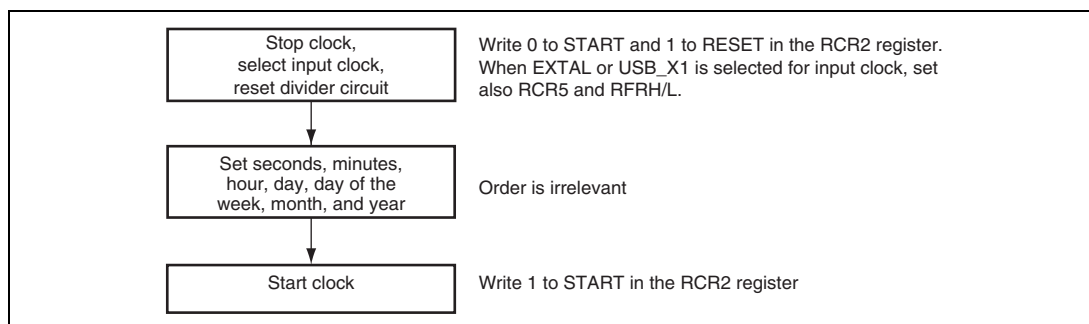

Figure 14.2 Setting Time

14.4.3 Reading Time

Figure 14.3 shows how to read the time.

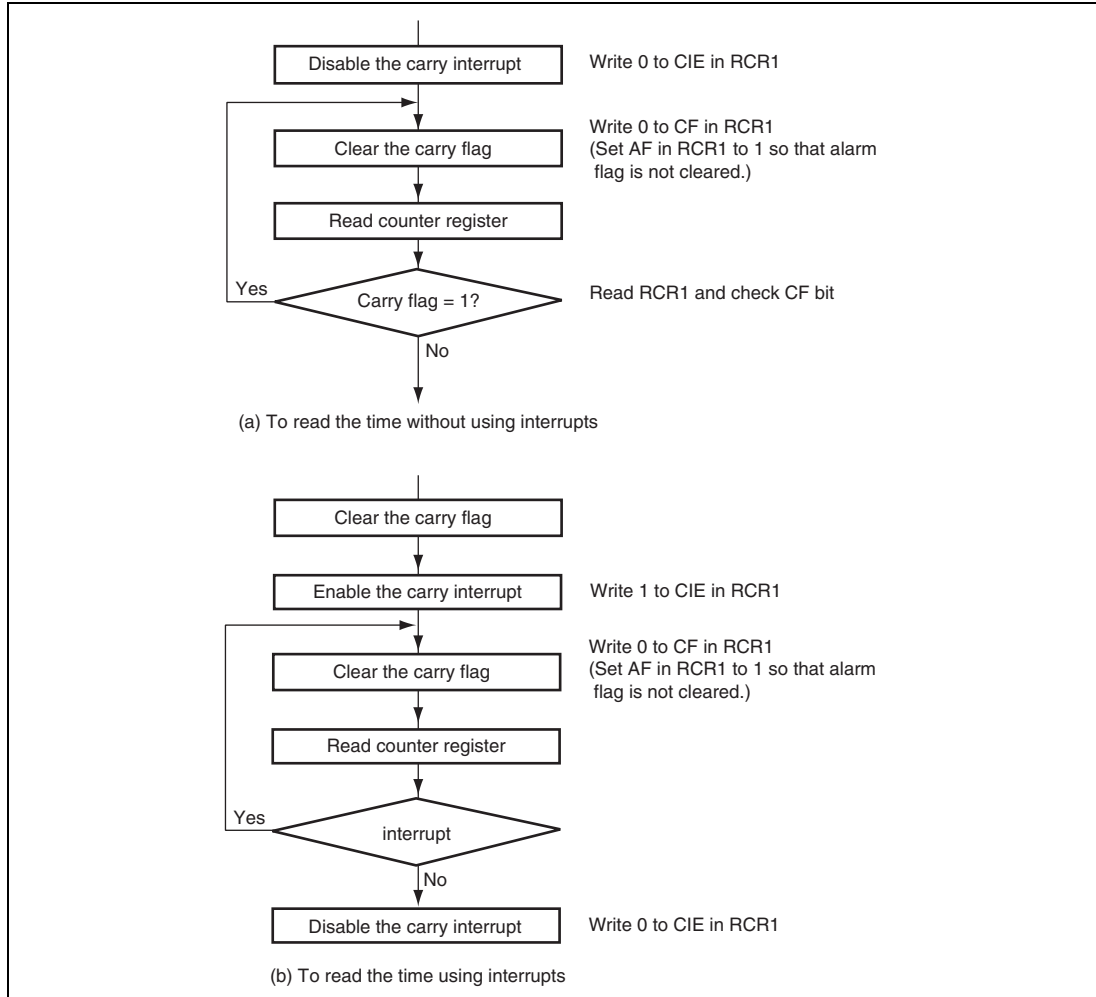

Figure 14.3 Reading Time

If a carry occurs while reading the time, the correct time will not be obtained, so it must be read again. Part (a) in figure 14.3 shows the method of reading the time without using interrupts; part (b) in figure 14.3 shows the method using carry interrupts. To keep programming simple, method (a) should normally be used.

14.4.4 Alarm Function

Figure 14.4 shows how to use the alarm function.

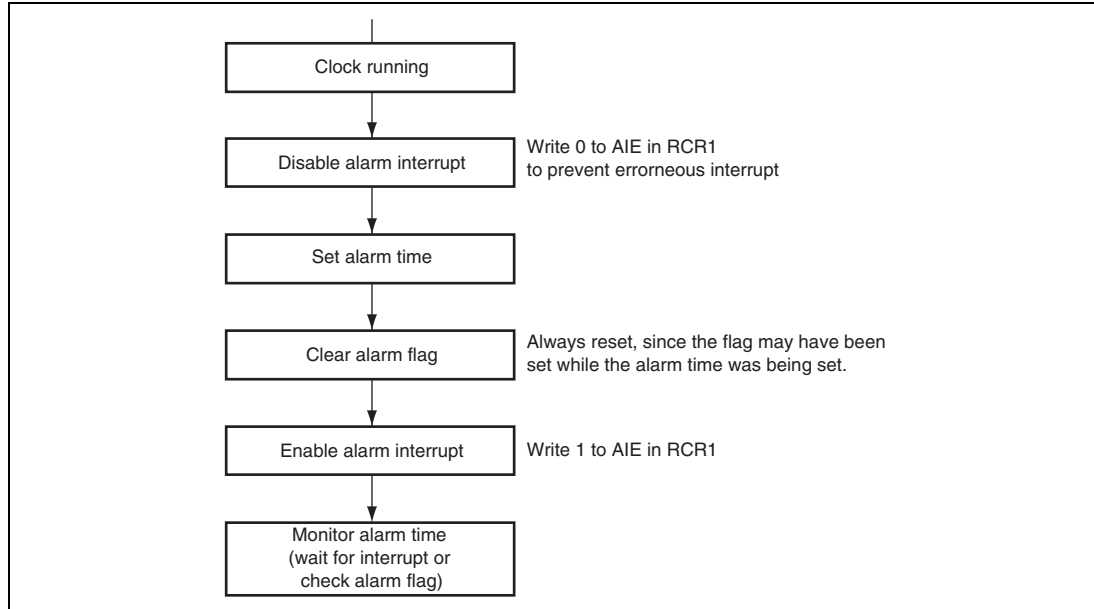

Figure 14.4 Using Alarm Function

Alarms can be generated using seconds, minutes, hours, day of the week, date, month, year, or any combination of these. Set the ENB bit in the register on which the alarm is placed to 1, and then set the alarm time in the lower bits. Clear the ENB bit in the register on which the alarm is not placed to 0.

When the clock and alarm times match, 1 is set in the AF bit in RCR1. Alarm detection can be checked by reading this bit, but normally it is done by interrupt. If 1 is set in the AIE bit in RCR1, an interrupt is generated when an alarm occurs.

The alarm flag is set when the clock and alarm times match. However, the alarm flag can be cleared by writing 0.

14.5 Usage Notes

14.5.1 Register Writing during Count

The following registers cannot be written to during a count (while bit 0 = 1 in RCR2).

RSECCNT, RMINCNT, RHRCNT, RDAYCNT, RWKCNT, RMONCNT, RYRCNT

The count must be stopped before writing to any of the above registers.

14.5.2 Use of Realtime Clock Periodic Interrupts

The method of using the periodic interrupt function is shown in figure 14.5.

A periodic interrupt can be generated periodically at the interval set by bits PES2 to PES0 in RCR2. When the time set by bits PES2 to PES0 has elapsed, the PEF is set to 1.

The PEF is cleared to 0 upon periodic interrupt generation or when bits PES2 to PES0 are set. Periodic interrupt generation can be confirmed by reading this bit, but normally the interrupt function is used.

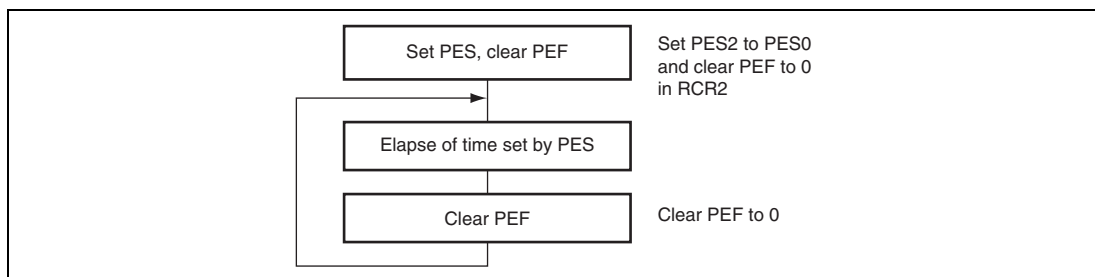

Figure 14.5 Using Periodic Interrupt Function

14.5.3 Transition to Standby Mode after Setting Register

When a transition to standby mode is made after registers in this module are set, sometimes counting is not performed correctly. In case the registers are set, be sure to make a transition to standby mode after performing one dummy read of the register.

14.5.4 Usage Notes when Writing to and Reading the Register

- When reading a counter register such as the second counter after having written to the register, follow the procedure in section 14.4.3, Reading Time.
- After writing to the RCR2 register, perform two dummy reads before reading data. The register contents from before the write are returned by the two dummy reads, and the third read returns the register contents reflecting the write.
- Registers other than the above can be read immediately after a write and the written value is reflected.

Section 15 Serial Communication Interface with FIFO

This LSI has an eight-channel serial communication interface with FIFO that supports both asynchronous and clock synchronous serial communication. It also has 16-stage FIFO registers for both transmission and reception independently for each channel that enable this LSI to perform efficient high-speed continuous communication.

15.1 Features

- Asynchronous serial communication:
 - Serial data communication is performed by start-stop in character units. This module can communicate with a universal asynchronous receiver/transmitter (UART), an asynchronous communication interface adapter (ACIA), or any other communications chip that employs a standard asynchronous serial system. There are eight selectable serial data communication formats.
 - Data length: 7 or 8 bits
 - Stop bit length: 1 or 2 bits
 - Parity: Even, odd, or none
 - Receive error detection: Parity, framing, and overrun errors
 - Break detection: Break is detected when a framing error is followed by at least one frame at the space 0 level (low level). It is also detected by reading the RxD level directly from the serial port register when a framing error occurs.
- Clock synchronous serial communication:
 - Serial data communication is synchronized with a clock signal. This module can communicate with other chips having a clock synchronous communication function. There is one serial data communication format.
 - Data length: 8 bits
 - Receive error detection: Overrun errors
- Full duplex communication: The transmitting and receiving sections are independent, so this module can transmit and receive simultaneously. Both sections use 16-stage FIFO buffering, so high-speed continuous data transfer is possible in both the transmit and receive directions.
- On-chip baud rate generator with selectable bit rates
- Internal or external transmit/receive clock source: From either baud rate generator (internal) or SCK pin (external)

- Four types of interrupts: Transmit-FIFO-data-empty interrupt, break interrupt, receive-FIFO-data-full interrupt, and receive-error interrupts are requested independently.
- When this module is not in use, it can be stopped by halting the clock supplied to it, saving power.
- In asynchronous mode, on-chip modem control functions ($\overline{\text{RTS}}$ and $\overline{\text{CTS}}$) (only channel 1).
- The quantity of data in the transmit and receive FIFO data registers and the number of receive errors of the receive data in the receive FIFO data register can be ascertained.
- A time-out error (DR) can be detected when receiving in asynchronous mode.
- In asynchronous mode, the base clock frequency can be either 16 or 8 times the bit rate.
- When an internal clock is selected as a clock source and the SCK pin is used as an input pin in asynchronous mode, either normal mode or double-speed mode can be selected for the baud rate generator.

Figure 15.1 shows a block diagram.

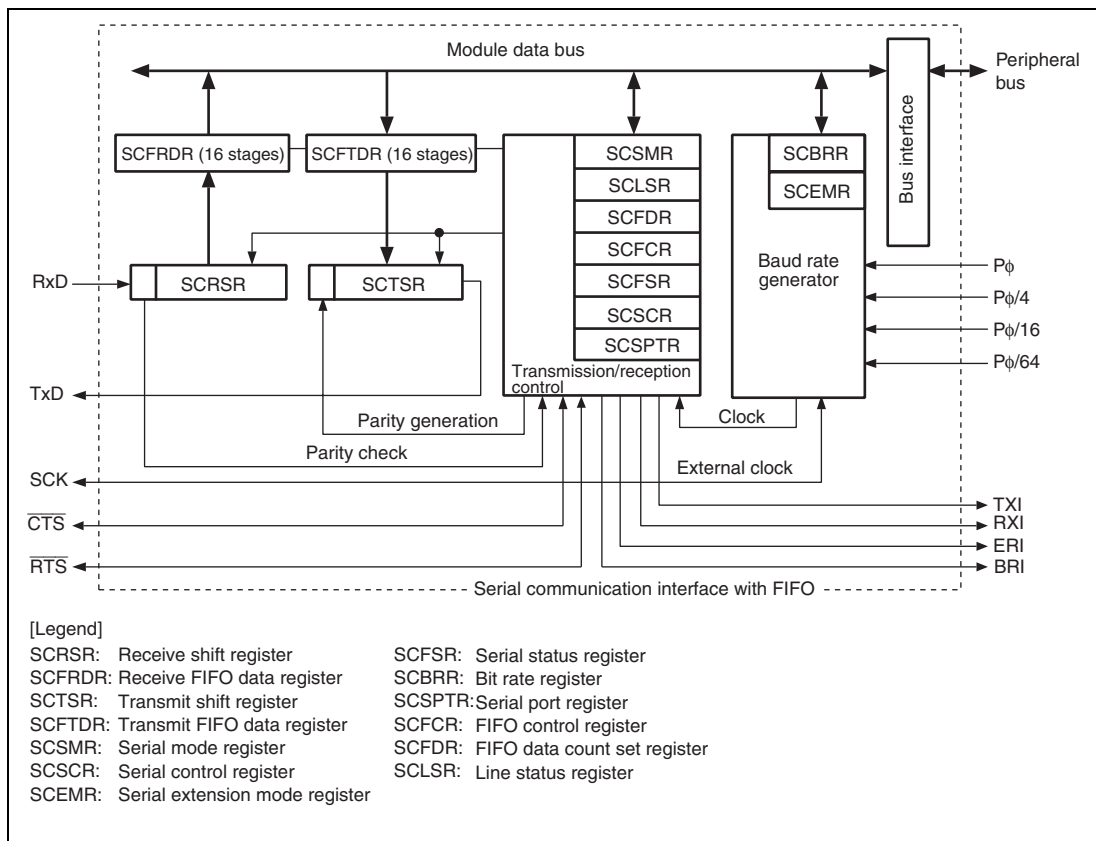

Figure 15.1 Block Diagram

15.2 Input/Output Pins

Table 15.1 shows the pin configuration.

Table 15.1 Pin Configuration

Channel	Pin Name	Symbol	I/O	Function
0 to 2, 4	Serial clock pins	SCK0 to SCK2, SCK4	I/O	Clock I/O
	Receive data pins	RxD0 to RxD2, RxD4	Input	Receive data input
	Transmit data pins	TxD0 to TxD2, TxD4	Output	Transmit data output
3, 5 to 7	Receive data pins	RxD3, RxD5 to RxD7*	Input	Receive data input
	Transmit data pins	TxD3, TxD5 to TxD7*	Output	Transmit data output
1	Request to send pin	$\overline{\text{RTS1}}$	I/O	Request to send
	Clear to send pin	$\overline{\text{CTS1}}$	I/O	Clear to send

Note: * Pins RxD5 to RxD7 and TxD5 to TxD7 cannot be used in the SH7266 Group.

15.3 Register Descriptions

This module has the following registers.

Table 15.2 Register Configuration

Channel	Register Name	Abbreviation	R/W	Initial Value	Address	Access Size
0	Serial mode register_0	SCSMR_0	R/W	H'0000	H'FFFE8000	16

	Serial extension mode register_7	SCEMR_7	R/W	H'0000	H'FFFEB828	16

- Notes: 1. Only 0 can be written to clear the flag. Bits 15 to 8, 3, and 2 are read-only bits that cannot be modified.
2. Only 0 can be written to clear the flag. Bits 15 to 1 are read-only bits that cannot be modified.

15.3.1 Receive Shift Register (SCRSR)

SCRSR receives serial data. Data input at the RxD pin is loaded into SCRSR in the order received, LSB (bit 0) first, converting the data to parallel form. When one byte has been received, it is automatically transferred to the receive FIFO data register (SCFRDR).

The CPU cannot read or write to SCRSR directly.

Bit:	7	6	5	4	3	2	1	0
Initial value:	-	-	-	-	-	-	-	-
R/W:	-	-	-	-	-	-	-	-

15.3.2 Receive FIFO Data Register (SCFRDR)

SCFRDR is a 16-byte FIFO register that stores serial receive data. The reception of one byte of serial data is complete when the received data is moved from the receive shift register (SCRSR) to SCFRDR for storage. Continuous reception is possible until 16 bytes are stored. The CPU can read but not write to SCFRDR. If data is read when there is no receive data in the SCFRDR, the value is undefined.

When SCFRDR is full of receive data, subsequent serial data is lost.

Bit:	7	6	5	4	3	2	1	0
Initial value:	-	-	-	-	-	-	-	-
R/W:	R	R	R	R	R	R	R	R

15.3.3 Transmit Shift Register (SCTSR)

SCTSR transmits serial data. Transmit data is loaded from the transmit FIFO data register (SCFTDR) into SCTSR, then the data is transmitted serially from the TxD pin, LSB (bit 0) first. After one data byte has been transmitted, the next transmit data is automatically loaded from SCFTDR into SCTSR and transmission is started again.

The CPU cannot read from or write to SCTSR directly.

Bit:	7	6	5	4	3	2	1	0
								
Initial value:	-	-	-	-	-	-	-	-
R/W:	-	-	-	-	-	-	-	-

15.3.4 Transmit FIFO Data Register (SCFTDR)

SCFTDR is a 16-byte FIFO register that stores data for serial transmission. When the transmit shift register (SCTSR) empty is detected, transmit data written in the SCFTDR is moved to SCTSR and serial transmission is started. Continuous serial transmission is performed until there is no transmit data left in SCFTDR. The CPU can write to SCFTDR at all times.

When SCFTDR is full of transmit data (16 bytes), no more data can be written. If writing of new data is attempted, the data is ignored.

Initial value:	-	-	-	-	-	-	-	-
R/W:	W	W	W	W	W	W	W	W

15.3.5 Serial Mode Register (SCSMR)

SCSMR specifies the serial communication format and selects the clock source for the baud rate generator.

The CPU can always read from and write to SCSMR.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	C/ \bar{A}	CHR	PE	O/ \bar{E}	STOP	-	CKS[1:0]	
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
7	C/ \bar{A}	0	R/W	Communication Mode Selects operating mode from asynchronous and clock synchronous modes. 0: Asynchronous mode 1: Clock synchronous mode
6	CHR	0	R/W	Character Length Selects 7-bit or 8-bit data length in asynchronous mode. In the clock synchronous mode, the data length is always 8 bits, regardless of the CHR setting. 0: 8-bit data 1: 7-bit data* Note: * When 7-bit data is selected, the MSB (bit 7) of the transmit FIFO data register is not transmitted.

Bit	Bit Name	Initial Value	R/W	Description
5	PE	0	R/W	<p>Parity Enable</p> <p>Selects whether to add a parity bit to transmit data and to check the parity of receive data, in asynchronous mode. In clock synchronous mode, a parity bit is neither added nor checked, regardless of the PE setting.</p> <p>0: Parity bit not added or checked 1: Parity bit added and checked*</p> <p>Note: * When PE is set to 1, an even or odd parity bit is added to transmit data, depending on the parity mode (O/\bar{E}) setting. Receive data parity is checked according to the even/odd (O/\bar{E}) mode setting.</p>
4	O/\bar{E}	0	R/W	<p>Parity Mode</p> <p>Selects even or odd parity when parity bits are added and checked. The O/\bar{E} setting is used only in asynchronous mode and only when the parity enable bit (PE) is set to 1 to enable parity addition and checking. The O/\bar{E} setting is ignored in clock synchronous mode, or in asynchronous mode when parity addition and checking is disabled.</p> <p>0: Even parity*¹ 1: Odd parity*²</p> <p>Notes: 1. If even parity is selected, the parity bit is added to transmit data to make an even number of 1s in the transmitted character and parity bit combined. Receive data is checked to see if it has an even number of 1s in the received character and parity bit combined.</p> <p>2. If odd parity is selected, the parity bit is added to transmit data to make an odd number of 1s in the transmitted character and parity bit combined. Receive data is checked to see if it has an odd number of 1s in the received character and parity bit combined.</p>

Bit	Bit Name	Initial Value	R/W	Description
3	STOP	0	R/W	<p>Stop Bit Length</p> <p>Selects one or two bits as the stop bit length in asynchronous mode. This setting is used only in asynchronous mode. It is ignored in clock synchronous mode because no stop bits are added.</p> <p>When receiving, only the first stop bit is checked, regardless of the STOP bit setting. If the second stop bit is 1, it is treated as a stop bit, but if the second stop bit is 0, it is treated as the start bit of the next incoming character.</p> <p>0: One stop bit When transmitting, a single 1-bit is added at the end of each transmitted character.</p> <p>1: Two stop bits When transmitting, two 1 bits are added at the end of each transmitted character.</p>
2	—	0	R	<p>Reserved</p> <p>This bit is always read as 0. The write value should always be 0.</p>
1, 0	CKS[1:0]	00	R/W	<p>Clock Select</p> <p>Select the internal clock source of the on-chip baud rate generator. For further information on the clock source, bit rate register settings, and baud rate, see section 15.3.8, Bit Rate Register (SCBRR).</p> <p>00: Pϕ 01: Pϕ/4 10: Pϕ/16 11: Pϕ/64</p> <p>Note: Pϕ: Peripheral clock</p>

15.3.6 Serial Control Register (SCSCR)

SCSCR enables/disables the transmitter/receiver operation and interrupt requests, and selects the transmit/receive clock source. The CPU can always read and write to SCSCR.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bit	Bit Name	Initial Value	R/W	Description
15 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
7	TIE	0	R/W	Transmit Interrupt Enable Enables or disables the transmit-FIFO-data-empty interrupt (TXI) requested when the serial transmit data is transferred from the transmit FIFO data register (SCFTDR) to the transmit shift register (SCTSR), when the quantity of data in the transmit FIFO register becomes less than the specified number of transmission triggers, and when the TDFE flag in the serial status register (SCFSR) is set to 1. 0: Transmit-FIFO-data-empty interrupt request (TXI) is disabled 1: Transmit-FIFO-data-empty interrupt request (TXI) is enabled* Note: * The TXI interrupt request can be cleared by writing a greater quantity of transmit data than the specified transmission trigger number to SCFTDR and by clearing TDFE to 0 after reading 1 from TDFE, or can be cleared by clearing TIE to 0.

Bit	Bit Name	Initial Value	R/W	Description
6	RIE	0	R/W	<p>Receive Interrupt Enable</p> <p>Enables or disables the receive FIFO data full (RXI) interrupts requested when the RDF flag or DR flag in serial status register (SCFSR) is set to 1, receive-error (ERI) interrupts requested when the ER flag in SCFSR is set to 1, and break (BRI) interrupts requested when the BRK flag in SCFSR or the ORER flag in line status register (SCLSR) is set to 1.</p> <p>0: Receive FIFO data full interrupt (RXI), receive-error interrupt (ERI), and break interrupt (BRI) requests are disabled</p> <p>1: Receive FIFO data full interrupt (RXI), receive-error interrupt (ERI), and break interrupt (BRI) requests are enabled*</p> <p>Note: * RXI interrupt requests can be cleared by reading the DR or RDF flag after it has been set to 1, then clearing the flag to 0, or by clearing RIE to 0. ERI or BRI interrupt requests can be cleared by reading the ER, BR or ORER flag after it has been set to 1, then clearing the flag to 0, or by clearing RIE and REIE to 0.</p>
5	TE	0	R/W	<p>Transmit Enable</p> <p>Enables or disables the serial transmitter.</p> <p>0: Transmitter disabled</p> <p>1: Transmitter enabled*</p> <p>Note: * Serial transmission starts after writing of transmit data into SCFTDR. Select the transmit format in SCSMR and SCFCR and reset the transmit FIFO before setting TE to 1.</p>

Bit	Bit Name	Initial Value	R/W	Description
4	RE	0	R/W	<p>Receive Enable</p> <p>Enables or disables the serial receiver.</p> <p>0: Receiver disabled*¹</p> <p>1: Receiver enabled*²</p> <p>Notes: 1. Clearing RE to 0 does not affect the receive flags (DR, ER, BRK, RDF, FER, PER, and ORER). These flags retain their previous values.</p> <p>2. Serial reception starts when a start bit is detected in asynchronous mode, or synchronous clock is detected in clock synchronous mode. Select the receive format in SCSMR and SCFCR and reset the receive FIFO before setting RE to 1.</p>
3	REIE	0	R/W	<p>Receive Error Interrupt Enable</p> <p>Enables or disables the receive-error (ERI) interrupts and break (BRI) interrupts. The setting of REIE bit is valid only when RIE bit is set to 0.</p> <p>0: Receive-error interrupt (ERI) and break interrupt (BRI) requests are disabled</p> <p>1: Receive-error interrupt (ERI) and break interrupt (BRI) requests are enabled*</p> <p>Note: * ERI or BRI interrupt requests can be cleared by reading the ER, BR or ORER flag after it has been set to 1, then clearing the flag to 0, or by clearing RIE and REIE to 0. Even if RIE is set to 0, when REIE is set to 1, ERI or BRI interrupt requests are enabled.</p>

Bit	Bit Name	Initial Value	R/W	Description
2	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
1, 0	CKE[1:0]	00	R/W	<p>Clock Enable</p> <p>Select the clock source and enable or disable clock output from the SCK pin. Depending on CKE[1:0], the SCK pin can be used for serial clock output or serial clock input. If serial clock output is set in clock synchronous mode, set the C/\bar{A} bit in SCSMR to 1, and then set CKE[1:0].</p> <ul style="list-style-type: none"> Asynchronous mode <ul style="list-style-type: none"> 00: Internal clock, SCK pin used for input pin (input signal is ignored) 01: Internal clock, SCK pin used for clock output (The output clock frequency is either 16 or 8 times the bit rate.) 10: External clock, SCK pin used for clock input (The input clock frequency is either 16 or 8 times the bit rate.) 11: Setting prohibited Clock synchronous mode <ul style="list-style-type: none"> 00: Internal clock, SCK pin used for serial clock output 01: Internal clock, SCK pin used for serial clock output 10: External clock, SCK pin used for serial clock input 11: Setting prohibited

15.3.7 Serial Status Register (SCFSR)

SCFSR is a 16-bit register. The upper 8 bits indicate the number of receive errors in the receive FIFO data register, and the lower 8 bits indicate the status flag indicating operating state.

The CPU can always read and write to SCFSR, but cannot write 1 to the status flags (ER, TEND, TDFE, BRK, RDF, and DR). These flags can be cleared to 0 only if they have first been read (after being set to 1). The PER flag (bits 15 to 12 and bit 2) and the FER flag (bits 11 to 8 and bit 3) are read-only bits that cannot be written.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PER[3:0]				FER[3:0]				ER	TEND	TDFE	BRK	FER	PER	RDF	DR
Initial value:	0	0	0	0	0	0	0	0	0	1	1	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/(W)*	R/(W)*	R/(W)*	R/(W)*	R	R	R/(W)*	R/(W)*

Note: * Only 0 can be written to clear the flag after 1 is read.

Bit	Bit Name	Initial Value	R/W	Description
15 to 12	PER[3:0]	0000	R	<p>Number of Parity Errors</p> <p>Indicate the quantity of data including a parity error in the receive data stored in the receive FIFO data register (SCFRDR). The value indicated by bits 15 to 12 after the ER bit in SCFSR is set, represents the number of parity errors in SCFRDR. When parity errors have occurred in all 16-byte receive data in SCFRDR, PER[3:0] shows 0000.</p>
11 to 8	FER[3:0]	0000	R	<p>Number of Framing Errors</p> <p>Indicate the quantity of data including a framing error in the receive data stored in SCFRDR. The value indicated by bits 11 to 8 after the ER bit in SCFSR is set, represents the number of framing errors in SCFRDR. When framing errors have occurred in all 16-byte receive data in SCFRDR, FER[3:0] shows 0000.</p>

Bit	Bit Name	Initial Value	R/W	Description
7	ER	0	R/(W)*	<p>Receive Error</p> <p>Indicates the occurrence of a framing error, or of a parity error when receiving data that includes parity.*¹</p> <p>0: Receiving is in progress or has ended normally [Clearing conditions]</p> <ul style="list-style-type: none"> ER is cleared to 0 a power-on reset ER is cleared to 0 when the chip is when 0 is written after 1 is read from ER <p>1: A framing error or parity error has occurred. [Setting conditions]</p> <ul style="list-style-type: none"> ER is set to 1 when the stop bit is 0 after checking whether or not the last stop bit of the received data is 1 at the end of one data receive operation*² ER is set to 1 when the total number of 1s in the receive data plus parity bit does not match the even/odd parity specified by the O/\bar{E} bit in SCSSMR <p>Notes: 1. Clearing the RE bit to 0 in SCSSCR does not affect the ER bit, which retains its previous value. Even if a receive error occurs, the receive data is transferred to SCFRDR and the receive operation is continued. Whether or not the data read from SCFRDR includes a receive error can be detected by the FER and PER bits in SCFSR.</p> <p>2. In two stop bits mode, only the first stop bit is checked; the second stop bit is not checked.</p>

Bit	Bit Name	Initial Value	R/W	Description
6	TEND	1	R/(W)*	<p>Transmit End</p> <p>Indicates that when the last bit of a serial character was transmitted, SCFTDR did not contain valid data, so transmission has ended.</p> <p>0: Transmission is in progress</p> <p>[Clearing condition]</p> <ul style="list-style-type: none"> TEND is cleared to 0 when 0 is written after 1 is read from TEND after transmit data is written in SCFTDR*¹ <p>1: End of transmission</p> <p>[Setting conditions]</p> <ul style="list-style-type: none"> TEND is set to 1 when the chip is a power-on reset TEND is set to 1 when TE is cleared to 0 in the serial control register (SCSCR) TEND is set to 1 when SCFTDR does not contain receive data when the last bit of a one-byte serial character is transmitted <p>Note: 1. Do not use this bit as a transmit end flag when the direct memory access controller writes data to SCFTDR due to a TXI interrupt request.</p>

Bit	Bit Name	Initial Value	R/W	Description
5	TDFE	1	R/(W)*	<p>Transmit FIFO Data Empty</p> <p>Indicates that data has been transferred from the transmit FIFO data register (SCFTDR) to the transmit shift register (SCTSR), the quantity of data in SCFTDR has become less than the transmission trigger number specified by the TTRG[1:0] bits in the FIFO control register (SCFCR), and writing of transmit data to SCFTDR is enabled.</p> <p>0: The quantity of transmit data written to SCFTDR is greater than the specified transmission trigger number</p> <p>[Clearing conditions]</p> <ul style="list-style-type: none"> • TDFE is cleared to 0 when data exceeding the specified transmission trigger number is written to SCFTDR after 1 is read from TDFE and then 0 is written • TDFE is cleared to 0 when direct memory access controller is activated by transmit FIFO data empty interrupt (TXI) and write data exceeding the specified transmission trigger number to SCFTDR <p>1: The quantity of transmit data in SCFTDR is less than or equal to the specified transmission trigger number*¹</p> <p>[Setting conditions]</p> <ul style="list-style-type: none"> • TDFE is set to 1 by a power-on reset • TDFE is set to 1 when the quantity of transmit data in SCFTDR becomes less than or equal to the specified transmission trigger number as a result of transmission <p>Note: 1. Since SCFTDR is a 16-byte FIFO register, the maximum quantity of data that can be written when TDFE is 1 is "16 minus the specified transmission trigger number". If an attempt is made to write additional data, the data is ignored. The quantity of data in SCFTDR is indicated by the upper 8 bits of SCFDR.</p>

Bit	Bit Name	Initial Value	R/W	Description
4	BRK	0	R/(W)*	<p>Break Detection</p> <p>Indicates that a break signal has been detected in receive data.</p> <p>0: No break signal received</p> <p>[Clearing conditions]</p> <ul style="list-style-type: none"> BRK is cleared to 0 when the chip is a power-on reset BRK is cleared to 0 when software reads BRK after it has been set to 1, then writes 0 to BRK <p>1: Break signal received*¹</p> <p>[Setting condition]</p> <ul style="list-style-type: none"> BRK is set to 1 when data including a framing error is received, and a framing error occurs with space 0 in the subsequent receive data <p>Note: 1. When a break is detected, transfer of the receive data (H'00) to SCFRDR stops after detection. When the break ends and the receive signal becomes mark 1, the transfer of receive data resumes.</p>
3	FER	0	R	<p>Framing Error Indication</p> <p>Indicates a framing error in the data read from the next receive FIFO data register (SCFRDR) in asynchronous mode.</p> <p>0: No receive framing error occurred in the next data read from SCFRDR</p> <p>[Clearing conditions]</p> <ul style="list-style-type: none"> FER is cleared to 0 when the chip undergoes a power-on reset FER is cleared to 0 when no framing error is present in the next data read from SCFRDR <p>1: A receive framing error occurred in the next data read from SCFRDR.</p> <p>[Setting condition]</p> <ul style="list-style-type: none"> FER is set to 1 when a framing error is present in the next data read from SCFRDR

Bit	Bit Name	Initial Value	R/W	Description
2	PER	0	R	<p>Parity Error Indication</p> <p>Indicates a parity error in the data read from the next receive FIFO data register (SCFRDR) in asynchronous mode.</p> <p>0: No receive parity error occurred in the next data read from SCFRDR</p> <p>[Clearing conditions]</p> <ul style="list-style-type: none">• PER is cleared to 0 when the chip undergoes a power-on reset• PER is cleared to 0 when no parity error is present in the next data read from SCFRDR <p>1: A receive parity error occurred in the next data read from SCFRDR</p> <p>[Setting condition]</p> <ul style="list-style-type: none">• PER is set to 1 when a parity error is present in the next data read from SCFRDR

Bit	Bit Name	Initial Value	R/W	Description
1	RDF	0	R/(W)*	<p>Receive FIFO Data Full</p> <p>Indicates that receive data has been transferred to the receive FIFO data register (SCFRDR), and the quantity of data in SCFRDR has become more than the receive trigger number specified by the RTRG[1:0] bits in the FIFO control register (SCFCR).</p> <p>0: The quantity of transmit data written to SCFRDR is less than the specified receive trigger number</p> <p>[Clearing conditions]</p> <ul style="list-style-type: none"> • RDF is cleared to 0 by a power-on reset, standby mode • RDF is cleared to 0 when the SCFRDR is read until the quantity of receive data in SCFRDR becomes less than the specified receive trigger number after 1 is read from RDF and then 0 is written • RDF is cleared to 0 when the direct memory access controller is activated by receive FIFO data full interrupt (RXI) and read SCFRDR until the quantity of receive data in SCFRDR becomes less than the specified receive trigger number <p>1: The quantity of receive data in SCFRDR is more than the specified receive trigger number</p> <p>[Setting condition]</p> <ul style="list-style-type: none"> • RDF is set to 1 when a quantity of receive data more than the specified receive trigger number is stored in SCFRDR*¹ <p>Note: 1. As SCFTDR is a 16-byte FIFO register, the maximum quantity of data that can be read when RDF is 1 becomes the specified receive trigger number. If an attempt is made to read after all the data in SCFRDR has been read, the data is undefined. The quantity of receive data in SCFRDR is indicated by the lower 8 bits of SCFDR.</p>

Bit	Bit Name	Initial Value	R/W	Description
0	DR	0	R/(W)*	<p>Receive Data Ready</p> <p>Indicates that the quantity of data in the receive FIFO data register (SCFRDR) is less than the specified receive trigger number, and that the next data has not yet been received after the elapse of 15 ETU from the last stop bit in asynchronous mode. In clock synchronous mode, this bit is not set to 1.</p> <p>0: Receiving is in progress, or no receive data remains in SCFRDR after receiving ended normally [Clearing conditions]</p> <ul style="list-style-type: none"> DR is cleared to 0 when the chip undergoes a power-on reset DR is cleared to 0 when all receive data are read after 1 is read from DR and then 0 is written. DR is cleared to 0 when all receive data are read after the direct memory access controller is activated by receive FIFO data full interrupt (RXI). <p>1: Next receive data has not been received [Setting condition]</p> <ul style="list-style-type: none"> DR is set to 1 when SCFRDR contains less data than the specified receive trigger number, and the next data has not yet been received after the elapse of 15 ETU from the last stop bit.*¹ <p>Note: 1. This is equivalent to 1.5 frames with the 8-bit, 1-stop-bit format. (ETU: elementary time unit)</p>

Note: * Only 0 can be written to clear the flag after 1 is read.

15.3.8 Bit Rate Register (SCBRR)

SCBRR is an 8-bit register that is used with the CKS1 and CKS0 bits in the serial mode register (SCSMR) and the BGDM and ABCS bits in the serial extension mode register (SCEMR) to determine the serial transmit/receive bit rate.

The CPU can always read and write to SCBRR. SCBRR is initialized to H'FF by a power-on reset. Each channel has independent baud rate generator control, so different values can be set in eight channels.

The SCBRR setting is calculated as follows:

- Asynchronous mode:

When baud rate generator operates in normal mode (when the BGDM bit of SCEMR is 0):

$$N = \frac{P\phi}{64 \times 2^{2n-1} \times B} \times 10^6 - 1 \quad (\text{Operation on a base clock with a frequency of 16 times the bit rate})$$

$$N = \frac{P\phi}{32 \times 2^{2n-1} \times B} \times 10^6 - 1 \quad (\text{Operation on a base clock with a frequency of 8 times the bit rate})$$

When baud rate generator operates in double speed mode (when the BGDM bit of SCEMR is 1):

$$N = \frac{P\phi}{32 \times 2^{2n-1} \times B} \times 10^6 - 1 \quad (\text{Operation on a base clock with a frequency of 16 times the bit rate})$$

$$N = \frac{P\phi}{16 \times 2^{2n-1} \times B} \times 10^6 - 1 \quad (\text{Operation on a base clock with a frequency of 8 times the bit rate})$$

- Clock synchronous mode:

$$N = \frac{P\phi}{8 \times 2^{2n-1} \times B} \times 10^6 - 1$$

- B: Bit rate (bits/s)
 N: SCBRR setting for baud rate generator ($0 \leq N \leq 255$)
 (The setting must satisfy the electrical characteristics.)
 P ϕ : Operating frequency for peripheral modules (MHz)
 n: Baud rate generator clock source (n = 0, 1, 2, 3) (for the clock sources and values of n, see table 15.3.)

Table 15.3 SCSMR Settings

n	Clock Source	SCSMR Settings	
		CKS[1]	CKS[0]
0	P ϕ	0	0
1	P ϕ /4	0	1
2	P ϕ /16	1	0
3	P ϕ /64	1	1

The bit rate error in asynchronous mode is given by the following formula:

When baud rate generator operates in normal mode (the BGDM bit of SCEMR is 0):

$$\text{Error (\%)} = \left\{ \frac{P\phi \times 10^6}{(N + 1) \times B \times 64 \times 2^{2n-1}} - 1 \right\} \times 100 \quad \text{(Operation on a base clock with a frequency of 16 times the bit rate)}$$

$$\text{Error (\%)} = \left\{ \frac{P\phi \times 10^6}{(N + 1) \times B \times 32 \times 2^{2n-1}} - 1 \right\} \times 100 \quad \text{(Operation on a base clock with a frequency of 8 times the bit rate)}$$

When baud rate generator operates in double speed mode (the BGDM bit of SCEMR is 1):

$$\text{Error (\%)} = \left\{ \frac{P\phi \times 10^6}{(N + 1) \times B \times 32 \times 2^{2n-1}} - 1 \right\} \times 100 \quad \text{(Operation on a base clock with a frequency of 16 times the bit rate)}$$

$$\text{Error (\%)} = \left\{ \frac{P\phi \times 10^6}{(N + 1) \times B \times 16 \times 2^{2n-1}} - 1 \right\} \times 100 \quad \text{(Operation on a base clock with a frequency of 8 times the bit rate)}$$

Table 15.4 lists the sample SCBRR settings in asynchronous mode in which a base clock frequency is 16 times the bit rate (the ABCS bit in SCEMR is 0) and the baud rate generator operates in normal mode (the BGDM bit in SCEMR is 1), and table 15.5 lists the sample SCBRR settings in clock synchronous mode.

Table 15.4 Bit Rates and SCBRR Settings (Asynchronous Mode, BGDM = 0, ABCS = 0)

Table 15.6 indicates the maximum bit rates in asynchronous mode when the baud rate generator is used. Table 15.7 lists the maximum bit rates in asynchronous mode when the external clock input is used. Table 15.8 lists the maximum bit rates in clock synchronous mode when the external clock input is used (when $t_{\text{Sycyc}} = 12t_{\text{peyc}}^*$).

Note: * Make sure that the electrical characteristics of this LSI and that of a connected LSI are satisfied.

15.3.9 FIFO Control Register (SCFCR)

SCFCR resets the quantity of data in the transmit and receive FIFO data registers, sets the trigger data quantity, and contains an enable bit for loop-back testing. SCFCR can always be read and written to by the CPU.

15.3.10 FIFO Data Count Set Register (SCFDR)

SCFDR is a 16-bit register which indicates the quantity of data stored in the transmit FIFO data register (SCFTDR) and the receive FIFO data register (SCFRDR).

It indicates the quantity of transmit data in SCFTDR with the upper 8 bits, and the quantity of receive data in SCFRDR with the lower 8 bits. SCFDR can always be read by the CPU.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	T[4:0]				-	-	-	R[4:0]					
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

12 to 8	T[4:0]	00000	R	T4 to T0 bits indicate the quantity of non-transmitted data stored in SCFTDR. H'00 means no transmit data, and H'10 means that SCFTDR is full of transmit data.
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4 to 0	R[4:0]	00000	R	R4 to R0 bits indicate the quantity of receive data stored in SCFRDR. H'00 means no receive data, and H'10 means that SCFRDR full of receive data.

15.3.11 Serial Port Register (SCSPTR)

SCSPTR controls input/output and data of pins multiplexed to the functions of this module. Bits 7 and 6 can control input/output data of $\overline{\text{RTS}}$ pin. Bits 5 and 4 can control input/output data of $\overline{\text{CTS}}$ pin. Bits 3 and 2 can control input/output data of SCK pin. Bits 1 and 0 can input data from RxD pin and output data to TxD pin, so they control break of serial transmitting/receiving.

The CPU can always read and write to SCSPTR.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

15 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
7	RTSIO	0	R/W	$\overline{\text{RTS}}$ Port Input/Output Indicates input or output of the serial port $\overline{\text{RTS}}$ pin. When the $\overline{\text{RTS}}$ pin is actually used as a port outputting the RTSDT bit value, the MCE bit in SCFCR should be cleared to 0. 0: RTSDT bit value not output to $\overline{\text{RTS}}$ pin 1: RTSDT bit value output to $\overline{\text{RTS}}$ pin
6	RTSDT	1	R/W	$\overline{\text{RTS}}$ Port Data Indicates the input/output data of the serial port $\overline{\text{RTS}}$ pin. Input/output is specified by the RTSIO bit. For output, the RTSDT bit value is output to the $\overline{\text{RTS}}$ pin. The $\overline{\text{RTS}}$ pin status is read from the RTSDT bit regardless of the RTSIO bit setting. However, $\overline{\text{RTS}}$ input/output must be set in the PFC. 0: Input/output data is low level 1: Input/output data is high level

Bit	Bit Name	Initial Value	R/W	Description
5	CTSIO	0	R/W	<p>CTS Port Input/Output</p> <p>Indicates input or output of the serial port $\overline{\text{CTS}}$ pin. When the $\overline{\text{CTS}}$ pin is actually used as a port outputting the CTS DT bit value, the MCE bit in SCFCR should be cleared to 0.</p> <p>0: CTS DT bit value not output to $\overline{\text{CTS}}$ pin 1: CTS DT bit value output to $\overline{\text{CTS}}$ pin</p>
4	CTS DT	1	R/W	<p>$\overline{\text{CTS}}$ Port Data</p> <p>Indicates the input/output data of the serial port $\overline{\text{CTS}}$ pin. Input/output is specified by the CTS IO bit. For output, the CTS DT bit value is output to the $\overline{\text{CTS}}$ pin. The $\overline{\text{CTS}}$ pin status is read from the CTS DT bit regardless of the CTS IO bit setting. However, $\overline{\text{CTS}}$ input/output must be set in the PFC.</p> <p>0: Input/output data is low level 1: Input/output data is high level</p>
3	SCKIO	0	R/W	<p>SCK Port Input/Output</p> <p>Indicates input or output of the serial port SCK pin. When the SCK pin is actually used as a port outputting the SCK DT bit value, the CKE[1:0] bits in SCSCR should be cleared to 0.</p> <p>0: SCK DT bit value not output to SCK pin 1: SCK DT bit value output to SCK pin</p>
2	SCK DT	0	R/W	<p>SCK Port Data</p> <p>Indicates the input/output data of the serial port SCK pin. Input/output is specified by the SCK IO bit. For output, the SCK DT bit value is output to the SCK pin. The SCK pin status is read from the SCK DT bit regardless of the SCK IO bit setting. However, SCK input/output must be set in the PFC.</p> <p>0: Input/output data is low level 1: Input/output data is high level</p>

Bit	Bit Name	Initial Value	R/W	Description
1	SPB2IO	0	R/W	<p>Serial Port Break Input/Output</p> <p>Indicates input or output of the serial port TxD pin. When the TxD pin is actually used as a port outputting the SPB2DT bit value, the TE bit in SCSCR should be cleared to 0.</p> <p>0: SPB2DT bit value not output to TxD pin 1: SPB2DT bit value output to TxD pin</p>
0	SPB2DT	0	R/W	<p>Serial Port Break Data</p> <p>Indicates the input data of the RxD pin and the output data of the TxD pin used as serial ports. Input/output is specified by the SPB2IO bit. When the TxD pin is set to output, the SPB2DT bit value is output to the TxD pin. The RxD pin status is read from the SPB2DT bit regardless of the SPB2IO bit setting. However, RxD input and TxD output must be set in the PFC.</p> <p>0: Input/output data is low level 1: Input/output data is high level</p>

15.3.12 Line Status Register (SCLSR)

The CPU can always read or write to SCLSR, but cannot write 1 to the ORER flag. This flag can be cleared to 0 only if it has first been read (after being set to 1).

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	ORER
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/(W)*

Note: * Only 0 can be written to clear the flag after 1 is read.

Bit	Bit Name	Initial Value	R/W	Description
15 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	ORER	0	R/(W)*	<p>Overrun Error</p> <p>Indicates the occurrence of an overrun error.</p> <p>0: Receiving is in progress or has ended normally*¹ [Clearing conditions]</p> <ul style="list-style-type: none"> ORER is cleared to 0 when the chip is a power-on reset ORER is cleared to 0 when 0 is written after 1 is read from ORER. <p>1: An overrun error has occurred*² [Setting condition]</p> <ul style="list-style-type: none"> ORER is set to 1 when the next serial receiving is finished while the receive FIFO is full of 16-byte receive data. <p>Notes:</p> <ol style="list-style-type: none"> Clearing the RE bit to 0 in SCSCR does not affect the ORER bit, which retains its previous value. The receive FIFO data register (SCFRDR) retains the data before an overrun error has occurred, and the next received data is discarded. When the ORER bit is set to 1, the next serial reception cannot be continued.

15.3.13 Serial Extension Mode Register (SCEMR)

The CPU can always read from or write to SCEMR. Setting the BGDM bit in this register to 1 allows the baud rate generator in this module operates in double-speed mode when asynchronous mode is selected (by setting the $\overline{C/\overline{A}}$ bit in SCSMR to 0) and an internal clock is selected as a clock source and the SCK pin is set as an input pin (by setting the CKE[1:0] bits in SCSCR to 00).

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	BGDM	-	-	-	-	-	-	ABCS
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
7	BGDM	0	R/W	Baud Rate Generator Double-Speed Mode When the BGDM bit is set to 1, the baud rate generator in this module operates in double-speed mode. This bit is valid only when asynchronous mode is selected by setting the $\overline{C/\overline{A}}$ bit in SCSMR to 0 and an internal clock is selected as a clock source and the SCK pin is set as an input pin by setting the CKE[1:0] bits in SCSCR to 00. In other settings, this bit is invalid (the baud rate generator operates in normal mode regardless of the BGDM setting). 0: Normal mode 1: Double-speed mode
6 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	ABCS	0	R/W	Base Clock Select in Asynchronous Mode This bit selects the base clock frequency within a bit period in asynchronous mode. This bit is valid only in asynchronous mode (when the $\overline{C/\overline{A}}$ bit in SCSMR is 0). 0: Base clock frequency is 16 times the bit rate 1: Base clock frequency is 8 times the bit rate

15.4 Operation

15.4.1 Overview

For serial communication, this module has an asynchronous mode in which characters are synchronized individually, and a clock synchronous mode in which communication is synchronized with clock pulses.

This module has a 16-stage FIFO buffer for both transmission and receptions, reducing the overhead of the CPU, and enabling continuous high-speed communication. Furthermore, channel 1 has $\overline{\text{RTS}}$ and $\overline{\text{CTS}}$ signals to be used as modem control signals.

The transmission format is selected in the serial mode register (SCSMR), as shown in table 15.9. The clock source is selected by the combination of the CKE1 and CKE0 bits in the serial control register (SCSCR), as shown in table 15.10.

(1) Asynchronous Mode

- Data length is selectable: 7 or 8 bits
- Parity bit is selectable. So is the stop bit length (1 or 2 bits). The combination of the preceding selections constitutes the communication format and character length.
- In receiving, it is possible to detect framing errors, parity errors, receive FIFO data full, overrun errors, receive data ready, and breaks.
- The number of stored data bytes is indicated for both the transmit and receive FIFO registers.
- An internal or external clock can be selected as the clock source.
 - When an internal clock is selected, this module operates using the clock of on-chip baud rate generator.
 - When an external clock is selected, the external clock input must have a frequency 16 or 8 times the bit rate. (The on-chip baud rate generator is not used.)

(2) Clock Synchronous Mode

- The transmission/reception format has a fixed 8-bit data length.
- In receiving, it is possible to detect overrun errors (ORER).
- An internal or external clock can be selected as the clock source.
 - When an internal clock is selected, this module operates using the clock of the on-chip baud rate generator, and outputs this clock to external devices as the synchronous clock.
 - When an external clock is selected, this module operates on the input external synchronous clock not using the on-chip baud rate generator.

Table 15.9 SCSMR Settings and Communication Formats

SCSMR Settings				Communication Format					
Bit 7 C/ \bar{A}	Bit 6 CHR	Bit 5 PE	Bit 3 STOP	Mode	Data Length	Parity Bit	Stop Bit Length		
0	0	0	0	Asynchronous	8 bits	Not set	1 bit		
			1				2 bits		
			0				Set	1 bit	
			1					2 bits	
		1	0	0	Clock synchronous	7 bits	Not set	1 bit	
				1				2 bits	
				0				Set	1 bit
				1					2 bits

[Legend]

x: Don't care

Table 15.10 SCSMR and SCSCR Settings and Clock Source Selection

SCSMR Bit 7 C/ \bar{A}	SCSCR		Transmit/Receive Clock	
	Bit 1, 0 CKE[1:0]	Mode	Clock Source	SCK Pin Function
0	00	Asynchronous	Internal	This module does not use the SCK pin.
	01			Outputs a clock with a frequency 16/8 times the bit rate
	10		External	Inputs a clock with frequency 16/8 times the bit rate
	11		Setting prohibited	
1	0x	Clock synchronous	Internal	Outputs the serial clock
	10		External	Inputs the serial clock
	11		Setting prohibited	

[Legend]

x: Don't care

Note: When using the baud rate generator in double-speed mode (BGMD = 1), select asynchronous mode by setting the C/A bit to 0, and select an internal clock as a clock source and the SCK pin is not used (the CKE[1:0] bits set to 00).

15.4.2 Operation in Asynchronous Mode

In asynchronous mode, each transmitted or received character begins with a start bit and ends with a stop bit. Serial communication is synchronized one character at a time.

The transmitting and receiving sections in this module are independent, so full duplex communication is possible. The transmitter and receiver are 16-byte FIFO buffered, so data can be written and read while transmitting and receiving are in progress, enabling continuous transmitting and receiving.

Figure 15.2 shows the general format of asynchronous serial communication.

In asynchronous serial communication, the communication line is normally held in the mark (high) state. This module monitors the line and starts serial communication when the line goes to the space (low) state, indicating a start bit. One serial character consists of a start bit (low), data (LSB first), parity bit (high or low), and stop bit (high), in that order.

When receiving in asynchronous mode, this module synchronizes at the falling edge of the start bit. This module samples each data bit on the eighth or fourth pulse of a clock with a frequency 16 or 8 times the bit rate. Receive data is latched at the center of each bit.

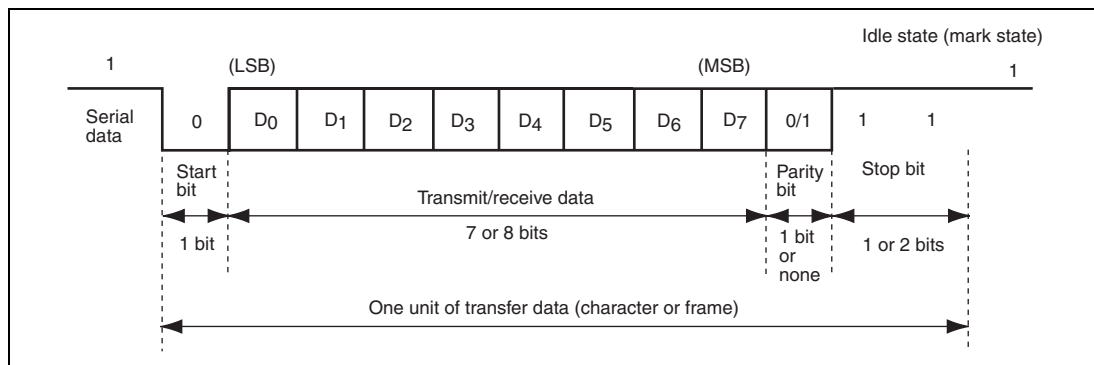

Figure 15.2 Example of Data Format in Asynchronous Communication (8-Bit Data with Parity and Two Stop Bits)

(1) Transmit/Receive Formats

Table 15.11 lists the eight communication formats that can be selected in asynchronous mode. The format is selected by settings in the serial mode register (SCSMR).

Table 15.11 Serial Communication Formats (Asynchronous Mode)

SCSMR Bits			Serial Transmit/Receive Format and Frame Length												
CHR	PE	STOP	1	2	3	4	5	6	7	8	9	10	11	12	
0	0	0	START	8-bit data							STOP				
0	0	1	START	8-bit data							STOP	STOP			
0	1	0	START	8-bit data							P	STOP			
0	1	1	START	8-bit data							P	STOP	STOP		
1	0	0	START	7-bit data						STOP					
1	0	1	START	7-bit data						STOP	STOP				
1	1	0	START	7-bit data						P	STOP				
1	1	1	START	7-bit data						P	STOP	STOP			

[Legend]

START: Start bit

STOP: Stop bit

P: Parity bit

(2) Clock

An internal clock generated by the on-chip baud rate generator or an external clock input from the SCK pin can be selected as the transmit/receive clock. The clock source is selected by the $\overline{C/A}$ bit in the serial mode register (SCSMR) and the CKE1 and CKE0 bits in the serial control register (SCSCR). For clock source selection, refer to table 15.10, SCSMR and SCSCR Settings and Clock Source Selection.

When an external clock is input at the SCK pin, it must have a frequency equal to 16 or 8 times the desired bit rate.

When this module operates on an internal clock, it can output a clock signal on the SCK pin. The frequency of this output clock is 16 or 8 times the desired bit rate.

(3) Transmitting and Receiving Data

- Initialization (Asynchronous Mode)

Before transmitting or receiving, clear the TE and RE bits to 0 in the serial control register (SCSCR), then initialize this module as follows.

When changing the operation mode or the communication format, always clear the TE and RE bits to 0 before following the procedure given below. Clearing TE to 0 initializes the transmit shift register (SCTSR). Clearing TE and RE to 0, however, does not initialize the serial status register (SCFSR), transmit FIFO data register (SCFTDR), or receive FIFO data register (SCFRDR), which retain their previous contents. Clear TE to 0 after all transmit data has been transmitted and the TEND flag in the SCFSR is set. The TE bit can be cleared to 0 during transmission, but the transmit data goes to the Mark state after the bit is cleared to 0. Set the TFRST bit in SCFCR to 1 and reset SCFTDR before TE is set again to start transmission.

When an external clock is used, the clock should not be stopped during initialization or subsequent operation. The operation becomes unreliable if the clock is stopped.

Figure 15.3 shows a sample flowchart for initialization.

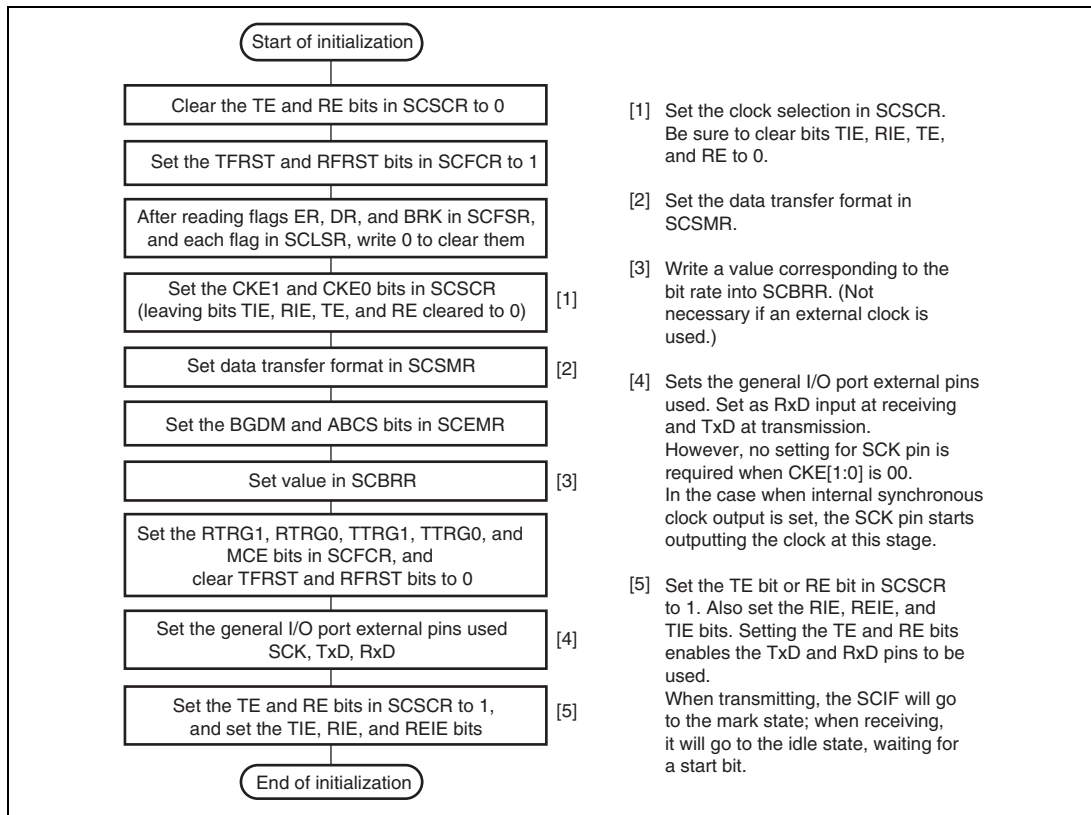

Figure 15.3 Sample Flowchart for Initialization

- Transmitting Serial Data (Asynchronous Mode)

Figure 15.4 shows a sample flowchart for serial transmission.

Use the following procedure for serial data transmission after enabling transmission.

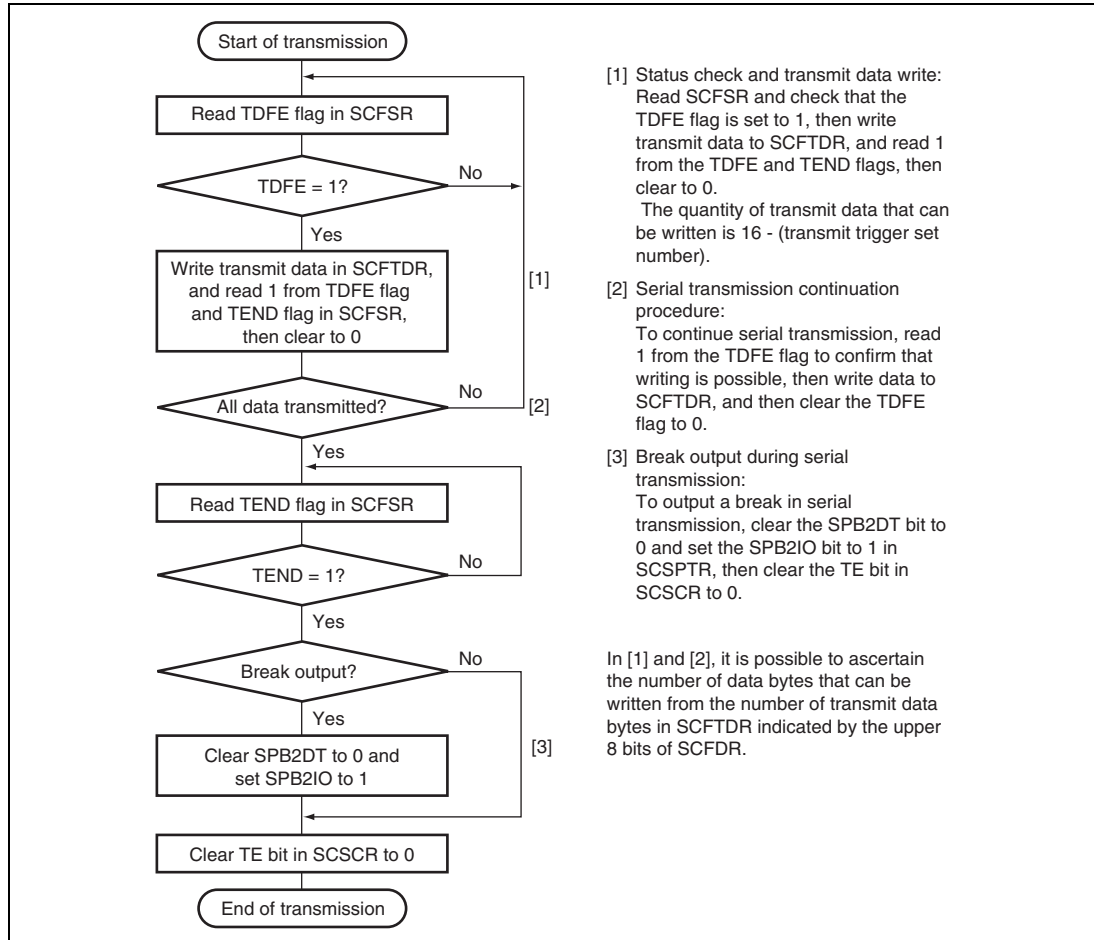

Figure 15.4 Sample Flowchart for Transmitting Serial Data

In serial transmission, this module operates as described below.

1. When data is written into the transmit FIFO data register (SCFTDR), the data is transferred from SCFTDR to the transmit shift register (SCTSR). Confirm that the TDFE flag in the serial status register (SCFSR) is set to 1 before writing transmit data to SCFTDR. The number of data bytes that can be written is (16 – transmit trigger setting).
2. When data is transferred from SCFTDR to SCTSR and transmission is started, consecutive transmit operations are performed until there is no transmit data left in SCFTDR. When the number of transmit data bytes in SCFTDR falls below the transmit trigger number set in the FIFO control register (SCFCR), the TDFE flag is set. If the TIE bit in the serial control register (SCSR) is set to 1 at this time, a transmit-FIFO-data-empty interrupt (TXI) request is generated.

The serial transmit data is sent from the TxD pin in the following order.

- A. Start bit: One-bit 0 is output.
 - B. Transmit data: 8-bit or 7-bit data is output in LSB-first order.
 - C. Parity bit: One parity bit (even or odd parity) is output. (A format in which a parity bit is not output can also be selected.)
 - D. Stop bit(s): One or two 1 bits (stop bits) are output.
 - E. Mark state: 1 is output continuously until the start bit that starts the next transmission is sent.
3. The SCFTDR transmit data is checked at the timing for sending the stop bit. If data is present, the data is transferred from SCFTDR to SCTSR, the stop bit is sent, and then serial transmission of the next frame is started.

Figure 15.5 shows an example of the operation for transmission.

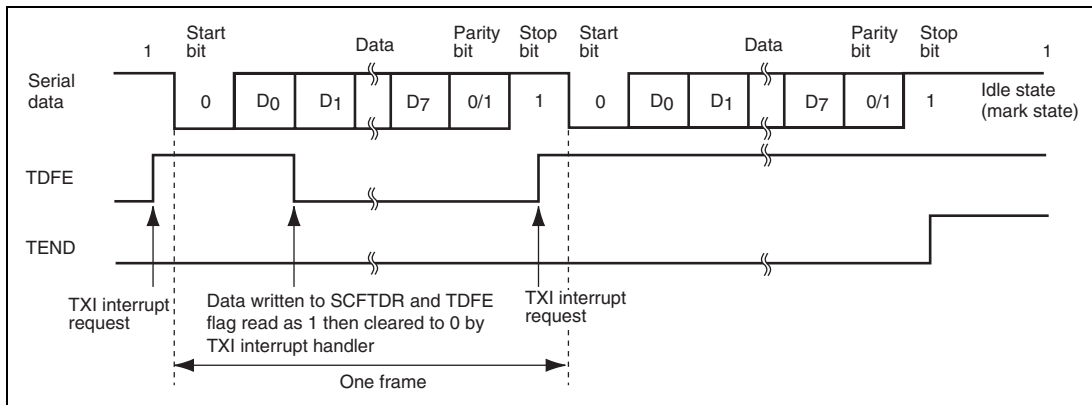

Figure 15.5 Example of Transmit Operation (8-Bit Data, Parity, 1 Stop Bit)

- When modem control is enabled in channel 1, transmission can be stopped and restarted in accordance with the \overline{CTS} input value. When \overline{CTS} is set to 1, if transmission is in progress, the line goes to the mark state after transmission of one frame. When \overline{CTS} is set to 0, the next transmit data is output starting from the start bit.

Figure 15.6 shows an example of the operation when modem control is used.

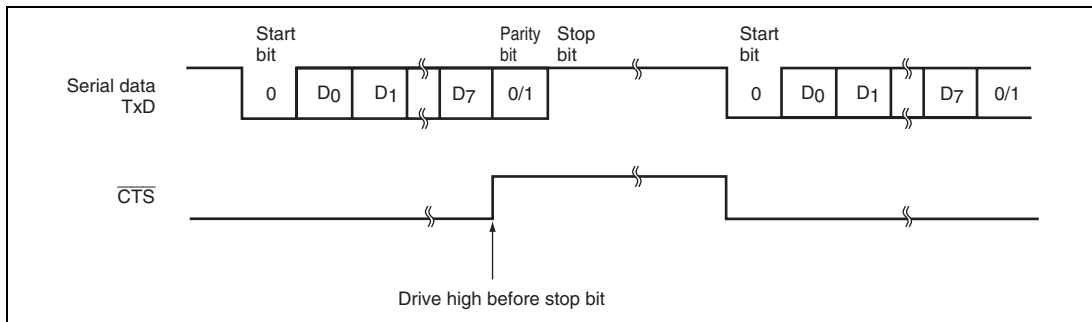

Figure 15.6 Example of Operation Using Modem Control (\overline{CTS})

- Receiving Serial Data (Asynchronous Mode)

Figures 15.7 and 15.8 show sample flowcharts for serial reception.

Use the following procedure for serial data reception after enabling reception.

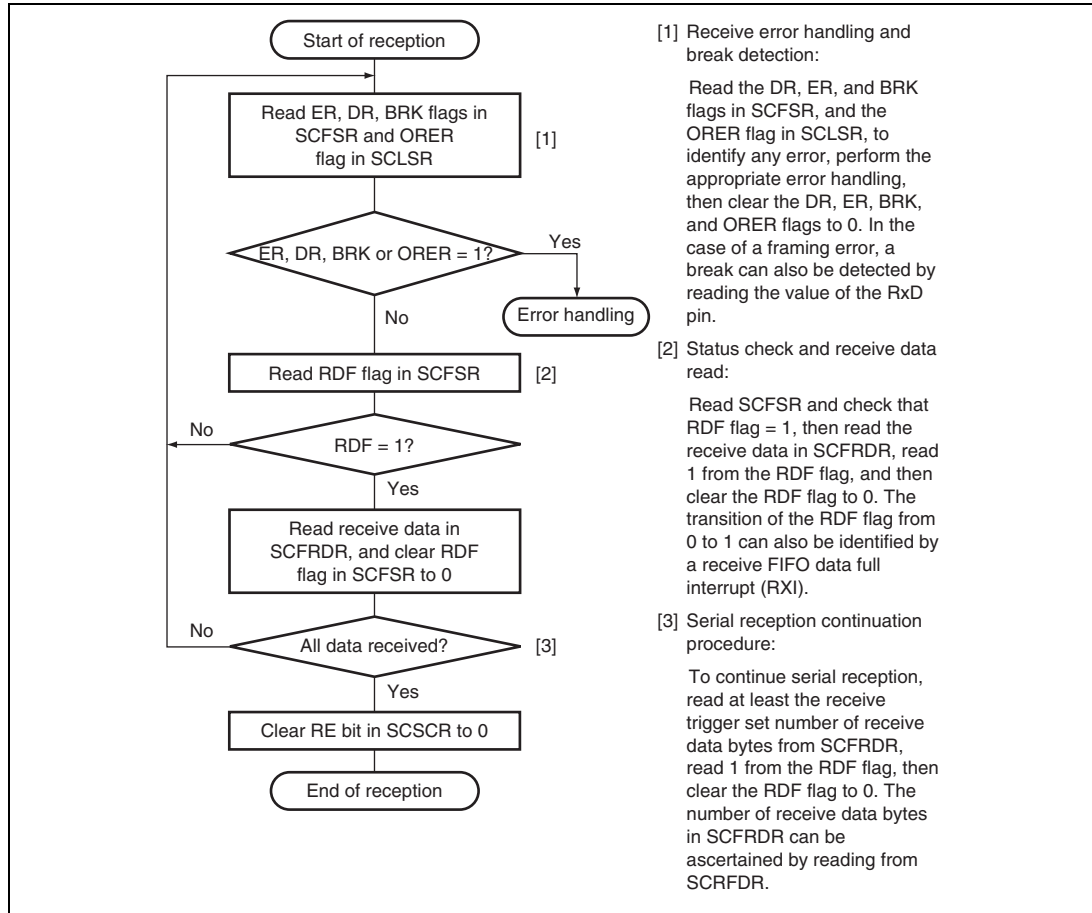

Figure 15.7 Sample Flowchart for Receiving Serial Data

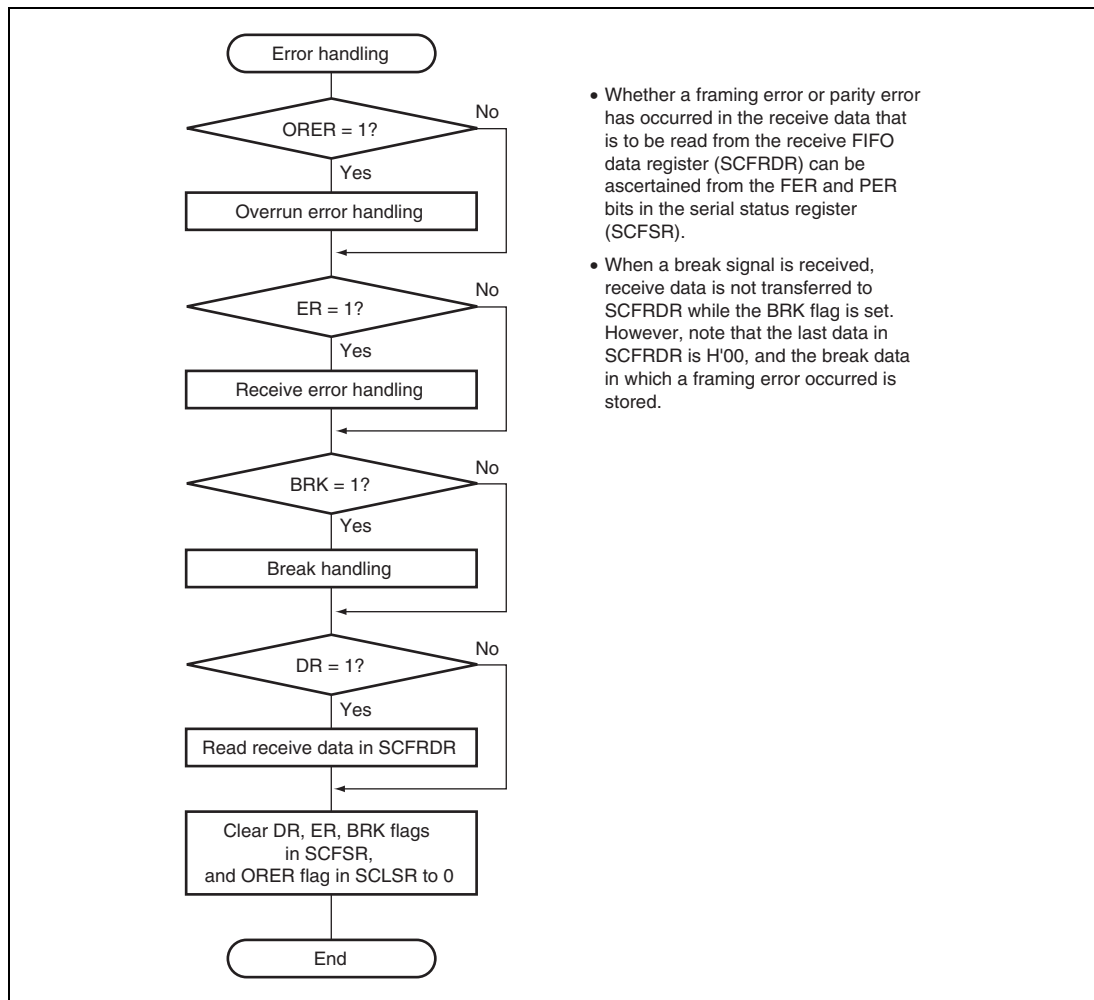

Figure 15.8 Sample Flowchart for Receiving Serial Data (cont)

In serial reception, this module operates as described below.

1. The transmission line is monitored, and if a 0 start bit is detected, internal synchronization is performed and reception is started.
2. The received data is stored in SCRSR in LSB-to-MSB order.
3. The parity bit and stop bit are received.

After receiving these bits, this module carries out the following checks.

- A. Stop bit check: Checks whether the stop bit is 1. If there are two stop bits, only the first is checked.
- B. Checks whether receive data can be transferred from the receive shift register (SCRSR) to SCFRDR.
- C. Overrun check: Checks that the ORER flag is 0, indicating that the overrun error has not occurred.
- D. Break check: Checks that the BRK flag is 0, indicating that the break state is not set.

If all the above checks are passed, the receive data is stored in SCFRDR.

Note: When a parity error or a framing error occurs, reception is not suspended.

4. If the RIE bit in SCSCR is set to 1 when the RDF or DR flag changes to 1, a receive-FIFO-data-full interrupt (RXI) request is generated. If the RIE bit or the REIE bit in SCSCR is set to 1 when the ER flag changes to 1, a receive-error interrupt (ERI) request is generated. If the RIE bit or the REIE bit in SCSCR is set to 1 when the BRK or ORER flag changes to 1, a break reception interrupt (BRI) request is generated.

Figure 15.9 shows an example of the operation for reception.

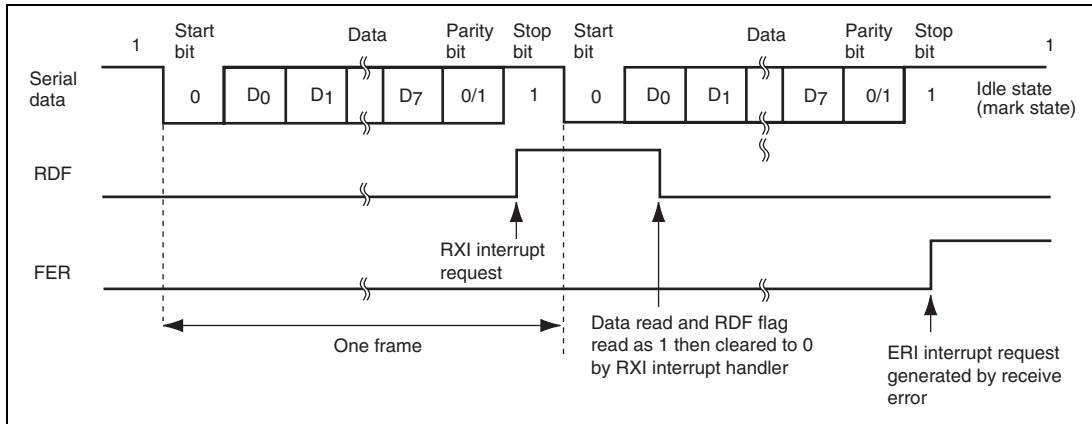

Figure 15.9 Example of Receive Operation (8-Bit Data, Parity, 1 Stop Bit)

- When modem control is enabled in channel 1, the $\overline{\text{RTS}}$ signal is output when SCFRDR is empty. When $\overline{\text{RTS}}$ is 0, reception is possible. When $\overline{\text{RTS}}$ is 1, this indicates that SCFRDR exceeds the number set for the RTS output active trigger.

Figure 15.10 shows an example of the operation when modem control is used.

Figure 15.10 Example of Operation Using Modem Control ($\overline{\text{RTS}}$)

15.4.3 Operation in Clock Synchronous Mode

In clock synchronous mode, data is transmitted and received in synchronization with clock pulses. This mode is suitable for high-speed serial communication.

The transmitter and receiver in this module are independent, so full-duplex communication is possible while sharing the same clock. The transmitter and receiver are also 16-byte FIFO buffered, so continuous transmitting or receiving is possible by reading or writing data while transmitting or receiving is in progress.

Figure 15.11 shows the general format in clock synchronous serial communication.

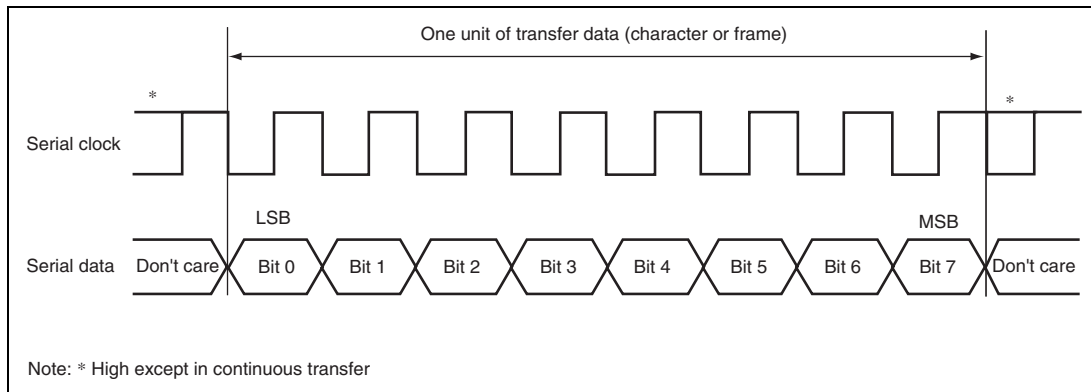

Figure 15.11 Data Format in Clock Synchronous Communication

In clock synchronous serial communication, each data bit is output on the communication line from one falling edge of the serial clock to the next. Data is guaranteed valid at the rising edge of the serial clock.

In each character, the serial data bits are transmitted in order from the LSB (first) to the MSB (last). After output of the MSB, the communication line remains in the state of the MSB.

In clock synchronous mode, data is received in synchronization with the rising edge of the serial clock.

(1) Transmit/Receive Formats

The data length is fixed at eight bits. No parity bit can be added.

(2) Clock

An internal clock generated by the on-chip baud rate generator by the setting of the C/A bit in SC5MR and CKE[1:0] in SC5CR, or an external clock input from the SCK pin can be selected as the transmit/receive clock.

When this module operates on an internal clock, it outputs the clock signal at the SCK pin. Eight clock pulses are output per transmitted or received character. When transmission or reception is not performed, the clock signal remains in the high state. When only receiving, the clock signal outputs while the RE bit of SC5CR is 1 and the number of data in receive FIFO is more than the receive FIFO data trigger number.

(3) Transmitting and Receiving Data

- Initialization (Clock Synchronous Mode)
Before transmitting, receiving, or changing the mode or communication format, the software must clear the TE and RE bits to 0 in the serial control register (SC5CR), then initialize this module. Clearing TE to 0 initializes the transmit shift register (SCTS5R). Clearing RE to 0, however, does not initialize the RDF, PER, FER, and ORER flags and receive data register (SCR5DR), which retain their previous contents.

Figure 15.12 shows a sample flowchart for initialization.

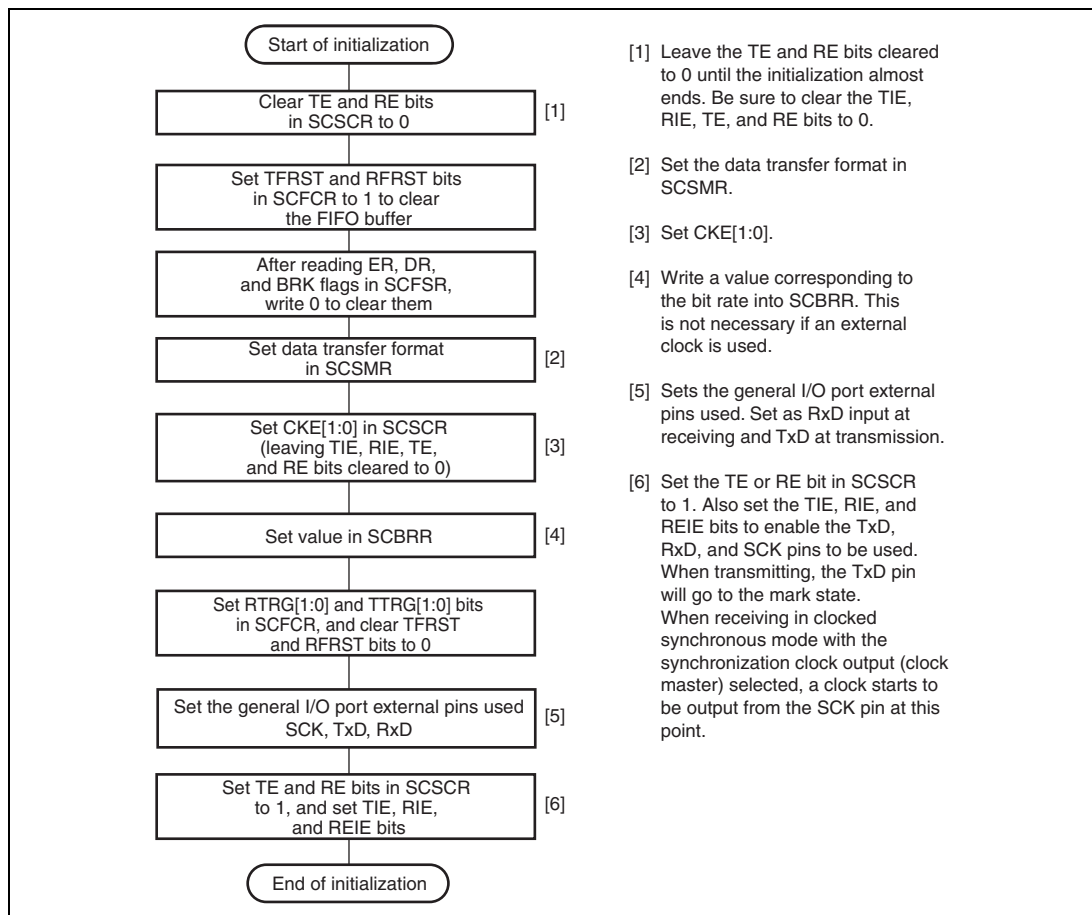

Figure 15.12 Sample Flowchart for Initialization

- Transmitting Serial Data (Clock Synchronous Mode)

Figure 15.13 shows a sample flowchart for transmitting serial data.

Use the following procedure for serial data transmission after enabling transmit operation.

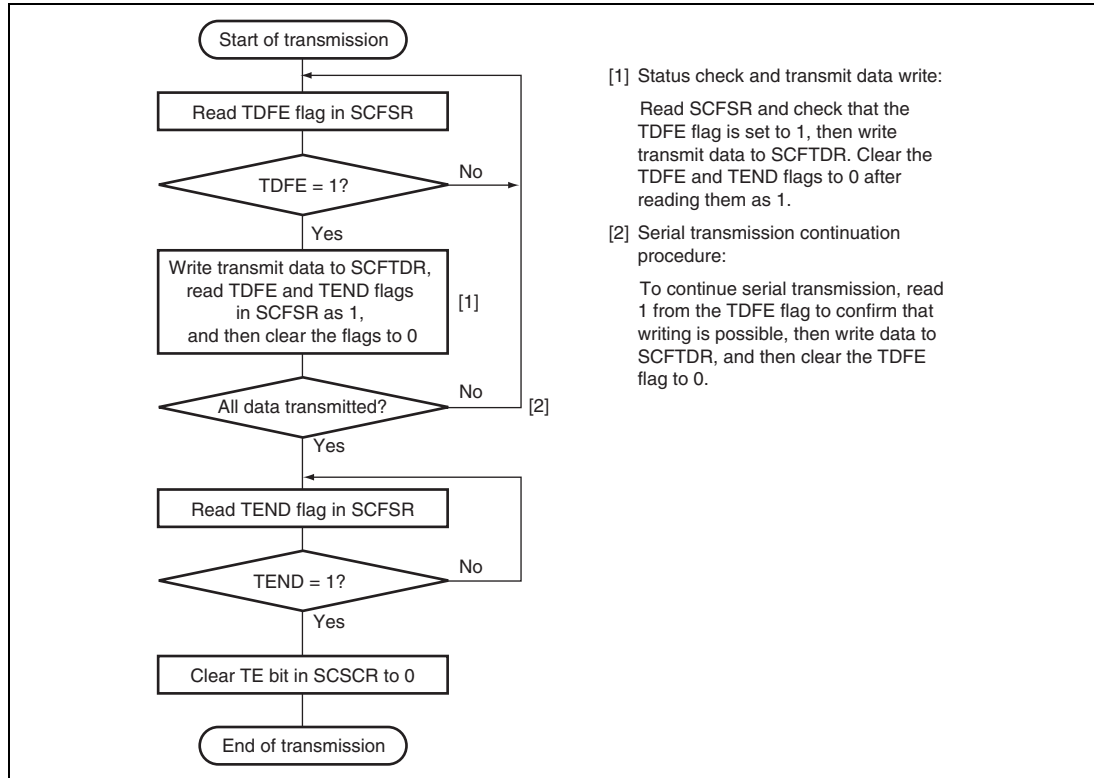

Figure 15.13 Sample Flowchart for Transmitting Serial Data

In serial transmission, this module operates as described below.

1. When data is written into the transmit FIFO data register (SCFTDR), the data is transferred from SCFTDR to the transmit shift register (SCTSR). Confirm that the TDFE flag in the serial status register (SCFSR) is set to 1 before writing transmit data to SCFTDR. The number of data bytes that can be written is (16 – transmit trigger setting).
2. When data is transferred from SCFTDR to SCTSR and transmission is started, consecutive transmit operations are performed until there is no transmit data left in SCFTDR. When the number of transmit data bytes in SCFTDR falls below the transmit trigger number set in the FIFO control register (SCFCR), the TDFE flag is set. If the TIE bit in the serial control register (SCSR) is set to 1 at this time, a transmit-FIFO-data-empty interrupt (TXI) request is generated.

If clock output mode is selected, eight synchronous clock pulses are output. If an external clock source is selected, data is output in synchronization with the input clock. Data is output from the TxD pin in order from the LSB (bit 0) to the MSB (bit 7).

3. The SCFTDR transmit data is checked at the timing for sending the MSB (bit 7). If data is present, the data is transferred from SCFTDR to SCTSR, and then serial transmission of the next frame is started. If there is no data, the TxD pin holds the state after the TEND flag in SCFSR is set to 1 and the MSB (bit 7) is sent.
4. After the end of serial transmission, the SCK pin is held in the high state.

Figure 15.14 shows an example of transmit operation.

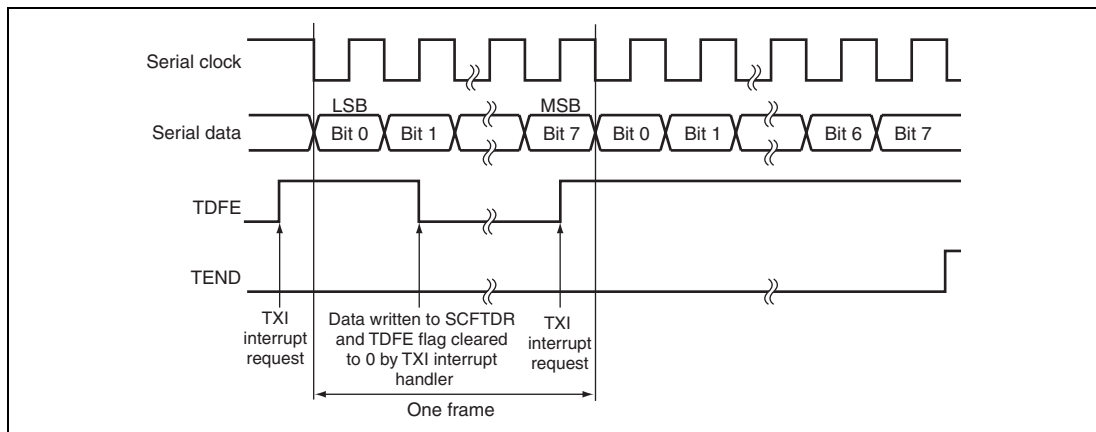

Figure 15.14 Example of Transmit Operation

- Receiving Serial Data (Clock Synchronous Mode)

Figures 15.15 and 15.16 show sample flowcharts for receiving serial data. Use the following procedure for serial data reception after enabling receive operation. When switching from asynchronous mode to clock synchronous mode without initialization, make sure that ORER, PER, and FER are cleared to 0.

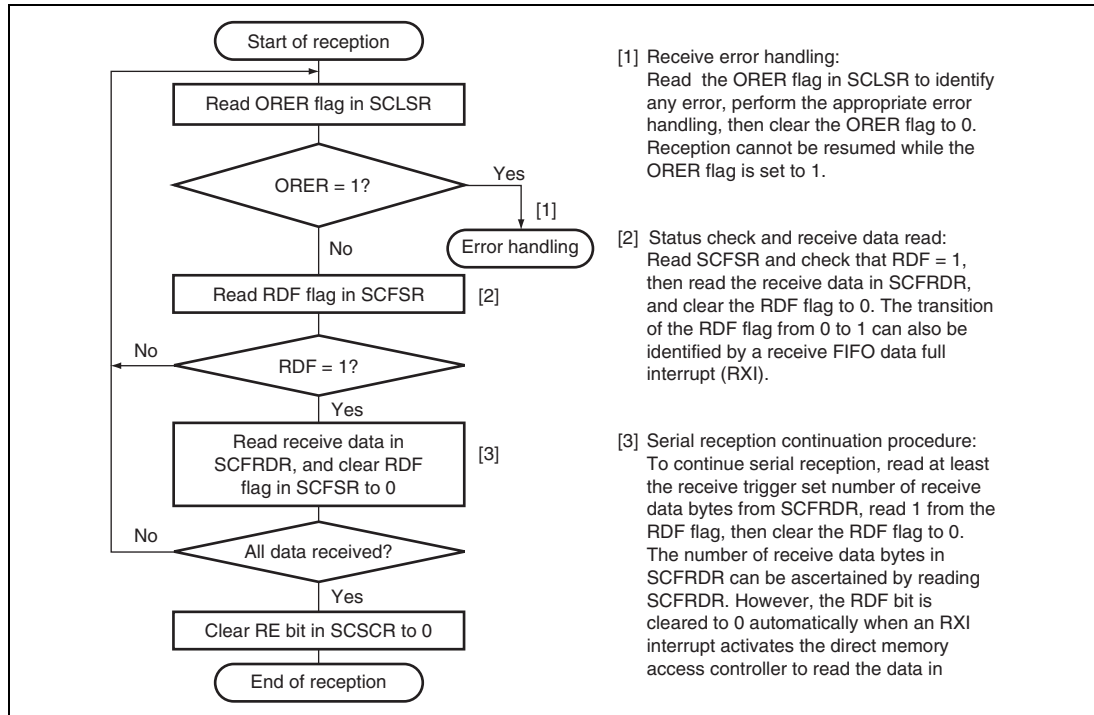

Figure 15.15 Sample Flowchart for Receiving Serial Data (1)

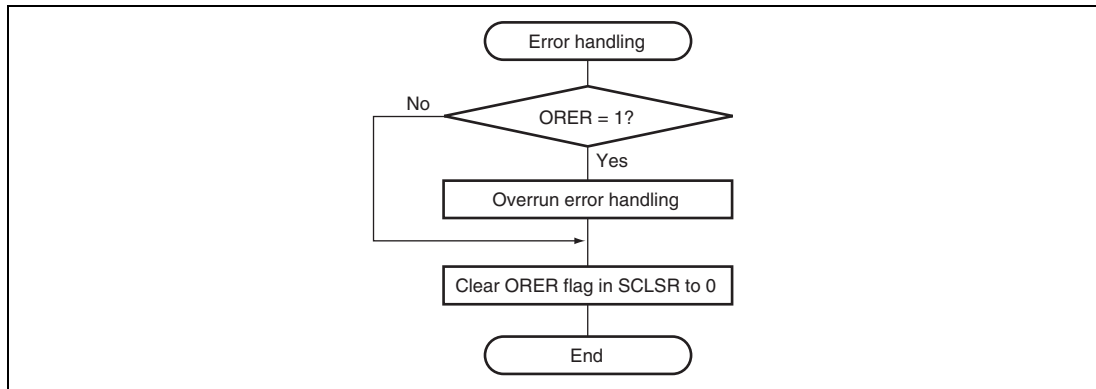

Figure 15.16 Sample Flowchart for Receiving Serial Data (2)

In serial reception, this module operates as described below.

1. Reception is started in synchronization with serial clock input or output.
2. Receive data is shifted into SCRSR in order from the LSB to the MSB. After the data reception, whether the receive data can be loaded from SCRSR into SCFRDR or not is checked. If this check is passed, the RDF flag is set to 1 and the received data is stored in SCFRDR. If the check is not passed (overrun error is detected), further reception is prevented.
3. After setting RDF to 1, if the receive FIFO data full interrupt enable bit (RIE) is set to 1 in SCSCR, a receive-data-full interrupt (RXI) request is generated. If the ORER bit is set to 1 and the receive-data-full interrupt enable bit (RIE) or the receive error interrupt enable bit (REIE) in SCSCR is also set to 1, a break interrupt (BRI) request is generated.

Figure 15.17 shows an example of receive operation.

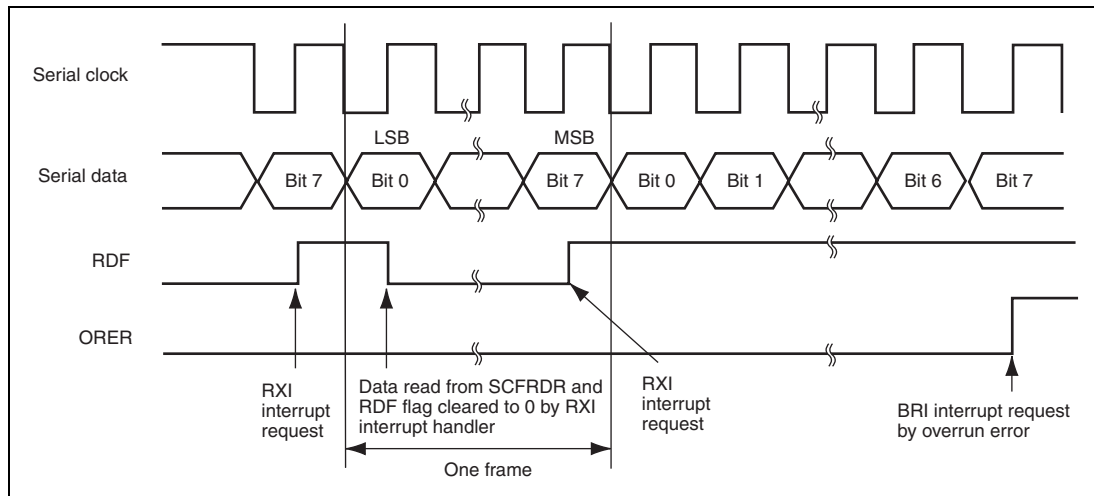

Figure 15.17 Example of Receive Operation

- Transmitting and Receiving Serial Data Simultaneously (Clock Synchronous Mode)

Figure 15.18 shows a sample flowchart for transmitting and receiving serial data simultaneously.

Use the following procedure for the simultaneous transmission/reception of serial data, after enabling transmit/receive operation.

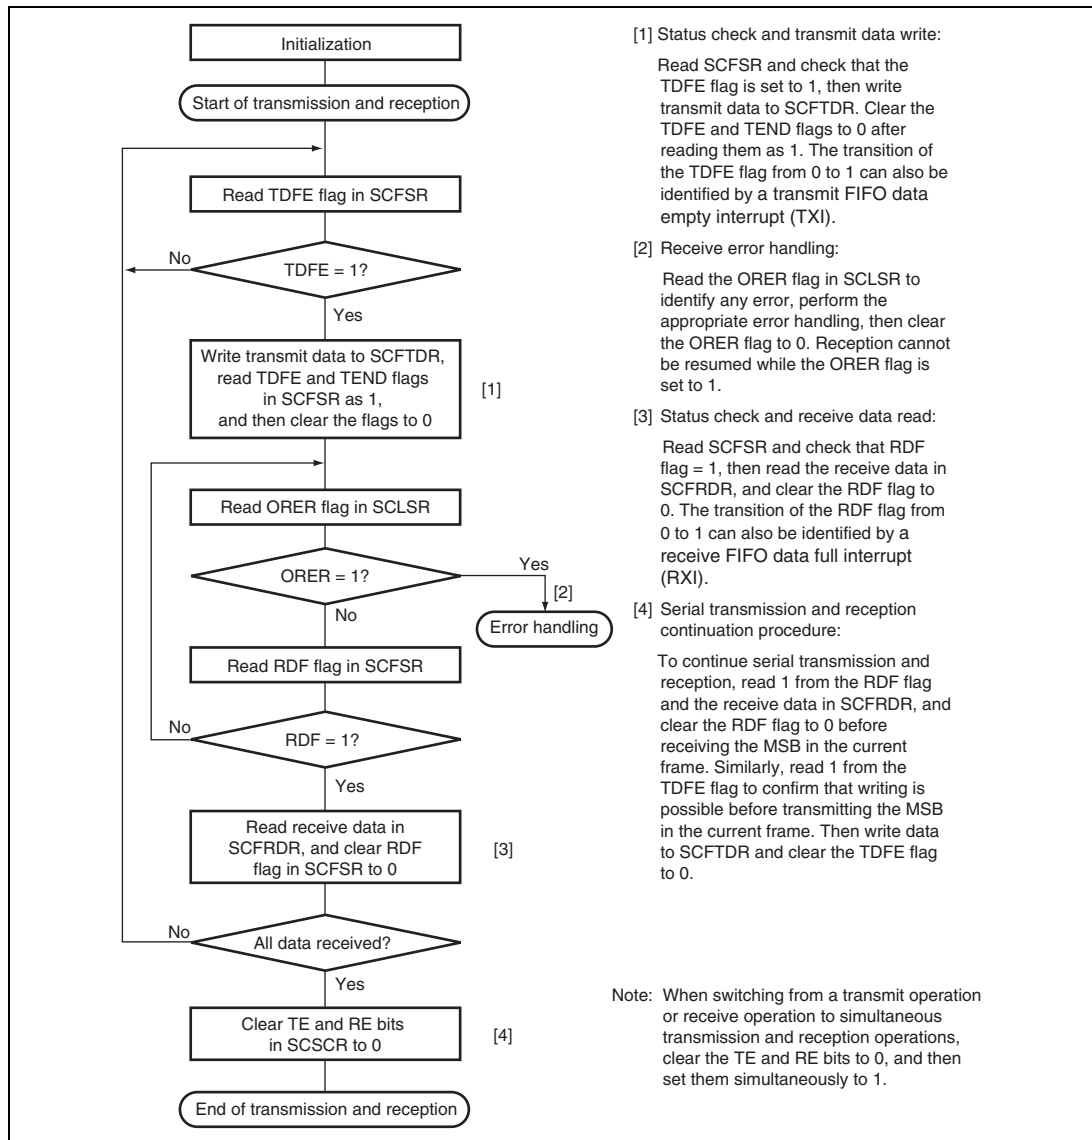

Figure 15.18 Sample Flowchart for Transmitting/Receiving Serial Data

15.5 Interrupts

This module has four interrupt sources: transmit-FIFO-data-empty (TXI), receive-error (ERI), receive FIFO data full (RXI), and break (BRI).

Table 15.12 shows the interrupt sources and their order of priority. The interrupt sources are enabled or disabled by means of the TIE, RIE, and REIE bits in SCSCR. A separate interrupt request is sent to the interrupt controller for each of these interrupt sources.

When a TXI request is enabled by the TIE bit and the TDFE flag in the serial status register (SCFSR) is set to 1, a TXI interrupt request is generated. The direct memory access controller can be activated and data transfer performed by this TXI interrupt request. At this time, an interrupt request is not sent to the CPU.

When an RXI request is enabled by the RIE bit and the RDF flag or the DR flag in SCFSR is set to 1, an RXI interrupt request is generated. The direct memory access controller can be activated and data transfer performed by this RXI interrupt request. At this time, an interrupt request is not sent to the CPU. The RXI interrupt request caused by the DR flag is generated only in asynchronous mode.

When the RIE bit is set to 0 and the REIE bit is set to 1, this module requests only an ERI or a BRI interrupt without requesting an RXI interrupt.

The TXI indicates that transmit data can be written, and the RXI indicates that there is receive data in SCFRDR.

Table 15.12 Interrupt Sources

Interrupt Source	Description	Direct Memory Access Controller Activation	Priority on Reset Release
BRI	Interrupt initiated by break (BRK) or overrun error (ORER)	Not possible	High
ERI	Interrupt initiated by receive error (ER)	Not possible	↑ ↓
RXI	Interrupt initiated by receive FIFO data full (RDF) or data ready (DR)	Possible	
TXI	Interrupt initiated by transmit FIFO data empty (TDFE)	Possible	Low

15.6 Usage Notes

Note the following when using this module.

15.6.1 SCFTDR Writing and TDFE Flag

The TDFE flag in the serial status register (SCFSR) is set when the number of transmit data bytes written in the transmit FIFO data register (SCFTDR) has fallen below the transmit trigger number set by bits TTRG[1:0] in the FIFO control register (SCFCR). After the TDFE flag is set, transmit data up to the number of empty bytes in SCFTDR can be written, allowing efficient continuous transmission.

However, if the number of data bytes written in SCFTDR is equal to or less than the transmit trigger number, the TDFE flag will be set to 1 again after being read as 1 and cleared to 0. TDFE flag clearing should therefore be carried out when SCFTDR contains more than the transmit trigger number of transmit data bytes.

The number of transmit data bytes in SCFTDR can be found from the upper 8 bits of the FIFO data count register (SCFDR).

15.6.2 SCFRDR Reading and RDF Flag

The RDF flag in the serial status register (SCFSR) is set when the number of receive data bytes in the receive FIFO data register (SCFRDR) has become equal to or greater than the receive trigger number set by bits RTRG[1:0] in the FIFO control register (SCFCR). After RDF flag is set, receive data equivalent to the trigger number can be read from SCFRDR, allowing efficient continuous reception.

However, if the number of data bytes in SCFRDR exceeds the trigger number, the RDF flag will be set to 1 again if it is cleared to 0. The RDF flag should therefore be cleared to 0 after being read as 1 after reading the number of the received data in the receive FIFO data register (SCFRDR) which is less than the trigger number.

The number of receive data bytes in SCFRDR can be found from the lower 8 bits of the FIFO data count register (SCFDR).

15.6.3 Restriction on Direct Memory Controller Usage

When the direct memory access controller writes data to SCFTDR due to a TXI interrupt request, the state of the TEND flag becomes undefined. Therefore, the TEND flag should not be used as the transfer end flag in such a case.

15.6.4 Break Detection and Processing

Break signals can be detected by reading the RxD pin directly when a framing error (FER) is detected. In the break state the input from the RxD pin consists of all 0s, so the FER flag is set and the parity error flag (PER) may also be set.

Note that, although transfer of receive data to SCFRDR is halted in the break state, the receive operation is continued.

15.6.5 Sending a Break Signal

The I/O condition and level of the TxD pin are determined by the SPB2IO and SPB2DT bits in the serial port register (SCSPTR). This feature can be used to send a break signal.

Until TE bit is set to 1 (enabling transmission) after initializing, the TxD pin does not work. During the period, mark status is performed by the SPB2DT bit. Therefore, the SPB2IO and SPB2DT bits should be set to 1 (high level output).

To send a break signal during serial transmission, clear the SPB2DT bit to 0 (designating low level), then clear the TE bit to 0 (halting transmission). When the TE bit is cleared to 0, the transmitter is initialized regardless of the current transmission state, and 0 is output from the TxD pin.

15.6.6 Receive Data Sampling Timing and Receive Margin (Asynchronous Mode)

This module operates on a base clock with a frequency 16 or 8 times the bit rate. In reception, the falling edge of the start bit is sampled at the base clock to perform synchronization internally. Receive data is latched at the rising edge of the eighth or fourth base clock pulse. When this module operates on a base clock with a frequency 16 times the bit rate, the receive data is sampled at the timing shown in figure 15.19.

**Figure 15.19 Receive Data Sampling Timing in Asynchronous Mode
(Operation on a Base Clock with a Frequency 16 Times the Bit Rate)**

The receive margin in asynchronous mode can therefore be expressed as shown in equation 1.

Equation 1:

$$M = \left| \left(0.5 - \frac{1}{2N} \right) - (L - 0.5) F - \frac{|D - 0.5|}{N} (1 + F) \right| \times 100 \%$$

Where: M: Receive margin (%)

N: Ratio of clock frequency to bit rate (N = 16 or 8)

D: Clock duty (D = 0 to 1.0)

L: Frame length (L = 9 to 12)

F: Absolute deviation of clock frequency

From equation 1, if F = 0, D = 0.5 and N = 16, the receive margin is 46.875%, as given by equation 2.

Equation 2:

When D = 0.5 and F = 0:

$$\begin{aligned} M &= (0.5 - 1/(2 \times 16)) \times 100\% \\ &= 46.875\% \end{aligned}$$

This is a theoretical value. A reasonable margin to allow in system designs is 20% to 30%.

15.6.7 Selection of Base Clock in Asynchronous Mode

In this LSI, when asynchronous mode is selected, the base clock frequency within a bit period can be set to the frequency 16 or 8 times the bit rate by setting the ABCS bit in SCEMR.

Note that, however, if the base clock frequency 8 times the bit rate is used, receive margin is decreased as calculated using equation 1 in section 15.6.6, Receive Data Sampling Timing and Receive Margin (Asynchronous Mode).

If the desired bit rate can be set simply by setting SCBRR and the CKS1 and CKS0 bits in SCSMR, it is recommended to use the base clock frequency within a bit period 16 times the bit rate (by setting the ABCS bit in SCEMR to 0). If an internal clock is selected as a clock source and the SCK pin is not used, the bit rate can be increased without decreasing receive margin by selecting double-speed mode for the baud rate generator (setting the BGDM bit in SCEMR to 1).

Section 16 Renesas Serial Peripheral Interface

This LSI includes two-channel Renesas serial peripheral interfaces.

This module is capable of full-duplex serial communication.

16.1 Features

This module has the following features.

- SPI transfer functions
 - Use of MOSI (master out/slave in), MISO (master in/slave out), SSL (slave select), and RSPCK (SPI clock) signals allow for serial communications through SPI operation (four-wire method).
 - Capable of serial communications in master/slave mode
 - Supports mode fault error detection (only in SPI slave mode)
 - Supports overrun error detection (only in SPI slave mode)
 - Switching of the polarity of the serial transfer clock
 - Switching of the clock phase of serial transfer
- Data format
 - MSB-first/LSB-first selectable
 - Transfer bit-length is selectable as 8, 16, or 32 bits.
- Bit rate
 - RSPCK can be divided by a maximum of 4096 in master mode
 - RSPCK can be generated by dividing B ϕ by the on-chip baud rate generator.
 - An externally input clock can be used as a serial clock.
- Buffer configuration
 - 8 bytes for transmission and 32 bytes for reception.

- SSL control function
 - One SSL signal for each channel
 - In master mode, outputs SSL signal.
 - In slave mode, inputs SSL signal.
 - Controllable delay from SSL output assertion to RSPCK operation (RSPCK delay)
 - Range: 1 to 8 RSPCK cycles (set in RSPCK-cycle units)
 - Controllable delay from RSPCK stoppage to SSL output negation (SSL negation delay)
 - Range: 1 to 8 RSPCK cycles (set in RSPCK-cycle units)
 - Controllable wait for next-access SSL output assertion (next-access delay)
 - Range: 1 to 8 RSPCK cycles (set in RSPCK-cycle units)
 - Function for changing SSL polarity
- Control in master transfer
 - A transfer of up to four commands can be executed sequentially in looped execution.
 - For each command, the following can be set:
 - SSL signal value, bit rate, RSPCK polarity/phase, transfer data length, LSB/MSB first, burst, RSPCK delay, SSL negation delay, and next-access delay.
 - A transfer can be initiated by writing to the transmit buffer.
 - A transfer can be initiated by clearing the SPTEF bit.
 - MOSI signal value specifiable in SSL negation
- Interrupt sources
 - Maskable interrupt sources:
 - Receive interrupt (receive buffer full)
 - Transmit interrupt (transmit buffer empty)
 - Error interrupt (mode fault, overrun)
- Others
 - Provides loop back mode
 - Provides a function for disabling (initializing) this module

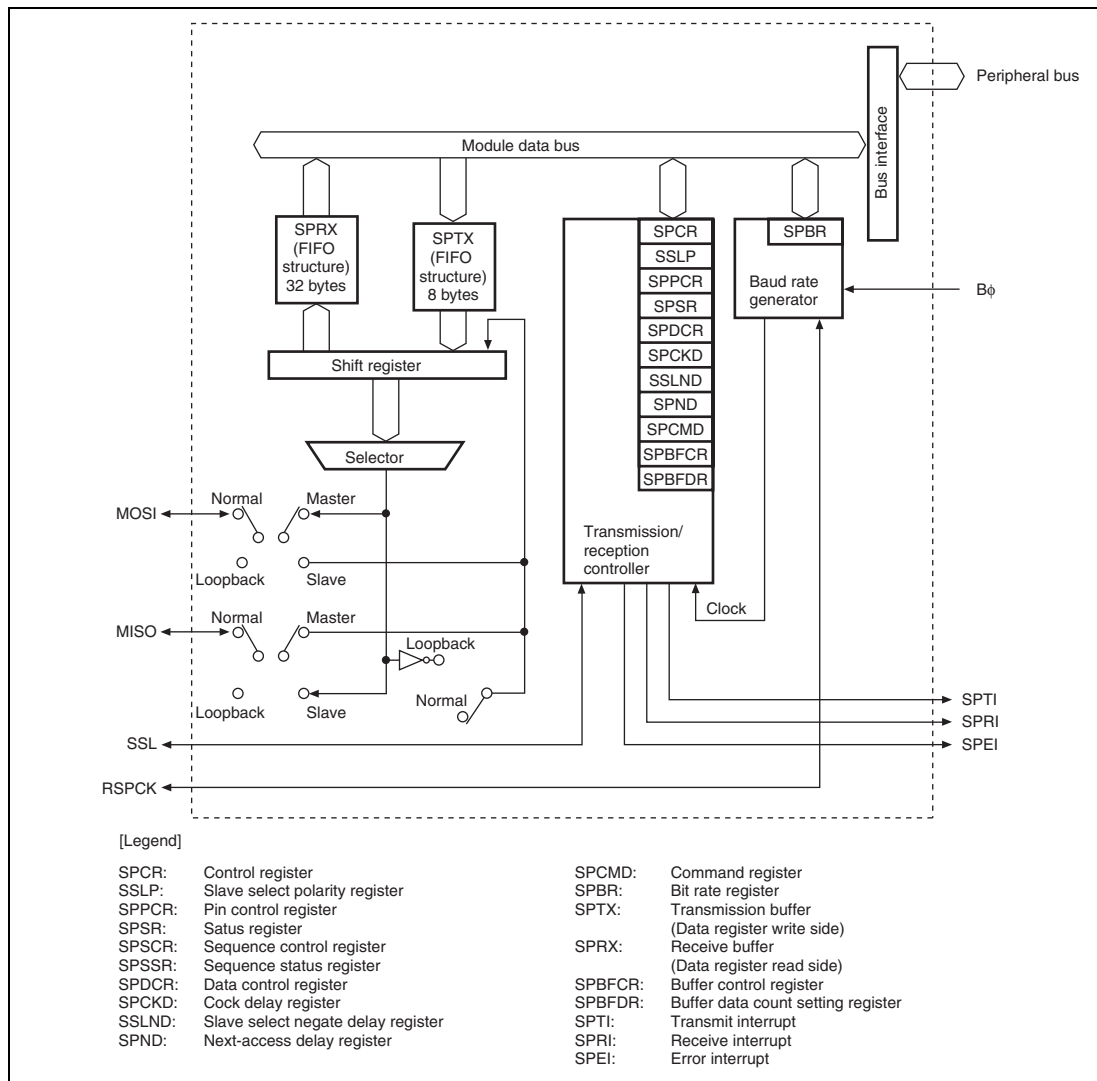

Figure 16.1 Block Diagram (for One Channel)

16.2 Input/Output Pins

Table 16.1 shows the pin configuration. This module automatically switches the input/output direction of the SSL pin. SSL is set as an output in master mode and as an input in slave mode. Pins RSPCK, MOSI, and MISO are automatically set as inputs or outputs according to the setting of master or slave and the level input on SSL (see section 16.4.2, Pin Control).

Table 16.1 Pin Configuration

Channel	Pin Name	Pin Name	I/O	Function
0	Clock pin	RSPCK0	I/O	Clock input/output
	Master transmit data pin	MOSI0	I/O	Master transmit data
	Slave transmit data pin	MISO0	I/O	Slave transmit data
	Slave select 0 pin	SSL00	I/O	Slave selection
1	Clock pin	RSPCK1	I/O	Clock input/output
	Master transmit data pin	MOSI1	I/O	Master transmit data
	Slave transmit data pin	MISO1	I/O	Slave transmit data
	Slave select 0 pin	SSL10	I/O	Slave selection

Note: In the description of the pins, the channel is omitted and pin names are described as RSPCK, MOSI, MISO, and SSL.

16.3 Register Descriptions

Table 16.2 shows the register configuration. These registers enable this module to perform the following controls: specifying master/slave modes, specifying a transfer format, and controlling the transmitter and receiver.

Table 16.2 Register Configuration

Channel	Register Name	Abbreviation* ¹	R/W	Initial Value	Address	Access Size
0	Control register_0	SPCR_0	R/W	H'00	H'FFFF8000	8, 16
	Slave select polarity register_0	SSLP_0	R/W	H'00	H'FFFF8001	8, 16

- Notes: 1. In the description of the register names, the channel is omitted.
2. Only 0 can be written to clear the flag.

16.3.1 Control Register (SPCR)

SPCR sets the operating mode. If the MSTR and MODFEN bits are changed while the function of this module is enabled by setting the SPE bit to 1, subsequent operations cannot be guaranteed.

Bit:	7	6	5	4	3	2	1	0
	SPRIE	SPE	SPTIE	SPEIE	MSTR	MOD FEN	—	—
Initial value:	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R	R

Bit	Bit Name	Initial Value	R/W	Description
7	SPRIE	0	R/W	Receive Interrupt Enable Enables or disables generation of receive interrupt requests (SPRI) when the number of receive data units in the receive buffer (SPRX) is equal to or greater than the specified receive buffer data triggering number and the SPRF flag in SPSR is set to 1. 0: Disables the generation of receive interrupt requests. 1: Enables the generation of receive interrupt requests.
6	SPE	0	R/W	Function Enable Setting this bit to 1 enables the module function. When the MODF bit in the status register (SPSR) is 1, the SPE bit cannot be set to 1 (see section 16.4.6, Error Detection). Setting the SPE bit to 0 disables the module function, and initializes a part of the module function (see section 16.4.7, Initialization). 0: Disables the module function 1: Enables the module function

Bit	Bit Name	Initial Value	R/W	Description
5	SPTIE	0	R/W	<p>Transmit Interrupt Enable</p> <p>Enables or disables generation of transmit interrupt requests (SPTI) when the number of transmit data units in the transmit buffer (SPTX) is equal to or less than the specified transmit buffer data triggering number and the SPTEF flag in SPSR is set to 1.</p> <p>0: Disables the generation of transmit interrupt requests.</p> <p>1: Enables the generation of transmit interrupt requests.</p>
4	SPEIE	0	R/W	<p>Error Interrupt Enable</p> <p>Enables or disables the generation of error interrupt requests when this module detects a mode fault error and sets the MODF bit in the status register (SPSR) to 1, or when this module detects an overrun error and sets the OVRF bit in SPSR to 1 (see section 16.4.6, Error Detection).</p> <p>0: Disables the generation of error interrupt requests.</p> <p>1: Enables the generation of error interrupt requests.</p> <p>Note: This bit is valid only in SPI slave mode.</p>
3	MSTR	0	R/W	<p>Master/Slave Mode Select</p> <p>Selects master/slave mode. According to MSTR bit settings, this module determines the direction of pins RSPCK, MOSI, MISO, and SSL pins.</p> <p>0: Slave mode</p> <p>1: Master mode</p>
2	MODFEN	0	R/W	<p>Mode Fault Error Detection Enable</p> <p>Enables or disables the detection of mode fault errors (see section 16.4.6, Error Detection).</p> <p>0: Disables the detection of mode fault errors</p> <p>1: Enables the detection of mode fault errors</p> <p>Note: This bit is valid only in SPI slave mode. When master mode is specified with the MSTR bit, this bit should always be cleared to 0.</p>
1, 0	—	All 0	R	<p>Reserved</p> <p>The write value should always be 0. Otherwise, operation cannot be guaranteed.</p>

16.3.2 Slave Select Polarity Register (SSLP)

SSLP sets the polarity of the SSL signal. If the contents of SSLOP are changed while the function of this module is enabled by setting the SPE bit in the control register (SPCR) to 1, subsequent operations cannot be guaranteed.

Bit:	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	SSL0P
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
7 to 1	—	All 0	R	Reserved The write value should always be 0. Otherwise, operation cannot be guaranteed.
0	SSL0P	0	R/W	SSL Signal Polarity Setting Sets the polarity of the SSL signal. The value of SSL0P indicates the active polarity of the SSL signal. 0: SSL signal 0-active 1: SSL signal 1-active

16.3.3 Pin Control Register (SPPCR)

SPPCR sets the modes of the pins. If the contents of this register are changed while the function of this module is enabled by setting the SPE bit in the control register (SPCR) to 1, subsequent operations cannot be guaranteed.

Bit:	7	6	5	4	3	2	1	0
	—	—	MOIFE	MOIFV	—	—	—	SPLP
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R/W	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
7, 6	—	All 0	R	Reserved The write value should always be 0. Otherwise, operation cannot be guaranteed.
5	MOIFE	0	R/W	MOSI Idle Value Fixing Enable Fixes the MOSI output value when this module in master mode is in an SSL negation period (including the SSL retention period during a burst transfer). When MOIFE is 0, this module outputs the last data from the previous serial transfer during the SSL negation period. When MOIFE is 1, this module outputs the fixed value set in the MOIFV bit to the MOSI bit. 0: MOSI output value equals final data from previous transfer 1: MOSI output value equals the value set in the MOIFV bit
4	MOIFV	0	R/W	MOSI Idle Fixed Value If the MOIFE bit is 1 in master mode, this module, according to MOIFV bit settings, determines the MOSI signal value during the SSL negation period (including the SSL retention period during a burst transfer). 0: MOSI Idle fixed value equals 0 1: MOSI Idle fixed value equals 1
3 to 1	—	All 0	R	Reserved The write value should always be 0. Otherwise, operation cannot be guaranteed.

Bit	Bit Name	Initial Value	R/W	Description
0	SPLP	0	R/W	<p>Loopback</p> <p>When the SPLP bit is set to 1, this module shuts off the path between the MISO pin and the shift register, and between the MOSI pin and the shift register, and connects (reverses) the input path and the output path for the shift register.</p> <p>0: Normal mode 1: Loopback mode</p>

16.3.4 Status Register (SPSR)

SPSR indicates the operating status.

Bit:	7	6	5	4	3	2	1	0
	SPRF	TEND	SPTEF	—	—	MODF	—	OVRF
Initial value:	0	1	1	0	0	0	0	0

4, 3	—	All 0	R	<p>Reserved</p> <p>The write value should always be 0. Otherwise, operation cannot be guaranteed.</p>

Bit	Bit Name	Initial Value	R/W	Description
2	MODF	0	R/(W)*	<p>Mode Fault Error Flag</p> <p>Indicates the occurrence of a mode fault error. If the MODFEN bit is set to 1 when this module is in slave mode and the SSL pin is negated before the RSPCK cycle necessary for data transfer ends, this module detects a mode fault error. The active level of the SSL signal is determined by the SSL0P bit in the slave select polarity register (SSLP).</p> <p>[Clearing conditions]</p> <ul style="list-style-type: none"> • SPSR is read when the MODF bit is 1, and then 0 is written to the MODF bit. • Power-on reset <p>0: No mode fault error occurred 1: A mode fault error occurred</p> <p>Note: This bit is valid only in SPI slave mode.</p>
1	—	0	R	<p>Reserved</p> <p>The write value should always be 0. Otherwise, operation cannot be guaranteed.</p>
0	OVRF	0	R/(W)*	<p>Overrun Error Flag</p> <p>Indicates the occurrence of an overrun error. If a serial transfer ends when there is not enough space for receiving the specified length of data in the receive buffer (SPRX), this module detects an overrun error, and sets the OVRF bit to 1.</p> <p>[Clearing conditions]</p> <ul style="list-style-type: none"> • SPSR is read when the OVRF bit is 1, and then 0 is written to the OVRF bit. • Power-on reset <p>0: No overrun error occurred 1: An overrun error occurred</p> <p>Note: This bit is valid only in SPI slave mode.</p>

Note: * Only 0 can be written to clear the flag after reading 1.

16.3.5 Data Register (SPDR)

SPDR is a buffer that holds data for transmission and reception.

The transmit buffer (SPTX) and receive buffer (SPRX) are independent and are mapped to SPDR.

SPDR should be read or written to in byte, word, or longword units according to the access width specification bit (SPLW) in the data control register (SPDCR).

The bit length to be used is determined by the data length specification bits (SPB3 to SPB0) in the command register (SPCMD).

When data is written to SPDR, the data will be written to the transmit buffer from SPDR if the transmit buffer has a space equal to or more than the SPDR access width. If there is not enough space, data will not be written to the transmit buffer. Even if an attempt is made to write data to the buffer, the data is ignored.

When data is read from SPDR, receive data in the receive buffer will be read. If SPDR is read when there is no receive data in the receive buffer, the read value is undefined.

When SPDR is written to with the longword-, word-, or byte-access width, the transmit data should be written to the following bits. If data is written to the other bits, the data is not guaranteed.

- Longword: Bits 31 to 0
- Word: Bits 31 to 16
- Byte: Bits 31 to 24

When SPDR is read with the longword-, word-, or byte-access width, the receive data should be read from the following bits. If data is read from the other bits, the data is not guaranteed.

- Longword: Bits 31 to 0
- Word: Bits 31 to 16
- Byte: Bits 31 to 24

16.3.6 Sequence Control Register (SPSCR)

SPSCR sets the sequence controlled method when this module operates in master mode. If the contents of SPSCR are changed while the MSTR and SPE bits in the control register (SPCR) are 1 with the function of this module enabled in master mode, the subsequent operation cannot be guaranteed.

Bit:	7	6	5	4	3	2	1	0

11:	4	0 → 1 → 2 → 3 → 0 → ...																	

16.3.7 Sequence Status Register (SPSSR)

SPSSR indicates the sequence control status when this module operates in master mode.

Bit:	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	SPCP1	SPCP0
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7 to 2	—	All 0	R	Reserved The write value should always be 0. Otherwise, operation cannot be guaranteed.
1	SPCP1	0	R	Command Pointer
0	SPCP0	0	R	During sequence control, these bits indicate one of the command registers 0 to 3 (SPCMD0 to SPCMD3) that is currently pointed to by the pointer. The relationship between the setting of SPCP1 and SPCP0 and SPCMD0 to SPCMD3 is shown below. For the sequence control, see section 16.4.8 (1) (c), Sequence Control. 00: SPCMD0 01: SPCMD1 10: SPCMD2 11: SPCMD3

16.3.8 Bit Rate Register (SPBR)

SPBR sets the bit rate in master mode. If the contents of SPBR are changed while the MSTR and SPE bits in the control register (SPCR) are 1 with the function of this module enabled in master mode, the subsequent operation cannot be guaranteed.

Bit:	7	6	5	4	3	2	1	0
	SPR7	SPR6	SPR5	SPR4	SPR3	SPR2	SPR1	SPR0
Initial value:	1	1	1	1	1	1	1	1
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

When this module is used in slave mode, the bit rate depends on the bit rate of the input clock regardless of the settings of SPBR and BRDV.

The bit rate is determined by combinations of SPBR settings and the bit settings in the BRDV1 and BRDV0 bits in the command registers (SPCMD0 to SPCMD3). The equation for calculating the bit rate is given below. In the equation, n denotes an SPBR setting (0, 1, 2, ..., 255), and N denotes bit settings in the bits BRDV1 and BRDV0 (0, 1, 2, 3).

$$\text{Bit rate} = \frac{f(B\phi)}{2 \times (n + 1) \times 2^N}$$

Table 16.3 shows examples of the relationship between the SPBR register and BRDV1 and BRDV0 bit settings.

Table 16.3 Relationship between SPBR and BRDV1 and BRDV0 Settings

SPBR (n)	BRDV[1:0] (N)	Division Ratio	Bit Rate		
			B ϕ = 40 MHz	B ϕ = 48 MHz	B ϕ = 72 MHz
0	0	2	20.0 Mbps	24.0 Mbps	36.0 Mbps
1	0	4	10.0 Mbps	12.0 Mbps	18.0 Mbps
2	0	6	6.67 Mbps	8.00 Mbps	12.0 Mbps
3	0	8	5.00 Mbps	6.00 Mbps	9.0 Mbps
4	0	10	4.00 Mbps	4.80 Mbps	7.2 Mbps
5	0	12	3.33 Mbps	6.67 Mbps	6.0 Mbps
5	1	24	1.67 Mbps	2.00 Mbps	3.0 Mbps
5	2	48	833 kbps	1.00 Mbps	1.5 Mbps
5	3	96	417 kbps	500 kbps	750 kbps
255	3	4096	9.77 kbps	11.72 kbps	17.58 kbps

16.3.9 Data Control Register (SPDCR)

SPDCR selects the width to access SPDR from longword-, word-, and byte-width, and enables or disables dummy data transmission for the master mode operation.

If the contents of bits other than the TXDMY of SPDCR are changed while bit TEND in the status register (SPSR) indicates that transmission is not completed, the subsequent operation cannot be guaranteed.

Bit:	7	6	5	4	3	2	1	0
	TXDMY	SPLW1	SPLW0	—	—	—	—	—
Initial value:	0	0	1	0	0	0	0	0
R/W:	R/W	R/W	R/W	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7	TXDMY	0	R/W	<p>Dummy Data Transmission Enable</p> <p>Enables or disables dummy data transmission.</p> <p>When communication is performed with this bit set to 1, dummy data is transmitted from the MOSI pin and a serial communication can be performed even if there is no transmit data in the transmit buffer.</p> <p>Specifically, if there is no transmit data in the transmit buffer and this bit is set to 1, dummy data is transferred to the shift register. Data previously transmitted from the pin is used as dummy data. If this bit is set to 1 after the initialization and a transfer is performed, the transmitted dummy data is undefined.</p> <p>0: Disables dummy data transmission.</p> <p>1: Enables dummy data transmission.</p> <p>Note: This bit is valid only in the master mode.</p>

Bit	Bit Name	Initial Value	R/W	Description
6	SPLW1	0	R/W	Access Width Specification
5	SPLW0	1	R/W	Specifies the width for accessing the data register (SPDR). If the length of data transferred to SPDR does not agree with these bit settings, operation is not guaranteed. 00: Setting prohibited 01: SPDR is accessed in bytes. 10: SPDR is accessed in words. 1:1 SPDR is accessed in longwords.
4 to 0	—	All 0	R	Reserved The write value should always be 0. Otherwise, operation cannot be guaranteed.

16.3.10 Clock Delay Register (SPCKD)

SPCKD sets a period from the beginning of SSL signal assertion to RSPCK oscillation (RSPCK delay) when the SCKDEN bit in the command register (SPCMD) is 1. If the contents of SPCKD are changed while the MSTR and SPE bits in the control register (SPCR) are 1 with the function of this module enabled in master mode, the subsequent operation cannot be guaranteed.

When using this module in slave mode, set B'000 to SCKDL2 to SCKDL0.

Bit:	7	6	5	4	3	2	1	0
	—	—	—	—	—	SCK DL2	SCK DL1	SCK DL0
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7 to 3	—	All 0	R	Reserved The write value should always be 0. Otherwise, operation cannot be guaranteed.
2	SCKDL2	0	R/W	RSPCK Delay Setting
1	SCKDL1	0	R/W	These bits set an RSPCK delay value when the SCKDEN bit in SPCMD is 1.
0	SCKDL0	0	R/W	The relationship between the setting of SCKDL2 to SCKDL0 and the RSPCK delay value is shown below. 000: 1 RSPCK 001: 2 RSPCK 010: 3 RSPCK 011: 4 RSPCK 100: 5 RSPCK 101: 6 RSPCK 110: 7 RSPCK 111: 8 RSPCK

16.3.11 Slave Select Negation Delay Register (SSLND)

SSLND sets a period (SSL negation delay) from the transmission of a final RSPCK edge to the negation of the SSL signal during a serial transfer by this module in master mode. If the contents of SSLND are changed while the MSTR and SPE bits in the control register (SPCR) are 1 with the function of this module enabled in master mode, the subsequent operation cannot be guaranteed.

When using this module in slave mode, set B'000 to SLNDL2 to SLNDL0.

Bit:	7	6	5	4	3	2	1	0
	—	—	—	—	—	SLN DL2	SLN DL1	SLN DL0
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7 to 3	—	All 0	R	Reserved The write value should always be 0. Otherwise, operation cannot be guaranteed.
2	SLNDL2	0	R/W	SSL Negation Delay Setting
1	SLNDL1	0	R/W	These bits set an SSL negation delay when the SLNDEN bit in SPCMD is 1.
0	SLNDL0	0	R/W	The relationship between the setting of SLNDL2 to SLNDL0 and the SSL negation delay value is shown below. 000: 1 RSPCK 001: 2 RSPCK 010: 3 RSPCK 011: 4 RSPCK 100: 5 RSPCK 101: 6 RSPCK 110: 7 RSPCK 111: 8 RSPCK

16.3.12 Next-Access Delay Register (SPND)

SPND sets a non-active period (next-access delay) after termination of a serial transfer when the SPNDEN bit in the command register (SPCMD) is 1. If the contents of SPND are changed while the MSTR and SPE bits in the control register (SPCR) are 1 with the function of this module enabled in master mode, the subsequent operation cannot be guaranteed.

When using this module in slave mode, set B'000 to SPNDL2 to SPNDL0.

Bit:	7	6	5	4	3	2	1	0
	—	—	—	—	—	SPN DL2	SPN DL1	SPN DL0
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7 to 3	—	All 0	R	Reserved The write value should always be 0. Otherwise, operation cannot be guaranteed.
2	SPNDL2	0	R/W	Next-Access Delay Setting
1	SPNDL1	0	R/W	These bits set a next-access delay when the SPNDEN bit in SPCMD is 1.
0	SPNDL0	0	R/W	The relationship between the setting of SPNDL2 to SPNDL0 and the next-access delay value is shown below. 000: 1 RSPCK + 2 B ϕ 001: 2 RSPCK + 2 B ϕ 010: 3 RSPCK + 2 B ϕ 011: 4 RSPCK + 2 B ϕ 100: 5 RSPCK + 2 B ϕ 101: 6 RSPCK + 2 B ϕ 110: 7 RSPCK + 2 B ϕ 111: 8 RSPCK + 2 B ϕ

16.3.13 Command Register (SPCMD)

Each channel has four command registers (SPCMD0 to SPCMD3). SPCMD0 to SPCMD3 are used to set a transfer format for master mode operation. Some of the bits in SPCMD0 are used to set a transfer mode for slave mode operation. In master mode, this module sequentially references SPCMD0 to SPCMD3 according to the settings in bits SPSLN1 and SPSLN0 in the sequence control register (SPSCR), and executes the serial transfer that is set in the referenced SPCMD.

While bit TEND in the status register (SPSR) indicates that transmission is not completed, correct operation of this module cannot be guaranteed if SPCMD is changed that is referred by this module. SPCMD referenced by this module in master mode can be checked by means of bits SPCP1 and SPCP0 in the sequence status register (SPSSR). When the function of this module in master mode is enabled, operation cannot be guaranteed if the value set in SPCMD0 is changed.

Bit:	15	14	13	12	11	10	9	8
	SCK DEN	SLN DEN	SPN DEN	LSBF	SPB3	SPB2	SPB1	SPB0

Bit	Bit Name	Initial Value	R/W	Description
15	SCKDEN	0	R/W	<p>RSPCK Delay Setting Enable</p> <p>Sets the period from the point this module in master mode activates the SSL signal until the RSPCK starts oscillation (RSPCK delay). If the SCKDEN bit is 0, this module sets the RSPCK delay to 1 RSPCK. If the SCKDEN bit is 1, this module starts the oscillation of RSPCK at an RSPCK delay in compliance with the clock delay register (SPCKD) settings.</p> <p>To use this module in slave mode, the SCKDEN bit should be set to 0.</p> <p>0: An RSPCK delay of 1 RSPCK 1: An RSPCK delay equal to SPCKD settings.</p>

Bit	Bit Name	Initial Value	R/W	Description
14	SLNDEN	0	R/W	<p>SSL Negation Delay Setting Enable</p> <p>Sets the period from the point this module in master mode stops RSPCK oscillation until this module sets the SSL signal inactive (SSL negation delay). If the SLNDEN bit is 0, this module sets the SSL negation delay to 1 RSPCK. If the SLNDEN bit is 1, this module negates the SSL signal at an SSL negation delay in compliance with the slave select negation delay register (SSLND) settings.</p> <p>To use this module in slave mode, the SLNDEN bit should be set to 0.</p> <p>0: An SSL negation delay of 1 RSPCK 1: An SSL negation delay equal to SSLND settings.</p>
13	SPNDEN	0	R/W	<p>Next-Access Delay Enable</p> <p>Sets the period from the point this module in master mode terminates a serial transfer and sets the SSL signal inactive until this module enables the SSL signal assertion for the next access (next-access delay). If the SPNDEN bit is 0, this module sets the next-access delay to $1 \text{ RSPCK} + 2B\phi$. If the SPNDEN bit is 1, this module inserts a next-access delay in compliance with the next-access delay register (SPND) settings.</p> <p>To use this module in slave mode, the SPNDEN bit should be set to 0.</p> <p>0: A next-access delay of $1 \text{ RSPCK} + 2 B\phi$ 1: A next-access delay equal to SPND settings.</p>

Bit	Bit Name	Initial Value	R/W	Description
12	LSBF	0	R/W	<p>LSB First</p> <p>Sets the data format in master mode or slave mode to MSB first or LSB first.</p> <p>0: MSB first</p> <p>1: LSB first</p>
11	SPB3	0	R/W	Data Length Setting
10	SPB2	1	R/W	These bits set a transfer data length in master mode or slave mode.
9	SPB1	1	R/W	
8	SPB0	1	R/W	
				<p>0100 to 0111: 8 bits</p> <p>1111: 16 bits</p> <p>0010, 0011: 32 bits</p> <p>Others: Setting prohibited</p>
7	SSLKP	0	R/W	<p>SSL Signal Level Keeping</p> <p>When this module in master mode performs a serial transfer, this bit specifies whether the SSL signal level for the current command is to be kept or negated between the SSL negation timing associated with the current command and the SSL assertion timing associated with the next command.</p> <p>To use this module in slave mode, the SSLKP bit should be set to 0.</p> <p>0: Negates all SSL signals upon completion of transfer.</p> <p>1: Keeps the SSL signal level from the end of the transfer until the beginning of the next access.</p>

Bit	Bit Name	Initial Value	R/W	Description
6 to 4	—	All 0	R	Reserved The write value should always be 0. Otherwise, operation cannot be guaranteed.
3	BRDV1	1	R/W	Bit Rate Division Setting
2	BRDV0	1	R/W	These bits are used to determine the bit rate. A bit rate is determined by combinations of bits BRDV1 and BRDV 0 and the settings in the bit rate register (SPBR) (see section 16.3.8, Bit Rate Register (SPBR)). The settings in SPBR determine the base bit rate. The settings in bits BRDV1 and BRDV0 are used to select a bit rate which is obtained by dividing the base bit rate by 1, 2, 4, or 8. In the bits SPCMD0 to SPCMD3, different BRDV1 and BRDV0 settings can be specified. This permits the execution of serial transfers at a different bit rate for each command. 00: Select the base bit rate 01: Select the base bit rate divided by 2 10: Select the base bit rate divided by 4 11: Select the base bit rate divided by 8

Bit	Bit Name	Initial Value	R/W	Description
1	CPOL	0	R/W	<p>RSPCK Polarity Setting</p> <p>Sets an RSPCK polarity in master or slave mode. When data communication is performed between the Renesas serial peripheral interface module and the other modules, the same RSPCK polarity should be set for both modules.</p> <p>0: RSPCK = 0 when idle 1: RSPCK = 1 when idle</p>
0	CPHA	1	R/W	<p>RSPCK Phase Setting</p> <p>Sets an RSPCK phase in master or slave mode. When data communication is performed between the Renesas serial peripheral interface module and the other modules, the same RSPCK phase should be set for both modules.</p> <p>0: Data sampling on odd edge, data variation on even edge 1: Data variation on odd edge, data sampling on even edge</p>

16.3.14 Buffer Control Register (SPBFCR)

SPBFCR resets the number of data units in the transmit buffer (SPTX) or receive buffer (SPRX) and sets the number of triggering data units.

Bit:	7	6	5	4	3	2	1	0
	TXRST	RXRST	TXTRG[1:0]	—	RXTRG[2:0]			
Initial value:	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7	TXRST	0	R/W	Transmit Buffer Data Reset Resets the transmit buffer to an empty state. Transmit data in the transmit buffer becomes invalid when this bit is set to 1. 0: Disables the reset operation*. 1: Enables the reset operation Note: The reset operation is performed after a power-on reset.
6	RXRST	0	R/W	Receive Buffer Data Reset Resets the receive buffer to an empty state. Receive data in the receive buffer becomes invalid when this bit is set to 1. 0: Disables the reset operation*. 1: Enables the reset operation Note: The reset operation is performed after a power-on reset.

Bit	Bit Name	Initial Value	R/W	Description
5, 4	TXTRG[1:0]	00	R/W	<p>Transmit Buffer Data Triggering Number</p> <p>Specifies the timing at which the transmit buffer empty state is determined, that is when the SPTEF flag in the status register is set. When the number of bytes of data in the transmit buffer (SPTX) is equal to or less than the specified triggering number, the SPTEF flag is set to 1.</p> <p>00: 7 bytes (1)* 01: 6 bytes (2)* 10: 4 bytes (4)* 11: 0 bytes (8)*</p> <p>Note: The value in the parenthesis shows the number of available bytes in the transmit buffer (SPTX).</p>
3	—	0	R	<p>Reserved</p> <p>The write value should always be 0. Otherwise, operation cannot be guaranteed.</p>
2 to 0	RXTRG[2:0]	000	R/W	<p>Receive Buffer Data Triggering Number</p> <p>Specifies the timing at which the receive buffer full state is determined, that is when the SPRF flag in the status register is set. When the number of bytes of data in the receive buffer (SPRX) is equal to or greater than the specified triggering number, the SPRF flag is set to 1.</p> <p>000: 1 byte (31)* 001: 2 bytes (30)* 010: 4 bytes (28)* 011: 8 bytes (24)* 100: 16 bytes (16)* 101: 24 bytes (8)* 110: 32 bytes (0)* 111: 5 bytes (27)*</p> <p>Note: * The value in the parenthesis shows the number of available bytes in the receive buffer (SPRX).</p>

16.3.15 Buffer Data Count Setting Register (SPBFDR)

SPBFDR indicates the number of data units stored in the transmit buffer (SPTX) and receive buffer (SPRX). The upper eight bits indicate the number of transmit data units in SPTX and the lower eight bits indicate the number of receive data units in SPRX.

Bit:	15	14	13	12	11	10	9	8
	—	—	—	—	T[3:0]			
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R
Bit:	7	6	5	4	3	2	1	0
	—	—	R[5:0]					
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15 to 12	—	All 0	R	Reserved The write value should always be 0. Otherwise, operation cannot be guaranteed.
11 to 8	T[3:0]	0000	R/W	Indicates the number of bytes of data to be transmitted in SPTX. B'0000 indicates that SPTX is empty. B'1000 indicates that SPTX is full.
7, 6	—	All 0	R	Reserved The write value should always be 0. Otherwise, operation cannot be guaranteed.
5 to 0	R[5:0]	000000	R/W	Shows the number of bytes of received data in SPRX. B'000000 indicates that SPRX is empty. B'100000 indicates that SPRX is full.

16.4 Operation

In this section, the serial transfer period means a period from the beginning of driving valid data to the fetching of the final valid data.

16.4.1 Overview of Operations

This module is capable of serial transfers in slave mode and master mode. A particular mode of this module can be selected by using the MSTR bit in the control register (SPCR). Table 16.4 gives the relationship between the modes and SPCR settings, and a description of each mode.

Table 16.4 Relationship between Modes and SPCR and Description of Each Mode

Mode	Slave (SPI Operation)	Master (SPI Operation)
MSTR bit setting	0	1
MODFEN bit setting	0 or 1	0
RSPCK signal	Input	Output
MOSI signal	Input	Output
MISO signal	Output/Hi-Z	Input
SSL signal	Input	Output
SSL polarity modification function	Supported	Supported
Transfer rate	Up to $B\phi/8$	Up to $B\phi/2$
Clock source	RSPCK input	On-chip baud rate generator
Clock polarity	Two	Two
Clock phase	Two	Two
First transfer bit	MSB/LSB	MSB/LSB
Transfer data length	8 to 32 bits	8 to 32 bits
Burst transfer	Possible (CPHA = 1)	Possible (CPHA = 0,1)
RSPCK delay control	Not supported	Supported
SSL negation delay control	Not supported	Supported
Next-access delay control	Not supported	Supported
Transfer activation method	SSL input active or RSPCK oscillation	Transmit buffer is written when SPE = 1
Sequence control	Not supported	Supported

Mode	Slave (SPI Operation)	Master (SPI Operation)
Transmit buffer empty detection	Supported	Supported
Receive buffer full detection	Supported	Supported
Overrun error detection	Supported	Not Supported
Mode fault error detection	Supported (MODFEN = 1)	Not supported

16.4.2 Pin Control

According to the MSTR bit in the control register (SPCR), this module can automatically switch pin directions and output modes. Table 16.5 shows the relationship between pin states and bit settings.

Table 16.5 Relationship between Pin States and Bit Settings

Mode	Pin	Pin State* ¹
Master mode (SPI operation) (MSTR = 1)	RSPCK	CMOS output
	SSL	CMOS output
	MOSI	CMOS output
	MISO	Input
Slave mode (SPI operation) (MSTR = 0)	RSPCK	Input
	SSL	Input
	MOSI	Input
	MISO*	CMOS output/Hi-Z

Note: When SSL is at the non-active level or the SPE bit in SPCR is clear to 0, the pin state is Hi-Z.

This module in master mode (SPI operation) determines MOSI signal values during the SSL negation period (including the SSL retention period during a burst transfer) according to MOIFE and MOIFV bit settings in SPPCR, as shown in table 16.6.

Table 16.6 MOSI Signal Value Determination during SSL Negation Period

MOIFE	MOIFV	MOSI Signal Value during SSL Negation Period
0	0, 1	Final data from previous transfer
1	0	Always 0
1	1	Always 1

16.4.3 System Configuration Example

(1) Master/Slave (with This LSI Acting as Master)

Figure 16.2 shows a master/slave system configuration example when this LSI is used as a master. In master/slave configuration, the SSL output of this LSI (master) is not used. The SSL input of the slave is fixed to the low level, and the slave is always maintained in a selected state. In the transfer format corresponding to the case where the CPHA bit in the control register (SPCR) is 0, there are slave devices for which the SSL signal cannot be fixed to the active level. In situations where the SSL signal cannot be fixed, the SSL output of this LSI should be connected to the SSL input of the slave device.

This LSI (master) always drives the RSPCK and MOSI. The slave always drives the MISO.

Figure 16.2 Master/Slave Configuration Example (This LSI = Master)

(2) Master/Slave (with This LSI Acting as Slave)

Figure 16.3 shows a master/slave system configuration example when this LSI is used as a slave. When this LSI is to operate as a slave, the SSL pin is used as SSL input. The master always drives the RSPCK and MOSI. This LSI (slave) always drives the MISO. When SSL is at the non-active level, the pin state is Hi-Z.

In the slave configuration in which the CPHA bit in the command register (SPCMD) is set to 1, the SSL input of this LSI (slave) is fixed to the 0 level, this LSI (slave) is always maintained in a selected state, and in this manner it is possible to execute serial transfer (figure 16.4).

Figure 16.3 Master/Slave Configuration Example (This LSI = Slave)

Figure 16.4 Master/Slave Configuration Example (This LSI = Slave, CPHA = 1)

(3) Master/Multi-Slave (with This LSI Acting as Slave)

Figure 16.5 shows a master/multi-slave system configuration example when this LSI is used as a slave. In the example of figure 16.5, the system is comprised of an master and two LSIs (slave X and slave Y).

The RSPCK and MOSI outputs of the master are connected to the RSPCK and MOSI inputs of the LSIs (slave X and slave Y). The MISO outputs of the LSIs (slave X and slave Y) are all connected to the MISO input of the master. SSLX and SSLY outputs of the master are connected to the SSL inputs of the LSIs (slave X and slave Y), respectively.

The master always drives RSPCK, MOSI, SSLX, and SSLY. Of the LSIs (slave X and slave Y), the slave that receives low level input into the SSL0 input drives MISO.

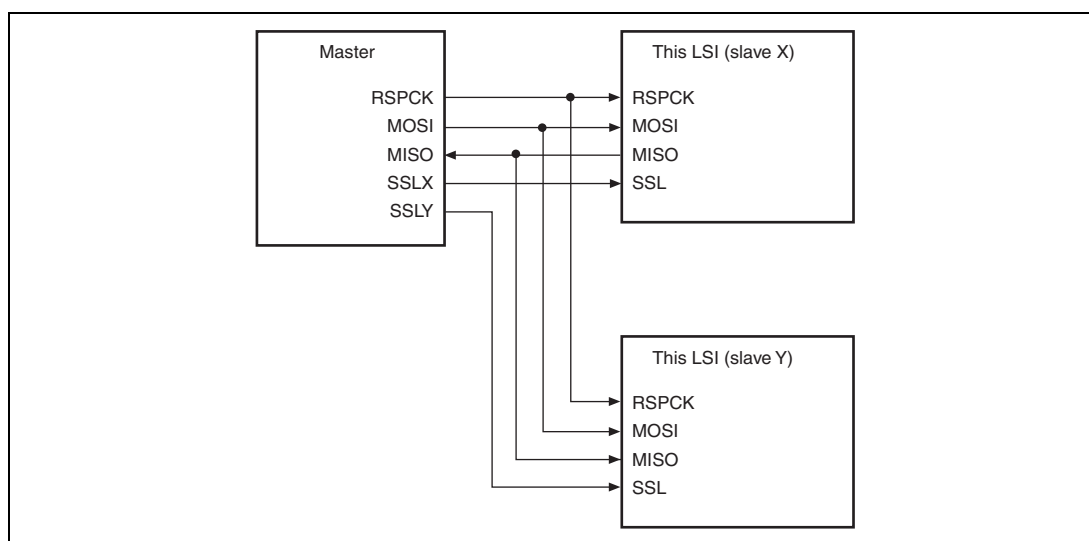

Figure 16.5 Master/Multi-Slave Configuration Example (This LSI = Slave)

16.4.4 Transfer Format

(1) CPHA = 0

Figure 16.6 shows a sample transfer format for the serial transfer of 8-bit data when the CPHA bit in the command register (SPCMD) is 0. In figure 16.6, RSPCK (CPOL = 0) indicates the RSPCK signal waveform when the CPOL bit in SPCMD is 0; RSPCK (CPOL = 1) indicates the RSPCK signal waveform when the CPOL bit is 1. The sampling timing represents the timing at which this module fetches serial transfer data into the shift register. The input/output directions of the signals depend on the settings of this module. For details, see section 16.4.2, Pin Control.

When the CPHA bit is 0, the driving of valid data to the MOSI and MISO signals commences at an SSL signal assertion timing. The first RSPCK signal change timing that occurs after the SSL signal assertion becomes the first transfer data fetching timing. After this timing, data is sampled at every 1 RSPCK cycle. The change timing for MOSI and MISO signals is always 1/2 RSPCK cycle after the transfer data fetch timing. The settings in the CPOL bit do not affect the RSPCK signal operation timing; they only affect the signal polarity.

t1 denotes a period from an SSL signal assertion to RSPCK oscillation (RSPCK delay). t2 denotes a period from the cessation of RSPCK oscillation to an SSL signal negation (SSL negation delay). t3 denotes a period in which SSL signal assertion is suppressed for the next transfer after the end of serial transfer (next-access delay). t1, t2, and t3 are controlled by a master device running on the system. For a description of t1, t2, and t3 when this module is in master mode, see section 16.4.3 (1), Master/Slave (with This LSI Acting as Master).

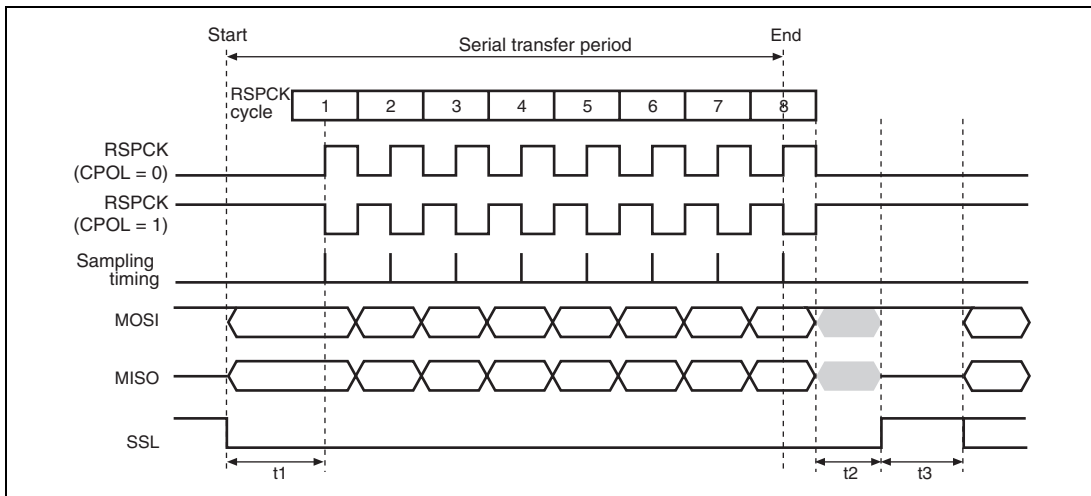

Figure 16.6 Transfer Format (CPHA = 0)

(2) CPHA = 1

Figure 16.7 shows a sample transfer format for the serial transfer of 8-bit data when the CPHA bit in the command register (SPCMD) is 1. In figure 16.7, RSPCK (CPOL = 0) indicates the RSPCK signal waveform when the CPOL bit in SPCMD is 0; RSPCK (CPOL = 1) indicates the RSPCK signal waveform when the CPOL bit is 1. The sampling timing represents the timing at which this module fetches serial transfer data into the shift register. The input/output directions of the signals depend on the modes (master or slave). For details, see section 16.4.2, Pin Control.

When the CPHA bit is 1, the driving of invalid data to the MOSI and MISO signals commences at an SSL signal assertion timing. The driving of valid data to the MOSI and MISO signals commences at the first RSPCK signal change timing that occurs after the SSL signal assertion. After this timing, data is updated at every 1 RSPCK cycle. The transfer data fetch timing is always 1/2 RSPCK cycle after the data update timing. The settings in the CPOL bit do not affect the RSPCK signal operation timing; they only affect the signal polarity.

t_1 , t_2 , and t_3 are the same as those in the case of CPHA = 0. For a description of t_1 , t_2 , and t_3 when this module is in master mode, see section 16.4.3 (1), Master/Slave (with This LSI Acting as Master).

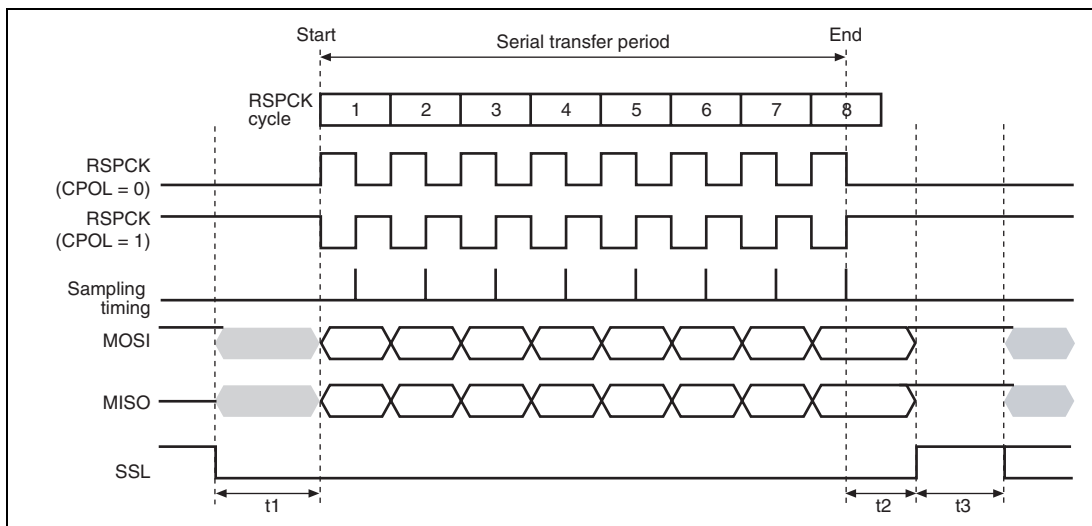

Figure 16.7 Transfer Format (CPHA = 1)

16.4.5 Data Format

The data format depends on the settings in the command register (SPCMD). Irrespective of MSB/LSB first, this module treats the range from the LSB of the data register (SPDR) to the assigned data length as transfer data.

(1) MSB First Transfer (32-Bit Data)

Figure 16.8 shows the operation of the transmit buffer (SPTX) and the shift register when this module performs a 32-bit data length MSB-first data transfer.

The CPU or direct memory access controller writes T31 to T00 to the transmit buffer of SPDR. If the shift register is empty, this module copies the data in the transmit buffer to the shift register, and fully populates the shift register. When serial transfer starts, this module outputs data from the MSB (bit 31) of the shift register, and shifts in the data from the LSB (bit 0) of the shift register. When the RSPCK cycle required for the serial transfer of 32 bits has passed, data R31 to R00 is stored in the shift register. In this state, this module copies the data from the shift register to the receive buffer, and empties the shift register. If the receive buffer does not have a space for the receive data length after the receive data has been copied from the shift register to the receive buffer, another serial transfer will not be started. In order to start another serial transfer, data for the receive data length should be read from the receive buffer to secure the necessary space in the receive buffer.

If another serial transfer is started before the CPU or direct memory access controller writes to the transmit buffer, received data R31 to R00 is shifted out from the shift register.

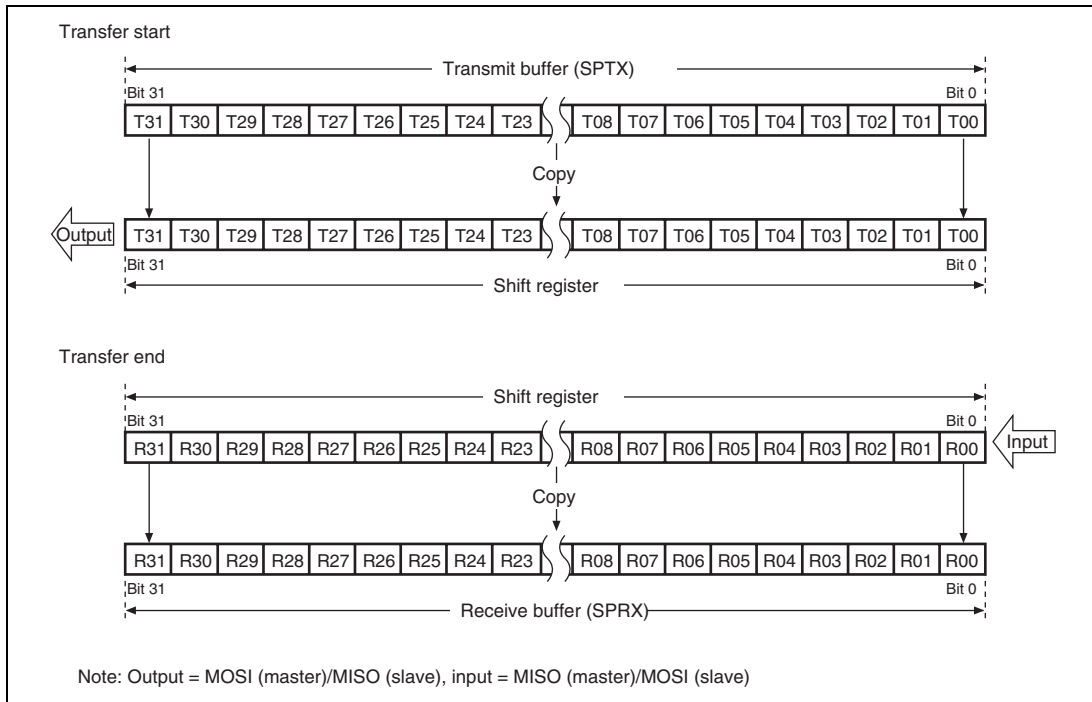

Figure 16.8 MSB First Transfer (32-Bit Data)

(2) MSB First Transfer (16-Bit Data)

Figure 16.9 shows the operation of the transmit buffer (SPTX) and the shift register when this module performs a 16-bit data length MSB-first data transfer.

The CPU or direct memory access controller writes T15 to T00 to the transmit buffer. If the shift register is empty, this module copies the data in the transmit buffer to the shift register, and fully populates the shift register. When serial transfer starts, this module outputs data from bit 15 of the shift register, and shifts in the data from the LSB (bit 0) of the shift register. When the RSPCK cycle required for the serial transfer of 16 bits has passed, received data R15 to R00 is stored in bits 15 to 0 of the shift register. After completion of the serial transfer, data that existed before the transfer is retained in bits 31 to 16 in the shift register. In this state, this module copies the data from the shift register to the receive buffer, and empties the shift register. If the receive buffer does not have a space for the receive data length after receive data has been copied from the shift register to the receive buffer, another serial transfer will not be started. In order to start another serial transfer, data for the receive data length should be read from the receive buffer to secure the necessary space in the receive buffer.

If another serial transfer is started before the CPU or direct memory access controller writes to the transmit buffer, received data R15 to R00 is shifted out from the shift register.

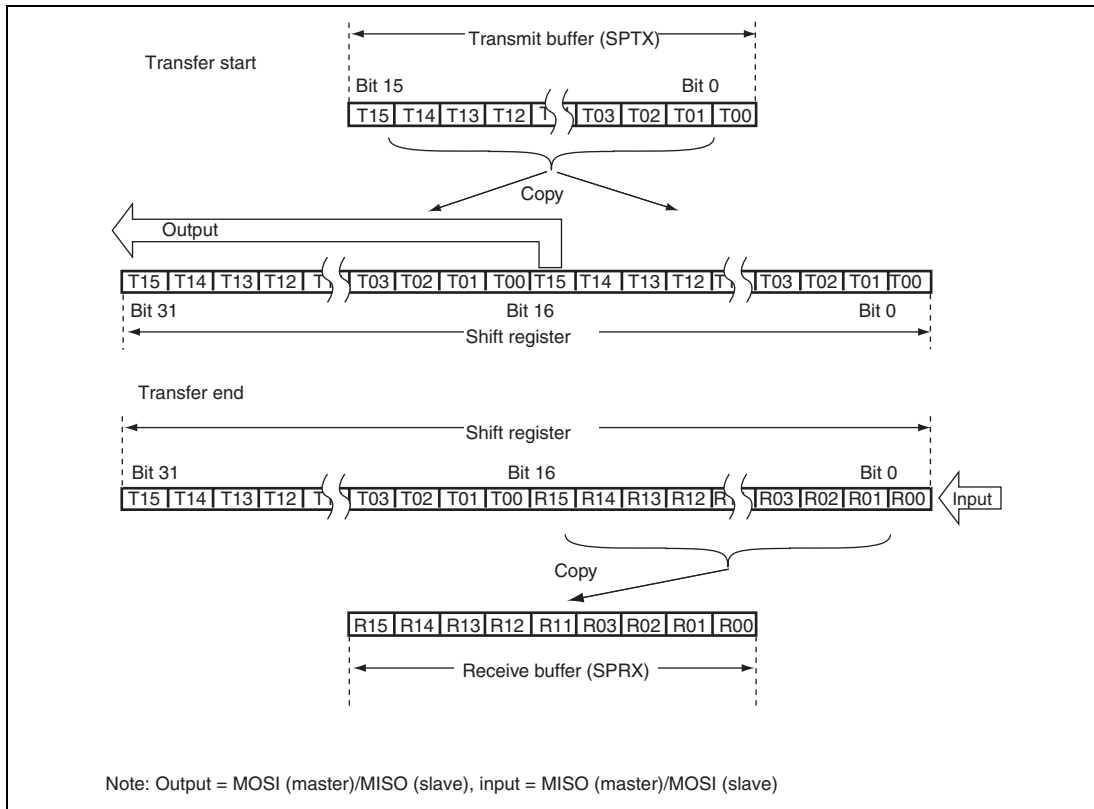

Figure 16.9 MSB First Transfer (16-Bit Data)

(3) MSB First Transfer (8-Bit Data)

Figure 16.10 shows the operation of the transmit buffer (SPDR) and the shift register when this module performs an 8-bit data length MSB-first data transfer.

The CPU or direct memory access controller writes T07 to T00 to the transmit buffer. If the shift register is empty, this module copies the data in the transmit buffer to the shift register, and fully populates the shift register. When serial transfer starts, this module outputs data from bit 7 of the shift register, and shifts in the data from the LSB (bit 0) of the shift register. When the RSPCK cycle required for the serial transfer of 8 bits has passed, received data R07 to R00 is stored in bits 7 to 0 of the shift register. After completion of the serial transfer, data that existed before the transfer is retained in bits 31 to 8 in the shift register. In this state, this module copies the data from the shift register to the receive buffer, and empties the shift register. If the receive buffer does not have a space for the receive data length after receive data has been copied from the shift register to the receive buffer, another serial transfer will not be started. In order to start another serial transfer, data for the receive data length should be read from the receive buffer to secure the necessary area in the receive buffer.

If another serial transfer is started before the CPU or direct memory access controller writes to the transmit buffer, received data R07 to R00 is shifted out from the shift register.

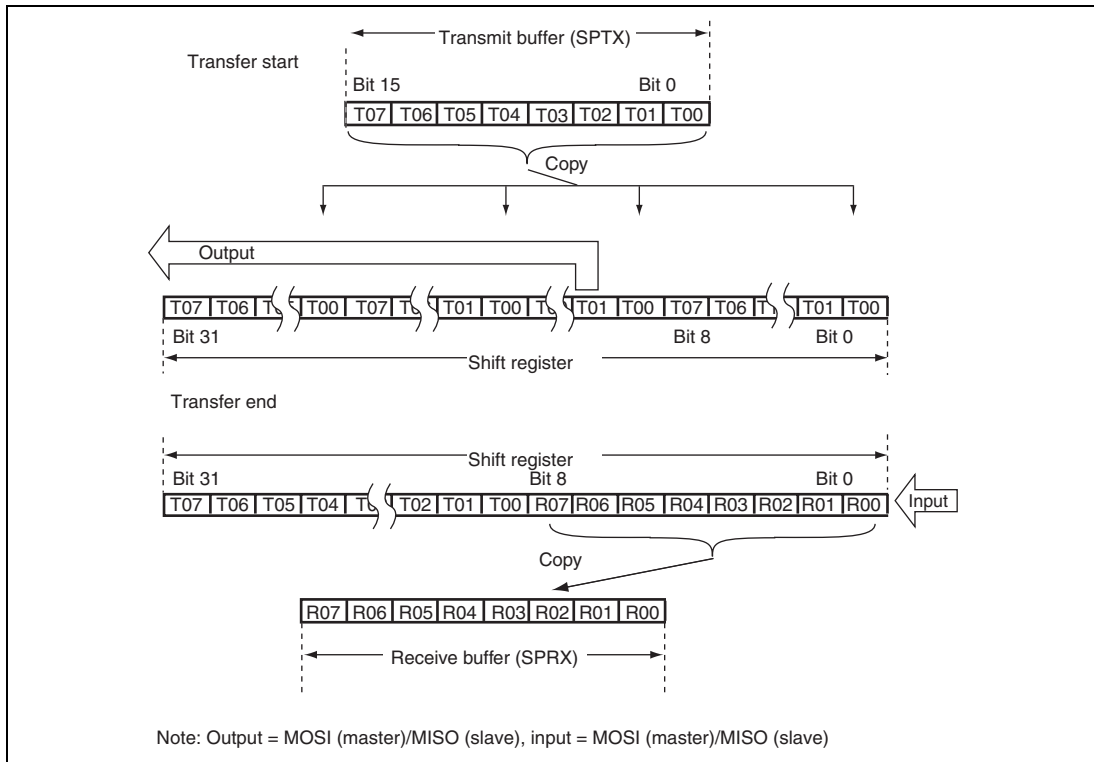

Figure 16.10 MSB First Transfer (8-Bit Data)

(4) LSB First Transfer (32-Bit Data)

Figure 16.11 shows the operation of the transmit buffer (SPTX) and the shift register when this module performs a 32-bit data length LSB-first data transfer.

The CPU or direct memory access controller writes T31 to T00 to the transmit buffer. If the shift register is empty, this module reverses the order of the bits of the data in the transmit buffer, copies it to the shift register, and fully populates the shift register. When serial transfer starts, this module outputs data from the MSB (bit 31) of the shift register, and shifts in the data from the LSB (bit 0) of the shift register. When the RSPCK cycle required for the serial transfer of 32 bits has passed, data R00 to R31 is stored in the shift register. In this state, this module copies the data, in which the order of the bits is reversed, from the shift register to the receive buffer, and empties the shift register.

If the receive buffer does not have a space for the receive data length after receive data has been copied from the shift register to the receive buffer, another serial transfer will not be started. In order to start another serial transfer, data for the receive data length should be read from the receive buffer to secure the necessary space in the receive buffer.

If another serial transfer is started before the CPU or direct memory access controller writes to the transmit buffer of the SPDR, received data R00 to R31 is shifted out from the shift register.

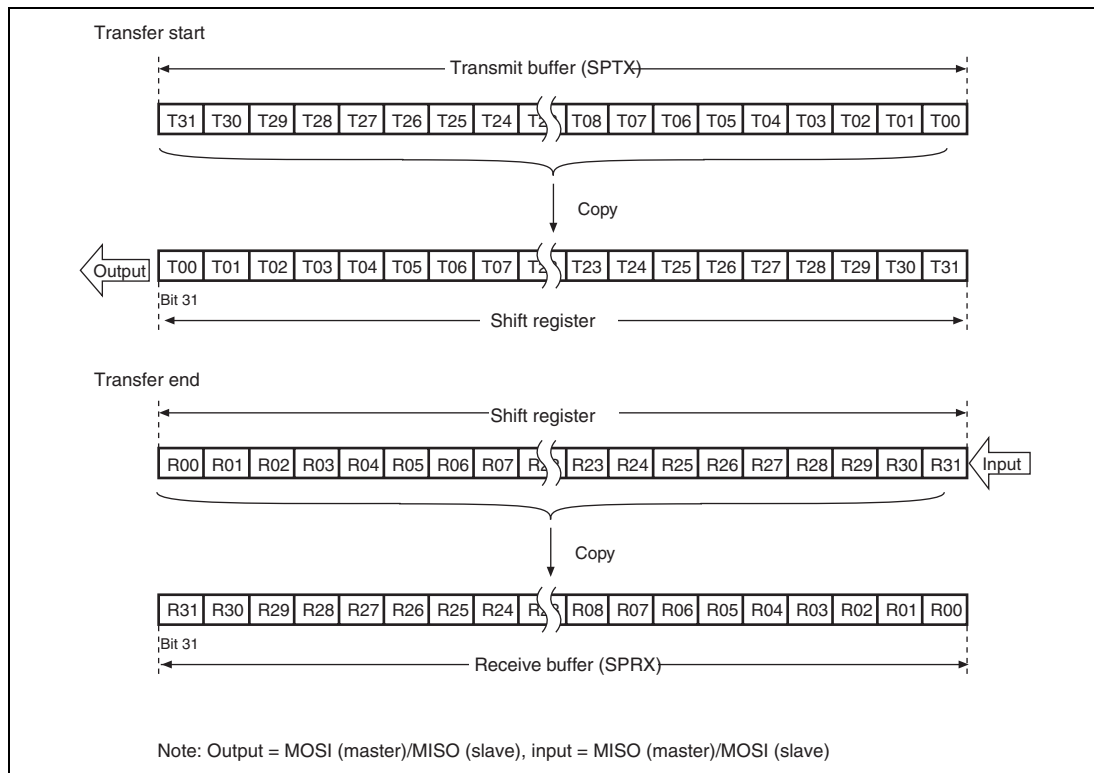

Figure 16.11 LSB First Transfer (32-Bit Data)

(5) LSB First Transfer (16-Bit Data)

Figure 16.12 shows the operation of the transmit buffer (SPTX) and the shift register when this module performs a 16-bit data length LSB-first data transfer.

The CPU or direct memory access controller writes T15 to T00 to the transmit buffer. If the shift register is empty, this module reverses the order of the bits of the data in the transmit buffer, copies it to the shift register, and fully populates the shift register. When serial transfer starts, this module outputs data from the MSB (bit 31) of the shift register, and shifts in the data from bit 16 of the shift register. When the RSPCK cycle required for the serial transfer of 16 bits has passed, received data R00 to R15 is stored in bits 31 to 16 of the shift register. After completion of the serial transfer, data that existed before the transfer is retained in bits 15 to 0 of the shift register. In this state, this module copies the data, in which the order of the bits is reversed, from the shift register to the receive buffer of SPDR, and empties the shift register.

If the receive buffer does not have a space for the receive data length after receive data has been copied from the shift register to the receive buffer, another serial transfer will not be started. In order to start another serial transfer, data for the receive data length should be read from the receive buffer to secure the necessary space in the receive buffer.

If another serial transfer is started before the CPU or direct memory access controller writes to the transmit buffer of SPDR, received data R00 to R15 is shifted out from the shift register.

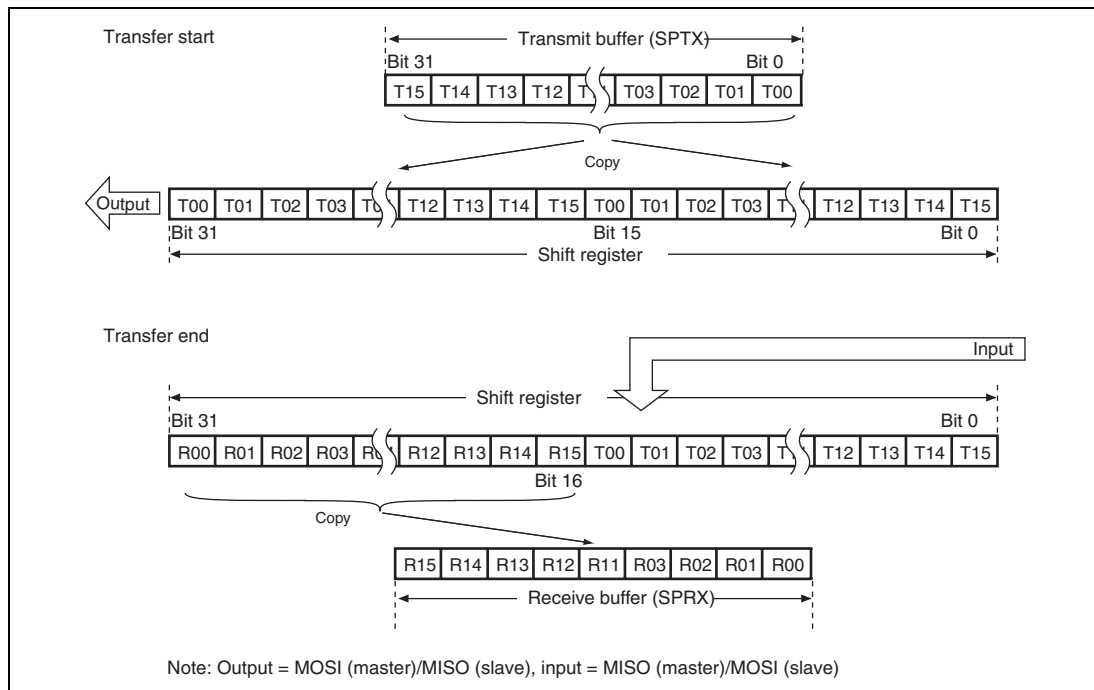

Figure 16.12 LSB First Transfer (16-Bit Data)

(6) LSB First Transfer (8-Bit Data)

Figure 16.13 shows the operation of the transmit buffer (SPTX) and the shift register when this module performs an 8-bit data length LSB-first data transfer.

The CPU or direct memory access controller writes T07 to T00 to the transmit buffer. If the shift register is empty, this module reverses the order of the bits of the data in the transmit buffer, copies it to the shift register, and fully populates the shift register. When serial transfer starts, this module outputs data from the MSB (bit 31) of the shift register, and shifts in the data from bit 24 of the shift register. When the RSPCK cycle required for the serial transfer of 8 bits has passed, received data R00 to R07 is stored in bits 31 to 24 of the shift register. After completion of the serial transfer, data that existed before the transfer is retained in bits 23 to 0 of the shift register. In this state, this module copies the data, in which the order of the bits is reversed, from the shift register to the receive buffer of SPDR, and empties the shift register.

If the receive buffer does not have a space for the receive data length after the receive data has been copied from the shift register to the receive buffer, another serial transfer will not be started. In order to start another serial transfer, data for the receive data length should be read from the receive buffer to secure the necessary space in the receive buffer.

If another serial transfer is started before the CPU or direct memory access controller writes to the transmit buffer of SPDR, received data R00 to R07 is shifted out from the shift register.

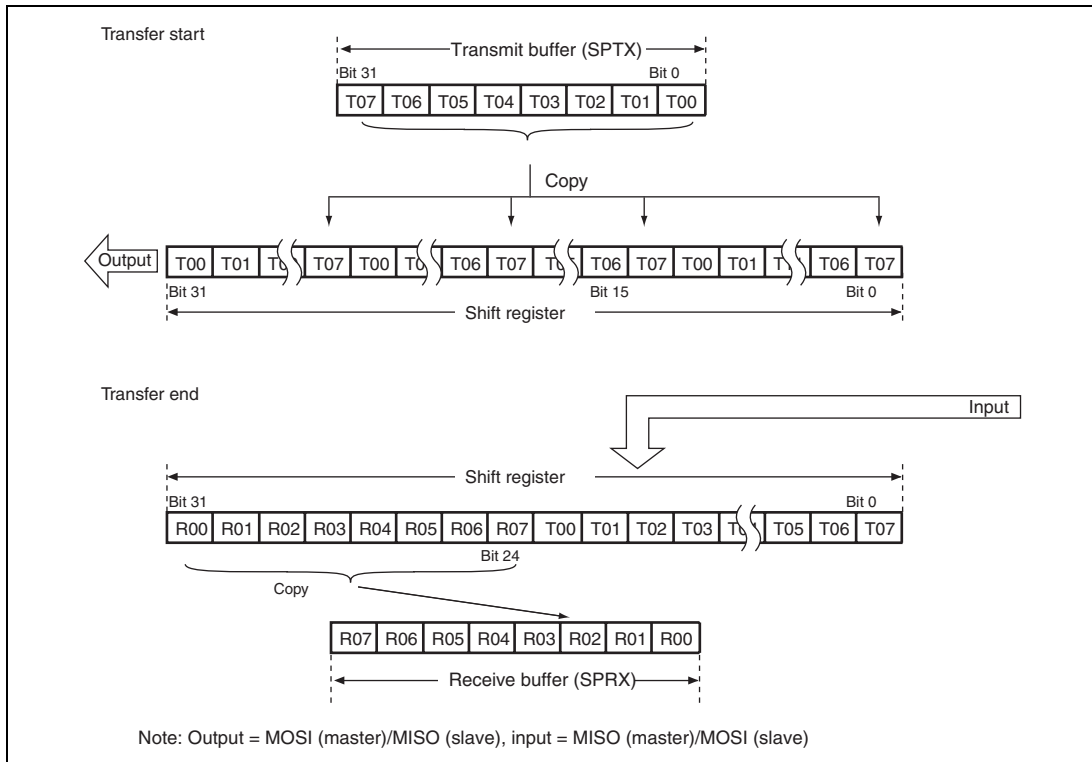

Figure 16.13 LSB First Transfer (8-Bit Data)

16.4.6 Error Detection

In the normal serial transfer, the data written from the data register (SPDR) to the transmit buffer is serially transmitted, and the serially received data can be read from the receive buffer of SPDR. If access is made to SPDR, depending on the status of the transmit buffer/receive buffer or the status at the beginning or end of serial transfer, in some cases non-normal transfers can be executed.

If a non-normal transfer operation occurs, this module detects the event as an overrun error or a mode fault error. Table 16.7 shows the relationship between non-normal transfer operations and the error detection function.

Table 16.7 Relationship between Non-Normal Transfer Operations and Error Detection Function

	Occurrence Condition	Operation	Error Detection
A	SPDR is written when the transmit buffer is full.	Missing write data.	None
B	Serial transfer is started in slave mode when transmit data is still not loaded on the shift register.	Data received in previous serial transfer is serially transmitted.	None
C	SPDR is read when the receive buffer is empty.	The output data is undefined.	None
D	Serial transfer terminates when the receive buffer is full.	Missing serial receive data.	Overrun error (only in slave mode)
E	The SSL input signal is negated during serial transfer in slave mode.	Serial transfer suspended. Missing send/receive data. Operation disabled.	Mode fault error

On operation A shown in table 16.7, this module does not detect an error. Whether SPDR can be written to or not can be checked using the T[3:0] bits in the buffer data count setting register (SPBFDR).

Likewise, this module does not detect an error on operation B. In a serial transfer that was started before the shift register was updated, this module sends the data that was received in the previous serial transfer, and does not treat the operation indicated in B as an error. Note that the received data from the previous serial transfer is retained in the receive buffer of SPDR, thus it can be correctly read.

Similarly, this module does not detect an error on operation C. To prevent extraneous data from being read, the number of receive data units stored in the receive buffer should be read from the R[5:0] bits in the buffer data count setting register (SPBFDR).

An overrun error shown in D is described in section 16.4.6 (1), Overrun Error. A mode fault error shown in E is described in section 16.4.6 (2), Mode Fault Error.

(1) Overrun Error

If serial transfer ends when the receive buffer of the data register (SPDR) is full, this module detects an overrun error, and sets the OVRF bit in SPSR to 1. When the OVRF bit is 1, this module does not copy data from the shift register to the receive buffer so that the data prior to the occurrence of the error is retained in the receive buffer. To reset the OVRF bit in SPSR to 0, either perform a power-on reset, or write a 0 to the OVRF bit after SPSR has been read with the OVRF bit set to 1.

Figure 16.14 shows an example of operation of the SPRF and OVRF bits in SPSR. The SPSR and SPDR accesses shown in figure 16.14 indicates the condition of accesses to SPSR and SPDR, respectively, where I denotes an idle cycle, W a write cycle, and R a read cycle. In the example of figure 16.14, this module performs an 8-bit serial transfer in which the CPHA bit in the command register (SPCMD) is 1, and CPOL is 0. The numbers given under the RSPCK waveform represent the number of RSPCK cycles (i.e., the number of transferred bits).

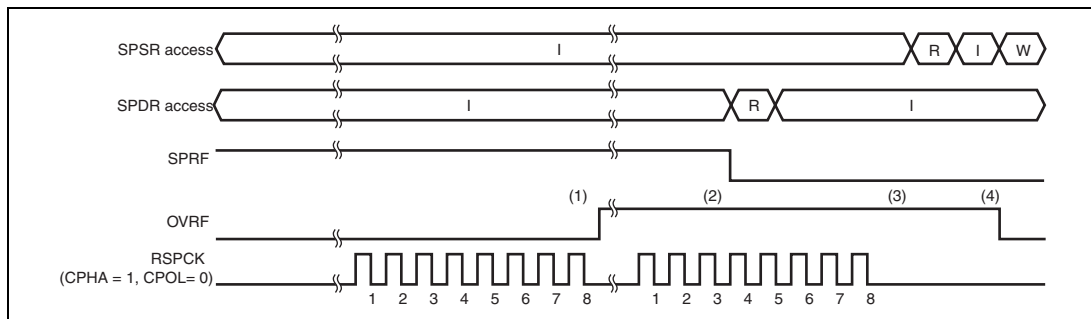

Figure 16.14 SPRF and OVRF Bit Operation Example

The operation of the flags at the timing shown in steps (1) to (4) in the figure is described below.

1. If a serial transfer terminates when the receive buffer does not have a space for the receive data length, this module detects an overrun error, and sets the OVRF bit to 1. This module does not copy the data in the shift register to the receive buffer.
2. The OVRF bit is not cleared even when SPDR is read and thus the number of data bytes in the receive buffer becomes less than the number of the receive buffer data triggering number specified by the RXTRG bits.
3. If the serial transfer terminates in an overrun error state, this module determines that the shift register is empty; in this manner, data transfer is enabled from the transmit buffer to the shift register.
4. If 0 is written to the OVRF bit after SPSR is read with OVRF = 1, this module clears the OVRF bit.

The occurrence of an overrun can be checked either by reading SPSR or by using an error interrupt and reading SPSR. When using an error interrupt, set the SPEIE bit in the control register (SPCR) to 1. When executing a serial transfer without using an error interrupt, measures should be taken to ensure the early detection of overrun errors, such as reading SPSR immediately after SPDR is read.

The OVRF bit is cleared to 0 under the following conditions:

- After SPSR is read in a condition in which the OVRF bit is set to 1, 0 is written to the OVRF bit.
- Power-on reset

Note: When the receive buffer has area enough to store receive data with an overrun error, this module receives receive data.

(2) Mode Fault Error

When the MSTR bit is 0, this module operates in slave mode. This module detects a mode fault error if the SSL input signal is negated during the serial transfer period (from the time the driving of valid data is started to the time the final valid data is fetched) when the MODFEN bit is 1 in slave mode.

Upon detecting a mode fault error, this module stops driving of the output signals and clears the SPE bit in SPCR to 0. When the SPE bit is cleared to 0, the function of this module is disabled and this module stops driving external signals. For details of disabling the function of this module by clearing the SPE bit to 0, see section 16.4.7, Initialization.

The occurrence of a mode fault error can be checked either by reading SPSR or by using an error interrupt and reading SPSR. When using an error interrupt, set the SPEIE bit in the control register (SPCR) to 1. To detect a mode fault error without using an error interrupt, it is necessary to poll SPSR.

When the MODF bit is 1, writing 1 to the SPE bit is ignored. To enable the function of this module after the detection of a mode fault error, the MODF bit must be set to 0. The MODF bit is cleared to 0 under the following conditions:

- After SPSR is read in a condition where the MODF bit has turned 1, 0 is written to the MODF bit.
- Power-on reset

16.4.7 Initialization

If 0 is written to the SPE bit in the control register (SPCR) or this module clears the SPE bit to 0 because of the detection of a mode fault error, this module disables the module function, and initializes a part of the module function. When a power-on reset is generated, this module initializes all of the module function. An explanation follows of initialization by the clearing of the SPE bit and initialization by a power-on reset.

(1) Initialization by Clearing SPE Bit

When the SPE bit in SPCR is cleared, this module performs the following initialization:

- Suspending any serial transfer that is being executed
- Stopping the driving of output signals (Hi-Z) in slave mode
- Initializing the internal state
- Initializing the TEND bit in SPSR

Initialization by the clearing of the SPE bit does not initialize the control bits of this module. For this reason, this module can be started in the same transfer mode as prior to the initialization if the SPE bit is re-set to 1.

16.4.8 SPI Operation

(1) Multi-Master Mode Operation

This section explains the operation in multi-master mode.

(a) Starting Serial Transfer

A serial transfer is started when transmit data is copied from the transmit buffer to the shift register, the shift register becomes full, and the receive buffer has a space for the receive data length. If transmit data has already been written to the shift register, data is not copied from the transmit buffer to the shift register.

For details of the transfer format, see section 16.4.4, Transfer Format.

(b) Terminating Serial Transfer

Irrespective of the CPHA bit in the command register (SPCMD), this module terminates the serial transfer after transmitting an RSPCK edge corresponding to the final sampling timing. After the serial transfer is completed, receive data is copied from the shift register to the receive buffer. If the receive buffer does not have a space for the receive data length after receive data is copied from the shift register to the receive buffer, another serial transfer will not be performed. In order to perform another serial transfer, data for the receive data length should be read from the receive buffer to secure the space for the receive data.

It should be noted that the final sampling timing varies depending on the bit length of transfer data. In master mode, the data length depends on the settings in bits SPB3 to SPB0 in SPCMD. For details on the transfer format, see section 16.4.4, Transfer Format.

(c) Sequence Control

The transfer format that is employed in master mode is determined by the sequence control register (SPSCR), command registers 0 to 3 (SPCMD0 to SPCMD3), the bit rate register (SPBR), the clock delay register (SPCKD), the slave select negation delay register (SSLND), and the next-access delay register (SPND).

SPSCR is a register used to determine the sequence configuration for serial transfers that are executed by this module in master mode. The following items are set in command registers SPCMD0 to SPCMD3: SSL output signal value, MSB/LSB first, data length, some of the bit rate settings, RSPCK polarity/phase, whether SPCKD is to be referenced, whether SSLND is to be referenced, and whether SPND is to be referenced. SPBR holds some of the bit rate settings; SPCKD, a clock delay value; SSLND, an SSL negation delay; and SPND, a next-access delay value.

According to the sequence length that is assigned to SPSCR, this module makes up a sequence comprised of a part or all of SPCMD0 to SPCMD3. This module contains a pointer to the SPCMD that makes up the sequence. The value of this pointer can be checked by reading bits SPCP1 and SPCP0 in the sequence status register (SPSSR). When the SPE bit in the control register (SPCR) is set to 1 and the function of this module is enabled, this module loads the pointer to the commands in SPCMD0, and incorporates the SPCMD0 settings into the transfer format at the beginning of serial transfer. This module increments the pointer each time the next-access delay period for a data transfer ends. Upon completion of the serial transfer that corresponds to the final command comprising the sequence, this module sets the pointer in SPCMD0, and in this manner the sequence is executed repeatedly.

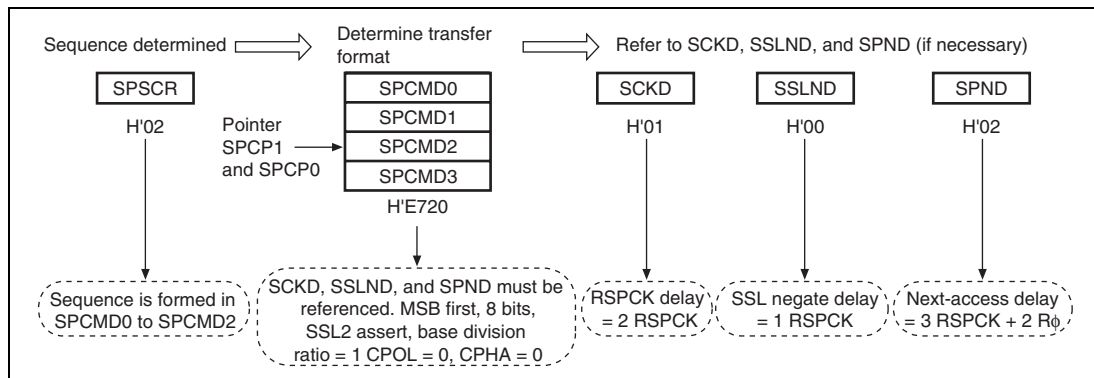

Figure 16.15 Determination Procedure of Serial Transfer Mode in Master Mode

(d) Burst Transfer

If the SSLKP bit in the command register (SPCMD) that this module references during the current serial transfer is 1, this module keeps the SSL signal level during the serial transfer until the beginning of the SSL signal assertion for the next serial transfer. If the SSL signal level for the next serial transfer is the same as the SSL signal level for the current serial transfer, this module can execute continuous serial transfers while keeping the SSL signal assertion status (burst transfer).

Figure 16.16 shows an example of an SSL signal operation for the case where a burst transfer is implemented using SPCMD0 and SPCMD1 settings. The text below explains operations (1) to (7) as depicted in figure 16.16. It should be noted that the polarity of the SSL output signal depends on the settings in the slave select polarity register (SSLP).

1. Based on SPCMD0, this module asserts the SSL signal and inserts RSPCK delays.
2. Serial transfers are executed according to SPCMD0.
3. SSL negation delays are inserted.
4. Because the SSLKP bit in SPCMD0 is 1, this module keeps the SSL signal value on SPCMD0. This period is sustained, at the shortest, for a period equal to the next-access delay of SPCMD0. If the shift register is empty after the passage of a minimum period, this period is sustained until such time as the transmit data is stored in the shift register for another transfer.
5. Based on SPCMD1, this module asserts the SSL signal and inserts RSPCK delays.
6. Serial transfers are executed according to SPCMD1.
7. Because the SSLKP bit in SPCMD1 is 0, this module negates the SSL signal. In addition, a next-access delay is inserted according to SPCMD1.

Figure 16.16 Example of Burst Transfer Operation using SSLKP Bit

If the SSL signal settings in the SPCMD in which 1 is assigned to the SSLKP bit are different from the SSL signal output settings in the SPCMD to be used in the next transfer, this module switches the SSL signal status to SSL signal assertion ((5) in figure 16.17) corresponding to the command for the next transfer. Notice that if such an SSL signal switching occurs, the slaves that drive the MISO signal compete, and the possibility arises of the collision of signal levels.

This module in master mode references within the module the SSL signal operation for the case where the SSLKP bit is not used. Even when the CPHA bit in SPCMD is 0, this module can accurately start serial transfers by asserting the SSL signal for the next transfer. For this reason, burst transfers in master mode can be executed irrespective of CPHA bit settings (see section 16.4.8 (2), Slave Mode Operation).

(e) RSPCK Delay (t1)

The RSPCK delay value in master mode depends on SCKDEN bit settings in the command register (SPCMD) and on clock delay register (SPCKD) settings. This module determines the SPCMD to be referenced during serial transfer by pointer control, and determines an RSPCK delay value during serial transfer by using the SCKDEN bit in the selected SPCMD and SPCKD, as shown in table 16.8. For a definition of RSPCK delay, see section 16.4.4, Transfer Format.

Table 16.8 Relationship among SCKDEN and SPCKD Settings and RSPCK Delay Values

SCKDEN	SPCKD	RSPCK Delay Value
0	000 to 111	1 RSPCK
1	000	1 RSPCK
	001	2 RSPCK
	010	3 RSPCK
	011	4 RSPCK
	100	5 RSPCK
	101	6 RSPCK
	110	7 RSPCK
	111	8 RSPCK

(f) SSL Negation Delay (t₂)

The SSL negation delay value in master mode depends on SLNDEN bit settings in the command register (SPCMD) and on SSL negation delay register (SSLND) settings. This module determines the SPCMD to be referenced during serial transfer by pointer control, and determines an SSL negation delay value during serial transfer by using the SLNDEN bit in the selected SPCMD and SSLND, as shown in table 16.9. For a definition of SSL negation delay, see section 16.4.4, Transfer Format.

Table 16.9 Relationship among SLNDEN and SSLND Settings and SSL Negation Delay Values

SLNDEN	SSLND	SSL Negation Delay Value
0	000 to 111	1 RSPCK
1	000	1 RSPCK
	001	2 RSPCK
	010	3 RSPCK
	011	4 RSPCK
	100	5 RSPCK
	101	6 RSPCK
	110	7 RSPCK
	111	8 RSPCK

(g) Next-Access Delay (t3)

The next-access delay value in master mode depends on SPNDEN bit settings in the command register (SPCMD) and on next-access delay register (SPND) settings. This module determines the SPCMD to be referenced during serial transfer by pointer control, and determines a next-access delay value during serial transfer by using the SPNDEN bit in the selected SPCMD and SPND, as shown in table 16.10. For a definition of next-access delay, see section 16.4.4, Transfer Format.

Table 16.10 Relationship among SPNDEN and SPND Settings and Next-Access Delay Values

SPNDEN	SPND	Next-Access Delay Value
0	000 to 111	1 RSPCK + 2 B ϕ
1	000	1 RSPCK + 2 B ϕ
	001	2 RSPCK + 2 B ϕ
	010	3 RSPCK + 2 B ϕ
	011	4 RSPCK + 2 B ϕ
	100	5 RSPCK + 2 B ϕ
	101	6 RSPCK + 2 B ϕ
	110	7 RSPCK + 2 B ϕ
	111	8 RSPCK + 2 B ϕ

(h) Initialization Flowchart

Figure 16.17 is a flowchart illustrating an example of initialization in SPI operation when this module is used in master mode. For a description of how to set up the interrupt controller, direct memory access controller, and input/output ports, see the descriptions given in the individual blocks.

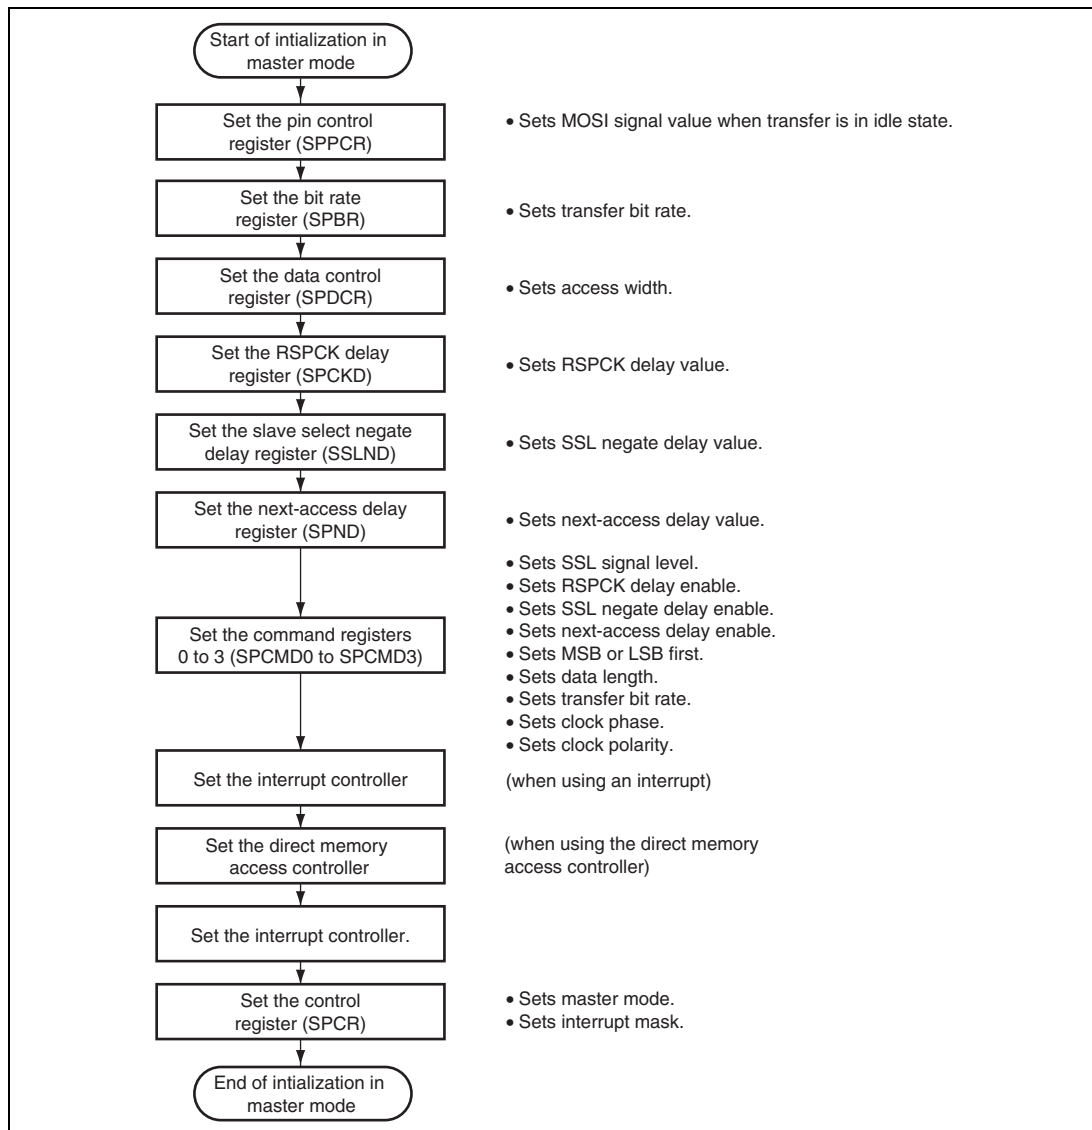

Figure 16.17 Example of Initialization Flowchart in Master Mode

(i) Transfer Operation Flowchart

Figure 16.18 is a flowchart illustrating a transfer in SPI operation when this module is used in master mode.

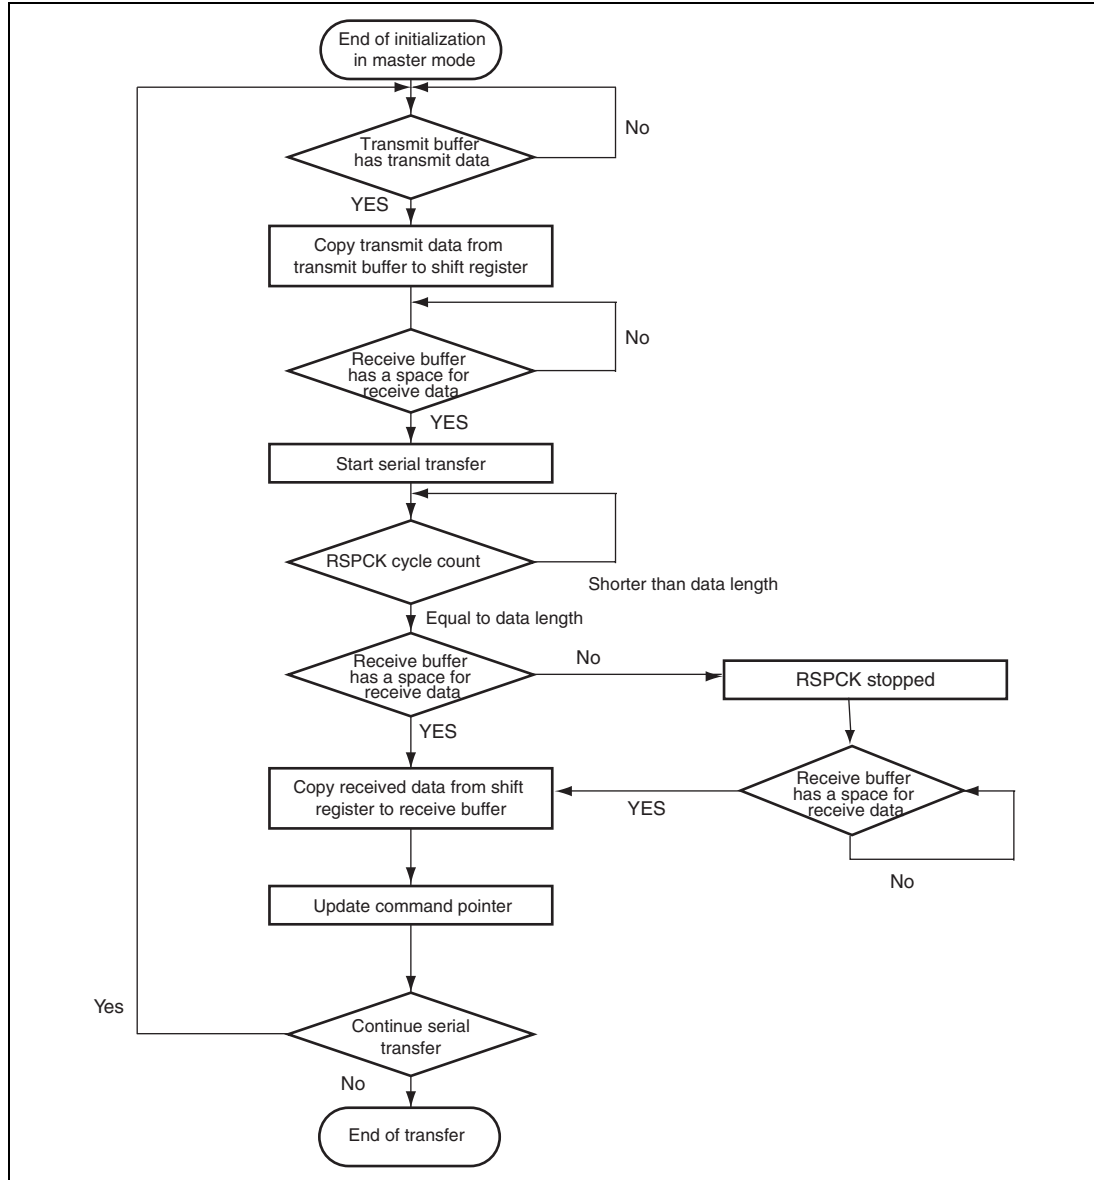

Figure 16.18 Transfer Operation Flowchart in Master Mode

(2) Slave Mode Operation

(a) Starting Serial Transfer

If this module detects an SSL input signal assertion when the CPHA bit in the command register 0 (SPCMD0) is 0, this module is required to start driving valid data to the MISO output signal. For this reason, when the CPHA bit is 0, the asserting of the SSL input signal triggers the start of a serial transfer.

If this module detects the first RSPCK edge in an SSL signal asserted condition when the CPHA bit is 1, this module is required to start driving valid data to the MISO output signal. For this reason, when the CPHA bit is 1, the first RSPCK edge in an SSL signal asserted condition triggers the start of a serial transfer.

When detecting the start of a serial transfer in a condition in which the shift register is empty, this module changes the status of the shift register to "full", so that data cannot be copied from the transmit buffer to the shift register when serial transfer is in progress. If the shift register was full before the serial transfer started, this module leaves the status of the shift register intact, in the full state.

Irrespective of CPHA bit settings, this module starts driving MISO output signals at the SSL signal assertion timing. Whether the data output from this module is valid or invalid differs depending on CPHA bit settings.

For details on the transfer format, see section 16.4.4, Transfer Format. The polarity of the SSL input signal depends on the setting of the SSL0P bit in the slave select polarity register (SSLP).

(b) Terminating Serial Transfer

Irrespective of the CPHA bit in the command register 0 (SPCMD0), this module terminates the serial transfer after detecting an RSPCK edge corresponding to the final sampling timing. When the receive buffer has an enough space for receive data, this module copies received data from the shift register to the receive buffer of the data register (SPDR) upon termination of the serial transfer. Irrespective of the value of the SPRF bit, this module changes the status of the shift register to "empty" upon termination of the serial transfer. If this module detects an SSL input signal negation from the beginning of serial transfer to the end of serial transfer, a mode fault error occurs (see section 16.4.6, Error Detection).

The final sampling timing changes depending on the bit length of the transfer data. In slave mode, the data length depends on the settings in bits SPB3 to SPB0 bits in SPCMD0. The polarity of the SSL input signal depends on the setting in the SSL0P bit in the slave select polarity register (SSLP). For details on the transfer format, see section 16.4.4, Transfer Format.

(c) Notes on Slave Operations

If the CPHA bit in the command register 0 (SPCMD0) is 0, this module starts serial transfers when it detects the assertion edge for an SSL input signal. In the type of configuration shown in figure 16.4 as an example, if this module is used in single-slave mode, the SSL signal is always fixed at active state. Therefore, when the CPHA bit is set to 0, this module cannot correctly start a serial transfer. To correctly execute send/receive operation in a configuration in which the SSL input signal is fixed at active state, the CPHA bit should be set to 1. When it is necessary to set the CPHA bit to 0, the SSL input signal should not be fixed.

(d) Burst Transfer

If the CPHA bit in the command register 0 (SPCMD0) is 1, continuous serial transfer (burst transfer) can be executed while retaining the assertion state for the SSL input signal. If the CPHA bit is 1, the period from the first RSPCK edge to the sampling timing for the reception of the final bit in an SSL signal active state corresponds to a serial transfer period. Even when the SSL input signal remains at the active level, this module can accommodate burst transfers because it can detect the start of access.

If the CPHA bit is 0, for the reason given in section 16.4.8 (2) (c), Notes on Slave Operations, second and subsequent serial transfers during the burst transfer cannot be executed correctly.

(e) Initialization Flowchart

Figure 16.19 is a flowchart illustrating an example of initialization in SPI operation when this module is used in slave mode. For a description of how to set up the interrupt controller, direct memory access controller, and input/output ports, see the descriptions given in the individual blocks.

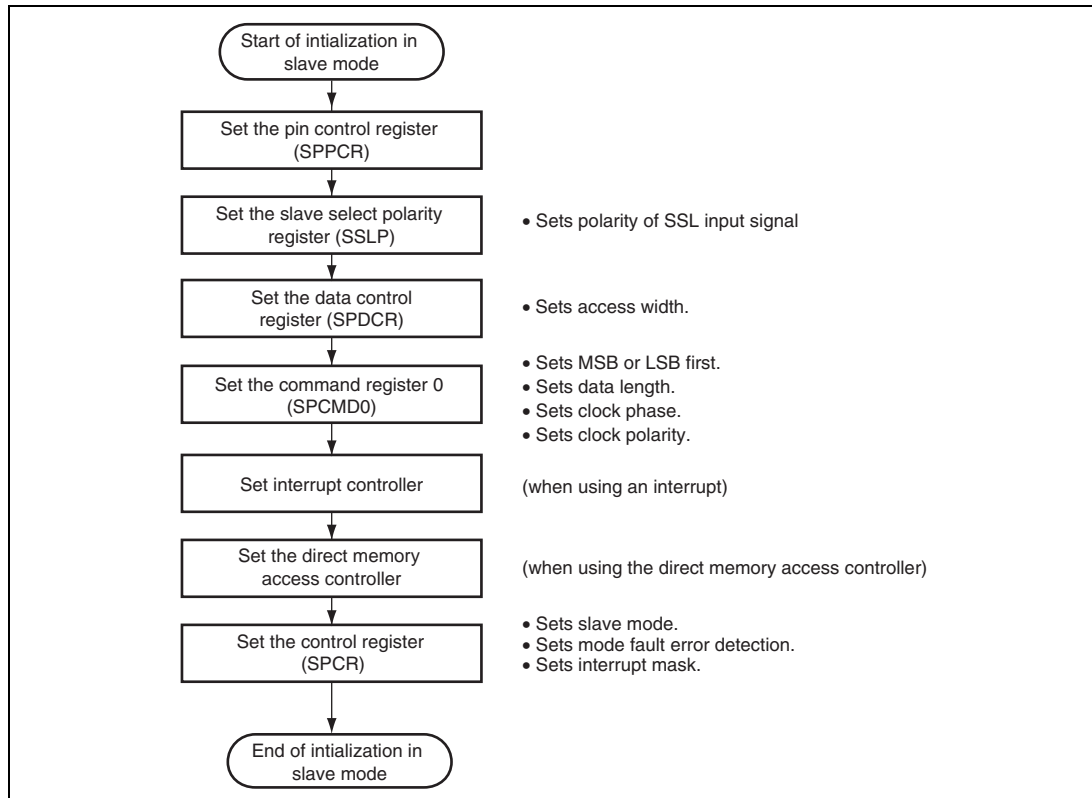

Figure 16.19 Example of Initialization Flowchart in Slave Mode

(f) Transfer Operation Flowchart (CPHA = 0)

Figure 16.20 is a flowchart illustrating a transfer in SPI operation when this module is used in slave mode with the CPHA bit in the command register 0 (SPCMD0) set to 0.

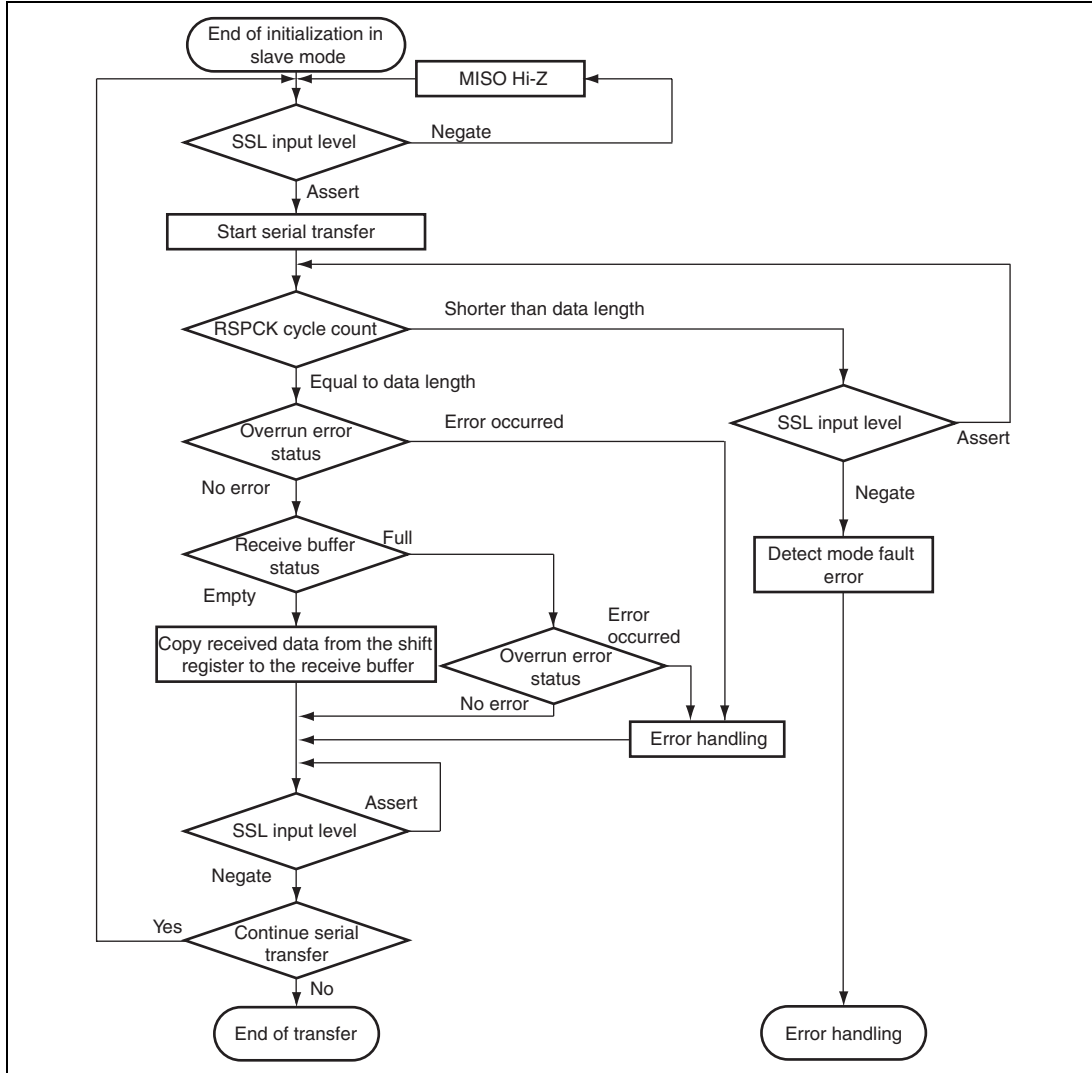

Figure 16.20 Transfer Operation Flowchart in Slave Mode (CPHA = 0)

(g) Transfer Operation Flowchart (CPHA = 1)

Figure 16.21 is a flowchart illustrating a transfer in SPI operation when this module is used in slave mode with the CPHA bit in the command register 0 (SPCMD0) and the MODFEN bit in the control register (SPCR) set to 1, respectively. The subsequent operation is not guaranteed when the serial transfer is started with the MODFEN bit set to 0 and the SSL input level is negated with the number of RSPCK cycles shorter than the data length.

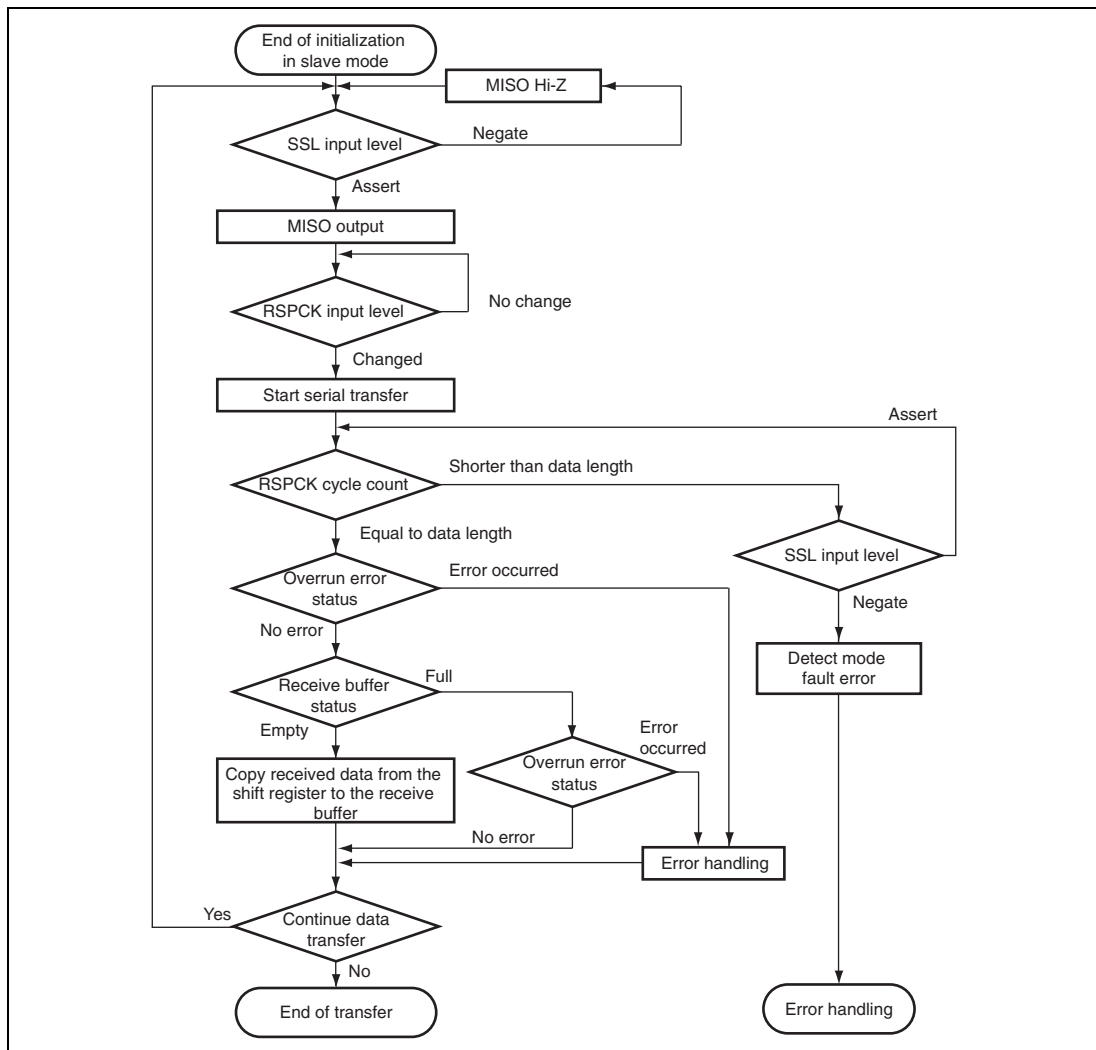

Figure 16.21 Transfer Operation Flowchart in Slave Mode (CPHA = 1)

16.4.9 Error Handling

Figures 16.22 and 16.23 show the error handling. The following error handling is used to return from the error state after an error in master or slave mode.

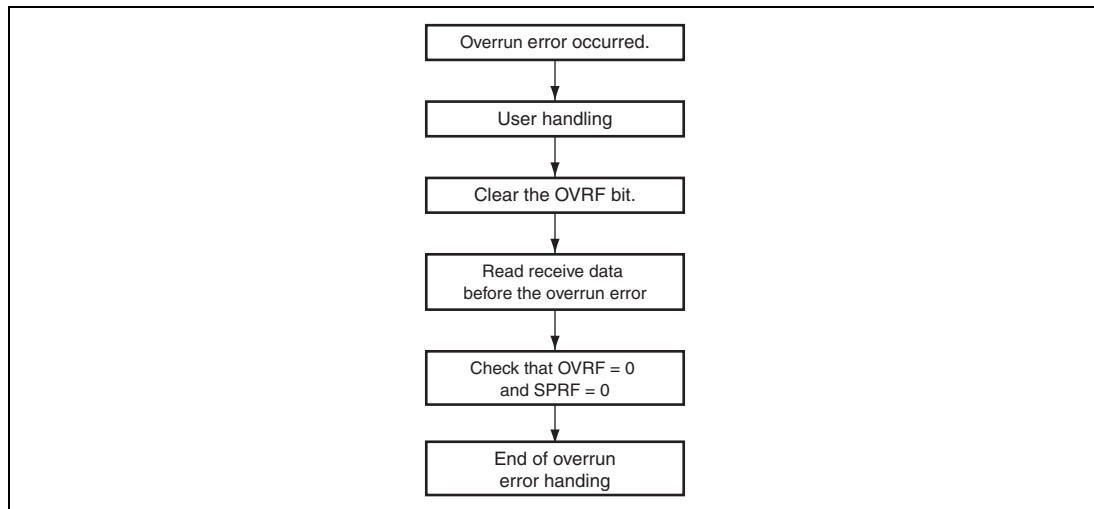

Figure 16.22 Error Handling (Overrun Error)

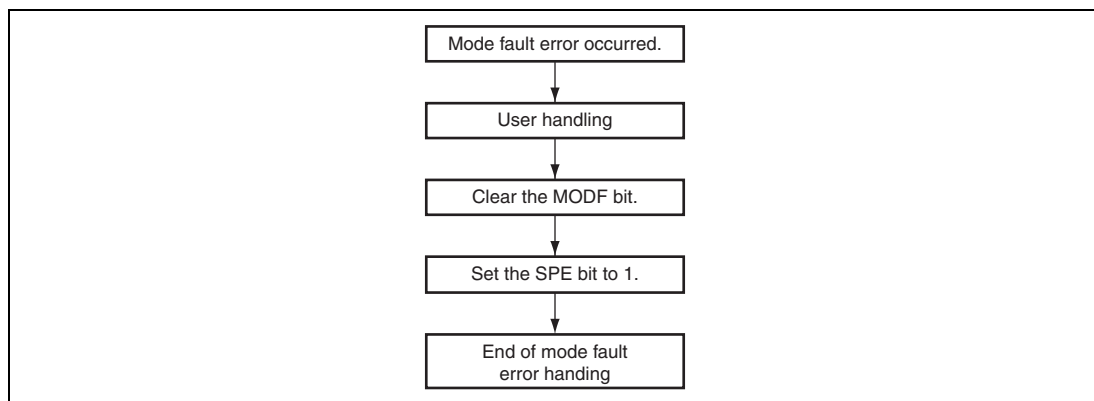

Figure 16.23 Error Handling (Mode Fault Error)

16.4.10 Loopback Mode

When 1 is written to the SPLP bit in the pin control register (SPPCR), this module shuts off the path between the MISO pin and the shift register, and between the MOSI pin and the shift register, and connects the input path and the output path (reversed) of the shift register. This is called loopback mode. When a serial transfer is executed in loopback mode, the transmit data becomes the received data. Figure 16.24 shows the configuration of the shift register input/output paths for the case where this module in master mode is set in loopback mode.

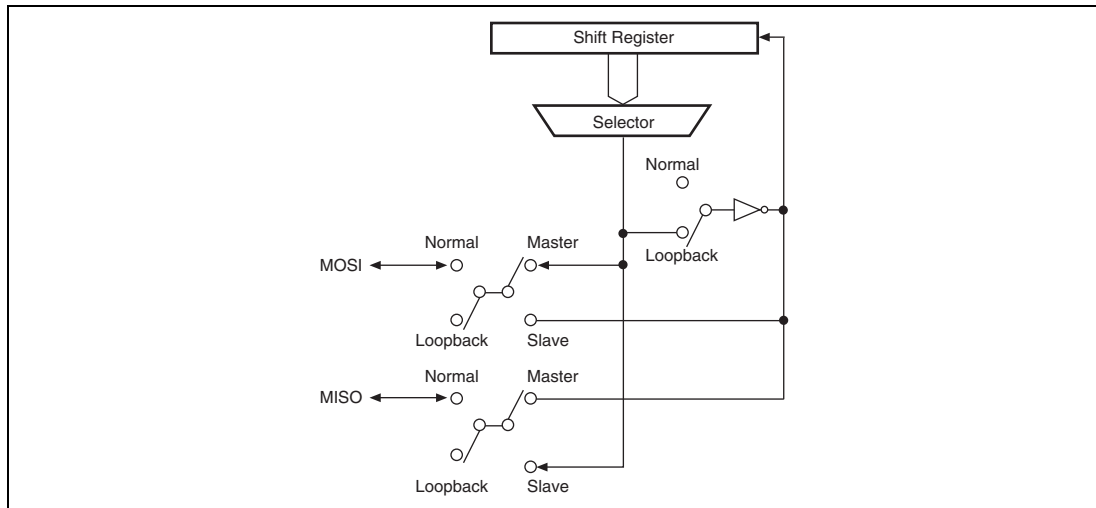

Figure 16.24 Configuration of Shift Register Input/Output Paths in Loopback Mode (Master Mode)

16.4.11 Interrupt Sources

This module has interrupt sources of receive buffer full, transmit buffer empty, mode fault, and overrun. In addition, the direct memory access controller can be activated by the receive buffer full or transmit buffer empty interrupt for data transfer.

Table 16.11 shows the interrupt sources.

When any of the interrupt conditions in table 16.11 is met, an interrupt is generated. The interrupt sources should be cleared with data transfer by the CPU or direct memory access controller.

Table 16.11 Interrupt Sources

Name	Interrupt Source	Abbreviation	Interrupt Condition	Activation of Direct Memory Access Controller
SPRI	Receive buffer full	RXI	(SPRIE = 1) • (SPRF = 1)	Possible
SPTI	Transmit buffer empty	TXI	(SPTIE = 1) • (SPTEF = 1)	Possible
SPEI	Mode fault	MOI	(SPEIE = 1) • (MODF = 1)	—
	Overrun	OVI	(SPEIE = 1) • (OVRF = 1)	—

Section 17 Renesas Quad Serial Peripheral Interface

17.1 Features

This module has the following features.

- Capable of communications to the serial flash memory through single-/dual-/quad-SPI operation
 - Single-SPI operation
 - Use of MO (master out), MI (master in), QSSL (slave select), and QSPCLK (SPI clock) signals allow for communications to the serial flash memory through SPI operation (four-wire method).
 - QMO output pin and QMI input pin
 - QSSL and QSPCLK serve as output pins.
 - Dual-SPI operation
 - Use of QIO1, QIO0, QSSL, and QSPCLK signals allow for serial communications through SPI operation (four-wire method).
 - Bidirectional QIO1 and QIO0 pins
 - QSSL and QSPCLK serve as output pins.
 - Quad-SPI operation
 - Use of QIO3 to QIO0, QSSL, and QSPCLK signals allow for serial communications through SPI operation (six-wire method).
 - Bidirectional QIO3 to QIO0 pins
 - QSSL and QSPCLK serve as output pins
- Transfer data length
 - Transfer data length is selectable from 8 bits to 128 Gbits
 - Data is continuously transferred one through 4,294,967,296 times in 8-, 16-, or 32-bit units
 - Transfer data length is selectable from 8, 16, and 32 bits
- Bit rate
 - QSPCLK can be divided by a maximum of 4080 (divide 2 or more in transmission)
 - QSPCLK can be generated by dividing $B\phi$ by the on-chip baud rate generator.

- Buffer configuration
 - 8 bits × 32 buffers for transmission and 8 bits × 32 buffers for reception
- Shift registers
 - 32 bits each for transmission and reception
- QSSL control function
 - Controllable delay from QSSL output assertion to QSPCLK operation (clock delay)
 - Range: 0 and 1.5 to 8.5 QSPCLK cycles (set in QSPCLK-cycle units)
 - Controllable delay from QSPCLK stoppage to QSSL output negation (QSSL negation delay)
 - Range: 0 to 8 QSPCLK cycles (set in QSPCLK-cycle units)
 - Controllable wait for next-access QSSL output assertion (next-access delay)
 - Range: 0 to 8 QSPCLK cycles (set in QSPCLK-cycle units)
 - Capable of holding QSSL output value from transfer end to next access
 - Function for changing QSSL polarity
- Transfer control
 - A transfer of up to four commands can be executed sequentially in looped execution.
 - Single-SPI or dual-/quad-SPI write operation: A transfer can be started when data is written to the transmit buffer while the SPI function is enabled.
 - Dual-/quad-SPI read operation: A transfer can be started when the SPI function is enabled while there is enough space for receiving the specified length of data in the receive buffer.
 - QIO3 to QIO0 and QMO output values can be specified during QSSL negation
 - QIO3 and QIO2 output values can be specified in single-/dual-SPI modes
- Interrupt sources
 - Maskable interrupt sources:
 - Receive buffer full interrupt
 - Transmit buffer empty interrupt
- Others
 - Provides loop back mode
 - Provides a function for initializing this module

17.2 Input/Output Pins

Table 17.1 shows the pin configuration.

Table 17.1 Pin Configuration

Pin Name	Pin Name	I/O	Function
Clock pin	QSPCLK	O	Clock output
Master transmit data/data 0 pin* ¹	QMO/QIO0	I/O	Master transmit data/data 0
Master input data/data 1 pin* ¹	QMI/QIO1	I/O	Master input data/data 1
Data 2 pin* ²	QIO2	I/O	Data 2
Data 3 pin* ²	QIO3	I/O	Data 3
Slave select pin	QSSL	O	Slave selection

Notes: 1. In single-SPI mode, QMO and QMI are enabled; QIO0 and QIO1 in dual-/quad-SPI modes.

2. In single-/dual-SPI modes, fixed value according to register setting is output; QIO2 and QIO3 in quad-SPI mode.

17.3 Register Descriptions

Table 17.2 shows the register configuration.

Table 17.2 Register Configuration

Register Name	Abbreviation	R/W	Initial Value	Address	Access Size
Control register	SPCR	R/W	H'00	H'FFFFFFE000	8, 16, 32
Slave select polarity register	SSLP	R/W	H'00	H'FFFFFFE001	8, 16, 32
Pin control register	SPPCR	R/W	H'06	H'FFFFFFE002	8, 16, 32
Status register	SPSR	R/(W)*	H'60	H'FFFFFFE003	8, 16, 32
Data register	SPDR	R/W	Undefined	H'FFFFFFE004	8, 16, 32
Sequence control register	SPSCR	R/W	H'00	H'FFFFFFE008	8, 16, 32
Sequence status register	SPSSR	R	H'00	H'FFFFFFE009	8, 16, 32
Bit rate register	SPBR	R/W	H'FF	H'FFFFFFE00A	8, 16, 32
Data control register	SPDCR	R/W	H'00	H'FFFFFFE00B	8, 16, 32
Clock delay register	SPCKD	R/W	H'00	H'FFFFFFE00C	8, 16, 32
Slave select negation delay register	SSLND	R/W	H'00	H'FFFFFFE00D	8, 16, 32
Next-access delay register	SPND	R/W	H'00	H'FFFFFFE00E	8, 16, 32
Command register 0	SPCMD0	R/W	H'E001	H'FFFFFFE010	16, 32
Command register 1	SPCMD1	R/W	H'E001	H'FFFFFFE012	16, 32
Command register 2	SPCMD2	R/W	H'E001	H'FFFFFFE014	16, 32
Command register 3	SPCMD3	R/W	H'E001	H'FFFFFFE016	16, 32
Buffer control register	SPBFCR	R/W	H'00	H'FFFFFFE018	8, 16, 32

Transfer data length multiplier setting register 1	SPBMUL1	R/W	H'00000001	H'FFFFFFE020	32
Transfer data length multiplier setting register 2	SPBMUL2	R/W	H'00000001	H'FFFFFFE024	32
Transfer data length multiplier setting register 3	SPBMUL3	R/W	H'00000001	H'FFFFFFE028	32

Note: * Only 0 can be written to clear the flag.

17.3.1 Control Register (SPCR)

SPCR sets the operating mode.

Bit:	7	6	5	4	3	2	1	0
	SPRIE	SPE	SPTIE	—	—	—	—	—
Initial Value:	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R	R/W	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7	SPRIE	0	R/W	<p>Receive Interrupt Enable</p> <p>Enables or disables generation of receive interrupt requests when the number of receive data units in the receive buffer is equal to or greater than the specified receive buffer data triggering number and the receive buffer full flag (SPRFF) in the status register (SPSR) is set to 1.</p> <p>0: Disables the generation of receive interrupt requests. 1: Enables the generation of receive interrupt requests.</p>
6	SPE	0	R/W	<p>SPI Function Enable</p> <p>Setting this bit to 1 enables the SPI module function. Setting this bit to 0 initializes a part of the module function.</p> <p>0: Disables the module function 1: Enables the module function</p>
5	SPTIE	0	R/W	<p>Transmit Interrupt Enable</p> <p>Enables or disables generation of transmit interrupt requests when the number of transmit data units in the transmit buffer is equal to or less than the specified transmit buffer data triggering number and the transmit buffer empty flag (SPTEF) in SPSR is set to 1.</p> <p>0: Disables the generation of transmit interrupt requests. 1: Enables the generation of transmit interrupt requests.</p>
4	—	0	R	<p>Reserved</p> <p>This bit is always read as 0. The write value should always be 0.</p>
3	—	0	R/W	<p>Reserved</p> <p>The write value should always be 1. Otherwise, operation cannot be guaranteed.</p>

Bit	Bit Name	Initial Value	R/W	Description
2 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

17.3.2 Slave Select Polarity Register (SSLP)

SSLP sets the polarity of the QSSL signal. If the contents of SSLP are modified while the SPE bit in the control register (SPCR) is set to 1, the subsequent operation cannot be guaranteed.

Bit:	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	SSLP
Initial Value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
7 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	SSLP	0	R/W	QSSL Signal Polarity Setting Sets the polarity of the QSSL signal. 0: QSSL signal low-active 1: QSSL signal high-active

17.3.3 Pin Control Register (SPPCR)

SPPCR sets the modes of the pins. If the contents of SPPCR are modified while the SPE bit in SPCR is set to 1, the subsequent operation cannot be guaranteed.

Bit:	7	6	5	4	3	2	1	0
	—	—	MOIFE	MOIFV	—	IO3FV	IO2FV	SPLP
Initial Value:	0	0	0	0	0	1	1	0
R/W:	R	R	R/W	R/W	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7, 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
5	MOIFE	0	R/W	Data Output Idle Value Fixing Enable Fixes the pin output value in a QSSL negation period or the QSSL keeping period during a burst transfer. In single-SPI mode, this bit setting applies to QMO. In dual-SPI mode, this bit setting applies to QIO1 and QIO0. In quad-SPI mode, this bit setting applies to QIO3 to QIO0. 0: Output value equals final data from previous transfer 1: Output value equals the value set in the MOIFV bit Note: In dual-/quad-SPI modes, QIO1 and QIO0/QIO3 to QIO0 are driven to the Hi-Z state regardless of this bit setting (see section 17.4.2, Pin Control).
4	MOIFV	0	R/W	Data Output Idle Fixed Value If the QMO idle value fixing enable bit (MOIFE) is 1, this module, according to QMO idle fixed value (MOIFV) bit settings, determines the output value during the QSSL negation period. 0: Output pin idle fixed value equals 0 1: Output pin idle fixed value equals 1
3	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
2	IO3FV	1	R/W	<p>Single-/Dual-SPI Mode QIO3 Output Fixed Value</p> <p>Fixes the output direction of the QIO3 pin in single-/dual-SPI modes. This bit is valid only in single-/dual-SPI modes, and is not affected by the MOIFE or MOIFV bit values.</p> <p>0: QIO3 output fixed value equals 0 1: QIO3 output fixed value equals 1</p>
1	IO2FV	1	R/W	<p>Single-/Dual-SPI Mode QIO2 Output Fixed Value</p> <p>Fixes the output direction of the QIO2 pin in single-/dual-SPI modes. This bit is valid only in single-/dual-SPI modes, and is not affected by the MOIFE or MOIFV bit values.</p> <p>0: QIO2 output fixed value equals 0 1: QIO2 output fixed value equals 1</p>
0	SPLP	0	R/W	<p>Loopback Mode</p> <p>When the SPLP bit is set to 1, this module shuts off the path between the data I/O pin and the transmit/receive shift register, and connects the input path and the output path for the transmit/receive shift register.</p> <p>0: Normal mode 1: Loopback mode</p> <p>Note: When the loopback mode is specified in dual-/quad-SPI modes, the SPI read/write access setting bit (SPRW) in command registers 0 to 3 (SPCMD0 to SPCMD3) should be set to 0 (write operation).</p>

17.3.4 Status Register (SPSR)

SPSR indicates the operating status.

Bit:	7	6	5	4	3	2	1	0
	SPRFF	TEND	SPTEF	—	—	MODF	UDRF	OVRF
Initial Value:	0	1	1	0	0	0	0	0
R/W:	R	R	R	R	R	R/(W)*	R/(W)*	R/(W)*

Note: * Only 0 can be written to clear the flag after reading 1.

Bit	Bit Name	Initial Value	R/W	Description
7	SPRFF	0	R	<p>Receive Buffer Full Flag</p> <p>Indicates that the number of receive data units in the receive buffer is equal to or greater than the receive buffer data triggering number specified in the buffer control register.</p> <p>0: The number of receive data units in the receive buffer is less than the receive buffer data triggering number.</p> <p>1: The number of receive data units in the receive buffer is equal to or greater than the receive buffer data triggering number.</p> <p>[Clearing conditions]</p> <ul style="list-style-type: none"> • The receive buffer data is read until the number of data units in the receive buffer becomes less than the specified receive buffer data triggering number. • Receive buffer data reset is enabled. • Power-on reset <p>[Setting condition]</p> <ul style="list-style-type: none"> • The number of data units in the receive buffer is equal to or greater than the specified receive buffer data triggering number.

Bit	Bit Name	Initial Value	R/W	Description

4 to 0	—	All 0	R	<p>Reserved</p> <p>These bits are always read as 0. The write value should always be 0.</p>

17.3.5 Data Register (SPDR)

SPDR accesses transmit/receive data buffer.

The transmit buffer (SPTXB) and receive buffer (SPRXB) are independent and are mapped to SPDR.

When data is written to SPDR, the data will be written to the transmit buffer.

When data is read from SPDR, the data will be read from the receive buffer.

SPDR should be read or written to in byte, word, or longword units.

When SPDR is read or written to with the longword-, word-, or byte-access width, the receive or transmit data should be read from or written to the following bits.

Longword: Bits 31 to 0

Word: Bits 31 to 16

Byte: Bits 31 to 24

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SPD31	SPD30	SPD29	SPD28	SPD27	SPD26	SPD25	SPD24	SPD23	SPD22	SPD21	SPD20	SPD19	SPD18	SPD17	SPD16
Initial Value:	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SPD15	SPD14	SPD13	SPD12	SPD11	SPD10	SPD9	SPD8	SPD7	SPD6	SPD5	SPD4	SPD3	SPD2	SPD1	SPD0
Initial Value:	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined	Undefined
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

17.3.6 Sequence Control Register (SPSCR)

SPSCR sets the sequence controlled method. If the contents of SPSCR are modified while the SPE bit in SPCR is 1, the subsequent operation cannot be guaranteed.

Bit:	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	SPSC1	SPSC0
Initial Value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1	SPSC1	0	R/W	Sequence Control Specification
0	SPSC0	0	R/W	These bits specify sequential operations. This module references SPCMD0 to SPCMD3 in the order according to these bit settings. 00: 0 → 0 → ... 01: 0 → 1 → 0 → ... 10: 0 → 1 → 2 → 0 → ... 11: 0 → 1 → 2 → 3 → 0 → ...

17.3.7 Sequence Status Register (SPSSR)

SPSSR indicates the sequence control status.

Bit:	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	SPSS1	SPSS0
Initial Value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1	SPSS1	0	R	Sequence Status
0	SPSS0	0	R	During sequence control, these bits indicate one of SPCMD0 to SPCMD3 that is currently referenced. 00: SPCMD0 01: SPCMD1 10: SPCMD2 11: SPCMD3

17.3.8 Bit Rate Register (SPBR)

SPBR sets the bit rate. If the contents of SPBR are modified while the SPE bit in SPCR is 1, the subsequent operation cannot be guaranteed.

Bit:	7	6	5	4	3	2	1	0
	SPBR7	SPBR6	SPBR5	SPBR4	SPBR3	SPBR2	SPBR1	SPBR0
Initial Value:	1	1	1	1	1	1	1	1
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

The bit rate is determined by combinations of SPBR settings and the bit settings in the bit rate division setting bits (BRDV1 and BRDV0) in SPCMD0 to SPCMD3.

When SPBR is set to 0, the base bit rate is selected.

The equation for calculating the bit rate when SPBR is not 0 is given below. In the equation, n denotes an SPBR setting (1, ..., 255), and N denotes bit settings in the bits BRDV1 and BRDV0 (0, 1, 2, 3).

$$\text{Bit rate} = \frac{f(B\phi)}{2 \times n \times 2^N}$$

Table 17.3 shows examples of the relationship between SPBR and BRDV1 and BRDV0 bit settings.

Table 17.3 Relationship between SPBR and BRDV1 and BRDV0 Settings

SPBR (n)	BRDV[1:0] (N)	Division Ratio	Bit Rate	
			B ϕ = 60 MHz	B ϕ = 72 MHz
0	0	1	60.0 Mbps	72.0 Mbps
1	0	2	30.0 Mbps	36.0 Mbps
2	0	4	15.0 Mbps	18.0 Mbps
3	0	6	10.0 Mbps	12.0 Mbps
4	0	8	7.50 Mbps	9.00 Mbps
5	0	10	6.00 Mbps	7.20 Mbps
6	0	12	5.00 Mbps	6.00 Mbps
6	1	24	2.50 Mbps	3.00 Mbps
6	2	48	1.25 Mbps	1.50 Mbps
6	3	96	625 kbps	750 kbps
255	3	4080	14.7 kbps	17.6 kbps

Note: In transmission, set SPBR and BRDV that the division ratio of QSPCLK is 2 or more.

17.3.9 Data Control Register (SPDCR)

SPDCR enables or disables dummy data transmission.

Bit:	7	6	5	4	3	2	1	0
	TXDMY	—	—	—	—	—	—	—
Initial Value:	0	0	0	0	0	0	0	0
R/W:	R/W	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7	TXDMY	0	R/W	<p>Dummy Data Transmission Enable</p> <p>Enables or disables dummy data transmission from the QMO pin in single-SPI mode and the transmit buffer is empty.</p> <p>Specifically, if this bit is set to 1 when the transmit buffer is empty, 0 is output from the QMO pin as dummy data.</p> <p>This bit setting can be changed while the transmit end flag (TEND) in SPSR is 1. Otherwise, operation cannot be guaranteed.</p> <p>0: Disables dummy data transmission. 1: Enables dummy data transmission.</p>
6 to 0	—	All 0	R	<p>Reserved</p> <p>These bits are always read as 0. The write value should always be 0.</p>

17.3.10 Clock Delay Register (SPCKD)

SPCKD sets a period (clock delay) from the beginning of QSSL signal assertion to QSPCLK oscillation when the QSPCLK delay setting enable bit (SCKDEN) in SPCMD0 to SPCMD3 is 1. If the contents of SPCKD are modified while the SPE bit in SPCR is 1, the subsequent operation cannot be guaranteed.

Bit:	7	6	5	4	3	2	1	0
	—	—	—	—	—	SCKDL2	SCKDL1	SCKDL0
Initial Value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7 to 3	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
2	SCKDL2	0	R/W	Clock Delay Setting
1	SCKDL1	0	R/W	These bits set a period (clock delay) from the beginning of QSSL signal assertion to QSPCLK oscillation when the SCKDEN bit in SPCMD0 to SPCMD3 is 1. 000: 1.5 QSPCLK cycles 001: 2.5 QSPCLK cycles 010: 3.5 QSPCLK cycles 011: 4.5 QSPCLK cycles 100: 5.5 QSPCLK cycles 101: 6.5 QSPCLK cycles 110: 7.5 QSPCLK cycles 111: 8.5 QSPCLK cycles
0	SCKDL0	0	R/W	

17.3.11 Slave Select Negation Delay Register (SSLND)

SSLND sets a period (QSSL negation delay) from the transmission of a final QSPCLK edge to the negation of the QSSL signal during a serial transfer when the QSSL negation delay setting enable bit (SLNDEN) in SPCMD0 to SPCMD3 is 1. If the contents of SSLND are modified while the SPE bit in SPCR is 1, the subsequent operation cannot be guaranteed.

Bit:	7	6	5	4	3	2	1	0
	—	—	—	—	—	SLNDL2	SLNDL1	SLNDL0
Initial Value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7 to 3	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
2	SLNDL2	0	R/W	QSSL Negation Delay Setting
1	SLNDL1	0	R/W	These bits set a period (QSSL negation delay) from the transmission of a final QSPCLK edge to the negation of the QSSL signal during a serial transfer when the SLNDEN bit in SPCMD0 to SPCMD3 is 1. 000: 1 QSPCLK cycle 001: 2 QSPCLK cycles 010: 3 QSPCLK cycles 011: 4 QSPCLK cycles 100: 5 QSPCLK cycles 101: 6 QSPCLK cycles 110: 7 QSPCLK cycles 111: 8 QSPCLK cycles If these bit settings are other than 2 QSPCLK or more cycles, the next-access delay setting (SPNDL) bit settings in the next-access delay register (SPND) should be other than 2 QSPCLK or more cycles.
0	SLNDL0	0	R/W	

17.3.12 Next-Access Delay Register (SPND)

SPND sets a period (next-access delay) from termination of a serial transfer to the beginning of the next serial transfer when the next-access delay enable bit (SPNDEN) in SPCMD0 to SPCMD3 is 1. If the contents of SPND are modified while the SPE bit in SPCR is 1, the subsequent operation cannot be guaranteed.

Bit:	7	6	5	4	3	2	1	0
	—	—	—	—	—	SPNDL2	SPNDL1	SPNDL0
Initial Value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7 to 3	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
2	SPNDL2	0	R/W	Next-Access Delay Setting
1	SPNDL1	0	R/W	These bits set a period (next-access delay) from termination of a serial transfer to the beginning of the next serial transfer when the SPNDEN bit in SPCMD0 to SPCMD3 is 1. 000: 1 QSPCLK cycle 001: 2 QSPCLK cycles 010: 3 QSPCLK cycles 011: 4 QSPCLK cycles 100: 5 QSPCLK cycles 101: 6 QSPCLK cycles 110: 7 QSPCLK cycles 111: 8 QSPCLK cycles If these bit settings are other than 2 QSPCLK or more cycles, the QSSL negation delay setting (SLNDL) bit settings in the slave select negation delay register (SSLND) should be other than 2 QSPCLK or more cycles.
0	SPNDL0	0	R/W	

17.3.13 Command Register n (SPCMDn) (n = 0 to 3)

Each channel has four command registers (SPCMD0 to SPCMD3). SPCMD0 to SPCMD3 are used to set a transfer format. This module sequentially references SPCMD0 to SPCMD3 according to the settings in the sequence control register (SPSCR), and executes the serial transfer that is set in the referenced SPCMD.

If the contents of currently referred-to SPCMD are modified while the TEND bit in SPSR indicates that communication has not been completed, the subsequent operation cannot be guaranteed. The currently referred-to SPCMD can be checked by reading the sequence status register (SPSSR).

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SCKDEN	SLNDEN	SPNDEN	LSBF	SPB3	SPB2	SPB1	SPB0	SSLKP	SPIMOD ₁	SPIMOD ₀	SPRW	BRDV1	BRDV0	CPOL	CPHA
Initial Value:	1	1	1	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15	SCKDEN	1	R/W	<p>Clock Delay Setting Enable</p> <p>Sets a period (clock delay) from the beginning of QSSL signal assertion to QSPCLK oscillation. If this bit is 0, this module sets the clock delay to 0 QSPCLK cycle. If this bit is 1, this module starts QSPCLK oscillation in compliance with the clock delay register (SPCKD) settings. For the continuous access in which QSSL is kept asserted over the multiple commands, this bit can be set to 0 only when the pertinent command is the second or subsequent one. Otherwise, this bit should be set to 1.</p> <p>0: A clock delay of 0 QSPCLK cycle 1: A clock delay equal to SPCKD settings.</p>

Bit	Bit Name	Initial Value	R/W	Description
14	SLNDEN	1	R/W	<p>QSSL Negation Delay Setting Enable</p> <p>Sets a period (QSSL negation delay) from QSPCLK oscillation stoppage to QSSL signal negation. If this bit is 0, this module sets the QSSL negation delay to 0 QSPCLK cycle. If this bit is 1, this module negates the QSSL signal in compliance with the slave select negation delay register (SSLND) settings. For the continuous access in which QSSL is kept asserted over the multiplier commands, this bit can be set to 0 only when the pertinent command is not the last one. Otherwise, this bit should be set to 1.</p> <p>0: An QSSL negation delay of 0 QSPCLK cycle 1: An QSSL negation delay equal to SSLND settings.</p>
13	SPNDEN	1	R/W	<p>Next-Access Delay Enable</p> <p>Sets the period (next-access delay) from termination of a serial transfer to the beginning of the next serial transfer. If this bit is 0, this module sets the next-access delay to 0 QSPCLK cycle. If this bit is 1, this module starts next serial transfer in compliance with the next-access delay register (SPND) settings. For the continuous access in which QSSL is kept asserted over the multiple commands, this bit can be set to 0 only when the pertinent command is not the last one. Otherwise, this bit should be set to 1.</p> <p>0: A next-access delay of 0 QSPCLK cycle. 1: A next-access delay equal to SPND settings.</p>
12	LSBF	0	R/W	<p>LSB First</p> <p>Sets the data format to MSB first or LSB first.</p> <p>0: MSB first 1: LSB first</p>

Bit	Bit Name	Initial Value	R/W	Description
11	SPB3	0	R/W	Transfer Data Length Setting
10	SPB2	0	R/W	These bits set the basic transfer data length for serial transfer. For LSB-first transfer, the transfer data is reversed within the data width specified with these bits. The actual amount of data to be transferred is determined by multiplying the value set with these bits by the value set with SPBMUL0 to SPBMUL3. 0000: 8 bits (1 byte) 0001: 16 bits (2 bytes) 0010: 32 bits (4 bytes) 0011 to 1111: Setting prohibited
9	SPB1	0	R/W	
8	SPB0	0	R/W	
7	SSLKP	0	R/W	
6	SPIMOD1	0	R/W	SPI Operating Mode
5	SPIMOD0	0	R/W	These bits select the operating mode from single-, dual-, or quad-SPI. 00: Single-SPI 01: Dual-SPI 10: Quad-SPI 11: Setting prohibited
4	SPRW	0	R/W	SPI Read/Write Access Sets an access direction in dual-/quad-SPI modes. This bit is invalid in single-SPI mode 0: Write operation (QIO1 and QIO0/QIO3 to QIO0: Output) 1: Read operation (QIO1 and QIO0/QIO3 to QIO0: Input)

Bit	Bit Name	Initial Value	R/W	Description
3	BRDV1	0	R/W	Bit Rate Frequency Division Setting
2	BRDV0	0	R/W	<p>The settings of this field and of the bit rate register (SPBR) together determine the bit rate. The base bit rate depends on the setting of the SPBR.</p> <p>The setting of this field selects division of the base bit rate by one, two, four, or eight.</p> <p>Individual BRDV [1:0] values can be set in each of command registers 0 to 3. Therefore, serial transfers can be at different bit rates for each of the commands.</p> <p>00: Base bit rate 01: Two division of the base 10: Four division of the base 11: Eight division of the base</p> <p>Note: In transmission, set SPBR and these bits that the division ratio of QSPCLK is 2 or more.</p>
1	CPOL	0	R/W	<p>QSPCLK Polarity Setting</p> <p>Sets an QSPCLK polarity. When data communication is performed between the Renesas serial peripheral interface module and the other modules, the same QSPCLK polarity should be set for both modules.</p> <p>0: Positive (QSPCLK = 0 when idle) 1: Negative (QSPCLK = 1 when idle)</p>
0	CPHA	1	R/W	<p>QSPCLK Phase Setting</p> <p>Sets an QSPCLK edge for latching and shifting data to be transferred. When data communication is performed between the Renesas serial peripheral interface module and the other modules, the same QSPCLK edge should be set for both modules.</p> <p>0: Data latch on odd edge, data shift on even edge 1: Data shift on odd edge, data latch on even edge</p> <p>Note: The first QSPCLK edge is treated as the first edge.</p>

Reference: Some serial flash memory datasheets refer to QSPCLK specifications, which are determined by what this document refers to as CPOL and CPHA bits, as SPI modes 0 to 3. Assuming that SPI modes 0 to 3 are controlled by SPI mode bits [1:0], CPOL and CPHA in this document correspond to SPI mode bits 1 and 0, respectively. In this module, the initial values of CPOL and CPHA are 0 and 1, respectively, selecting SPI mode 1 as the initial mode.

- Notes:
1. When setting any or all of the clock delay period, QSSL negation delay period, and next-access delay period to 0, be sure to set QSSLKP to 1 to select the continuous access in which QSSL is not negated. Otherwise, operation cannot be guaranteed. For the method of setting the various delay periods for the continuous access in which QSSL is not negated, see below.
 2. For the continuous access in which QSSL is not negated, QSPCLK clock stopping is followed by the QSSL negation delay period, next-access delay period, and next command clock delay period, in this order. When setting any of the QSSL negation delay setting enable bit (SLNDEN), next-access delay enable bit (SPNDEN), and clock delay setting enable bit (SCKDEN) to 0, be sure to set the bit corresponding to the later period prior to the bit corresponding to the earlier period.

In the above figure, (1), (2), and (3) refer to the QSSL negation delay period, next-access delay period, and next command clock delay period, respectively. When setting any of these bits to 0, be sure to set (3) first. In other words, setting 1 after 0 as in $\{(1), (2), (3)\} = \{0, 0, 1\}, \{0, 1, 1\}, \{0, 1, 0\} \dots$ is prohibited. Allowed setting is $\{(1), (2), (3)\} = \{1, 1, 1\}, \{1, 1, 0\}, \{1, 0, 0\}, \{0, 0, 0\}$. If set otherwise, operation cannot be guaranteed.

- Notes:
1. When changing BRDV[1:0] or CPOL for each command for the continuous access in which the QSSL level is held, be sure to insert the QSSL negation delay period, next-access delay period, and clock delay period between commands. Otherwise, operation cannot be guaranteed.
 2. A clock polarity changing point may be detected as a clock edge if CPOL is changed with the QSSL level held.

Note: When changing SPIMOD[1:0] or CPHA for each command for the continuous access in which the QSSL level is held, be sure to insert one cycle or more between commands. Otherwise, operation cannot be guaranteed.
 (This also applies to write-to-read or read-to-write switching in dual-/quad-SPI modes.)
 In the figure below, the data line is driven during the command n period if command n is for dual-/quad-SPI write access.

17.3.14 Buffer Control Register (SPBFCR)

SPBFCR resets the number of data units in the transmit buffer (SPTXB) or receive buffer (SPRXB) and sets the number of triggering data units.

Bit:	7	6	5	4	3	2	1	0
	TXRST	RXRST	TXTRG1	TXTRG0	—	RXTRG2	RXTRG1	RXTRG0
Initial Value:	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7	TXRST	0	R/W	Transmit Buffer Data Reset Invalidates transmit data in the transmit buffer and resets the transmit buffer to an empty state. 0: Allows the transmit buffer normal operation. 1: Resets the transmit buffer.
6	RXRST	0	R/W	Receive Buffer Data Reset Invalidates receive data in the receive buffer and resets the receive buffer to an empty state. 0: Allows the receive buffer normal operation. 1: Resets the receive buffer.
5	TXTRG1	0	R/W	Transmit Buffer Data Triggering Number
4	TXTRG0	0	R/W	Specifies the timing at which the transmit buffer empty state is determined, that is when the SPTEF flag in the status register is set. When the number of bytes of data in the transmit buffer (SPTXB) is equal to or less than the specified triggering number, the SPTEF flag is set to 1. 00: 31 bytes (1 byte available) 01: 30 bytes (2 bytes available) 10: 28 bytes (4 bytes available) 11: 0 bytes (32 bytes available)
3	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
2	RXTRG2	0	R/W	Receive Buffer Data Triggering Number
1	RXTRG1	0	R/W	Specifies the timing at which the receive buffer full state is determined, that is when the SPRFF flag in the status register is set. When the number of bytes of data in the receive buffer (SPRXB) is equal to or greater than the specified triggering number, the SPRFF flag is set to 1. 000: 1 byte (31 bytes available) 001: 2 bytes (30 bytes available) 010: 4 bytes (28 bytes available) 011: 5 bytes (27 bytes available) 100: 8 bytes (24 bytes available) 101: 16 bytes (16 bytes available) 110: 24 bytes (8 bytes available) 111: 32 bytes (0 byte available)
0	RXTRG0	0	R/W	

17.3.15 Buffer Data Count Setting Register (SPBDCR)

SPBDCR indicates the number of data units stored in the transmit buffer (SPTXB) and receive buffer (SPRXB). The upper eight bits indicate the number of transmit data units in the transmit buffer and the lower eight bits indicate the number of receive data units in the receive buffer.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	TXBC5	TXBC4	TXBC3	TXBC2	TXBC1	TXBC0	—	—	RXBC5	RXBC4	RXBC3	RXBC2	RXBC1	RXBC0
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15, 14	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
13 to 8	TXBC[5:0]	000000	R	Transmit Data Byte Counter Indicates the number of transmit data bytes in the transmit data buffer (SPTXB). B'000000 indicates that SPTXB is empty. B'100000 indicates that SPTXB is full.
7, 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
5 to 0	RXBC[5:0]	000000	R	Receive Data Byte Counter Indicates the number of receive data bytes in the receive data buffer (SPRXB). B'000000 indicates that SPRXB is empty. B'100000 indicates that SPRXB is full.

17.3.16 Transfer Data Length Multiplier Setting Register n (SPBMULn) (n = 0, 1, 2, 3)

SPBMUL0 to SPBMUL3 set the number of times to transfer the specific length of data defined by the transfer data length setting bits (SPB[3:0]) in SPCMD0 to SPCMD3. SPBMUL0 to SPBMUL3 correspond to SPCMD0 to SPCMD3, respectively.

If a command register is referred to while the TEND bit in SPSR indicates that communication has not been completed and SPBMUL corresponding to the referred-to command register is modified, the subsequent operation is not guaranteed. The currently referred-to command register can be checked by reading the sequence status register (SPSSR).

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	SPBMUL [31:24]								SPBMUL [23:16]							
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	SPBMUL [31:0]	H'00000001	R/W	<p>Transfer Data Length Multiplier Setting</p> <p>These bits set the multiplier for transfer data; that is, the number of times to transfer the specific length of data defined by SPB3 to SPB0 bits in SPCMD0 to SPCMD3.</p> <p>The actual amount of data to be transferred is determined by $SPB[3:0] \times SPBMUL[31:0]$.</p> <p>Setting these bits to H'00000000 allows the defined size of data to be transferred 4,294,967,296 times.</p>

17.4 Operation

In this section, the serial transfer period means a period from the beginning of driving valid data to the fetching of the final valid data, and the QSSL negation period means the idle period.

17.4.1 Overview of Operations

This module is capable of serial transfers in single-/dual-/quad-SPI modes. Table 17.4 gives the features of single-/dual-/quad-SPI modes.

Table 17.4 Features of Each SPI Mode

	Single-SPI	Dual-SPI	Quad-SPI
Number of data lines	One input line and one output line	Two IO lines	Four IO lines
Data line direction	Single-directional	Bidirectional	Bidirectional
Simultaneous transmission/reception	Supported	Not supported	Not supported

Table 17.5 gives the overview of operation.

Table 17.5 Overview of Operation

Items	Specification
QSPCLK signal	Output
QMO signal (single-SPI)	Output
QMI signal (single-SPI)	Input
QIO1 and QIO0 (dual-SPI)/ QIO3 to QIO0 (quad-SPI)	Input/output
QSSL signal	Output
Switching QSSL polarity	Supported
Transfer rate	$\sim B\phi$
Clock source	On-chip baud rate generator
Clock polarity	Positive/negative
Clock phase	Latch at rising/output at falling Latch at falling/output at rising
Transfer bit order	MSB first/LSB first
Transfer data length	$(8/16/32) \times (1 \text{ to } 4,294,967,296) \text{ bits}$
Burst transfer	Supported
QSPCLK delay control	Supported
QSSL negation delay control	Supported
Next-access delay control	Supported
Transfer start method	Writing data to the transmit buffer when SPE = 1 There is space in the receive buffer when SPE = 1*
Sequence control	Supported
Transmit buffer empty detection	Supported
Receive buffer full detection	Supported
Overrun error detection	Not supported
Underrun error detection	Not supported
Mode fault error detection	Not supported

Note: * During single-SPI operation and dual-/quad-SPI mode write operation, a transfer is started by setting SPE to 1 and writing data to the transmit buffer. During dual-/quad-SPI mode read operation, a transfer is started by setting SPE to 1 when there is space for the specified length of data in the receive buffer.

17.4.2 Pin Control

This module automatically switches the pin states according to the status after write/read transfer in single-/dual-/quad-SPI mode. The status of the data pins (QMO/QMI/QIO[3:0]) in the idle state depends on the MOIFE and MOIFV bit settings, the single-/dual-SPI mode QIO3 output fixed value bit (IO3FV) setting in, and the single-/dual-SPI mode QIO2 output fixed value bit (IO2FV) setting. Table 17.6 shows the pin states in single-SPI mode. Table 17.7 shows the pin states in dual-/quad-SPI modes.

Table 17.6 Pin States in Single-SPI Mode

Items	Single-SPI Mode
QSSL	Output
QSPCLK	Output
QMO	Output
QMI	Input
QMO in the idle state	MOIFE = 0: Final output value MOIFE = 1: MOIFV setting value
QMI in the idle state	—
QIO2	IO2FV setting value output or not used
QIO3	IO3FV setting value output or not used

Table 17.7 Pin States in Dual-/Quad-SPI Mode

Items	Dual-SPI Mode	Quad-SPI Mode
QSSL	Output	Output
QSPCLK	Output	Output
QIO0	I/O	I/O
QIO1	I/O	I/O
QIO2	IO2FV setting value output or not used	I/O
QIO3	IO3FV setting value output or not used	I/O
QIO0 in the idle state	After writing: MOIFE = 0: Final output value MOIFE = 1: MOIFV setting value After reading: Hi-Z	After writing: MOIFE = 0: Final output value MOIFE = 1: MOIFV setting value After reading: Hi-Z
QIO1 in the idle state	After writing: MOIFE = 0: Final output value MOIFE = 1: MOIFV setting value After reading: Hi-Z	After writing: MOIFE = 0: Final output value MOIFE = 1: MOIFV setting value After reading: Hi-Z
QIO2 in the idle state	IO2FV setting value output or not used	After writing: MOIFE = 0: Final output value MOIFE = 1: MOIFV setting value After reading: Hi-Z
QIO3 in the idle state	IO3FV setting value output or not used	After writing: MOIFE = 0: Final output value MOIFE = 1: MOIFV setting value After reading: Hi-Z

17.4.3 Transfer Format

The SPI has four clock settings determined by the QSPCLK polarity setting (CPOL) and QSPCLK phase setting (CPHA) bits in SPCMD0 to SPCMD3. Figure 17.1 shows the data latch/shift timing based on each setting in an 8-bit MSB first transfer. In figure 17.1, L indicates the latch timing and S indicates the shift timing. DATA corresponds to QMI/QMO in single-SPI mode; QIO1 and QIO0 in dual-SPI mode; or QIO3 to QIO0 in quad-SPI mode. t_{ckd} indicates the clock delay period when the SCKDEN bit in SPCMD0 to SPCMD3 is set to 1. Similarly, t_{slnd} indicates the QSSL negation delay period when the SLNDEN bit in SPCMD0 to SPCMD3 is set to 1, and t_{spnd} indicates the next-access delay period when the SPNDEN bit in SPCMD0 to SPCMD3 is set to 1.

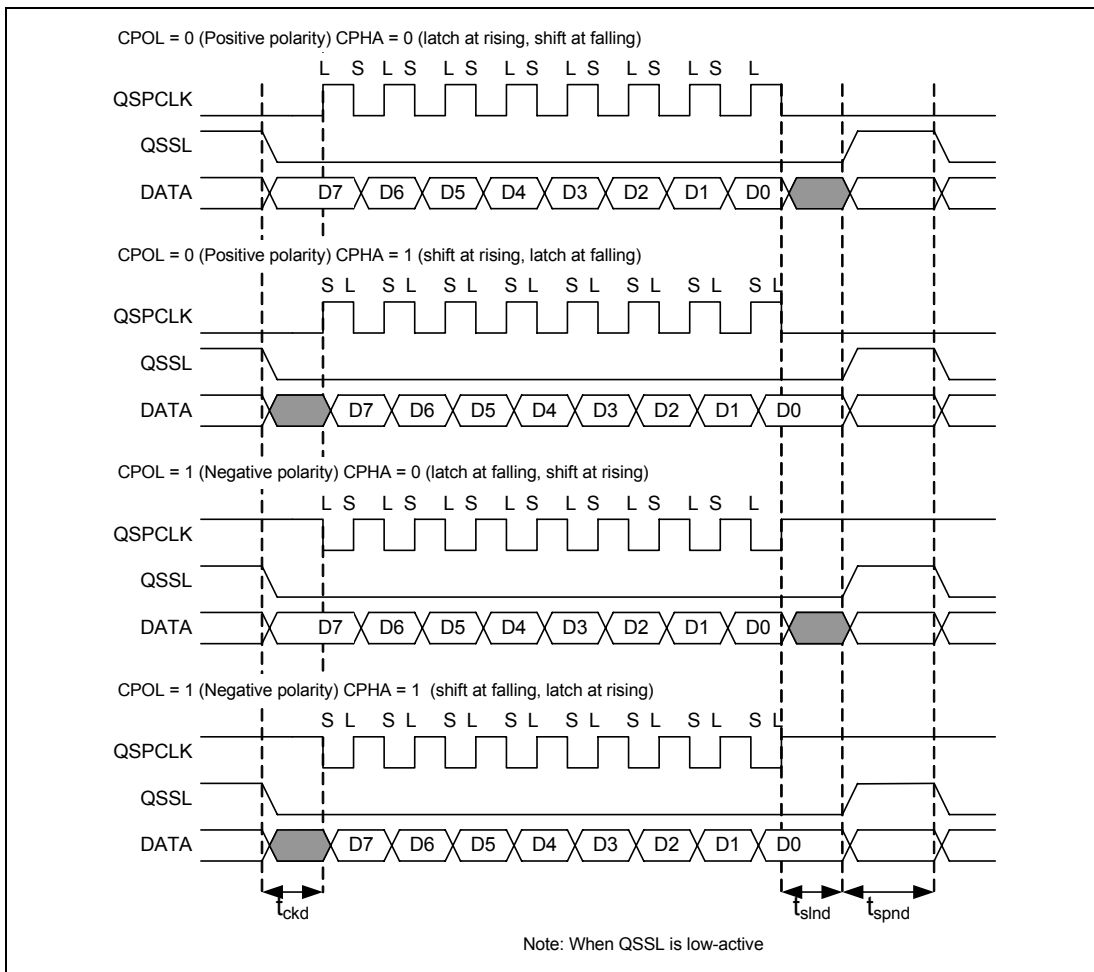

Figure 17.1 SPI Clock Setting and Transfer Timing

Note that when the base bit rate is used, transmission and reception when CPHA = 0 is not available.

The following describes 8-bit MSB first transfer in single-/dual-/quad-SPI modes when CPOL = 0 and CPHA = 0.

(1) Single-SPI Mode

Figure 17.2 shows the transfer format in single-SPI mode. This mode provides transmission and reception simultaneously. Since one data line is used for serial communication both in transmission and reception, the communication speed is 1 bit per QSPCLK clock cycle. Transfer data is specified using SPCMD0 to SPCMD3. For details of transfer data, see section 17.4.4, Transfer Data.

Figure 17.2 Transfer Format in Single-SPI Format

(2) Dual-SPI Mode

Figure 17.3 shows the transfer format in dual-SPI mode. This mode only provides operation of a single direction, that is, either transmission or reception. Transmission or reception can be set using the SPI read/write access setting bit (SPRW) in SPCMD0 to SPCMD3. Transmission is carried out by write operation and reception by read operation. The IO directions of QIO1 and QIO0 are switched accordingly. Since two data lines are used for serial communication both in transmission and reception, the communication speed is 2 bits per QSPCLK clock cycle. The start bit of the transfer data is output from QIO1. Transfer data is specified using SPCMD0 to SPCMD3. For details of transfer data, see section 17.4.4, Transfer Data.

Figure 17.3 Transfer Format in Dual-SPI Format

(3) Quad-SPI Mode

Figure 17.4 shows the transfer format in quad-SPI mode. This mode provides operation of a single direction, that is, either transmission or reception. Transmission or reception can be set using the SPRW bit in SPCMD0 to SPCMD3. Transmission and reception are accomplished by writing and reading, respectively. The IO directions of QIO3 to QIO0 are switched accordingly. Since four data lines are used for serial communication both in transmission and reception, the communication speed is 4 bits per QSPCLK clock cycle. The start bit of the transfer data is output from QIO3. Transfer data is specified using SPCMD0 to SPCMD3. For details of transfer data, see section 17.4.4, Transfer Data.

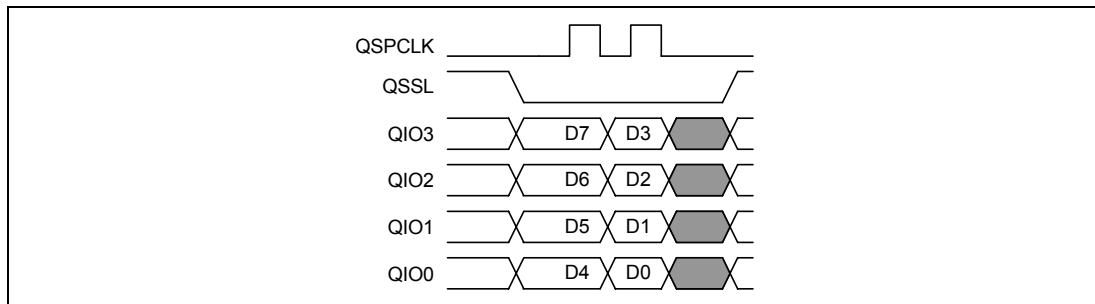

Figure 17.4 Transfer Format in Quad-SPI Format

17.4.4 Transfer Data

The data format is determined by the SPB3 to SPB0 and the LSB first (LSBF) bits in SPCMD0 to SPCMD3 and SPBMUL0 to SPBMUL3. In both MSB first and LSB first transfers, this module treats the specified size of data beginning at the MSB of the transmit shift register as transmit data, and the specified length of data beginning at the LSB of the receive shift register as receive data, regardless of whether the actual arrangement is MSB or LSB-first. The following sections describe MSB first and LSB first transfers in 32-bit, 16-bit, and 8-bit data units.

(1) MSB First Transfer (32-Bit Data)

Figure 17.5 shows the operation of the transmit buffer and transmit shift register, and the receive shift register and receive buffer when this module performs a 32-bit MSB-first data transfer.

For data transmission, the CPU or direct memory access controller writes 32-bit transmit data to the transmit buffer (SPTXB). If the transmit shift register is empty, this module copies the data with MSB-aligned in the transmit buffer to the transmit shift register, and fills the transmit shift register. When data transmission is started, this module outputs data beginning at the MSB (bit 31) of the transmit shift register, and when the QSPCLK clock cycle required for the serial transfer of 32 bits has passed, the transmit shift register becomes empty.

For data reception, data received from the data pin is stored in the receive shift register beginning at the LSB (bit 0). When the QSPCLK clock cycle required for the serial transfer of 32 bits has passed, the receive shift register becomes full. If the receive buffer (SPRXB) has a space for 32 bits or more, this module copies the 32-bit data beginning at the LSB from the receive shift register to the receive buffer, and empties the receive shift register. If the receive buffer does not have a space for 32 bits or more, data reception is not carried out. In order to start reception, the specified length of data should be read from the receive buffer to secure the space for 32 bits or more in the receive buffer.

In actual transfer, this operation is repeated for the number of times defined by SPBMUL0 to SPBMUL3.

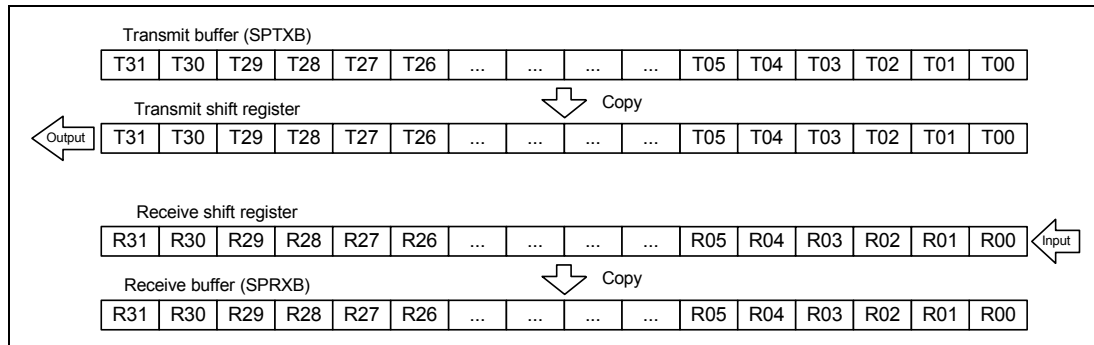

Figure 17.5 MSB First Transfer (32-Bit Data)

(2) MSB First Transfer (16-Bit Data)

Figure 17.6 shows the operation of the transmit buffer and transmit shift register, and the receive shift register and receive buffer when this module performs a 16-bit MSB-first data transfer.

For data transmission, the CPU or direct memory access controller writes 16-bit transmit data to the transmit buffer (SPTXB). If the transmit shift register is empty, this module copies the data with MSB-aligned in the transmit buffer to the transmit shift register, and fills the transmit shift register. When data transmission is started, this module outputs data beginning at the MSB (bit 31) of the transmit shift register, and when the QSPCLK clock cycle required for the serial transfer of 16 bits has passed, the transmit shift register becomes empty.

For data reception, data received from the data pin is stored in the receive shift register beginning at the LSB (bit 0). When the QSPCLK clock cycle required for the serial transfer of 16 bits has passed, the receive shift register becomes full. If the receive buffer (SPRXB) has a space for 16 bits or more, this module copies the 16-bit data beginning at the LSB from the receive shift register to the receive buffer, and empties the receive shift register. If the receive buffer does not have a space for 16 bits or more, data reception is not carried out. In order to start reception, the specified length of data should be read from the receive buffer to secure the space for 16 bits or more in the receive buffer.

In actual transfer, this operation is repeated for the number of times defined by SPBMUL0 to SPBMUL3.

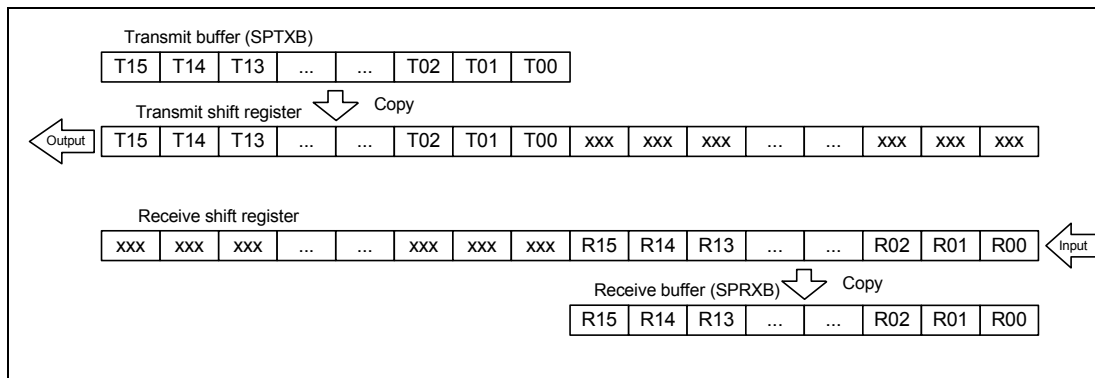

Figure 17.6 MSB First Transfer (16-Bit Data)

(3) MSB First Transfer (8-Bit Data)

Figure 17.7 shows the operation of the transmit buffer and transmit shift register, and the receive shift register and receive buffer when this module performs an 8-bit MSB-first data transfer.

For data transmission, the CPU or direct memory access controller writes 8-bit transmit data to the transmit buffer (SPTXB). If the transmit shift register is empty, this module copies the data with MSB-aligned in the transmit buffer to the transmit shift register, and fills the transmit shift register. When data transmission is started, this module outputs data beginning at the MSB (bit 31) of the transmit shift register, and when the QSPCLK clock cycle required for the serial transfer of 8 bits has passed, the transmit shift register becomes empty.

For data reception, data received from the data pin is stored in the receive shift register beginning at the LSB (bit 0). When the QSPCLK clock cycle required for the serial transfer of 8 bits has passed, the receive shift register becomes full. If the receive buffer (SPRXB) has a space for 8 bits or more, this module copies the 8-bit data beginning at the LSB from the receive shift register to the receive buffer, and empties the receive shift register. If the receive buffer does not have a space for 8 bits or more, data reception is not carried out. In order to start reception, data for the specified length of data should be read from the receive buffer to secure the space for 8 bits or more in the receive buffer.

In actual transfer, this operation is repeated for the number of times defined by SPBMUL0 to SPBMUL3.

Figure 17.7 MSB First Transfer (8-Bit Data)

(4) LSB First Transfer (32-Bit Data)

Figure 17.8 shows the operation of the transmit buffer and transmit shift register, and the receive shift register and receive buffer when this module performs a 32-bit LSB-first data transfer.

For data transmission, the CPU or direct memory access controller writes 32-bit transmit data to the transmit buffer (SPTXB). If the transmit shift register is empty, this module reverses the bit order in the 32-bit transmit data, copies it with MSB-aligned to the transmit shift register, and fills the transmit shift register. When data transmission is started, this module outputs data beginning at the MSB (bit 31) of the transmit shift register, and when the QSPCLK clock cycle required for the serial transfer of 32 bits has passed, the transmit shift register becomes empty.

For data reception, data received from the data pin is stored in the receive shift register beginning at the LSB (bit 0). When the QSPCLK clock cycle required for the serial transfer of 32 bits has passed, the receive shift register becomes full. If the receive buffer (SPRXB) has a space for 32 bits or more, this module reverses the order of the bits of the 32-bit data, copies it beginning at the LSB from the receive shift register to the receive buffer, and empties the receive shift register. If the receive buffer does not have a space for 32 bits or more, data reception is not carried out. In order to start reception, the specified length of data should be read from the receive buffer to secure the space for 32 bits or more in the receive buffer.

In actual transfer, this operation is repeated for the number of times defined by SPBMUL0 to SPBMUL3.

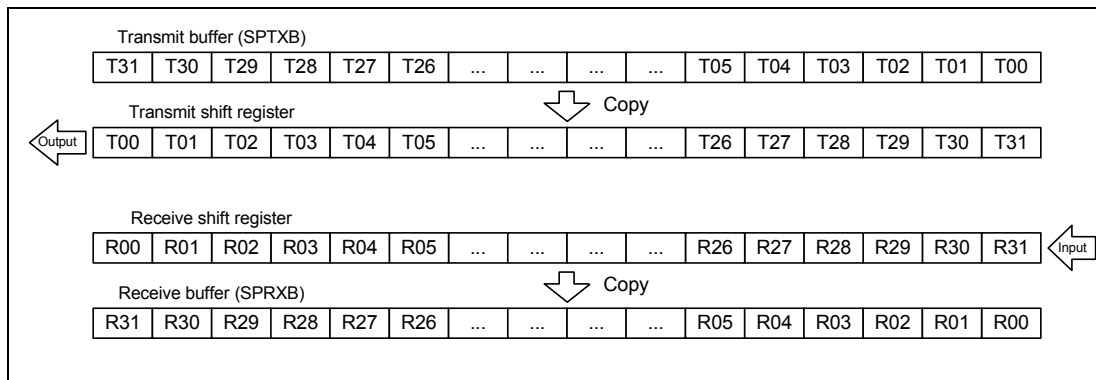

Figure 17.8 LSB First Transfer (32-Bit Data)

(5) LSB First Transfer (16-Bit Data)

Figure 17.9 shows the operation of the transmit buffer and transmit shift register, and the receive shift register and receive buffer when this module performs a 16-bit LSB-first data transfer.

For data transmission, the CPU or direct memory access controller writes 16-bit transmit data to the transmit buffer (SPTXB). If the transmit shift register is empty, this module reverses the bit order in the 16-bit transmit data, copies it with MSB-aligned to the transmit shift register, and fills the transmit shift register. When data transmission is started, this module outputs data beginning at the MSB (bit 31) of the transmit shift register, and when the QSPCLK clock cycle required for the serial transfer of 16 bits has passed, the transmit shift register becomes empty.

For data reception, data received from the data pin is stored in the receive shift register beginning at the LSB (bit 0). When the QSPCLK clock cycle required for the serial transfer of 16 bits has passed, the receive shift register becomes full. If the receive buffer (SPRXB) has a space for 16 bits or more, this module reverses the bit order in the 16-bit data, copies it beginning at the LSB from the receive shift register to the receive buffer, and empties the receive shift register. If the receive buffer does not have a space for 16 bits or more, data reception is not carried out. In order to start reception, the specified length of data should be read from the receive buffer to secure the space for 16 bits or more in the receive buffer.

In actual transfer, this operation is repeated for the number of times defined by SPBMUL0 to SPBMUL3.

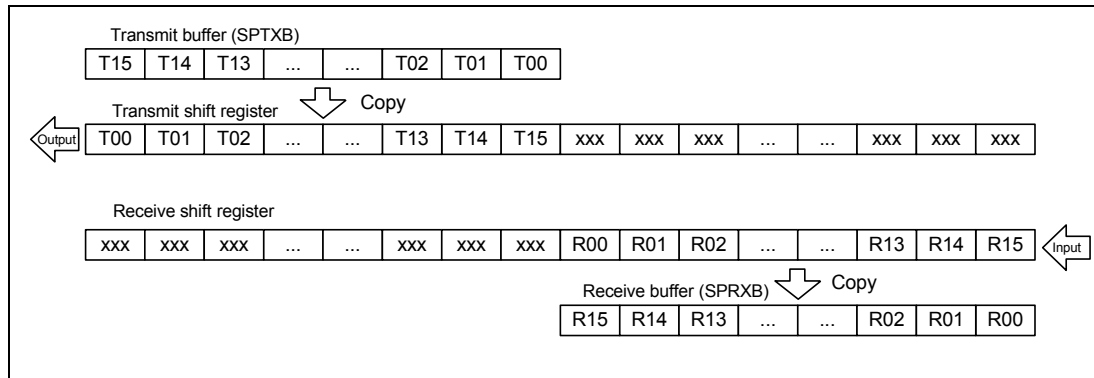

Figure 17.9 LSB First Transfer (16-Bit Data)

(6) LSB First Transfer (8-Bit Data)

Figure 17.10 shows the operation of the transmit buffer and transmit shift register, and the receive shift register and receive buffer when this module performs an 8-bit LSB-first data transfer.

For data transmission, the CPU or direct memory access controller writes 8-bit transmit data to the transmit buffer (SPTXB). If the transmit shift register is empty, this module reverses the bit order in the 8-bit transmit data, copies it with MSB-aligned to the transmit shift register, and fills the transmit shift register. When data transmission is started, this module outputs data beginning at the MSB (bit 31) of the transmit shift register, and when the QSPCLK clock cycle required for the serial transfer of 8 bits has passed, the transmit shift register becomes empty.

For data reception, data received from the data pin is stored in the received shift register beginning at the LSB (bit 0). When the QSPCLK clock cycle required for the serial transfer of 8 bits has passed, the receive shift register becomes full. If the receive buffer (SPRXB) has a space for 8 bits or more, this module reverses the bit order in the 8-bit data, copies it beginning at the LSB from the receive shift register to the receive buffer, and empties the receive shift register. If the receive buffer does not have a space for 8 bits or more, data reception is not carried out. In order to start reception, the specified length of data should be read from the receive buffer to secure the space for 8 bits or more in the receive buffer.

In actual transfer, this operation is repeated for the number of times defined by SPBMUL0 to SPBMUL3.

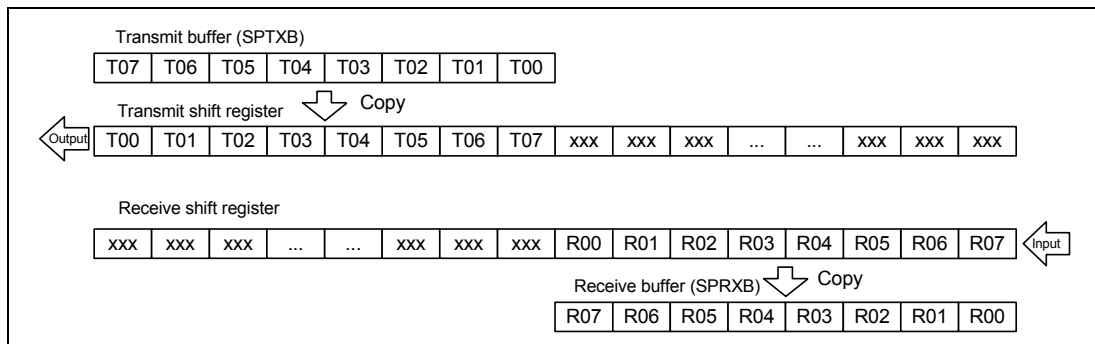

Figure 17.10 LSB First Transfer (8-Bit Data)

17.4.5 Non-Normal Transfer Operations

In the normal serial transfer, the data written from SPDR to the transmit buffer is serially transmitted, and the serially received data can be read from the receive buffer of SPDR. If access is made to SPDR, depending on the status of the transmit buffer/receive buffer, in some cases non-normal transfers can be executed.

Table 17.8 shows the relationship between non-normal transfer operations.

Table 17.8 Relationship between Non-Normal Transfer Operations

	Occurrence Condition	Operation
A	SPDR is written when the transmit buffer is full.	Missing write data.
B	SPDR is read when the receive buffer is empty.	The output data is undefined.

On operation A shown in table 17.8, whether SPDR can be written to or not can be checked using the transmit data byte counter bits (TXBC[5:0]) in the buffer data count setting register (SPBDCR).

Similarly, on operation B shown in table 17.8, whether the valid data is stored in the receive buffer or not can be checked by reading the receive data byte counter bits (RXBC[5:0]) in SPBDCR.

17.4.6 Initialization

If 0 is written to the SPE bit in SPCR, this module disables the module function, and initializes a part of the module function. When a power-on reset is generated, this module initializes all of the module function.

When the SPE bit in SPCR is cleared to 0, this module performs the following initialization:

- Suspending any serial transfer that is being executed
- Initializing the transmit shift register and the receive shift register
- Initializing the internal state machine
- Initializing the sequence
- Initializing the TEND bit in SPSR

Initialization by the clearing of the SPE bit to 0 does not initialize the control bits of this module and the transmit/receive buffer. For this reason, this module can be started in the same transfer mode as prior to the initialization if the SPE bit is re-set to 1. However, clearing the SPE bit to 0 initializes the transmit shift register and the receive shift register and allows the data that is being transferred to be discarded.

17.4.7 SPI Operation

The operating modes of this module are listed below.

- Single-SPI mode
- Dual-SPI mode/quad-SPI mode

The operation in each mode is described below.

(1) Single-SPI Mode

(a) Starting Serial Transfer

The serial transfer start conditions are: there is the specified length of data in the transmit buffer; and there is space for the specified length of data in the receive buffer.

(b) Terminating Serial Transfer

Irrespective of the clock setting, this module terminates the serial transfer after transmitting an QSPCLK edge corresponding to the final sampling timing. After the serial transfer is completed, receive data is copied from the receive shift register to the receive buffer. If there is not enough space for the specified length of data in the receive buffer after receive data is copied from the receive shift register to the receive buffer, another serial transfer will not be performed.

(c) Sequence Control

In single-SPI mode, according to the sequence length that is assigned to the sequence control register (SPSCR), this module makes up a sequence comprised of a part or all of SPCMD0 to SPCMD3 and SPBMUL0 to SPBMUL3. This module contains a pointer to the SPCMD that makes up the sequence. The value of this pointer can be checked by reading SPSSR.

When the SPE bit in SPCR is set to 1 and the function of this module is enabled, this module loads the pointer to the commands in SPCMD0, and incorporates the SPCMD0 and SPBMUL0 settings into the transfer format at the beginning of serial transfer. This module increments the pointer each time the next-access delay period for a data transfer that corresponds to the referenced SPCMD0 to SPCMD3 ends. Upon completion of the serial transfer that corresponds to the final command comprising the sequence, this module sets the pointer in SPCMD0, and in this manner the sequence is executed repeatedly.

The following items are set in command registers SPCMD0 to SPCMD3: basic transfer data length, MSB or LSB first, clock settings, some of the bit rate settings, SPI transfer mode and transfer direction (only in dual-/quad-SPI modes), whether QSSL level is held, a clock delay period, an QSSL negation delay period, and a next-access delay period. The total amount of data to be transferred is determined by multiplying the basic length of data to be transferred by the value set with SPBMUL0 to SPBMUL3.

Figure 17.11 shows an operation example when SPSCR is set to H'02, and the sequence is configured based on SPCMD0 to SPCMD2 settings. In figure 17.11, shaded areas of QMO/QMI indicate invalid data. Periods (1) to (3) in figure 17.11 indicate the followings.

- (1) Clock delay period (SPCKD) setting value = B'000 (1 QSPCLK cycle)
- (2) QSSL negation delay period (QSSLND) setting value = B'000 (1 QSPCLK cycle)
- (3) Next-access delay period (SPND) setting value = B'000 (1 QSPCLK cycle)

Figure 17.11 Sequence Control Operation

(d) Burst Transfer

This module can execute burst transfer with the following two methods in single-SPI mode.

One method uses the SPB[3:0] bits in SPCMD0 to SPCMD3 and SPBMUL0 to SPBMUL3. Setting SPB[3:0] to select 8, 16, or 32 bits and setting SPBMUL0 to SPBMUL3 to select one through 4,294,967,296 allows the specified length of data to be continuously transferred for the specified times, where the length is specified by SPB[3:0] and the number of times is specified by SPBMUL0 to SPBMUL3. However, if the transmit buffer (SPTXB) becomes empty during transfer, or the receive buffer (SPRXB) has no longer a space enough to receive the specified length of data defined by SPB[3:0], the clock is stopped until transfer is resumed. Figure 17.12 shows a burst transfer example in which SPB[3:0] are set to select 32 bits and SPBMUL to select four times thus specifying 128 bits as a total transfer data amount. The following describes operations (1) to (4) in the figure.

- (1) First 32-bit data transfer
- (2) Second 32-bit data transfer
- (3) When the transmit buffer becomes empty or the receive buffer has no longer a space for 32 or more bits, the clock is stopped. Here, the QMO continues outputting the previous value. When data is written to the transmit buffer or an enough space is created in the receive buffer, the clock output is resumed to restart transfer.
- (4) Third and fourth 32-bit data transfer

Figure 17.12 Burst Transfer Example in which Total Transfer Data Amount is 128 Bits (Single-SPI Mode Used)

In the other method, QSSL is kept asserted after a serial transfer is completed until the next serial transfer. Setting the QSSL signal level keeping bit (SSLKP) to 1 in SPCMD0 to SPCMD3 allows the QSSL signal to be kept asserted after the transfer corresponding to the pertinent command register is completed until the next transfer. Figure 17.13 shows a burst transfer example in which the QSSL signal level keeping function is used. The following describes operations (1) to (6) in the figure.

- (1) Clock delay period according to the SPCMD0 setting. The setting must be made so that the delay period should be at least one QSPCLK cycle for the first transfer in the burst transfer.
- (2) QSSL negation delay period according to the SPCMD0 setting. Since SSLKP is set to 1, QSSL is not negated even after QSSL negation delay period is over. The QSSL negation delay period depends on the SLNDEN bit setting in SPCMD0. When SLNDEN is 1, the QSSL negation delay period is determined by the SSLND setting, and the delay period is 0 QSPCLK cycle when SLNDEN is 0.
- (3) Next-access delay period according to the SPCMD0 setting. Since SSLKP is set to 1, QSSL is not negated even after next-access delay period is over. The next-access delay period depends on the SPNDEN bit setting in SPCMD0. When SPNDEN is 1, the next-access delay period is determined by the SPND setting, and the delay period is 0 QSPCLK cycle when SPNDEN is 0.
- (4) Clock delay period according to the SPCMD1 setting. The clock delay period depends on the SCKDEN bit setting in SPCMD1. When SCKDEN is 1, the clock delay period is determined by the SPCKD setting, and the delay period is 0 QSPCLK cycle when SCKDEN is 0.
- (5) QSSL negation delay period according to the SPCMD1 setting. The setting must be made so that the delay period should be at least one QSPCLK cycle for the last transfer in the burst transfer. Since SSLKP in SPCMD1 is set to 0, QSSL is negated after QSSL negation delay period is over.
- (6) Next-access delay period according to the SPCMD1 setting. The setting must be made so that the delay period should be at least one QSPCLK cycle for the last transfer in the burst transfer. Be sure to set SSLKP to 0 to negate QSSL.

Figure 17.13 Burst Transfer Example in which QSSL Signal Level Keeping Function is Used (Single-SPI Mode)

Note the following when specifying a burst transfer using this method.

Periods (2) to (4) must be inserted without fail when changing the clock frequency division ratio or clock polarity through command update.

When the clock frequency division ratio is changed, period (4) may be advanced or delayed with respect to the set value.

At least period (2) must be inserted when changing the clock phase or transfer mode (single-/dual-/quad-SPI) through command update (changing dual-/quad-SPI includes changing read/write operation).

(e) Initialization Flowchart

Figure 17.14 is a flowchart illustrating an example of initialization in SPI operation when this module is used in single-SPI mode. For a description of how to set up the interrupt controller and direct memory access controller, see the descriptions given in the individual blocks.

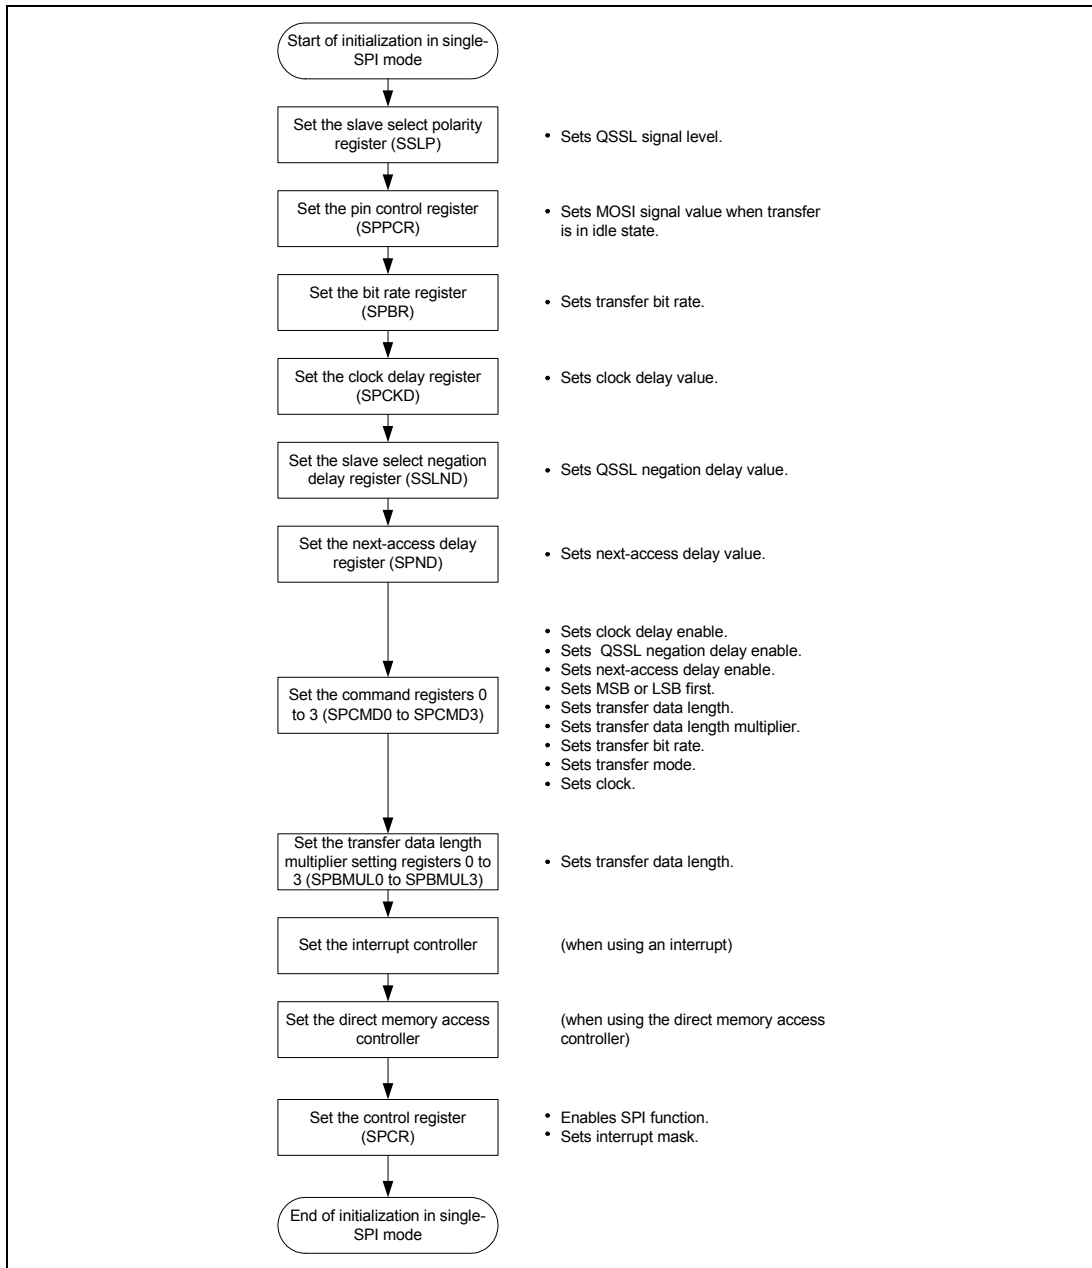

Figure 17.14 Example of Initialization Flowchart in Single-SPI Mode

(f) Transfer Operation Flowchart

Figure 17.15 is a flowchart illustrating a transfer in SPI operation when this module is used in single-SPI mode. Burst transfer by setting the transfer data length is also executed based on this flowchart.

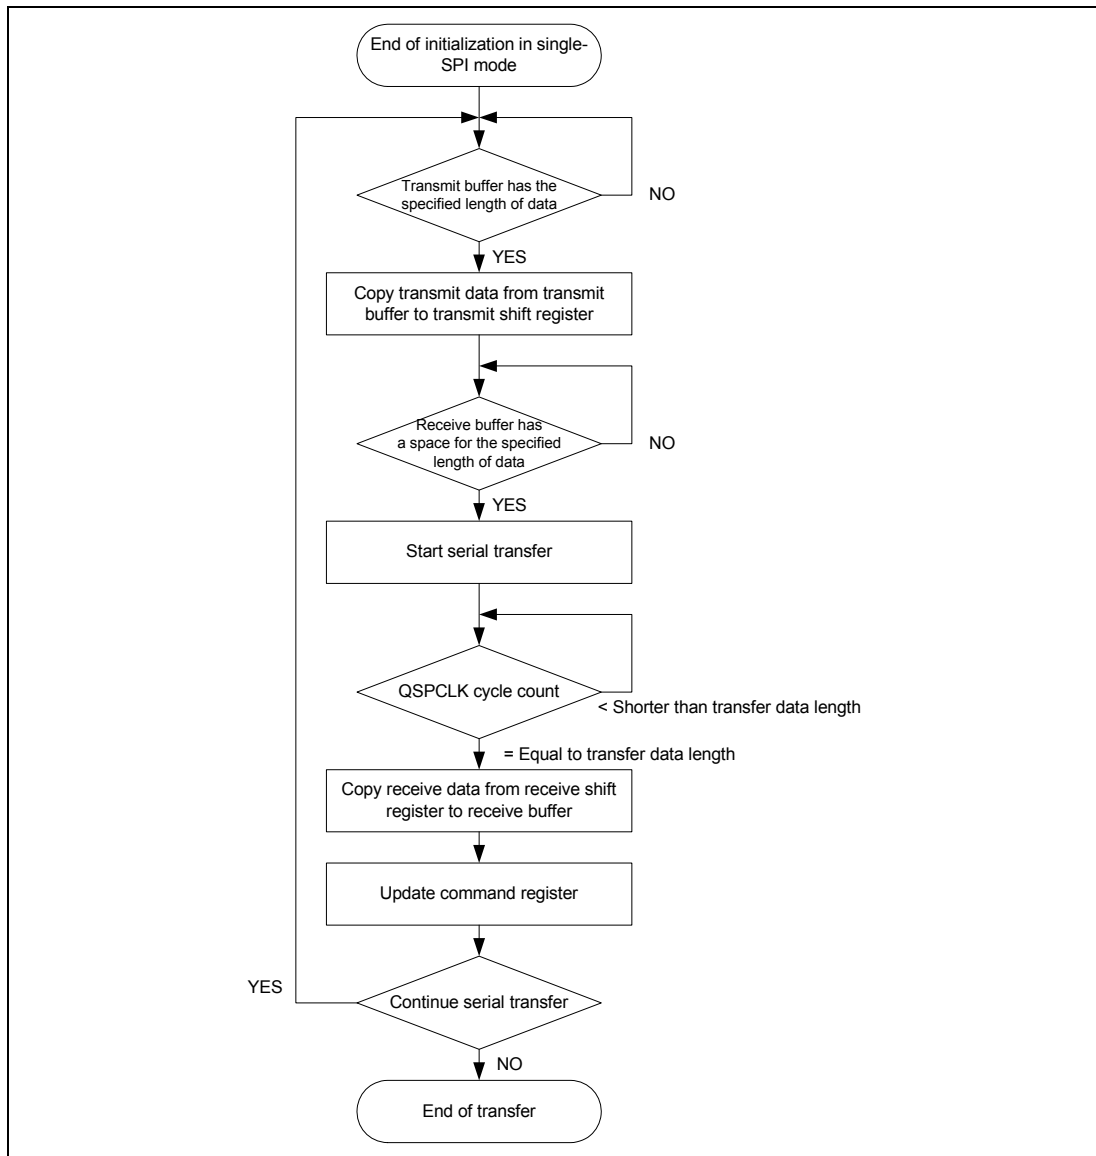

Figure 17.15 Transfer Operation Flowchart in Single-SPI Mode

(2) Dual-SPI/Quad-SPI Mode

(a) Starting Serial Transfer

In dual-/quad-SPI modes, the serial transfer start condition is different depending on the data transfer direction (transmission or reception).

In data transmission, the serial transfer start condition is that there is the specified length of data in the transmit buffer.

In data reception, the serial transfer start condition is that there is a space for the specified length of data in the receive buffer.

(b) Terminating Serial Transfer

Irrespective of data transmission or reception, this module terminates the serial transfer after transmitting an QSPCLK edge corresponding to the final sampling timing.

During idle cycles in dual-/quad-SPI modes, the IO pins are controlled differently depending on whether it is after write or read operation. Specifically, the IO pins output either the last output data or the fixed level depending on the register setting after write operation, whereas the IO pins are driven to the Hi-Z state after read operation. Figure 17.16 shows an example of the pin states after quad-SPI mode access is completed. The following describes operations (1) and (2) in the figure.

- (1) During write operation, QIO0 to QIO3 serve as output pins. Thus, when QSSL is negated upon completion of write operation, QIO0 to QIO3 output different values depending on the value of MOIFE in the SPPCR. Specifically, the IO pins output the level specified by MOIFV when MOIFE is 1, whereas the IO pins output the last output data when MOIFE is 0.
- (2) During read operation, QIO0 to QIO3 serve as input pins. Thus, when QSSL is negated upon completion of read operation, QIO0 to QIO3 are driven to Hi-Z state irrespective of the values of MOIFE and MOIFV.

For details on the pin control in dual-/quad-SPI modes, see section 17.4.2, Pin Control.

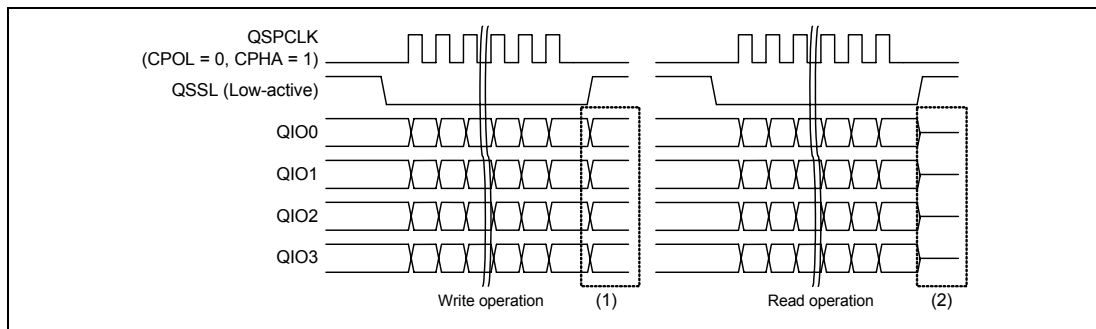

Figure 17.16 Example of Pin States after Quad-SPI Mode Access is Completed

(c) Sequence Control

As with the single-SPI mode, in dual-/quad-SPI modes, according to the sequence length that is assigned to SPSCR, this module makes up a sequence comprised of SPCMD0 to SPCMD3 and SPBMUL0 to SPBMUL3. For details on operation, see section 17.4.7 (1) (c), Sequence Control.

Dual-/quad-SPI modes only provide operation of a single direction, that is, either transmission or reception for serial transfer. Transmission or reception is set using the SPI read/write access setting bit (SPRW) in SPCMD0 to SPCMD3. One of the three operating modes including dual-SPI mode, quad-SPI mode, and single-SPI mode is set using the SPI operating mode setting bits (SPIMOD[1:0]) in SPCMD0 to SPCMD3. Combining these bits allow switching single-SPI mode, dual-SPI mode transmission/reception, and quad-SPI mode transmission/reception to control sequence. Figure 17.17 shows an example of sequence configuration with transfer mode switching.

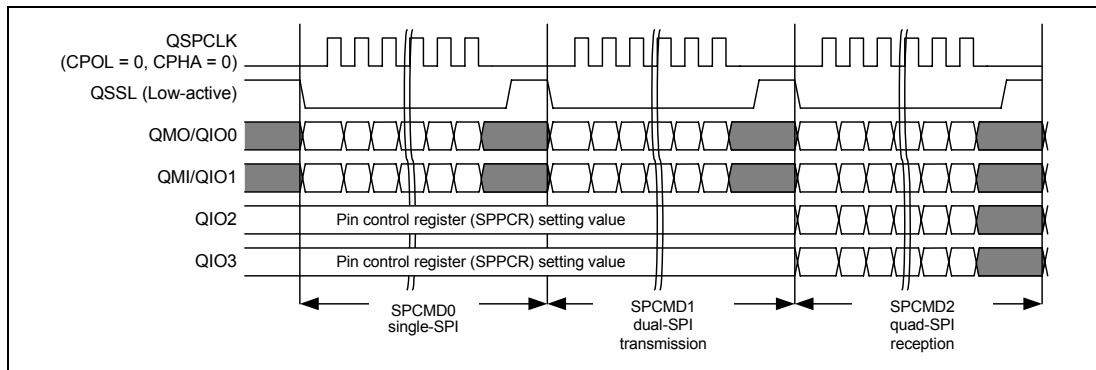

Figure 17.17 Example of Sequence Configuration with Transfer Mode Switching

Note the following when configuring a sequence in dual-/quad-SPI modes.

When all the commands configuring a sequence are dual-/quad-SPI read operations, the sequential operation is continued as long as the receive buffer has an enough space for the receive data.

To terminate read operation, clear the SPE bit to 0 in SPCR after receiving the required length of data, or execute write operation for the last sequence to empty the transmit buffer.

(d) Burst Transfer

This module can execute burst transfer with the following two methods in dual/quad SPI modes.

One method uses the SPB[3:0] bits in SPCMD0 to SPCMD3 and SPBMUL0 to SPBMUL3. As with the single-SPI mode, setting SPB[3:0] to select 8, 16, or 32 bits and setting SPBMUL0 to SPBMUL3 to select one through 4,294,967,296 allows the specified length of data to be continuously transferred for the specified times, where the length is specified by SPB[3:0] and the number of times is specified by SPBMUL0 to SPBMUL3. However, if the transmit buffer (SPTXB) becomes empty during transfer, or the receive buffer (SPRXB) has no longer a space enough to receive the specified length of data defined by SPB[3:0], the clock is stopped until transfer is resumed. This method is effective to transfer a large amount of data in dual-/quad SPI modes. Figure 17.18 shows a burst transfer example in which SPB[3:0] are set to select 32 bits and SPBMUL to select four times thus specifying 128 bits as a total transfer data amount. The following describes operations (1) to (4) in the figure.

- (1) First 32-bit data transfer
- (2) Second 32-bit data transfer
- (3) When the transmit buffer becomes empty or the receive buffer has no longer a space for 32 or more bits, the clock is stopped. Here, when QIO3 to QIO0 serve as output pins, QIO3 to QIO0 continue outputting the previous value. When QIO3 to QIO0 serve as input pins, the inputs to QIO3 to QIO0 depend on the output value of the device to communicate with. When data is written to the transmit buffer or an enough space is created in the receive buffer, the clock output is resumed to restart transfer.
- (4) Third and fourth 32-bit data transfer

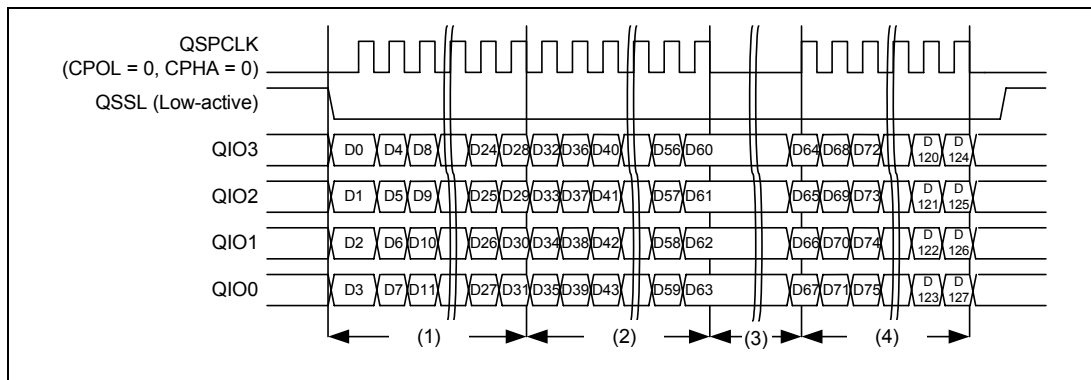

Figure 17.18 Burst Transfer Example in which Total Transfer Data Amount is 128 Bits (Quad-SPI Mode)

The other method uses the QSSL signal level keeping function as in single-SPI mode. Since this method allows switching the SPI transfer modes (single-/dual-/quad-SPI) during a transfer, it is particularly convenient when used with serial flash memory, where command data is written in single-SPI mode and data to be stored in memory is written in quad-SPI mode. Note, however, that at least one delay cycle should be inserted between transfers when switching the SPI transfer modes. Figure 17.19 shows a burst transfer example in which both single-SPI and quad-SPI modes are used. The following describes operations (1) to (6) in the figure.

- (1) Clock delay period according to the SPCMD0 setting. The setting must be made so that the delay period should be at least one QSPCLK cycle for the first transfer in the burst transfer.
- (2) QSSL negation delay period according to the SPCMD0 setting. Since SSLKP in SPCMD0 is set to 1, QSSL is not negated even after QSSL negation delay period is over. The QSSL negation delay period depends on the SLNDEN bit setting in SPCMD0. When SLNDEN is 1, the QSSL negation delay period is determined by the SSLND setting, and the delay period is 0 QSPCLK cycle when SLNDEN is 0.
- (3) Next-access delay period according to the SPCMD0 setting. Since SSLKP is set to 1, QSSL is not negated even after next-access delay period is over. The next-access delay period depends on the SPNDEN bit setting in SPCMD0. When SPNDEN is 1, the next-access delay period is determined by the SPND setting, and the delay period is 0 QSPCLK cycle when SPNDEN is 0. Up to this period, the data pin is driven according to the SPCMD0 setting.
- (4) Clock delay period according to the SPCMD1 setting. The clock delay period depends on the SCKDEN bit setting in SPCMD1. When SCKDEN is 1, the clock delay period is determined by the SPCKD setting, and the delay period is 0 QSPCLK cycle when SCKDEN is 0.

- (5) QSSL negation delay period according to the SPCMD1 setting. The setting must be made so that the delay period should be at least one QSPCLK cycle for the last transfer in the burst transfer. Since SSLKP in SPCMD1 is set to 0, QSSL is negated after QSSL negation delay period is over.
- (6) Next-access delay period according to the SPCMD1 setting. The setting must be made so that the delay period should be at least one QSPCLK cycle for the last transfer in the burst transfer. Be sure to set SSLKP to 0 to negate QSSL.

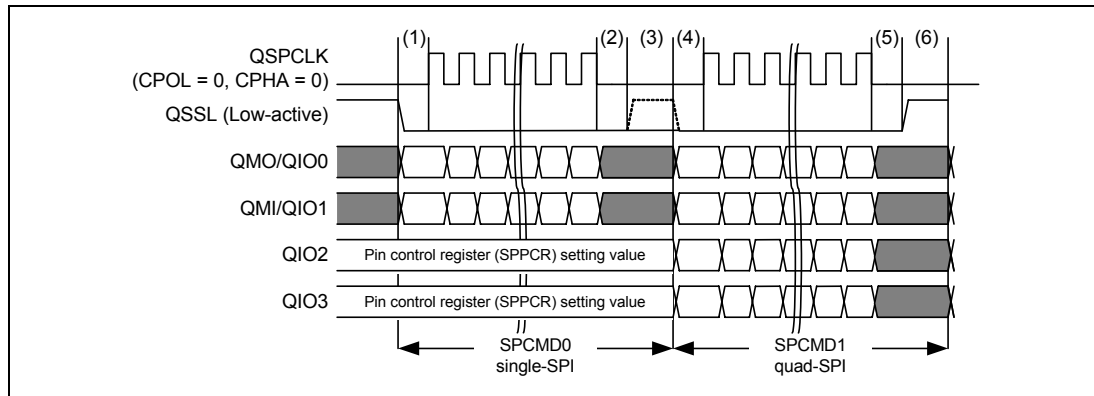

Figure 17.19 Burst Transfer Example in which QSSL Signal Level Keeping Function is Used (Single- and Quad-SPI Modes Used)

Note the following when specifying a burst transfer using this method.

Periods (2) to (4) must be inserted without fail when changing the clock frequency division ratio or clock polarity through command update.

When the clock frequency division ratio is changed, period (4) may be advanced or delayed with respect to the set value.

At least period (2) must be inserted when changing the clock phase or transfer mode (single-/dual-/quad-SPI) through command update (changing dual-/quad-SPI includes changing read/write operation).

(e) Initialization Flowchart

Figure 17.20 is a flowchart illustrating an example of initialization in SPI operation when this module is used in dual-/quad-SPI mode. For a description of how to set up the interrupt controller and direct memory access controller, see the descriptions given in the individual blocks.

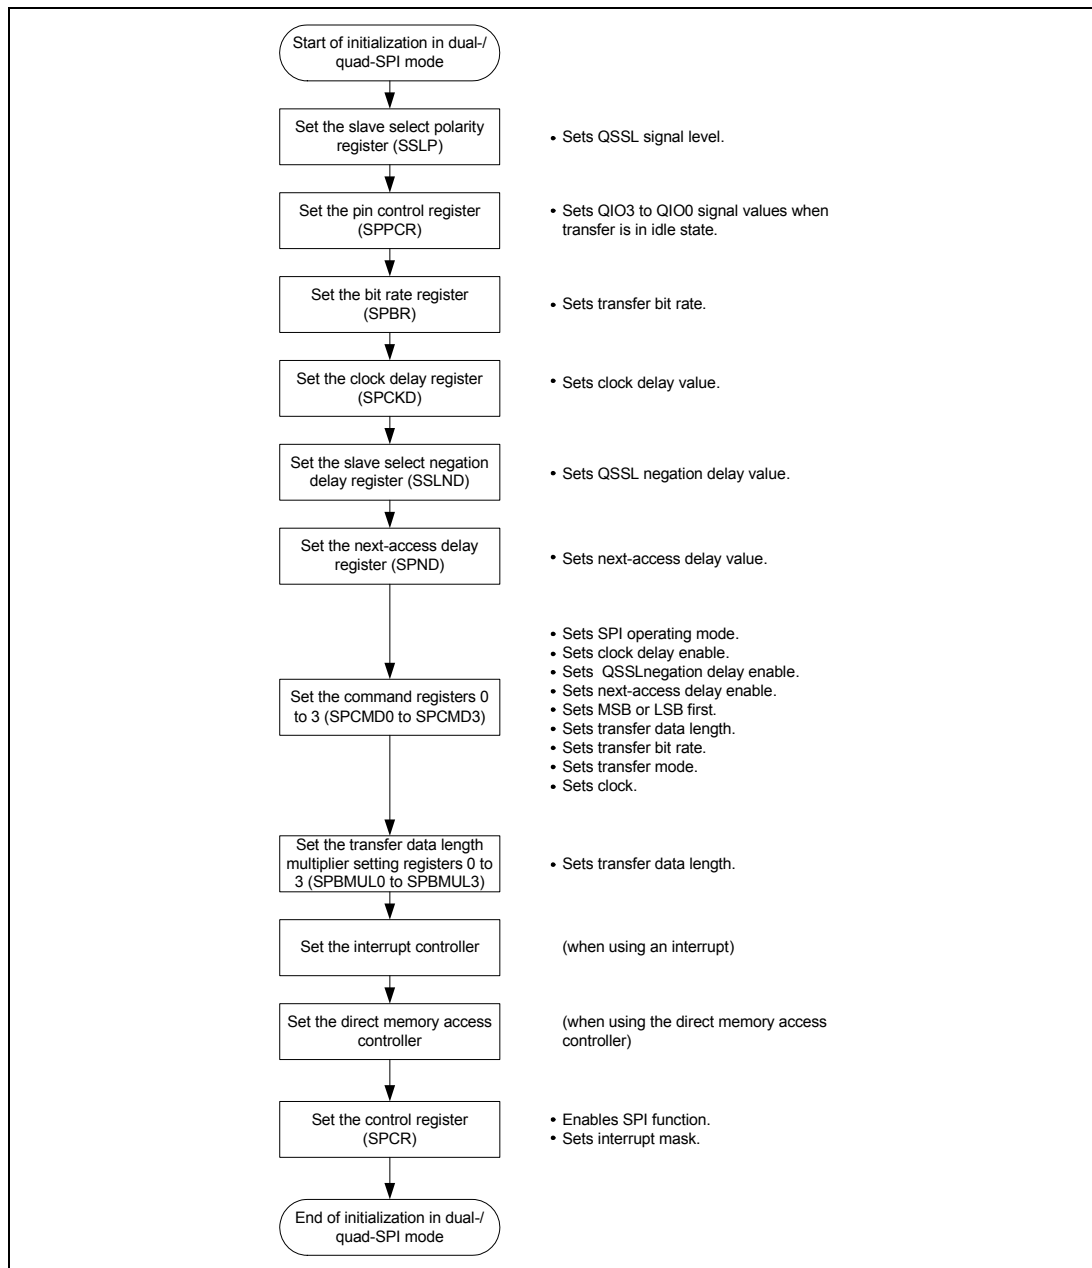

Figure 17.20 Example of Initialization Flowchart in Dual-/Quad-SPI Mode

(f) Transfer Operation Flowchart

Figure 17.21 is a flowchart illustrating a transfer in SPI operation when this module is used in dual-/quad-SPI mode.

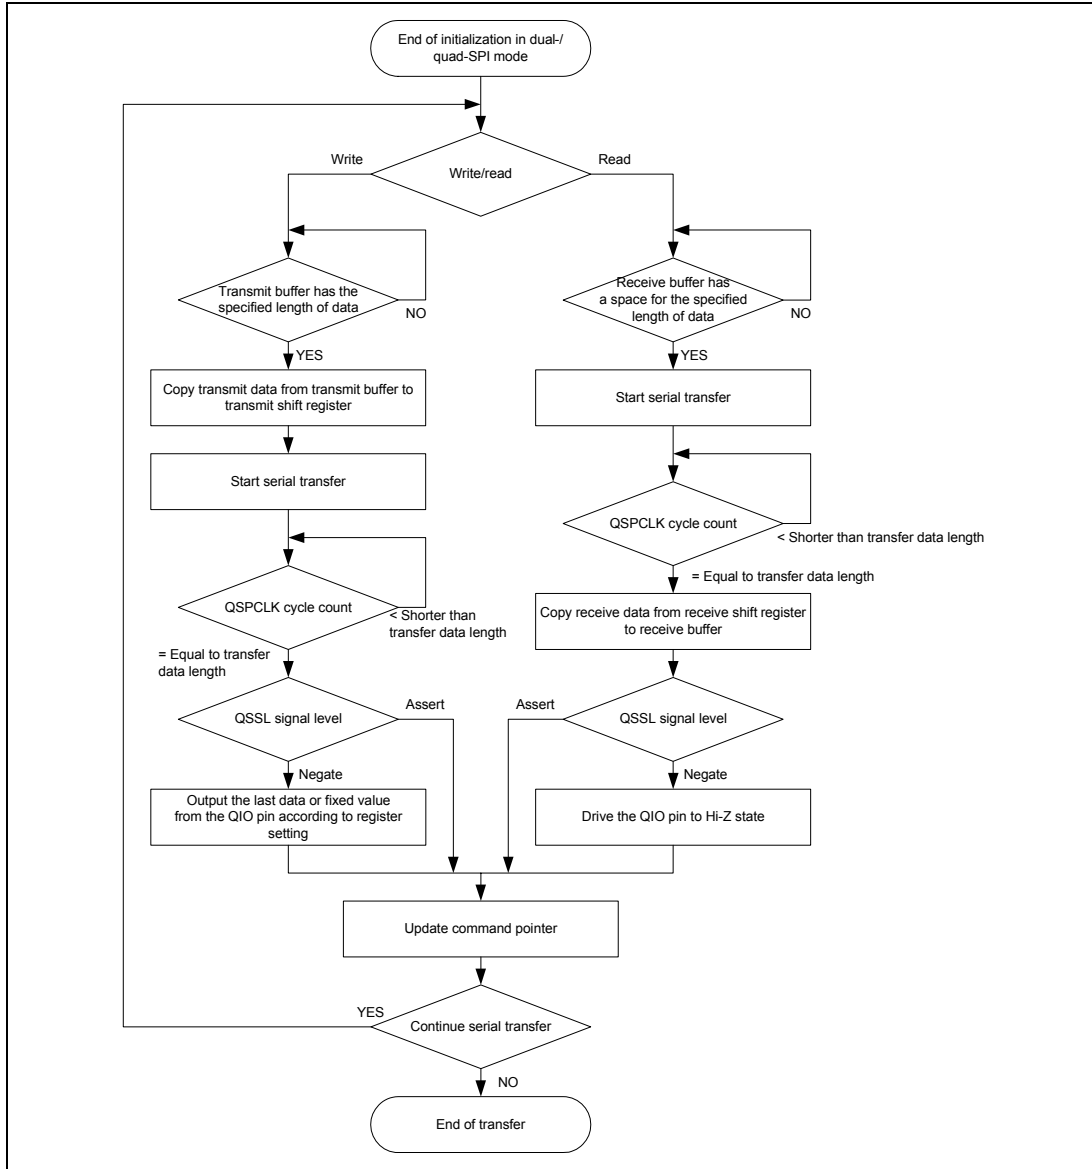

Figure 17.21 Transfer Operation Flowchart in Dual-/Quad-SPI Mode

17.4.8 Interrupt Sources

This module has interrupt sources of receive buffer full and transmit buffer empty. In addition, the direct memory access controller can be activated by the receive buffer full or transmit buffer empty interrupt for data transfer.

Table 17.9 shows the interrupt sources.

When any of the interrupt conditions in table 17.9 is met, an interrupt is generated. The interrupt sources should be cleared with data transfer by the CPU or direct memory access controller.

Table 17.9 Interrupt Sources

Name	Interrupt Source	Abbreviation	Interrupt Condition	Activation of Direct Memory Access Controller
SPRI	Receive buffer full	RXI	(SPRIE = 1) • (SPRF = 1)	Possible
SPTI	Transmit buffer empty	TXI	(SPTIE = 1) • (SPTEF = 1)	Possible

17.4.9 Loopback Mode

This module provides loopback mode for testing. Writing 1 to the loopback mode bit (SPLP) in the pin control register (SPPCR) enables loopback mode. In loopback mode, this module disconnects the paths between the transmit/receive shift registers and the QMI/QMO and QIO3 to QIO0 pins, and connects the outputs from the transmit shift register to the inputs to the receive shift register instead. Figure 17.22 shows a schematic internal connection in loopback mode.

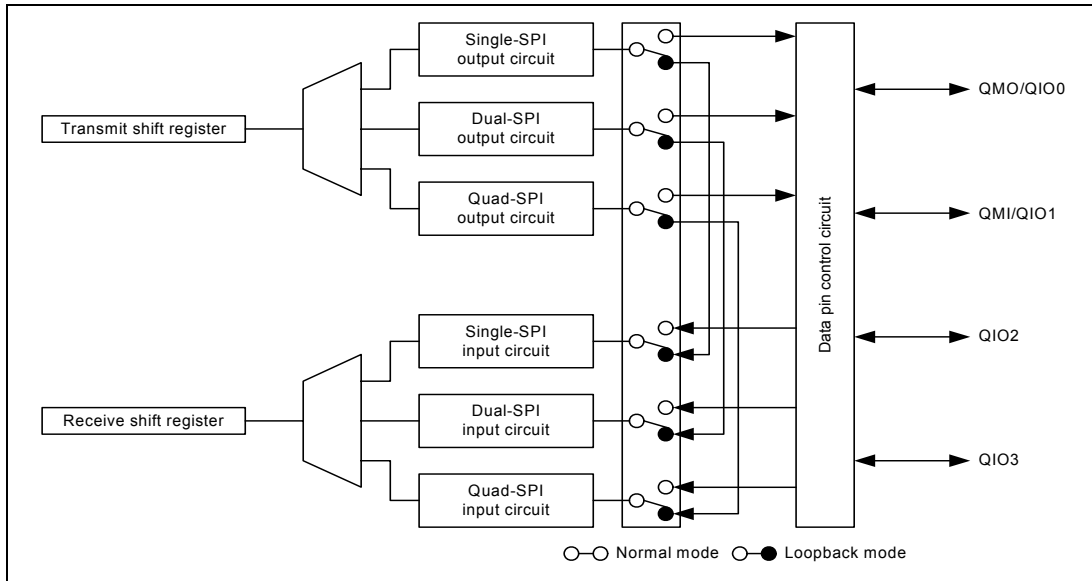

Figure 17.22 Schematic Internal Connection in Loopback Mode

Section 18 I²C Bus Interface 3

The I²C bus interface 3 conforms to and provides a subset of the Philips I²C (Inter-IC) bus interface functions. However, the configuration of the registers that control the I²C bus differs partly from the Philips register configuration.

The I²C bus interface 3 has three channels.

18.1 Features

- Selection of I²C format or clocked synchronous serial format
- Continuous transmission/reception
Since the shift register, transmit data register, and receive data register are independent from each other, the continuous transmission/reception can be performed.

I²C bus format:

- Start and stop conditions generated automatically in master mode
- Selection of acknowledge output levels when receiving
- Automatic loading of acknowledge bit when transmitting
- Bit synchronization function
In master mode, the state of SCL is monitored per bit, and the timing is synchronized automatically. If transmission/reception is not yet possible, set the SCL to low until preparations are completed.
- Six interrupt sources
Transmit data empty (including slave-address match), transmit end, receive data full (including slave-address match), arbitration lost, NACK detection, and stop condition detection
- The direct memory access controller can be activated by a transmit-data-empty request or receive-data-full request to transfer data.
- Direct bus drive
Two pins, SCL and SDA pins, function as NMOS open-drain outputs when the bus drive function is selected.

Clocked synchronous serial format:

- Four interrupt sources
Transmit-data-empty, transmit-end, receive-data-full, and overrun error
- The direct memory access controller can be activated by a transmit-data-empty request or receive-data-full request to transfer data.

Figure 18.1 shows a block diagram.

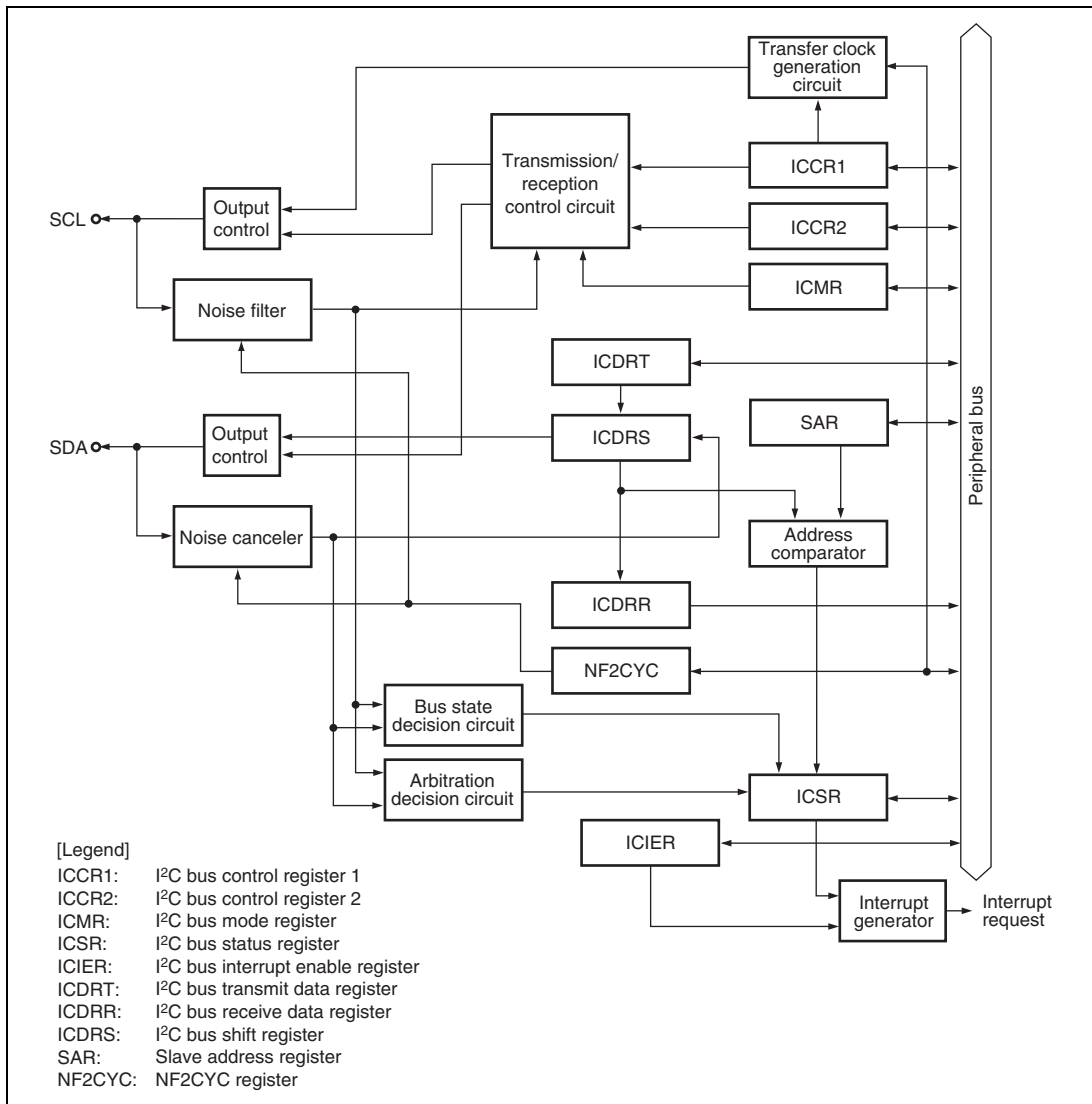

Figure 18.1 Block Diagram

18.2 Input/Output Pins

Table 18.1 shows the pin configuration.

Table 18.1 Pin Configuration

Pin Name	Symbol	I/O	Function
Serial clock	SCL0 to SCL2	I/O	I ² C serial clock input/output
Serial data	SDA0 to SDA2	I/O	I ² C serial data input/output

Figure 18.2 shows an example of I/O pin connections to external circuits.

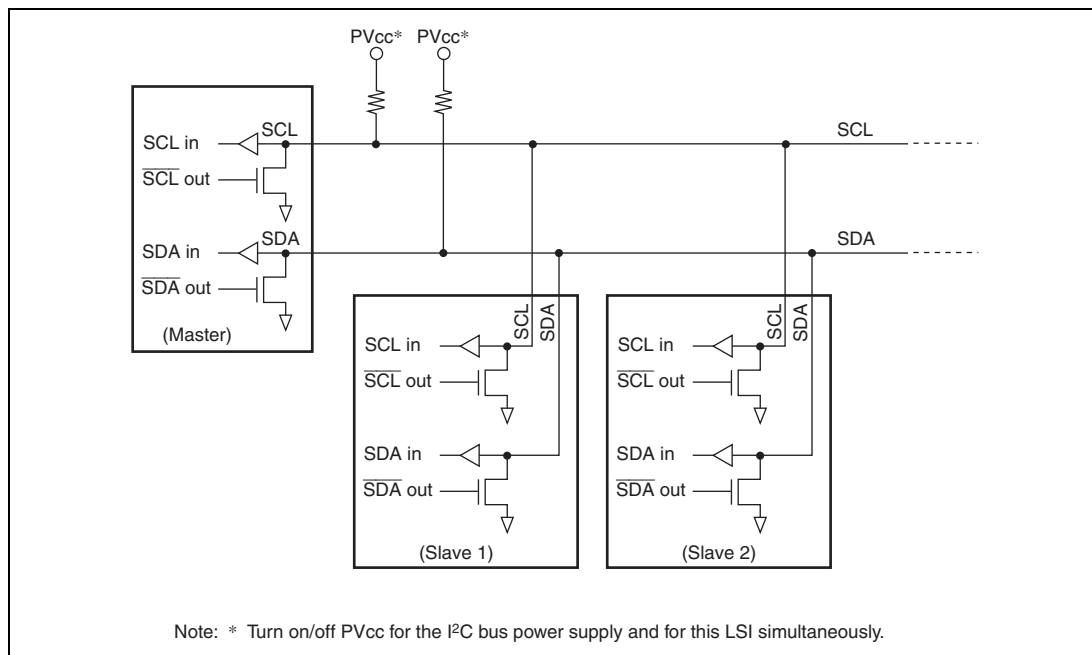

Figure 18.2 External Circuit Connections of I/O Pins

18.3 Register Descriptions

Table 18.2 shows the register configuration.

Table 18.2 Register Configuration

Channel	Register Name	Abbreviation	R/W	Initial Value	Address	Access Size
0	I ² C bus control register 1	ICCR1_0	R/W	H'00	H'FFFEE000	8
	I ² C bus control register 2	ICCR2_0	R/W	H'7D	H'FFFEE001	8
	I ² C bus mode register	ICMR_0	R/W	H'38	H'FFFEE002	8

	I ² C bus transmit data register	ICDRT_2	R/W	H'FF	H'FFFEE806	8
	I ² C bus receive data register	ICDRR_2	R/W	H'FF	H'FFFEE807	8
	NF2CYC register	NF2CYC_2	R/W	H'00	H'FFFEE808	8

18.3.1 I²C Bus Control Register 1 (ICCR1)

ICCR1 is an 8-bit readable/writable register that enables or disables the I²C bus interface 3, controls transmission or reception, and selects master or slave mode, transmission or reception, and transfer clock frequency in master mode.

Bit:	7	6	5	4	3	2	1	0
	ICE	RCVD	MST	TRS	CKS[3:0]			
Initial value:	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7	ICE	0	R/W	I ² C Bus Interface 3 Enable 0: SCL and SDA output is disabled. (Input to SCL and SDA is enabled.) 1: This bit is enabled for transfer operations. (SCL and SDA pins are bus drive state.)
6	RCVD	0	R/W	Reception Disable Enables or disables the next operation when TRS is 0 and ICRRR is read. 0: Enables next reception 1: Disables next reception

Bit	Bit Name	Initial Value	R/W	Description
5	MST	0	R/W	Master/Slave Select
4	TRS	0	R/W	<p>Transmit/Receive Select</p> <p>In master mode with the I²C bus format, when arbitration is lost, MST and TRS are both reset by hardware, causing a transition to slave receive mode. Modification of the TRS bit should be made between transfer frames.</p> <p>When seven bits after the start condition is issued in slave receive mode match the slave address set to SAR and the 8th bit is set to 1, TRS is automatically set to 1. If an overrun error occurs in master receive mode with the clocked synchronous serial format, MST is cleared and the mode changes to slave receive mode.</p> <p>Operating modes are described below according to MST and TRS combination. When clocked synchronous serial format is selected and MST = 1, clock is output.</p> <p>00: Slave receive mode 01: Slave transmit mode 10: Master receive mode 11: Master transmit mode</p>
3 to 0	CKS[3:0]	0000	R/W	<p>Transfer Clock Select</p> <p>These bits should be set according to the necessary transfer rate (table 18.3) in master mode.</p>

Table 18.3 Transfer Rate

NF2CYC		ICCR1			Clock	Transfer Rate (kHz)			
Bit 4	Bit 3	Bit 2	Bit 1	Bit 0		P ϕ = 20.0 MHz	P ϕ = 24.0 MHz	P ϕ = 32.0 MHz	P ϕ = 36.0 MHz

				1	P ϕ /1728	11.6	13.9	18.5	20.8

Note: The settings should satisfy external specifications.

18.3.2 I²C Bus Control Register 2 (ICCR2)

ICCR2 is an 8-bit readable/writable register that issues start/stop conditions, manipulates the SDA pin, monitors the SCL pin, and controls reset in the control part of the I²C bus.

Bit:	7	6	5	4	3	2	1	0
	BBSY	SCP	SDAO	SDAOP	SCLO	-	IICRST	-
Initial value:	0	1	1	1	1	1	0	1
R/W:	R/W	R/W	R/W	R/W	R	R	R/W	R

Bit	Bit Name	Initial Value	R/W	Description
7	BBSY	0	R/W	<p>Bus Busy</p> <p>Enables to confirm whether the I²C bus is occupied or released and to issue start/stop conditions in master mode. With the clocked synchronous serial format, this bit is always read as 0. With the I²C bus format, this bit is set to 1 when the SDA level changes from high to low under the condition of SCL = high, assuming that the start condition has been issued. This bit is cleared to 0 when the SDA level changes from low to high under the condition of SCL = high, assuming that the stop condition has been issued. Write 1 to BBSY and 0 to SCP to issue a start condition. Follow this procedure when also re-transmitting a start condition. Write 0 in BBSY and 0 in SCP to issue a stop condition.</p>
6	SCP	1	R/W	<p>Start/Stop Issue Condition Disable</p> <p>Controls the issue of start/stop conditions in master mode. To issue a start condition, write 1 in BBSY and 0 in SCP. A retransmit start condition is issued in the same way. To issue a stop condition, write 0 in BBSY and 0 in SCP. This bit is always read as 1. Even if 1 is written to this bit, the data will not be stored.</p>

Bit	Bit Name	Initial Value	R/W	Description
5	SDAO	1	R/W	<p>SDA Output Value Control</p> <p>This bit is used with SDAOP when modifying output level of SDA. This bit should not be manipulated during transfer.</p> <p>0: When reading, SDA pin outputs low. When writing, SDA pin is changed to output low.</p> <p>1: When reading, SDA pin outputs high. When writing, SDA pin is changed to output Hi-Z (outputs high by external pull-up resistance).</p>
4	SDAOP	1	R/W	<p>SDAO Write Protect</p> <p>Controls change of output level of the SDA pin by modifying the SDAO bit. To change the output level, clear SDAO and SDAOP to 0 or set SDAO to 1 and clear SDAOP to 0. This bit is always read as 1.</p>
3	SCLO	1	R	<p>SCL Output Level</p> <p>Monitors SCL output level. When SCLO is 1, SCL pin outputs high. When SCLO is 0, SCL pin outputs low.</p>
2	—	1	R	<p>Reserved</p> <p>This bit is always read as 1. The write value should always be 1.</p>
1	IICRST	0	R/W	<p>Control Part Reset</p> <p>Resets bits BC[2:0] in ICMR and internal circuits. If this bit is set to 1 when hang-up occurs because of communication failure during I²C bus operation, bits BC[2:0] in ICMR and internal circuits can be reset.</p>
0	—	1	R	<p>Reserved</p> <p>This bit is always read as 1. The write value should always be 1.</p>

18.3.3 I²C Bus Mode Register (ICMR)

ICMR is an 8-bit readable/writable register that selects whether the MSB or LSB is transferred first, performs master mode wait control, and selects the transfer bit count.

Bits BC[2:0] are initialized to H'0 by the IICRST bit in ICCR2.

Bit:	7	6	5	4	3	2	1	0
	MLS	-	-	-	BCWP	BC[2:0]		
Initial value:	0	0	1	1	1	0	0	0
R/W:	R/W	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7	MLS	0	R/W	MSB-First/LSB-First Select 0: MSB-first 1: LSB-first Set this bit to 0 when the I ² C bus format is used.
6	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
5, 4	—	All 1	R	Reserved These bits are always read as 1. The write value should always be 1.
3	BCWP	1	R/W	BC Write Protect Controls the BC[2:0] modifications. When modifying the BC[2:0] bits, this bit should be cleared to 0. In clocked synchronous serial mode, the BC[2:0] bits should not be modified. 0: When writing, values of the BC[2:0] bits are set. 1: When reading, 1 is always read. When writing, settings of the BC[2:0] bits are invalid.

Bit	Bit Name	Initial Value	R/W	Description																		
2 to 0	BC[2:0]	000	R/W	<p>Bit Counter</p> <p>These bits specify the number of bits to be transferred next. When read, the remaining number of transfer bits is indicated. With the I²C bus format, the data is transferred with one addition acknowledge bit. Should be made between transfer frames. If these bits are set to a value other than B'000, the setting should be made while the SCL pin is low. The bit value returns to B'000 automatically at the end of a data transfer including the acknowledge bit. And the value becomes B'111 automatically after the stop condition detection. These bits are cleared by a power-on reset and in software standby mode and module standby mode. These bits are also cleared by setting the IICRST bit of ICCR2 to 1. With the clocked synchronous serial format, these bits should not be modified.</p> <table border="1"> <thead> <tr> <th>I²C Bus Format</th> <th>Clocked Synchronous Serial Format</th> </tr> </thead> <tbody> <tr> <td>000: 9 bits</td> <td>000: 8 bits</td> </tr> <tr> <td>001: 2 bits</td> <td>001: 1 bit</td> </tr> <tr> <td>010: 3 bits</td> <td>010: 2 bits</td> </tr> <tr> <td>011: 4 bits</td> <td>011: 3 bits</td> </tr> <tr> <td>100: 5 bits</td> <td>100: 4 bits</td> </tr> <tr> <td>101: 6 bits</td> <td>101: 5 bits</td> </tr> <tr> <td>110: 7 bits</td> <td>110: 6 bits</td> </tr> <tr> <td>111: 8 bits</td> <td>111: 7 bits</td> </tr> </tbody> </table>	I ² C Bus Format	Clocked Synchronous Serial Format	000: 9 bits	000: 8 bits	001: 2 bits	001: 1 bit	010: 3 bits	010: 2 bits	011: 4 bits	011: 3 bits	100: 5 bits	100: 4 bits	101: 6 bits	101: 5 bits	110: 7 bits	110: 6 bits	111: 8 bits	111: 7 bits

111: 8 bits	111: 7 bits																					

18.3.4 I²C Bus Interrupt Enable Register (ICIER)

ICIER is an 8-bit readable/writable register that enables or disables interrupt sources and acknowledge bits, sets acknowledge bits to be transferred, and confirms acknowledge bits received.

Bit:	7	6	5	4	3	2	1	0
	TIE	TEIE	RIE	NAKIE	STIE	ACKE	ACKBR	ACKBT
Initial value:	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
7	TIE	0	R/W	Transmit Interrupt Enable When the TDRE bit in ICSR is set to 1 or 0, this bit enables or disables the transmit data empty interrupt (TXI). 0: Transmit data empty interrupt request (TXI) is disabled. 1: Transmit data empty interrupt request (TXI) is enabled.
6	TEIE	0	R/W	Transmit End Interrupt Enable Enables or disables the transmit end interrupt (TEI) at the rising of the ninth clock while the TDRE bit in ICSR is 1. TEI can be canceled by clearing the TEND bit or the TEIE bit to 0. 0: Transmit end interrupt request (TEI) is disabled. 1: Transmit end interrupt request (TEI) is enabled.
5	RIE	0	R/W	Receive Interrupt Enable Enables or disables the receive data full interrupt request (RXI) when receive data is transferred from ICDRS to ICRR and the RDRF bit in ICSR is set to 1. RXI can be canceled by clearing the RDRF or RIE bit to 0. 0: Receive data full interrupt request (RXI) are disabled. 1: Receive data full interrupt request (RXI) are enabled.

Bit	Bit Name	Initial Value	R/W	Description
4	NAKIE	0	R/W	<p>NACK Receive Interrupt Enable</p> <p>Enables or disables the NACK detection and arbitration lost/overrun error interrupt request (NAKI) when the NACKF or AL/OVE bit in ICSR is set. NAKI can be canceled by clearing the NACKF, AL/OVE, or NAKIE bit to 0.</p> <p>0: NACK receive interrupt request (NAKI) is disabled. 1: NACK receive interrupt request (NAKI) is enabled.</p>
3	STIE	0	R/W	<p>Stop Condition Detection Interrupt Enable</p> <p>Enables or disables the stop condition detection interrupt request (STPI) when the STOP bit in ICSR is set.</p> <p>0: Stop condition detection interrupt request (STPI) is disabled. 1: Stop condition detection interrupt request (STPI) is enabled.</p>
2	ACKE	0	R/W	<p>Acknowledge Bit Judgment Select</p> <p>0: The value of the receive acknowledge bit is ignored, and continuous transfer is performed. 1: If the receive acknowledge bit is 1, continuous transfer is halted.</p>
1	ACKBR	0	R	<p>Receive Acknowledge</p> <p>In transmit mode, this bit stores the acknowledge data that are returned by the receive device. This bit cannot be modified. This bit can be canceled by setting the BBSY bit in ICCR2 to 1.</p> <p>0: Receive acknowledge = 0 1: Receive acknowledge = 1</p>
0	ACKBT	0	R/W	<p>Transmit Acknowledge</p> <p>In receive mode, this bit specifies the bit to be sent at the acknowledge timing.</p> <p>0: 0 is sent at the acknowledge timing. 1: 1 is sent at the acknowledge timing.</p>

18.3.5 I²C Bus Status Register (ICSR)

ICSR is an 8-bit readable/writable register that confirms interrupt request flags and their status.

Bit:	7	6	5	4	3	2	1	0
	TDRE	TEND	RDRF	NACKF	STOP	AL/OVE	AAS	ADZ
Initial value:	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7	TDRE	0	R/W	Transmit Data Register Empty [Clearing conditions] <ul style="list-style-type: none"> • When 0 is written in TDRE after reading TDRE = 1 • When data is written to ICDRT [Setting conditions] <ul style="list-style-type: none"> • When data is transferred from ICDRT to ICDRS and ICDRT becomes empty • When TRS is set • When the start condition (including retransmission) is issued • When slave mode is changed from receive mode to transmit mode
6	TEND	0	R/W	Transmit End [Clearing conditions] <ul style="list-style-type: none"> • When 0 is written in TEND after reading TEND = 1 • When data is written to ICDRT [Setting conditions] <ul style="list-style-type: none"> • When the ninth clock of SCL rises with the I²C bus format while the TDRE flag is 1 • When the final bit of transmit frame is sent with the clocked synchronous serial format

Bit	Bit Name	Initial Value	R/W	Description
5	RDRF	0	R/W	Receive Data Full [Clearing conditions] <ul style="list-style-type: none"> • When 0 is written in RDRF after reading RDRF = 1 • When ICDRR is read [Setting condition] <ul style="list-style-type: none"> • When a receive data is transferred from ICDRS to ICDRR
4	NACKF	0	R/W	No Acknowledge Detection Flag [Clearing condition] <ul style="list-style-type: none"> • When 0 is written in NACKF after reading NACKF = 1 [Setting condition] <ul style="list-style-type: none"> • When no acknowledge is detected from the receive device in transmission while the ACKF bit in ICIER is 1
3	STOP	0	R/W	Stop Condition Detection Flag [Clearing condition] <ul style="list-style-type: none"> • When 0 is written in STOP after reading STOP = 1 [Setting condition] <ul style="list-style-type: none"> • When a stop condition is detected after frame transfer is completed

Bit	Bit Name	Initial Value	R/W	Description
2	AL/OVE	0	R/W	<p>Arbitration Lost Flag/Overrun Error Flag</p> <p>Indicates that arbitration was lost in master mode with the I²C bus format and that the final bit has been received while RDRF = 1 with the clocked synchronous format.</p> <p>When two or more master devices attempt to seize the bus at nearly the same time, if the I²C bus interface 3 detects data differing from the data it sent, it sets AL to 1 to indicate that the bus has been occupied by another master.</p> <p>[Clearing condition]</p> <ul style="list-style-type: none"> When 0 is written in AL/OVE after reading AL/OVE = 1 <p>[Setting conditions]</p> <ul style="list-style-type: none"> If the internal SDA and SDA pin disagree at the rise of SCL in master transmit mode When the SDA pin outputs high in master mode while a start condition is detected When the final bit is received with the clocked synchronous format while RDRF = 1
1	AAS	0	R/W	<p>Slave Address Recognition Flag</p> <p>In slave receive mode, this flag is set to 1 if the first frame following a start condition matches bits SVA[6:0] in SAR.</p> <p>[Clearing condition]</p> <ul style="list-style-type: none"> When 0 is written in AAS after reading AAS = 1 <p>[Setting conditions]</p> <ul style="list-style-type: none"> When the slave address is detected in slave receive mode When the general call address is detected in slave receive mode.
0	ADZ	0	R/W	<p>General Call Address Recognition Flag</p> <p>This bit is valid in slave receive mode with the I²C bus format.</p> <p>[Clearing condition]</p> <ul style="list-style-type: none"> When 0 is written in ADZ after reading ADZ = 1 <p>[Setting condition]</p> <ul style="list-style-type: none"> When the general call address is detected in slave receive mode

18.3.6 Slave Address Register (SAR)

SAR is an 8-bit readable/writable register that selects the communications format and sets the slave address. In slave mode with the I²C bus format, if the upper seven bits of SAR match the upper seven bits of the first frame received after a start condition, this module operates as the slave device.

Bit	Bit Name	Initial Value	R/W	Description
7 to 1	SVA[6:0]	0000000	R/W	Slave Address These bits set a unique address in these bits, differing from the addresses of other slave devices connected to the I ² C bus.
0	FS	0	R/W	Format Select 0: I ² C bus format is selected 1: Clocked synchronous serial format is selected

18.3.7 I²C Bus Transmit Data Register (ICDRT)

ICDRT is an 8-bit readable/writable register that stores the transmit data. When ICDRT detects the space in the shift register (ICDRS), it transfers the transmit data which is written in ICDRT to ICDRS and starts transferring data. If the next transfer data is written to ICDRT while transferring data of ICDRS, continuous transfer is possible.

18.3.8 I²C Bus Receive Data Register (ICDRR)

ICDRR is an 8-bit register that stores the receive data. When data of one byte is received, ICDRR transfers the receive data from ICDRS to ICDRR and the next data can be received. ICDRR is a receive-only register, therefore the CPU cannot write to this register.

18.3.9 I²C Bus Shift Register (ICDRS)

ICDRS is a register that is used to transfer/receive data. In transmission, data is transferred from ICDRT to ICDRS and the data is sent from the SDA pin. In reception, data is transferred from ICDRS to ICDRR after data of one byte is received. This register cannot be read directly from the CPU.

18.3.10 NF2CYC Register (NF2CYC)

NF2CYC is an 8-bit readable/writable register that selects a transfer clock and the range of the noise filtering for the SCL and SDA pins. For details of the noise filter, see section 18.4.7, Noise Filter.

Bit:	7	6	5	4	3	2	1	0
	-	-	-	CKS4	-	-	PRS	NF2 CYC
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	CKS4	0	R/W	Transfer Clock Select This bit should be set according to the necessary transfer rate (table 18.3) in master mode. For 1-Mbyte version, this bit is reserved and always read as 0. The write value should always be 0.
3, 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1	PRS	0	R/W	Pulse Width Ratio Select Specifies the ratio of the high-level period to the low-level period for the SCL signal. 0: The ratio of high to low is 0.5 to 0.5. 1: The ratio of high to low is about 0.4 to 0.6.
0	NF2CYC	0	R/W	Noise Filtering Range Select 0: The noise less than one cycle of the peripheral clock can be filtered out 1: The noise less than two cycles of the peripheral clock can be filtered out

18.4 Operation

The I²C bus interface 3 can communicate either in I²C bus mode or clocked synchronous serial mode by setting FS in SAR.

18.4.1 I²C Bus Format

Figure 18.3 shows the I²C bus formats. Figure 18.4 shows the I²C bus timing. The first frame following a start condition always consists of eight bits.

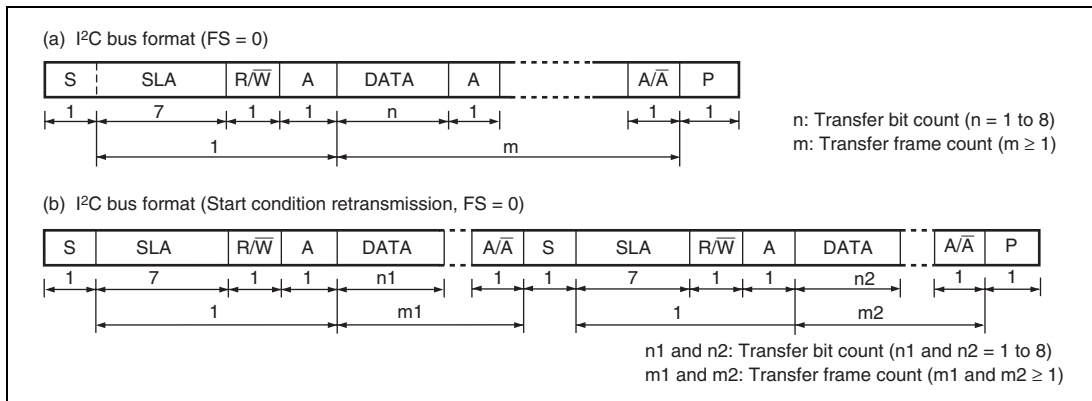

Figure 18.3 I²C Bus Formats

Figure 18.4 I²C Bus Timing

[Legend]

- S: Start condition. The master device drives SDA from high to low while SCL is high.
- SLA: Slave address
- R/W: Indicates the direction of data transfer: from the slave device to the master device when R/W is 1, or from the master device to the slave device when R/W is 0.
- A: Acknowledge. The receive device drives SDA to low.
- DATA: Transfer data
- P: Stop condition. The master device drives SDA from low to high while SCL is high.

18.4.2 Master Transmit Operation

In master transmit mode, the master device outputs the transmit clock and transmit data, and the slave device returns an acknowledge signal. For master transmit mode operation timing, refer to figures 18.5 and 18.6. The transmission procedure and operations in master transmit mode are described below.

1. Set the ICE bit in ICCR1 to 1. Also, set bits CKS[3:0] in ICCR1. (Initial setting)
2. Read the BBSY flag in ICCR2 to confirm that the bus is released. Set the MST and TRS bits in ICCR1 to select master transmit mode. Then, write 1 to BBSY and 0 to SCP. (Start condition issued) This generates the start condition.
3. After confirming that TDRE in ICSR has been set, write the transmit data (the first byte data show the slave address and $\overline{R/\overline{W}}$) to ICDRT. At this time, TDRE is automatically cleared to 0, and data is transferred from ICDRT to ICDRS. TDRE is set again.
4. When transmission of one byte data is completed while TDRE is 1, TEND in ICSR is set to 1 at the rise of the 9th transmit clock pulse. Read the ACKBR bit in ICIER, and confirm that the slave device has been selected. Then, write second byte data to ICDRT. When ACKBR is 1, the slave device has not been acknowledged, so issue the stop condition. To issue the stop condition, write 0 to BBSY and SCP. SCL is fixed low until the transmit data is prepared or the stop condition is issued.
5. The transmit data after the second byte is written to ICDRT every time TDRE is set.
6. Write the number of bytes to be transmitted to ICDRT. Wait until TEND is set (the end of last byte data transmission) while TDRE is 1, or wait for NACK (NACKF in ICSR = 1) from the receive device while ACKE in ICIER is 1. Then, issue the stop condition to clear TEND or NACKF.
7. When the STOP bit in ICSR is set to 1, the operation returns to the slave receive mode.

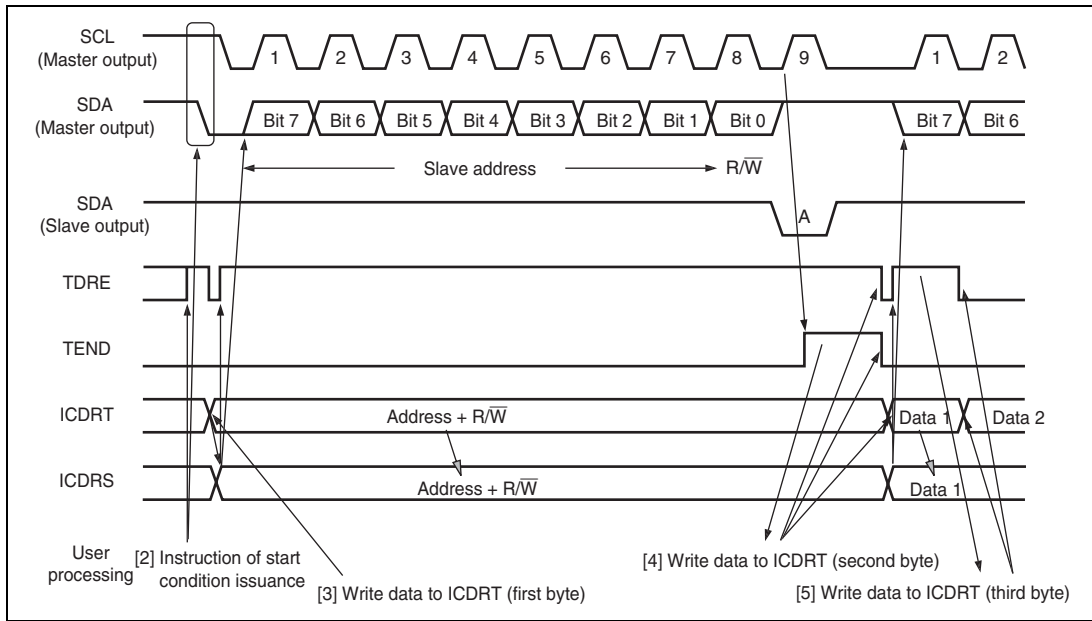

Figure 18.5 Master Transmit Mode Operation Timing (1)

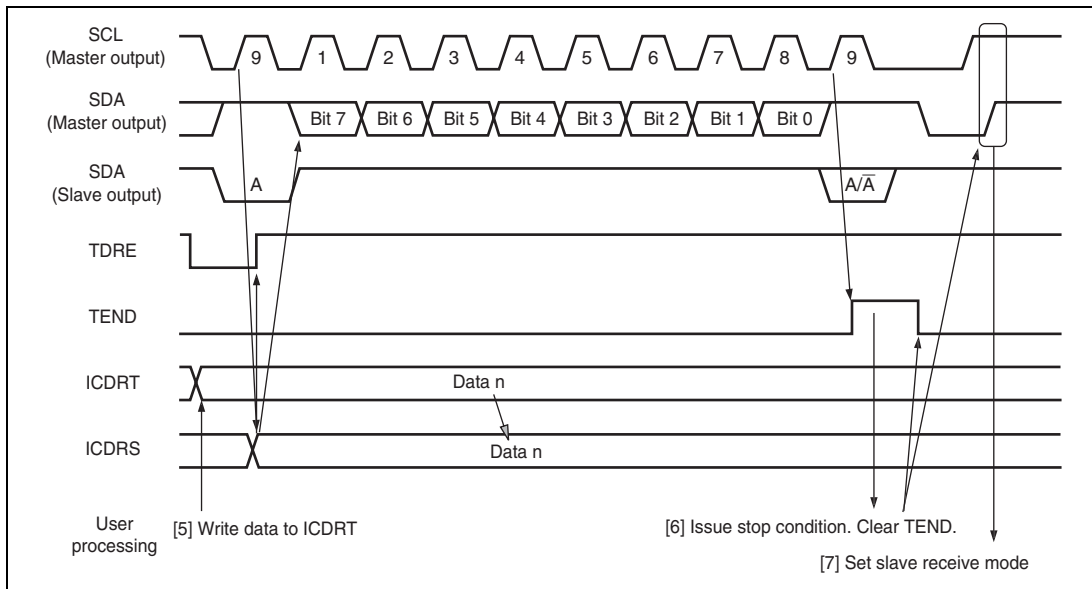

Figure 18.6 Master Transmit Mode Operation Timing (2)

18.4.3 Master Receive Operation

In master receive mode, the master device outputs the receive clock, receives data from the slave device, and returns an acknowledge signal. For master receive mode operation timing, refer to figures 18.7 and 18.8. The reception procedure and operations in master receive mode are shown below.

1. Clear the TEND bit in ICSR to 0, then clear the TRS bit in ICCR1 to 0 to switch from master transmit mode to master receive mode. Then, clear the TDRE bit to 0.
2. When ICDRR is read (dummy data read), reception is started, and the receive clock is output, and data received, in synchronization with the internal clock. The master device outputs the level specified by ACKBT in ICIER to SDA, at the 9th receive clock pulse.
3. After the reception of first frame data is completed, the RDRF bit in ICSR is set to 1 at the rise of 9th receive clock pulse. At this time, the receive data is read by reading ICDRR, and RDRF is cleared to 0.
4. The continuous reception is performed by reading ICDRR every time RDRF is set. If 8th receive clock pulse falls after reading ICDRR by the other processing while RDRF is 1, SCL is fixed low until ICDRR is read.
5. If next frame is the last receive data, set the RCVD bit in ICCR1 to 1 before reading ICDRR. This enables the issuance of the stop condition after the next reception.
6. When the RDRF bit is set to 1 at rise of the 9th receive clock pulse, issue the stage condition.
7. When the STOP bit in ICSR is set to 1, read ICDRR. Then clear the RCVD bit to 0.
8. The operation returns to the slave receive mode.

Note: If only one byte is received, read ICDRR (dummy-read) after the RCVD bit in ICCR1 is set.

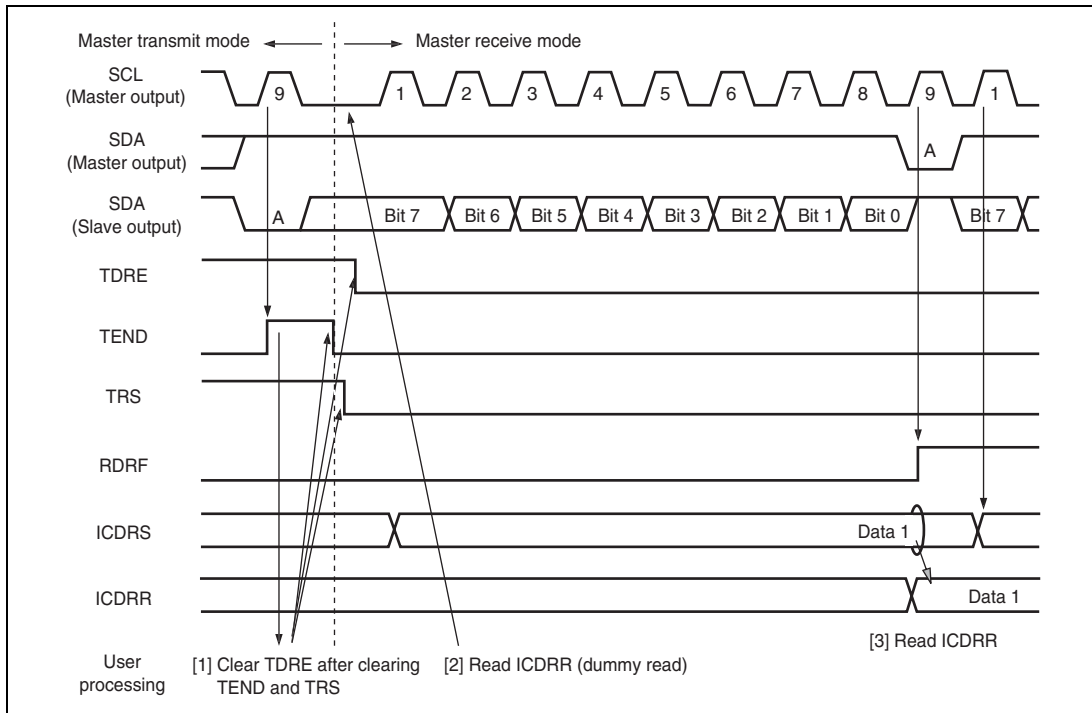

Figure 18.7 Master Receive Mode Operation Timing (1)

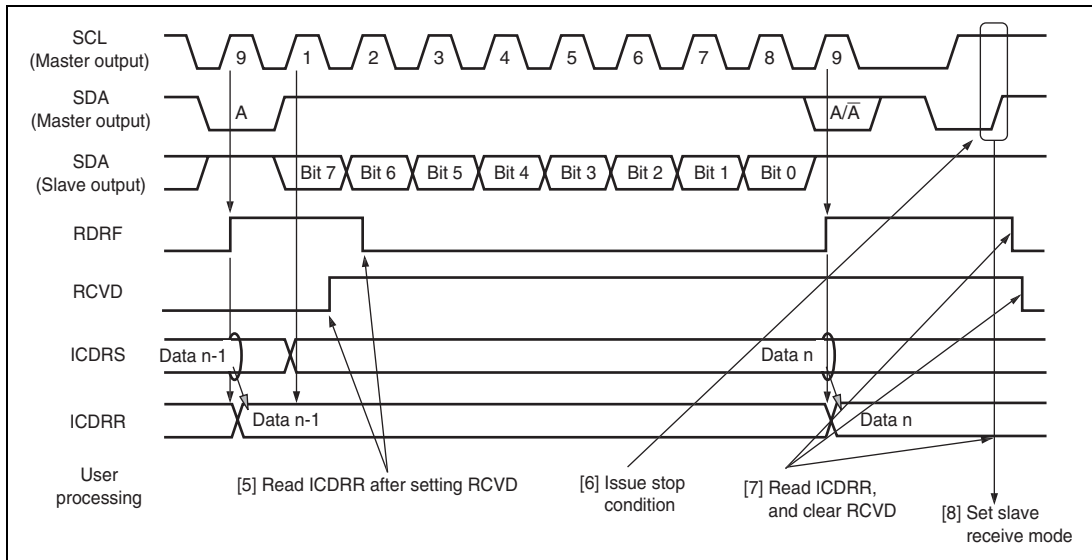

Figure 18.8 Master Receive Mode Operation Timing (2)

18.4.4 Slave Transmit Operation

In slave transmit mode, the slave device outputs the transmit data, while the master device outputs the receive clock and returns an acknowledge signal. For slave transmit mode operation timing, refer to figures 18.9 and 18.10.

The transmission procedure and operations in slave transmit mode are described below.

1. Set the ICE bit in ICCR1 to 1. Set bits CKS[3:0] in ICCR1. (Initial setting) Set the MST and TRS bits in ICCR1 to select slave receive mode, and wait until the slave address matches.
2. When the slave address matches in the first frame following detection of the start condition, the slave device outputs the level specified by ACKBT in ICIER to SDA, at the rise of the 9th clock pulse. At this time, if the 8th bit data (R/W) is 1, the TRS bit in ICCR1 and the TDRE bit in ICSR are set to 1, and the mode changes to slave transmit mode automatically. The continuous transmission is performed by writing transmit data to ICDRT every time TDRE is set.
3. If TDRE is set after writing last transmit data to ICDRT, wait until TEND in ICSR is set to 1, with TDRE = 1. When TEND is set, clear TEND.
4. Clear TRS for the end processing, and read ICDRR (dummy read). SCL is opened.
5. Clear TDRE.

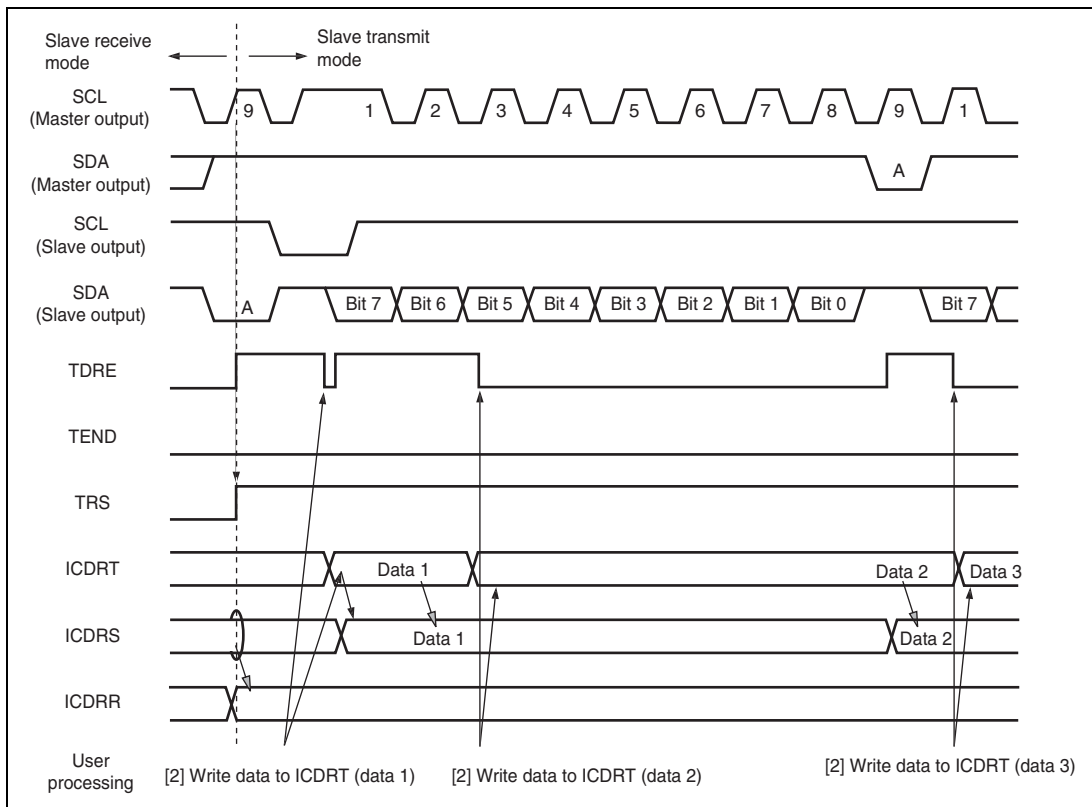

Figure 18.9 Slave Transmit Mode Operation Timing (1)

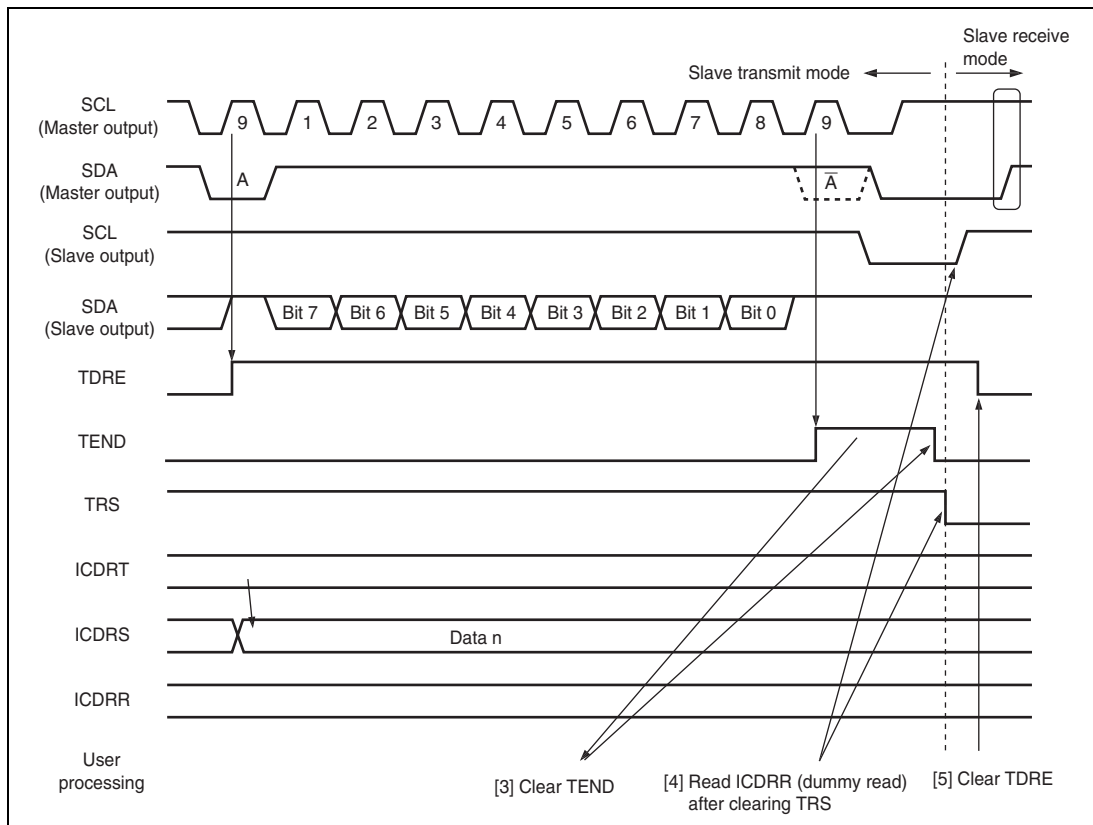

Figure 18.10 Slave Transmit Mode Operation Timing (2)

18.4.5 Slave Receive Operation

In slave receive mode, the master device outputs the transmit clock and transmit data, and the slave device returns an acknowledge signal. For slave receive mode operation timing, refer to figures 18.11 and 18.12. The reception procedure and operations in slave receive mode are described below.

1. Set the ICE bit in ICCR1 to 1. Set bits CKS[3:0] in ICCR1. (Initial setting) Set the MST and TRS bits in ICCR1 to select slave receive mode, and wait until the slave address matches.
2. When the slave address matches in the first frame following detection of the start condition, the slave device outputs the level specified by ACKBT in ICIER to SDA, at the rise of the 9th clock pulse. At the same time, RDRF in ICSR is set to read ICDRR (dummy read). (Since the read data show the slave address and R/W, it is not used.)
3. Read ICDRR every time RDRF is set. If 8th receive clock pulse falls while RDRF is 1, SCL is fixed low until ICDRR is read. The change of the acknowledge before reading ICDRR, to be returned to the master device, is reflected to the next transmit frame.
4. The last byte data is read by reading ICDRR.

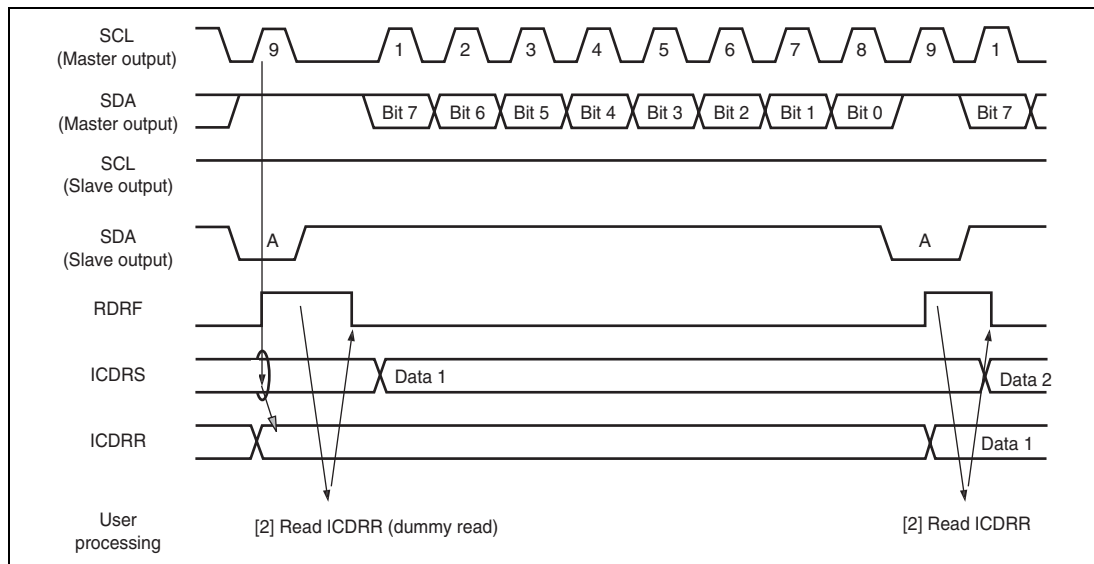

Figure 18.11 Slave Receive Mode Operation Timing (1)

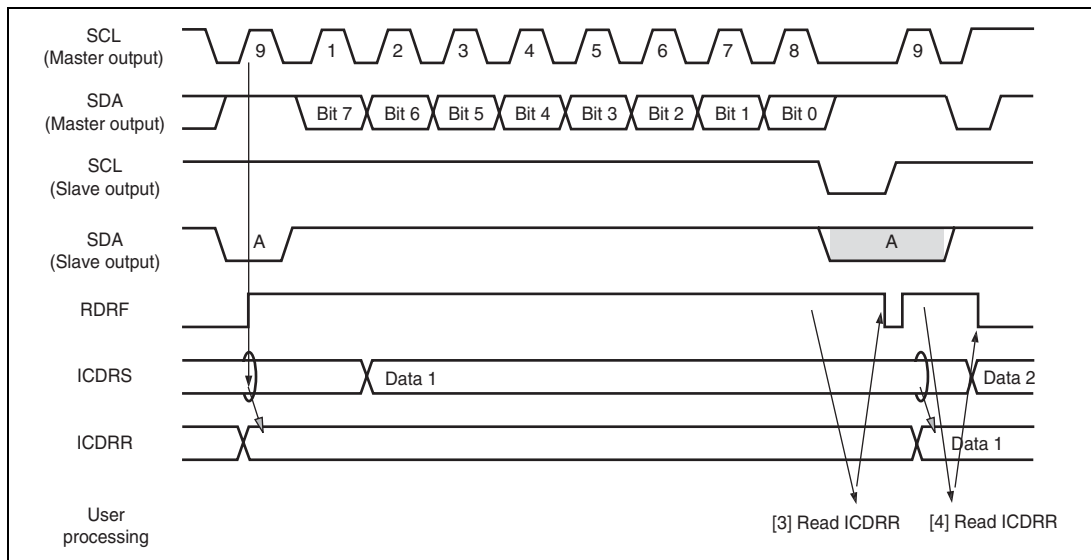

Figure 18.12 Slave Receive Mode Operation Timing (2)

18.4.6 Clocked Synchronous Serial Format

This module can be operated with the clocked synchronous serial format, by setting the FS bit in SAR to 1. When the MST bit in ICCR1 is 1, the transfer clock output from SCL is selected. When MST is 0, the external clock input is selected.

(1) Data Transfer Format

Figure 18.13 shows the clocked synchronous serial transfer format.

The transfer data is output from the fall to the fall of the SCL clock, and the data at the rising edge of the SCL clock is guaranteed. The MLS bit in ICMR sets the order of data transfer, in either the MSB first or LSB first. The output level of SDA can be changed during the transfer wait, by the SDAO bit in ICCR2.

Figure 18.13 Clocked Synchronous Serial Transfer Format

(2) Transmit Operation

In transmit mode, transmit data is output from SDA, in synchronization with the fall of the transfer clock. The transfer clock is output when MST in ICCR1 is 1, and is input when MST is 0. For transmit mode operation timing, refer to figure 18.14. The transmission procedure and operations in transmit mode are described below.

1. Set the ICE bit in ICCR1 to 1. Set the MST and CKS[3:0] bits in ICCR1. (Initial setting)
2. Set the TRS bit in ICCR1 to select the transmit mode. Then, TDRE in ICSR is set.
3. Confirm that TDRE has been set. Then, write the transmit data to ICDRT. The data is transferred from ICDRT to ICDRS, and TDRE is set automatically. The continuous transmission is performed by writing data to ICDRT every time TDRE is set. When changing from transmit mode to receive mode, clear TRS while TDRE is 1.

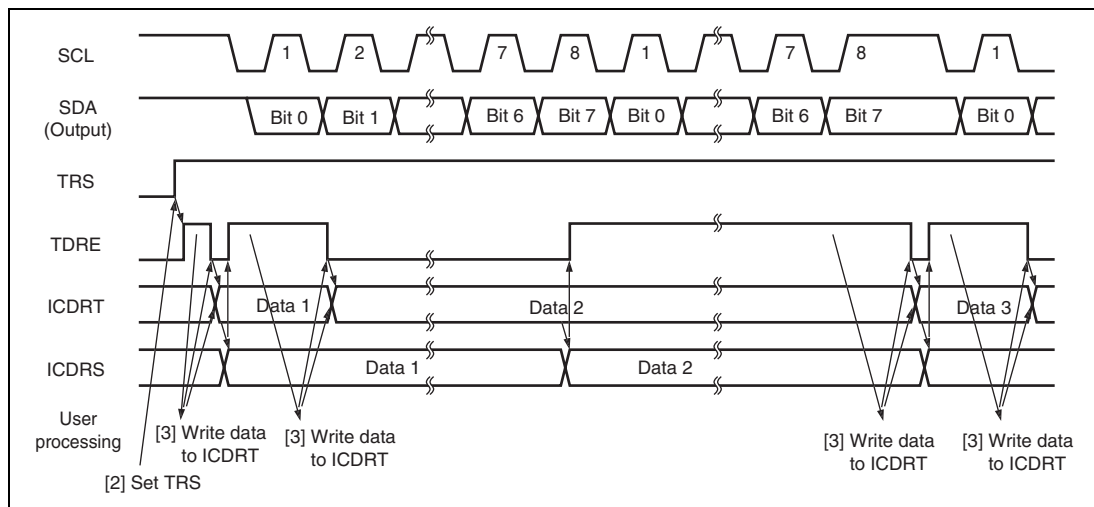

Figure 18.14 Transmit Mode Operation Timing

(3) Receive Operation

In receive mode, data is latched at the rise of the transfer clock. The transfer clock is output when MST in ICCR1 is 1, and is input when MST is 0. For receive mode operation timing, refer to figure 18.15. The reception procedure and operations in receive mode are described below.

1. Set the ICE bit in ICCR1 to 1. Set bits CKS[3:0] in ICCR1. (Initial setting)
2. When the transfer clock is output, set MST to 1 to start outputting the receive clock.
3. When the receive operation is completed, data is transferred from ICDRS to ICDRR and RDRF in ICSR is set. When MST = 1, the next byte can be received, so the clock is continually output. The continuous reception is performed by reading ICDRR every time RDRF is set. When the 8th clock is risen while RDRF is 1, the overrun is detected and AL/OVE in ICSR is set. At this time, the previous reception data is retained in ICDRR.
4. To stop receiving when MST = 1, set RCVD in ICCR1 to 1, then read ICDRR. Then, SCL is fixed high after receiving the next byte data.

Notes: Follow the steps below to receive only one byte with MST = 1 specified. See figure 18.16 for the operation timing.

1. Set the ICE bit in ICCR1 to 1. Set bits CKS[3:0] in ICCR1. (Initial setting)
2. Set MST = 1 while the RCVD bit in ICCR1 is 0. This causes the receive clock to be output.
3. Check if the BC2 bit in ICMR is set to 1 and then set the RCVD bit in ICCR1 to 1. This causes the SCL to be fixed to the high level after outputting one byte of the receive clock.

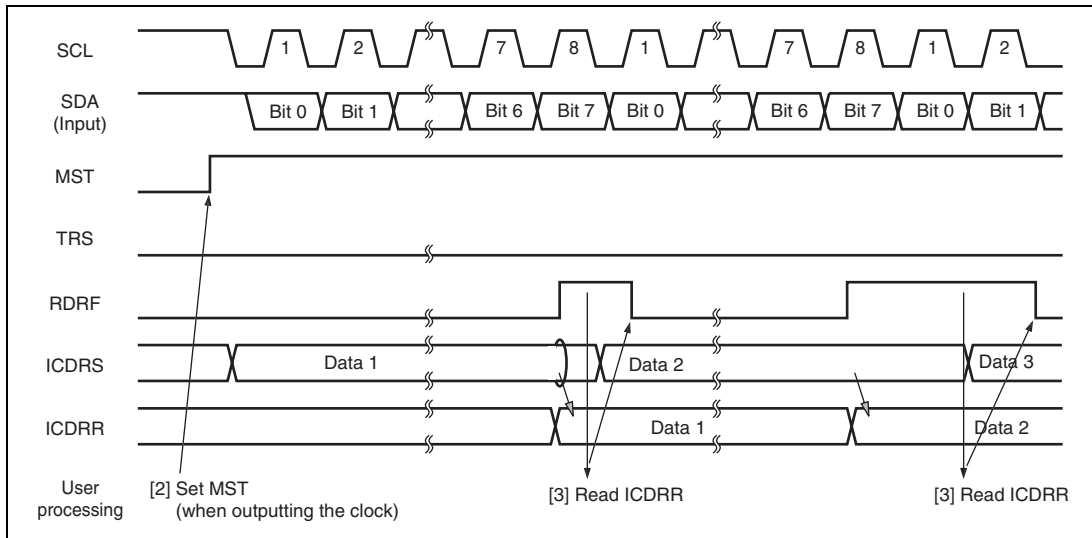

Figure 18.15 Receive Mode Operation Timing

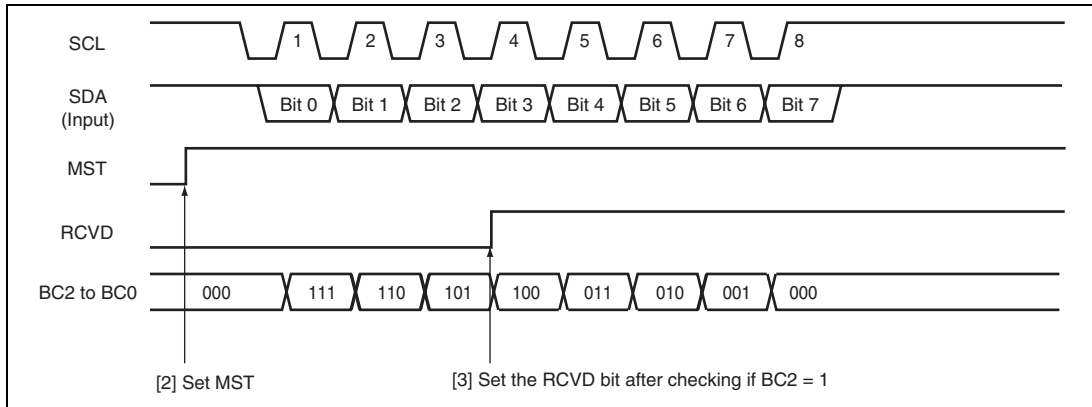

Figure 18.16 Operation Timing For Receiving One Byte (MST = 1)

18.4.7 Noise Filter

The logic levels at the SCL and SDA pins are routed through noise filters before being latched internally. Figure 18.17 shows a block diagram of the noise filter circuit.

The noise filter consists of three cascaded latches and a match detector. The SCL (or SDA) input signal is sampled on the peripheral clock. When NF2CYC is set to 0, this signal is not passed forward to the next circuit unless the outputs of both latches agree. When NF2CYC is set to 1, this signal is not passed forward to the next circuit unless the outputs of three latches agree. If they do not agree, the previous value is held.

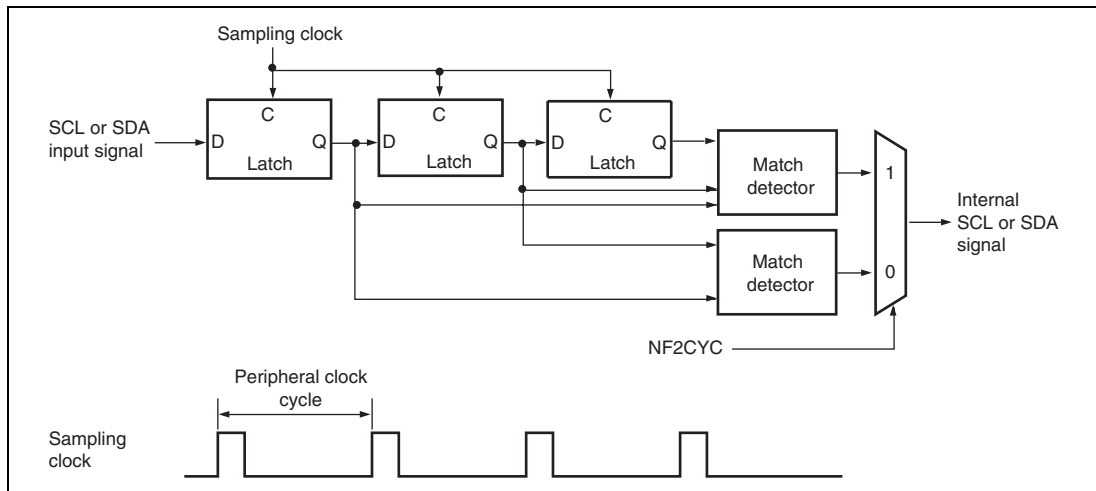

Figure 18.17 Block Diagram of Noise Filter

18.4.8 Example of Use

Flowcharts in respective modes that use the I²C bus interface 3 are shown in figures 18.18 to 18.21.

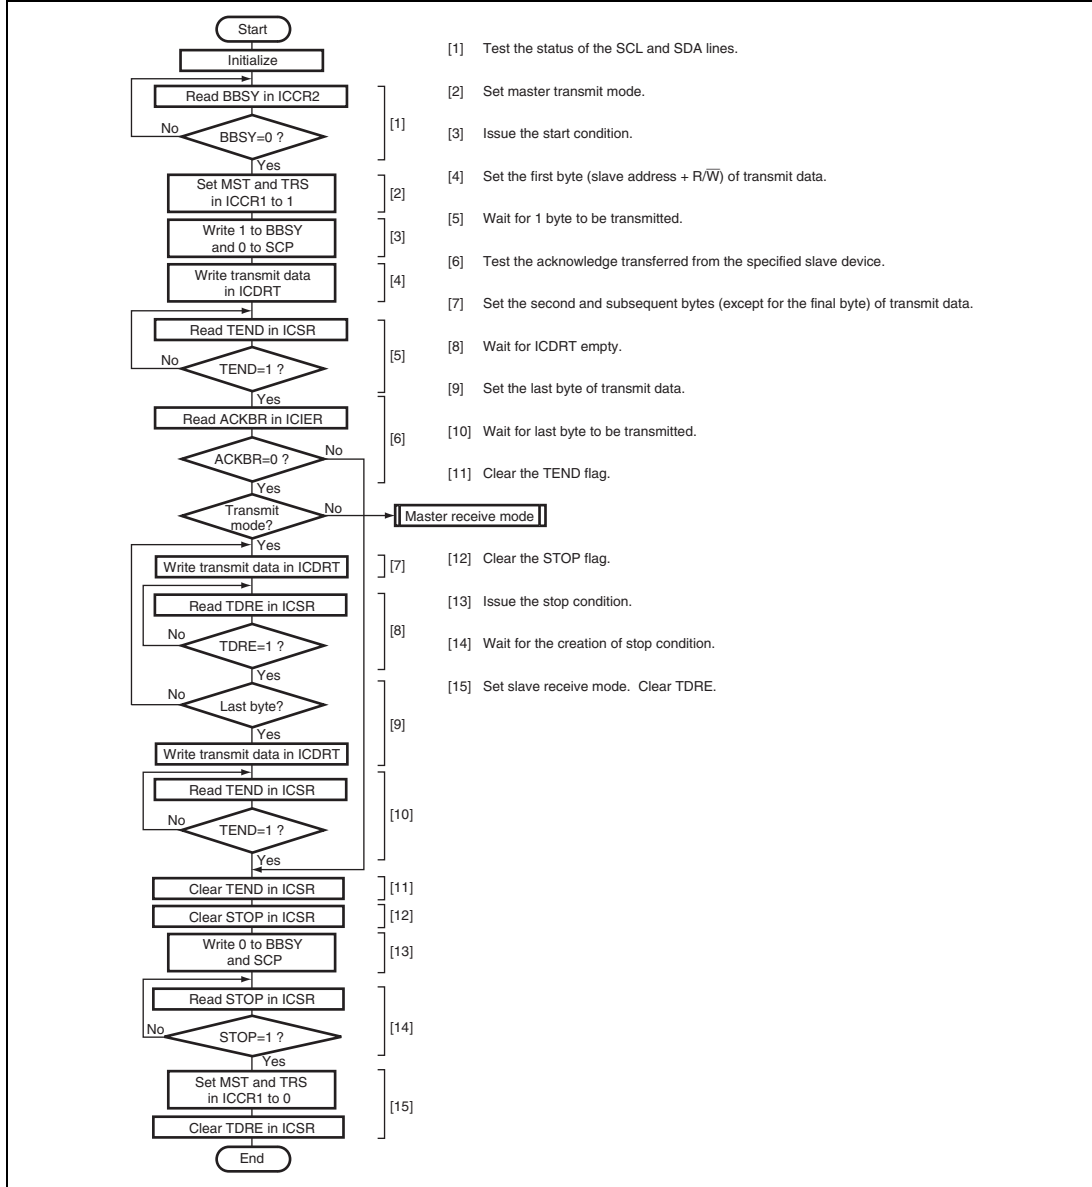

Figure 18.18 Sample Flowchart for Master Transmit Mode

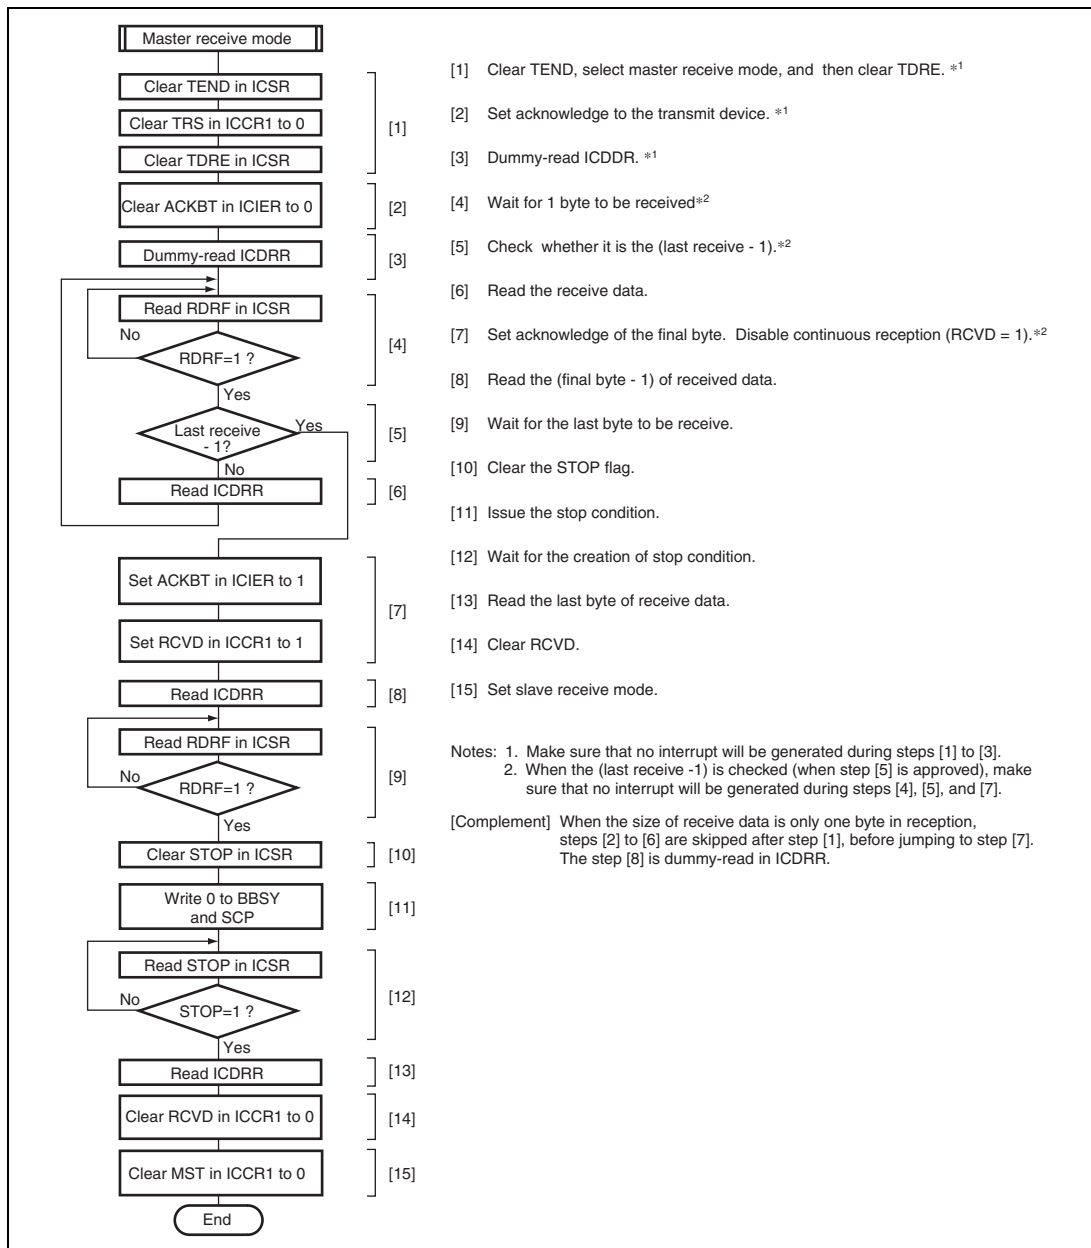

Figure 18.19 Sample Flowchart for Master Receive Mode

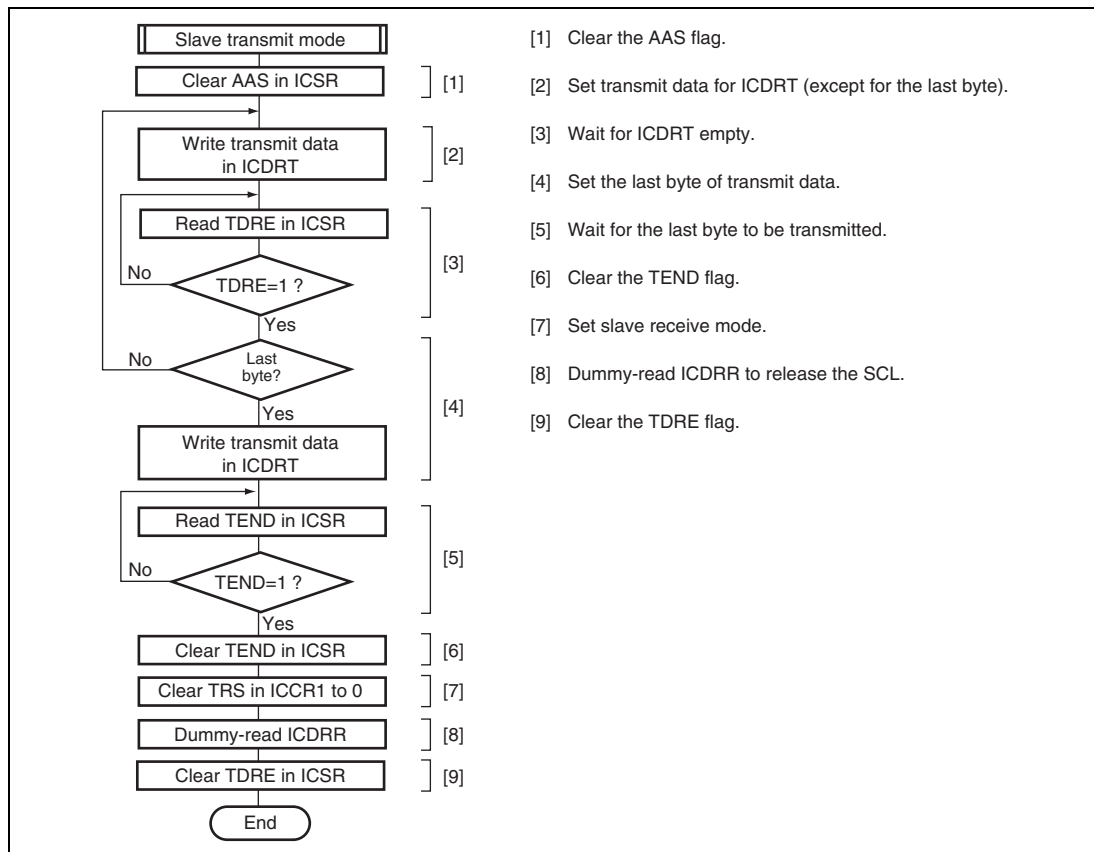

Figure 18.20 Sample Flowchart for Slave Transmit Mode

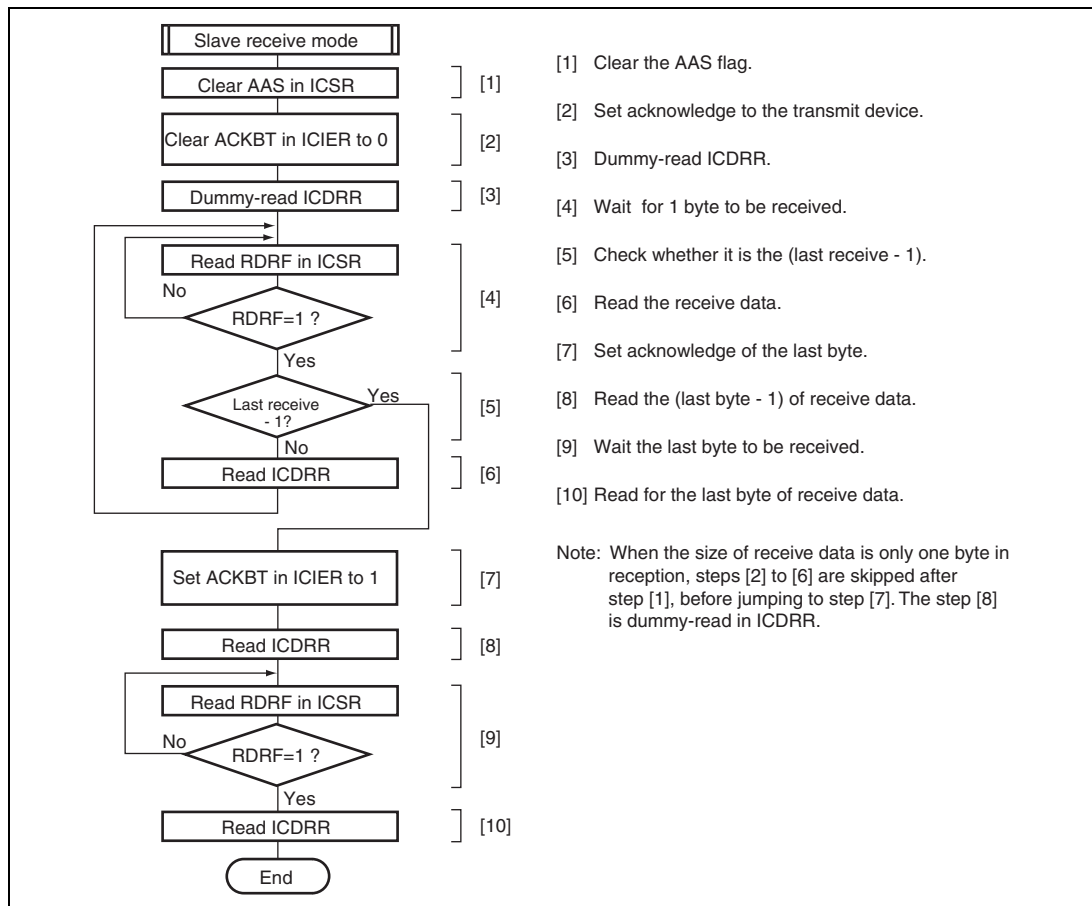

Figure 18.21 Sample Flowchart for Slave Receive Mode

18.5 Interrupt Requests

There are six interrupt requests in this module; transmit data empty, transmit end, receive data full, NACK detection, STOP recognition, and arbitration lost/overrun error. Table 18.4 shows the contents of each interrupt request.

Table 18.4 Interrupt Requests

Interrupt Request	Abbreviation	Interrupt Condition	I ² C Bus Format	Clocked Synchronous Serial Format
Transmit data Empty	TXI	(TDRE = 1) • (TIE = 1)	√	√
Transmit end	TEI	(TEND = 1) • (TEIE = 1)	√	√
Receive data full	RXI	(RDRF = 1) • (RIE = 1)	√	√
STOP recognition	STPI	(STOP = 1) • (STIE = 1)	√	—
NACK detection	NAKI	{(NACKF = 1) + (AL = 1)} • (NAKIE = 1)	√	—
Arbitration lost/ overrun error			√	√

When the interrupt condition described in table 18.4 is 1, the CPU executes an interrupt exception handling. Note that a TXI or RXI interrupt can activate the direct memory access controller if the setting for direct memory access controller activation has been made. In such a case, an interrupt request is not sent to the CPU. Interrupt sources should be cleared in the exception handling. The TDRE and TEND bits are automatically cleared to 0 by writing the transmit data to ICDRT. The RDRF bit is automatically cleared to 0 by reading ICDRR. The TDRE bit is set to 1 again at the same time when the transmit data is written to ICDRT. Therefore, when the TDRE bit is cleared to 0, then an excessive data of one byte may be transmitted.

18.6 Bit Synchronous Circuit

In master mode, this module has a possibility that high level period may be short in the two states described below.

- When SCL is driven to low by the slave device
- When the rising speed of SCL is lowered by the load of the SCL line (load capacitance or pull-up resistance)

Therefore, it monitors SCL and communicates by bit with synchronization.

Figure 18.22 shows the timing of the bit synchronous circuit and table 18.5 shows the time when the SCL output changes from low to Hi-Z then SCL is monitored.

Figure 18.22 Bit Synchronous Circuit Timing

Table 18.5 Time for Monitoring SCL

CKS4	CKS3	CKS2	Time for Monitoring SCL
0	0	0	9 tpcyc*
		1	21 tpcyc*
	1	0	39 tpcyc*
		1	87 tpcyc*
1	0	0	79 tpcyc*
		1	175 tpcyc*
	1	0	159 tpcyc*
		1	351 tpcyc*

Note: * tpcyc indicates the frequency of the peripheral clock (P ϕ).

18.7 Usage Notes

18.7.1 Note on Setting for Multi-Master Operation

In multi-master operation, when the transfer rate setting for this module (ICCR1.CKS[3:0]) makes this LSI slower than the other masters, pulse cycles with an unexpected length will infrequently be output on SCL.

Be sure to specify a transfer rate that is at least 1/1.8 of the fastest transfer rate among the other masters.

18.7.2 Note on Master Receive Mode

Reading ICDRR around the falling edge of the 8th clock might fail to fetch the receive data.

In addition, when RCVD is set to 1 around the falling edge of the 8th clock and the receive buffer full, a stop condition may not be issued.

Use either 1 or 2 below as a measure against the situations above.

1. In master receive mode, read ICDRR before the rising edge of the 8th clock.
2. In master receive mode, set the RCVD bit to 1 so that transfer proceeds in byte units.

18.7.3 Note on Setting ACKBT in Master Receive Mode

In master receive mode operation, set ACKBT before the falling edge of the 8th SCL cycle of the last data being continuously transferred. Not doing so can lead to an overrun for the slave transmission device.

18.7.4 Note on the States of Bits MST and TRN when Arbitration is Lost

When sequential bit-manipulation instructions are used to set the MST and TRS bits to select master transmission in multi-master operation, a conflicting situation where AL in ICSR = 1 but the mode is master transmit mode (MST = 1 and TRS = 1) may arise; this depends on the timing of the loss of arbitration when the bit manipulation instruction for TRS is executed.

This can be avoided in either of the following ways.

- In multi-master operation, use the MOV instruction to set the MST and TRS bits.
- When arbitration is lost, check whether the MST and TRS bits are 0. If the MST and TRS bits have been set to a value other than 0, clear the bits to 0.

18.7.5 Note on I²C-bus Interface Master Receive Mode

After a master receive operation is completed, confirm the falling edge of the ninth clock cycle of the SCL signal and generate a stop condition or regenerate a start condition.

18.7.6 Note on IICRST and BBSY bits

When 1 is written to IICRST in ICCR2, this LSI release SCL and SDA pins. Then, if the SDA level changes from low to high under the condition of SCL = high, BBSY in ICCR2 is cleared to 0 assuming that the stop condition has been issued.

Section 19 Serial Sound Interface

The serial sound interface is a module designed to send or receive audio data interface with various devices offering Philips format compatibility. It also provides additional modes for other common formats, as well as support for multi-channel mode.

19.1 Features

- Number of channels: Four channels
- Operating mode: Non-compressed mode
The non-compressed mode supports serial audio streams divided by channels.
- Serves as both a transmitter and a receiver
Channel 0 supports full-duplex communications.
- Capable of using serial bus format
- Asynchronous transfer takes place between the data buffer and the shift register.
- It is possible to select a value as the dividing ratio for the clock used by the serial bus interface.
- It is possible to control data transmission or reception with DMA transfer and interrupt requests.
- Selects the oversampling clock input from among the following pins:
AUDIO_CLK (1 to 25 MHz)
AUDIO_X1, AUDIO_X2 (when connecting a crystal resonator: 10 to 25 MHz, when used to input external clock: 1 to 25 MHz)
- Includes 8-stage FIFO buffers in transmitter and receiver

Figure 19.1 shows a schematic diagram of the four channels in this module.

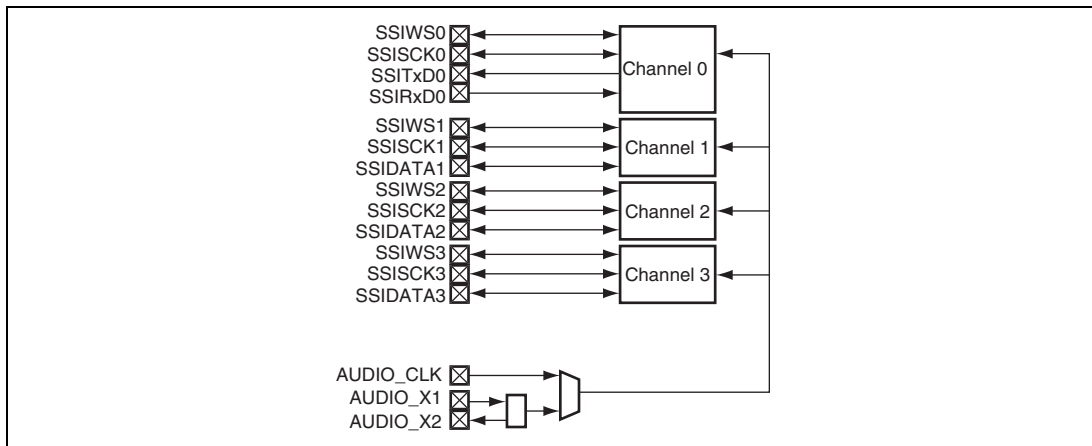

Figure 19.1 Schematic Diagram of Serial Sound Interface

Figure 19.2 shows a block diagram of this module.

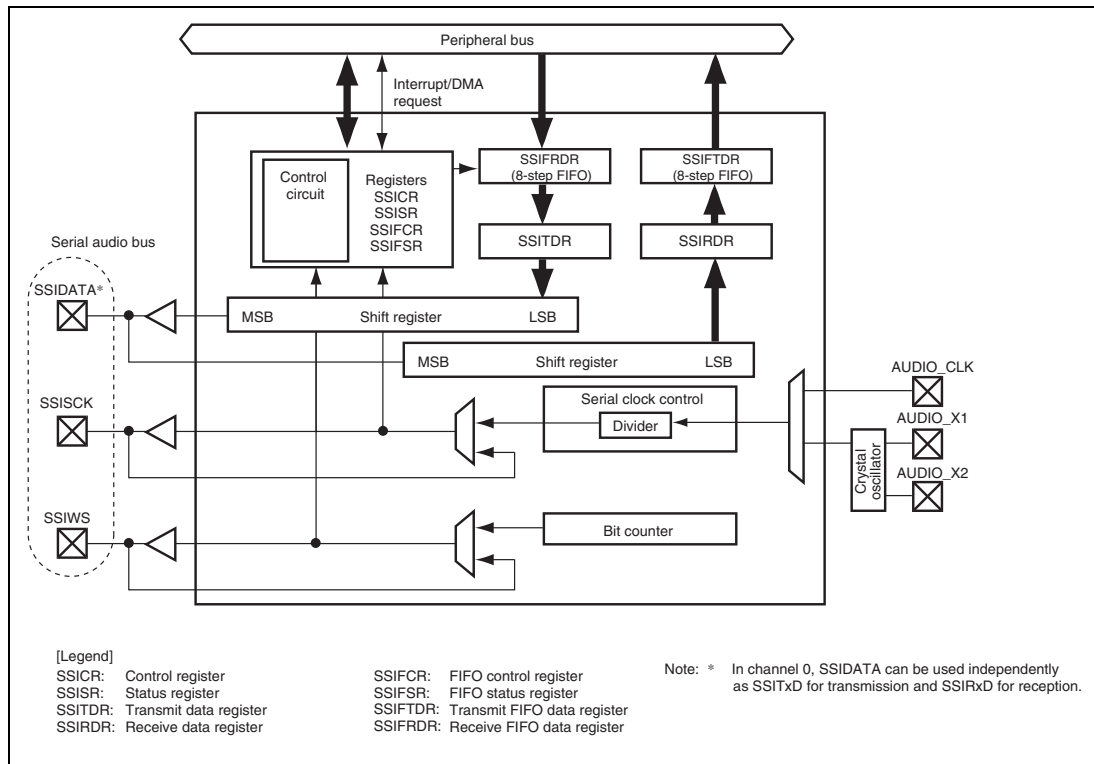

Figure 19.2 Block Diagram of Serial Sound Interface

19.2 Input/Output Pins

Table 19.1 shows the pin assignments relating to this module.

Table 19.1 Pin Assignments

Channel	Pin Name	I/O	Description
0	SSISCK0	I/O	Serial bit clock
	SSIWS0	I/O	Word selection
	SSITxD0	Output	Serial data output
	SSIRxD0	Input	Serial data input
1 to 3	SSISCK1 to SSISCK3	I/O	Serial bit clock
	SSIWS1 to SSIWS3	I/O	Word selection
	SSIDATA1 to SSIDATA3	I/O	Serial data input/output
Common	AUDIO_CLK	Input	External clock for audio (input oversampling clock)
	AUDIO_X1	Input	Crystal resonator/external clock for audio (input oversampling clock)
	AUDIO_X2	Output	

19.3 Register Description

Table 19.2 lists the register configuration. Note that explanation in the text does not refer to the channels.

Table 19.2 Register Configuration

Channel	Register Name	Abbreviation	R/W	Initial Value	Address	Access Size
0	Control register 0	SSICR_0	R/W	H'00000000	H'FFFF0000	8, 16, 32
	Status register 0	SSISR_0	R/W* ¹	H'02000013	H'FFFF0004	8, 16, 32

- Notes: 1. Although bits 29 to 26 in these registers can be read from or written to, bits other than these are read-only. For details, refer to section 19.3.2, Status Register (SSISR).
2. To bits 16 and 0 in these registers, only 0 can be written to clear the flags. Other bits are read-only. For details, refer to section 19.3.6, FIFO Status Register (SSIFSR).

19.3.1 Control Register (SSICR)

SSICR is a readable/writable 32-bit register that controls the IRQ, selects the polarity status, and sets operating mode.

R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Note: * The bit can be read or written to. Writing 0 initializes the bit, but writing 1 is ignored.

Bit	Bit Name	Initial Value	R/W	Description
31, 30	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
29	TUIRQ	0	R/(W)*	Transmit Underflow Error Interrupt Status Flag This status flag indicates that transmit data was supplied at a lower rate than was required. This bit is set to 1 regardless of the value of the TUIEN bit and can be cleared by writing 0 to this bit. If TUIRQ = 1 and TUIEN = 1, an interrupt occurs. If TUIRQ = 1, SSITDR did not have data written to it before it was required for transmission. This will lead to the same data being transmitted once more and a potential corruption of multi-channel data. As a result, this module will output erroneous data. Note: When an underflow error occurs, the current data in the data buffer of this module is transmitted until the next data is written.

Bit	Bit Name	Initial Value	R/W	Description
28	TOIRQ	0	R/(W)*	<p>Transmit Overflow Error Interrupt Status Flag</p> <p>This status flag indicates that transmit data was supplied at a higher rate than was required.</p> <p>This bit is set to 1 regardless of the value of the TOIEN bit and can be cleared by writing 0 to this bit.</p> <p>If TOIRQ = 1 and TOIEN = 1, an interrupt occurs.</p> <p>If TOIRQ = 1, SSIFTDR had data written to it while the transmit FIFO is full (TDC = H'8). This will lead to the loss of data and a potential corruption of multi-channel data.</p>
27	RUIRQ	0	R/(W)*	<p>Receive Underflow Error Interrupt Status Flag</p> <p>This status flag indicates that receive data was supplied at a lower rate than was required.</p> <p>This bit is set to 1 regardless of the value of the RUIEN bit and can be cleared by writing 0 to this bit.</p> <p>If RUIRQ = 1 and RUIEN = 1, an interrupt occurs.</p> <p>If RUIRQ = 1, SSIFRDR was read while the receive FIFO is empty (RDC = H'0). This can cause invalid receive data to be stored, which may lead to corruption of multi-channel data.</p>
26	ROIRQ	0	R/(W)*	<p>Receive Overflow Error Interrupt Status Flag</p> <p>This status flag indicates that receive data was supplied at a higher rate than was required.</p> <p>This bit is set to 1 regardless of the value of the ROIEN bit and can be cleared by writing 0 to this bit.</p> <p>If ROIRQ = 1 and ROIEN = 1, an interrupt occurs.</p> <p>If ROIRQ = 1, SSIRDR was not read before there was new unread data written to it. This will lead to the loss of data and a potential corruption of multi-channel data.</p> <p>Note: When an overflow error occurs, the current data in the data buffer of this module is overwritten by the next incoming data from the SSI interface.</p>

1	RSWNO	1	R	<p>Receive Serial Word Number</p> <p>This status bit indicates the current word number.</p> <p>This bit indicates which system word the data in SSIRDR currently represents. This value will change as the data in SSIRDR is updated from the shift register, regardless of whether SSIRDR has been read.</p>
0	IDST	1	R	<p>Idle Mode Status Flag</p> <p>This status flag indicates that the serial bus activity has stopped.</p> <p>This bit is cleared to 0 if the serial bus are currently active while TEN = 1 or REN = 1.</p> <p>This bit is automatically set to 1 if both TEN and REN are cleared to 0 and the current system word communication is completed.</p> <p>Note: If the external device stops the serial bus clock before the current system word is completed, this bit is not set.</p>

Note: * The bit can be read or written to. Writing 0 initializes the bit, but writing 1 is ignored.

19.3.3 Transmit Data Register (SSITDR)

SSITDR is a 32-bit register that stores data to be transmitted. The data for transmission to be stored to SSITDR is automatically transferred from the transmit FIFO data register.

Data written to this register is transferred to the shift register upon transmission request. If the data word length is less than 32 bits, the alignment is determined by the setting of the PDTA control bit in SSICR.

The CPU cannot read or write data from/to SSITDR.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Initial value:	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-

R/W:	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-

19.3.4 Receive Data Register (SSIRDR)

SSIRDR is a 32-bit register that stores received data. The received data stored in SSIRDR is automatically transferred to the receive FIFO data register.

Data in this register is transferred from the shift register each time data word is received. If the data word length is less than 32 bits, the alignment is determined by the setting of the PDTA control bit in SSICR.

The CPU cannot read or write data from/to SSIRDR.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Initial value:	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
R/W:	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-

19.3.5 FIFO Control Register (SSIFCR)

SSIFCR is a readable/writable 32-bit register that specifies the data trigger numbers and selects between transmission and reception for the FIFO data register, and enables or disables FIFO data reset and interrupt requests.

SSIFCR can always be read or written by the CPU.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
7, 6	TTRG[1:0]	00	R/W	Transmit Data Trigger Number These bits specify the number of transmit data bytes in the FIFO (transmit trigger number) at which the TDE flag in the FIFO status register (SSIFSR) is set while the FIFO is operating for transmission. The TDE flag is set to 1 when the number of transmit data bytes in the transmit FIFO data register (SSIFTDR) has become equal to or less than the set trigger number shown below. 00: 7 (1)* 01: 6 (2)* 10: 4 (4)* 11: 2 (6)* Note: * The values in parenthesis are the number of empty stages in SSIFTDR at which the TDE flag is set.

Bit	Bit Name	Initial Value	R/W	Description
5, 4	RTRG[1:0]	00	R/W	<p>Receive Data Trigger Number</p> <p>These bits specify the number of received data bytes in the FIFO (receive trigger number) at which the RDF flag in the FIFO status register (SSIFSR) is set while the FIFO is operating for reception.</p> <p>The RDF flag is set to 1 when the number of received data bytes in the receive FIFO data register (SSIFRDR) has become equal to or greater than the set trigger number shown below.</p> <p>00: 1 01: 2 10: 4 11: 6</p>
3	TIE	0	R/W	<p>Transmit Interrupt Enable</p> <p>Enables or disables generation of transmit data empty interrupt (TXI) requests in the following situation: when the FIFO is operating for transmission, the data for transmission in the transmit FIFO data register (SSIFTDR) is transferred to the transmit data register (SSITDR) and the number of data bytes in the transmit FIFO data register has become less than the set transmit trigger number; and thus the TDE flag in the FIFO status register (SSIFSR) is set to 1.</p> <p>0: Transmit data empty interrupt (TXI) request is disabled 1: Transmit data empty interrupt (TXI) request is enabled*</p> <p>Note: * TXI can be cleared by clearing either the TDE flag (see the description of the TDE bit for details) or TIE bit.</p>

Bit	Bit Name	Initial Value	R/W	Description
2	RIE	0	R/W	<p>Receive Interrupt Enable</p> <p>Enables or disables generation of receive data full interrupt (RXI) requests when the RDF flag in the FIFO status register (SSIFSR) is set to 1 while the FIFO is operating for reception.</p> <p>0: Receive data full interrupt (RXI) request is disabled 1: Receive data full interrupt (RXI) request is enabled*</p> <p>Note: * RXI can be cleared by clearing either the RDF flag (see the description of the RDF bit for details) or RIE bit.</p>
1	TFRST	0	R/W	<p>Transmit FIFO Data Register Reset</p> <p>Invalidates the data in the transmit FIFO data register (SSIFTDR) to reset the FIFO to an empty state.</p> <p>0: Reset is disabled. 1: Reset is enabled.</p> <p>Note: FIFO is reset at a power-on reset.</p>
0	RFRST	0	R/W	<p>Receive FIFO Data Register Reset</p> <p>Invalidates the data in the receive FIFO data register (SSIFRDR) to reset the FIFO to an empty state.</p> <p>0: Reset is disabled 1: Reset is enabled</p> <p>Note: FIFO is reset at a power-on reset.</p>

19.3.6 FIFO Status Register (SSIFSR)

SSIFSR consists of status flags indicating the operating status of the FIFO data register.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16	
	-	-	-	-	TDC[3:0]				-	-	-	-	-	-	-	-	TDE
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/(W)*	

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
	-	-	-	-	RDC[3:0]				-	-	-	-	-	-	-	-	RDF
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/(W)*	

Bit	Bit Name	Initial Value	R/W	Description
31 to 28	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
27 to 24	TDC[3:0]	0000	R	Number of Data Bytes Stored in SSIFTDR TDC[3:0] = H'0 indicates no data for transmission. TDC[3:0] = H'8 indicates that 32 bytes of data for transmission is stored in SSIFTDR.
23 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	TDE	1	R/(W)*	Transmit Data Empty Indicates that, when the FIFO is operating for transmission, the data for transmission in the transmit FIFO data register (SSIFTDR) is transferred to the transmit data register (SSITDR), the number of data bytes in the FIFO data register has become less than the transmit trigger number specified by TTRG[1:0] in the FIFO control register (SSIFCR), and thus writing of data transmission to SSIFTDR has been enabled.

Bit	Bit Name	Initial Value	R/W	Description
16	TDE	1	R/(W)*	<p>0: Number of data bytes for transmission in SSIFTDR is greater than the set transmit trigger number.</p> <p>[Clearing conditions]</p> <ul style="list-style-type: none"> 0 is written to TDE after data of the number of bytes larger than the set transmit trigger number is written to SSIFTDR. The direct memory access controller is activated by transmit data empty (TXI) interrupt, and data of the number of bytes larger than the set transmit trigger number is written to SSIFTDR. <p>1: Number of data bytes for transmission in SSIFTDR is equal to or less than the set transmit trigger number.</p> <p>*</p> <p>[Setting conditions]</p> <ul style="list-style-type: none"> Power-on reset Number of transmission data bytes to be stored in SSIFTDR has become equal to or less than the set transmit trigger number. <p>Note: 1. Since SSIFTDR is an 8-stage FIFO register, the amount of data that can be written to it while TDE = 1 is "8 – transmit trigger number to be specified" bytes at maximum. Writing more data will be ignored. The number of data bytes in SSIFTDR is indicated in the TDC bits in SSIFSR.</p>
15 to 12	—	All 0	R	<p>Reserved</p> <p>These bits are always read as 0. The write value should always be 0.</p>
11 to 8	RDC[3:0]	0000	R	<p>Number of Data Bytes Stored in SSIFRDR</p> <p>RDC[3:0] = H'0 indicates no received data.</p> <p>RDC[3:0] = H'8 indicates that 32 bytes of received data is stored in SSIFRDR.</p>
7 to 1	—	All 0	R	<p>Reserved</p> <p>This bit is always read as 0. The write value should always be 0.</p>

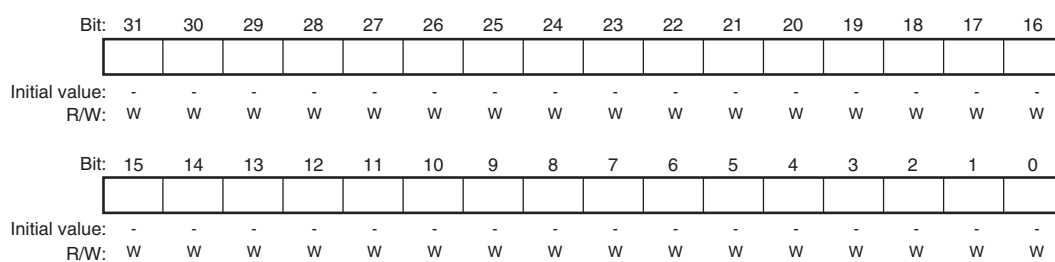

Bit	Bit Name	Initial Value	R/W	Description
0	RDF	0	R/(W)*	<p>Receive Data Full</p> <p>Indicates that, when the FIFO is operating for reception, the received data is transferred to the receive FIFO data register (SSIFRDR) and the number of data bytes in the FIFO data register has become greater than the receive trigger number specified by RTRG[1:0] in the FIFO control register (SSIFCR).</p> <p>0: Number of received data bytes in SSIFRDR is less than the set receive trigger number.</p> <p>[Clearing conditions]</p> <ul style="list-style-type: none"> • Power-on reset • 0 is written to RDF after the receive FIFO is empty with writing 1 to RFRST. • 0 is written to RDF after data is read from SSIFRDR until the number of data bytes in SSIFRDR becomes less than the set receive trigger number. • The direct memory access controller is activated by receive data full (RXI) interrupt, and data is read from SSIFRDR until the number of data bytes in SSIFRDR becomes less than the set receive trigger number. <p>1: Number of received data bytes in SSIFRDR is equal to or greater than the set receive trigger number.</p> <p>[Setting condition]</p> <ul style="list-style-type: none"> • Data of the number of bytes that is equal to or greater than the set receive trigger number is stored in SSIFRDR.*¹ <p>Note: 1. Since SSIFRDR is an 8-stage FIFO register, the amount of data that can be read from it while RDF = 1 is the set receive trigger number of bytes at maximum. Continuing to read data from SSIFRDR after reading all the data will result in undefined data to be read. The number of data bytes in SSIFRDR is indicated in the RDC bits in SSIFSR.</p>

Note: * The bit can be read or written to. Writing 0 initializes the bit, but writing 1 is ignored.

19.3.7 Transmit FIFO Data Register (SSIFTDR)

SSIFTDR is a FIFO register consisting of eight stages of 32-bit registers for storing data to be serially transmitted. On detecting that the transmit data register (SSITDR) is empty, this module transfers the data for transmission written to SSIFTDR to SSITDR to start serial transmission, which can continue until SSIFTDR becomes empty. SSIFTDR can be written to by the CPU at any time.

Note that when SSIFTDR is full of data (32 bytes), the next data cannot be written to it. If writing is attempted, it will be ignored and an overflow occurs.

Note: * Not writable during reception.

19.3.8 Receive FIFO Data Register (SSIFRDR)

SSIFRDR is a FIFO register consisting of eight stages of 32-bit registers for storing serially received data. When four bytes of data have been received, this module transfers the received data in the receive data register (SSIRDTR) to SSIFRDR to complete reception operation. Reception can continue until 32 bytes of data have been stored to SSIFRDR. SSIFRDR can be read by the CPU but cannot be written to. Note that when SSIFRDR is read when it stores no received data, undefined values will be read and a receive underflow occurs.

After SSIFRDR becomes full of received data, the data received thereafter will be lost and a receive overflow occurs.

19.4 Operation Description

19.4.1 Bus Format

This module can operate as a transmitter or a receiver and can be configured into many serial bus formats in either mode.

The bus format can be selected from one of the eight major modes shown in table 19.3.

Table 19.3 Bus Format for SSIF Module

	Non- Compression Slave Receiver	Non- Compression Slave Transmitter	Non- Compression Slave Transceiver	Non- Compression Master Receiver	Non- Compression Master Transmitter	Non- Compression Master Transceiver
TEN	0	1	1	0	1	1
REN	1	0	1	1	0	1

CHNL[1:0]						

19.4.2 Non-Compressed Modes

The non-compressed modes support all serial audio streams split into channels. It supports Philips, Sony and Matsushita modes as well as many more variants on these modes.

(1) Slave Receiver

This mode allows the module to receive serial data from another device. The clock and word select signal used for the serial data stream is also supplied from an external device. If these signals do not conform to the format specified in the configuration fields of this module, operation is not guaranteed.

(2) Slave Transmitter

This mode allows the module to transmit serial data to another device. The clock and word select signal used for the serial data stream is also supplied from an external device. If these signals do not conform to the format specified in the configuration fields of this module, operation is not guaranteed.

(3) Slave Transceiver

This mode allows serial data transmission and reception between this module and another device. The clock and word select signal used for the serial data stream is also supplied from an external device. If these signals do not conform to the format specified in the configuration fields of this module, operation is not guaranteed.

(4) Master Receiver

This mode allows the module to receive serial data from another device. The clock and word select signals are internally derived from the oversampling clock. The format of these signals is defined in the configuration fields of this module. If the incoming data does not follow the configured format, operation is not guaranteed.

(5) Master Transmitter

This mode allows the module to transmit serial data to another device. The clock and word select signals are internally derived from the oversampling clock. The format of these signals is defined in the configuration fields of this module.

(6) Master Transceiver

This mode allows serial data transmission and reception between this module and another device. The clock and word select signals are internally derived from the oversampling clock. The format of these signals is defined in the configuration fields of this module.

(7) Operating Setting Related to Word Length

All bits related to the SSICR's word length are valid in non-compressed modes. There are many configurations this module supports, but some of the combinations are shown below for the popular formats by Philips, Sony, and Matsushita.

- Philips Format

Figures 19.3 and 19.4 demonstrate the supported Philips format both with and without padding. Padding occurs when the data word length is smaller than the system word length.

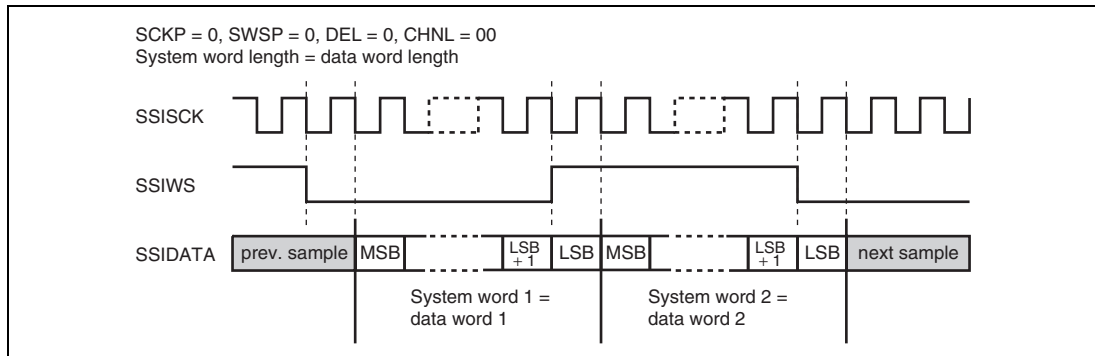

Figure 19.3 Philips Format (without Padding)

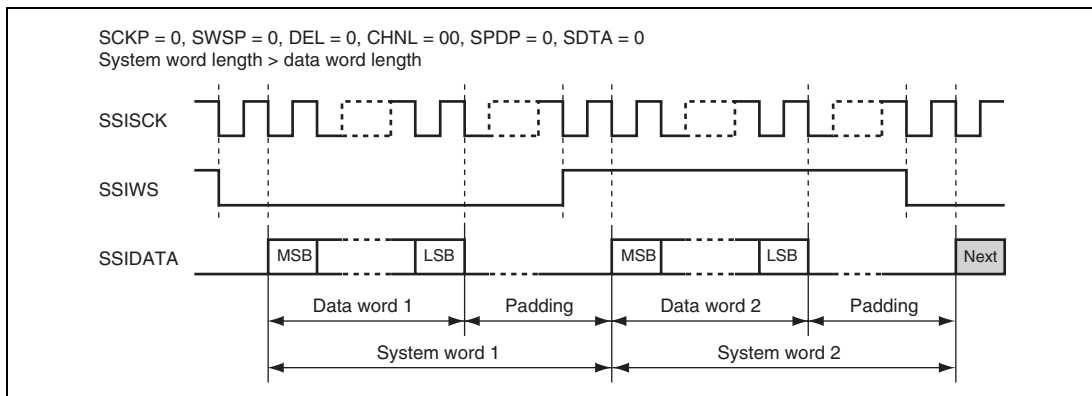

Figure 19.4 Philips Format (with Padding)

Figure 19.5 shows Sony format and figure 19.6 shows Matsushita format. Padding is assumed in both cases, but may not be present in a final implementation if the system word length equals the data word length.

- Sony Format

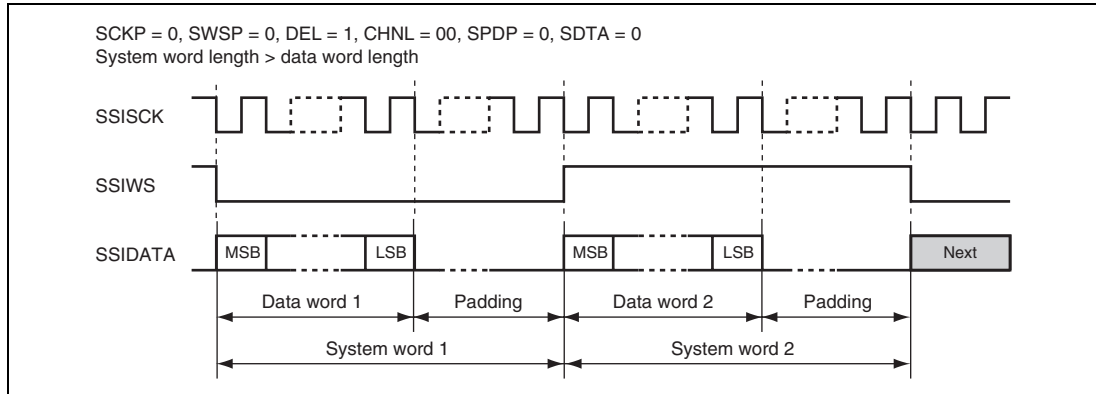

Figure 19.5 Sony Format
(Transmitted and received in the order of serial data and padding bits)

- Matsushita Format

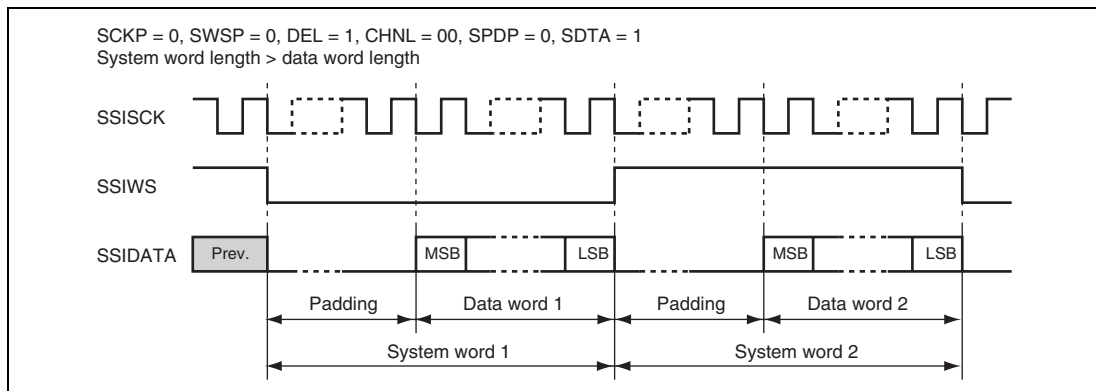

Figure 19.6 Matsushita Format
(Transmitted and Received in the Order of Padding Bits and Serial Data)

(8) Multi-channel Formats

Some devices extend the definition of the specification by Philips and allow more than 2 channels to be transferred within two system words.

This module supports the transfer of 4, 6, and 8 channels by using the CHNL, SWL and DWL bits only when the system word length (SWL) is greater than or equal to the data word length (DWL) multiplied by channels (CHNL).

Table 19.4 shows the number of padding bits for each of the valid setting. If setting is not valid, "—" is indicated instead of a number.

Table 19.4 The Number of Padding Bits for Each Valid Setting

Padding Bits per System										
	Word	DWL[2:0]	000	001	010	011	100	101	110	
CHNL [1:0]	Decoded Channels per System Word	SWL [2:0]	Decoded Word Length	8	16	18	20	22	24	32

When this module acts as a transmitter, each word written to SSITDR is transmitted to the serial audio bus in the order they are written. When this module acts as a receiver, each word received by the serial audio bus is read in the order received from the SSIRDR register.

Figures 19.7 to 19.9 show how the data on 4, 6, and 8 channels are transferred to the serial audio bus. Note that there are no padding bits in the first example, the second example is left-aligned and the third is right-aligned. The other conditions in these examples have been selected arbitrarily.

(9) Bit Setting Configuration Format

Several more configuration bits in non-compressed mode are shown below. These bits are not mutually exclusive, but some combinations may not be useful for any other device.

These configuration bits are described below with reference to figure 19.10.

**Figure 19.10 Basic Sample Format
(Transmit Mode with Example System/Data Word Length)**

Figure 19.10 uses a system word length of 6 bits and a data word length of 4 bits. These settings are not possible with this module but are used only for clarification of the other configuration bits.

19.4.3 Operation Modes

There are three modes of operation: configuration, enabled and disabled. Figure 19.19 shows how the module enters each of these modes.

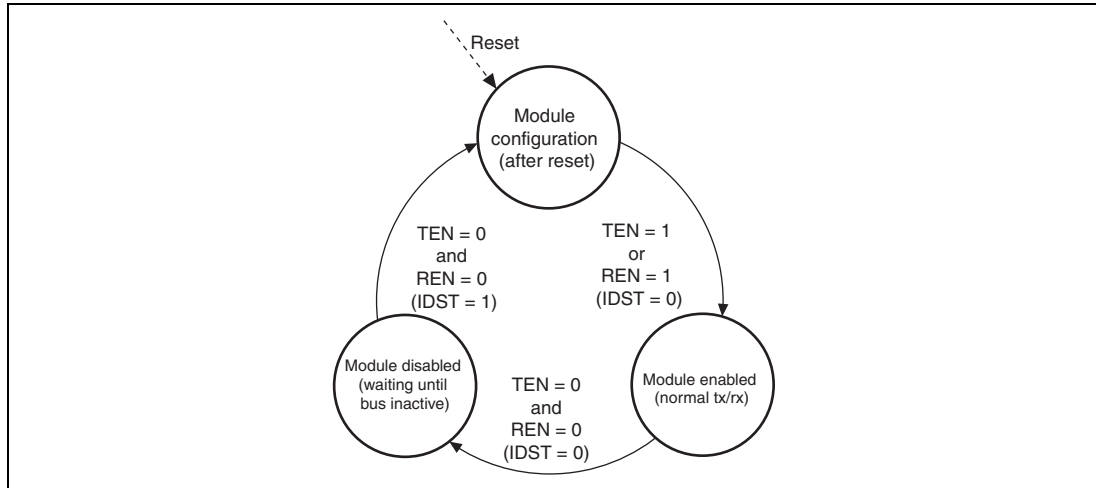

Figure 19.19 Operation Modes

(1) Configuration Mode

This mode is entered after the module is released from reset. All required configuration fields in the control register should be defined in this mode, before this module is enabled by setting the TEN and REN bits.

Setting the TEN and REN bits causes the module to enter the module enabled mode.

(2) Module Enabled Mode

Operation of the module in this mode is dependent on the operation mode selected. For details, refer to section 19.4.4, Transmit Operation and section 19.4.5, Receive Operation, below.

19.4.4 Transmit Operation

Transmission can be controlled either by DMA transfer or interrupt.

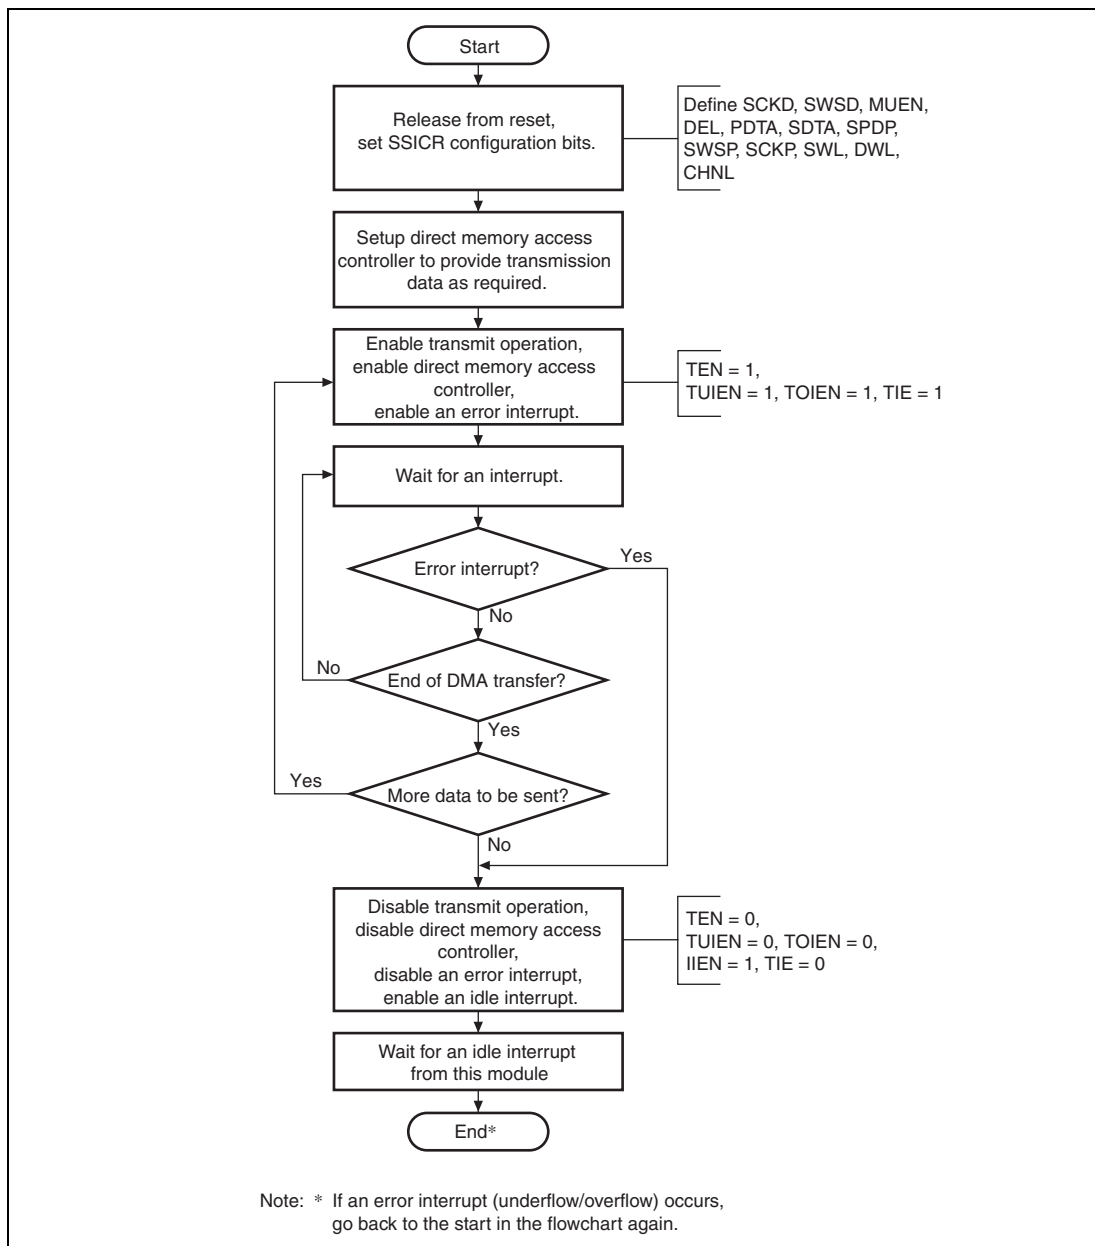

DMA control is preferred to reduce the processor load. In DMA control mode, the processor will only receive interrupts if there is an underflow or overflow of data or if the DMA transfer has been completed.

The alternative method is using the interrupts that this module generates to supply data as required.

When disabling this module, the clock* must be kept supplied to this module until the IIRQ bit indicates that the module is in the idle state.

Figure 19.20 shows the transmit operation in DMA control mode, and figure 19.21 shows the transmit operation in interrupt control mode.

Note: * Input clock from the SSISCK pin when SCKD = 0.
Oversampling clock when SCKD = 1.

(1) Transmission Using Direct Memory Access Controller**Figure 19.20 Transmission Using Direct Memory Access Controller**

(2) Transmission Using Interrupt-Driven Data Flow Control

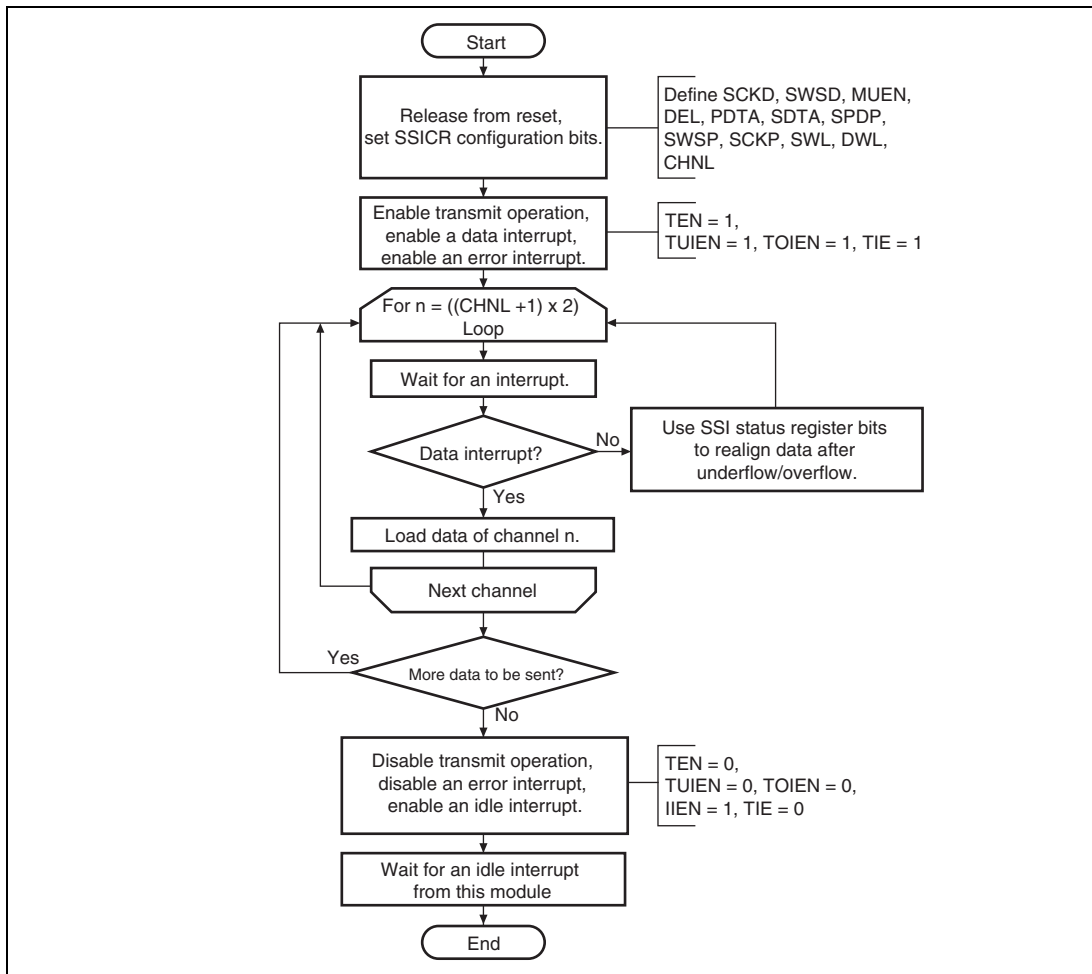

Figure 19.21 Transmission Using Interrupt-Driven Data Flow Control

19.4.5 Receive Operation

Like transmission, reception can be controlled either by DMA transfer or interrupt.

Figures 19.22 and 19.23 show the flow of operation.

When disabling this module, the clock* must be kept supplied to this module until the IIRQ bit indicates that the module is in the idle state.

Note: * Input clock from the SSISCK pin when SCKD = 0.
Oversampling clock when SCKD = 1.

(1) Reception Using Direct Memory Access Controller

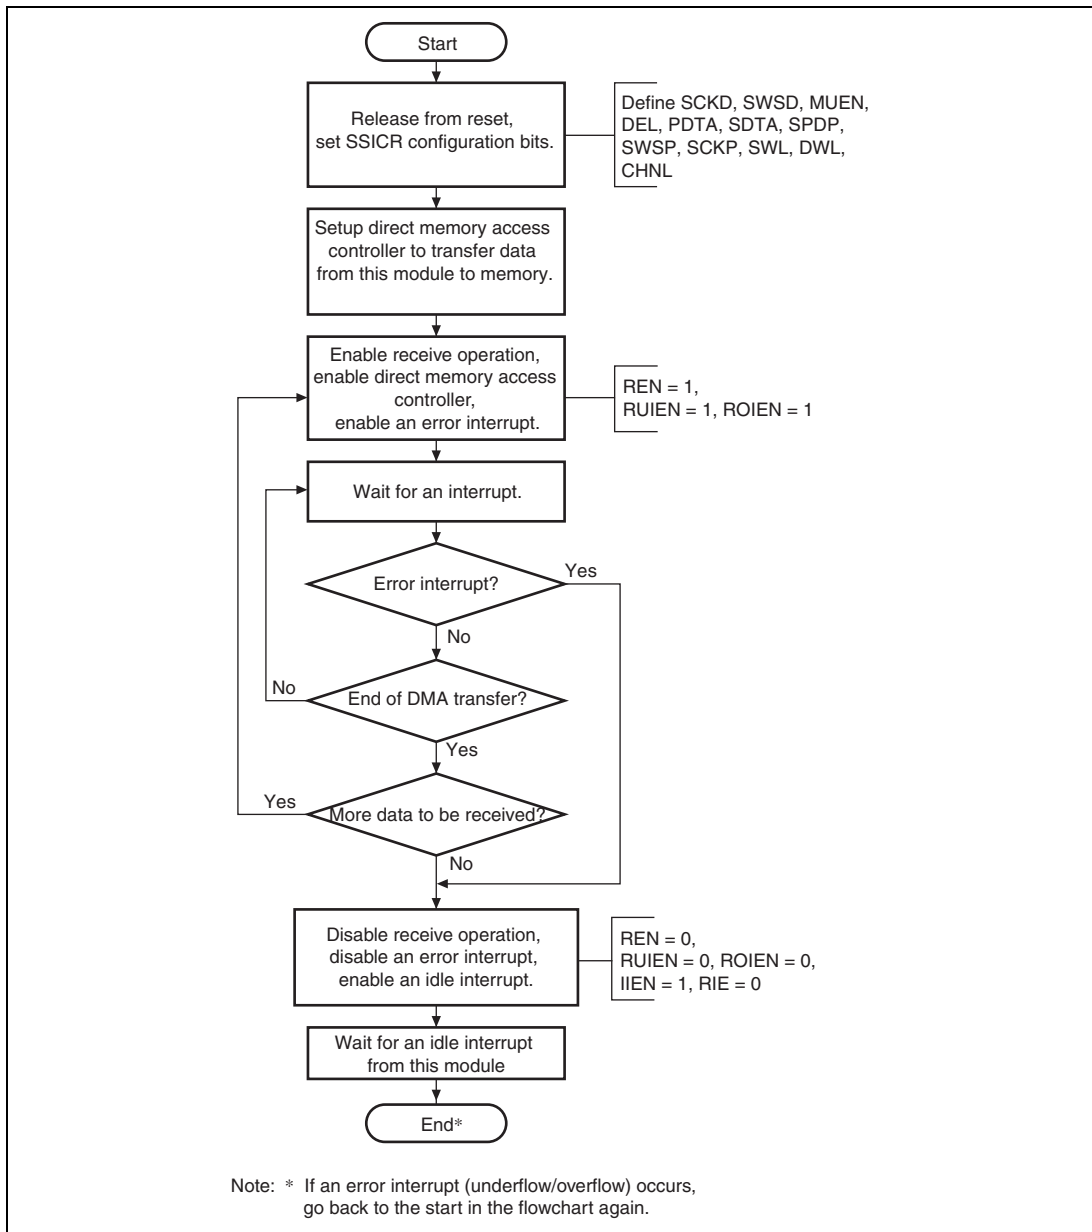

Figure 19.22 Reception Using Direct Memory Access Controller

(2) Reception Using Interrupt-Driven Data Flow Control

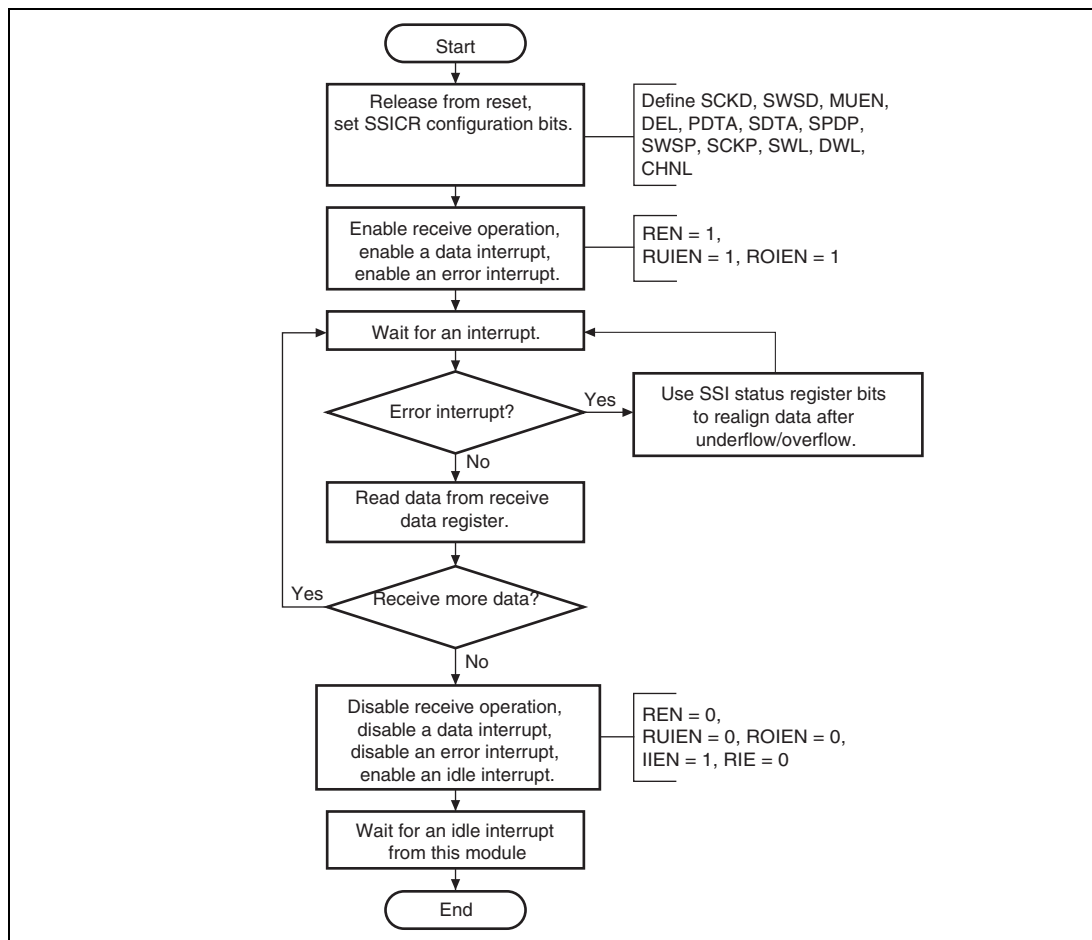

Figure 19.23 Reception Using Interrupt-Driven Data Flow Control

When an underflow or overflow error condition has matched, this module can be recovered to the status before underflow or overflow condition match by using the TCHNO [1:0] and TSWNO bits in transmission and the RCHNO[1:0] and RSWNO bits in reception. When an underflow or overflow occurs, the host can read the channel number and system word number to determine what point the serial audio stream has reached. In the transmitter case, the host can skip forward through the data it wants to transmit until it finds the sample data that matches what this module is expecting to transmit next, and so resynchronize with the audio data stream. In the receiver case the host CPU can store null data to make the number of receive data items consistent until it is ready to store the sample data that this module is indicating will be received next, and so resynchronize with the audio data stream.

19.4.6 Serial Bit Clock Control

This function is used to control and select which clock is used for the serial bus interface.

If the serial clock direction is set to input (SCKD = 0), this module is in clock slave mode and the shift register uses the bit clock that was input to the SSISCK pin.

If the serial clock direction is set to output (SCKD = 1), this module is in clock master mode, and the shift register uses the oversampling clock or a divided oversampling clock as the bit clock. The oversampling clock is divided by the ratio specified by the serial oversampling clock division ratio bits (CKDV) in SSICR for use as the bit clock by the shift register.

In either case the module pin, SSISCK, is the same as the bit clock.

19.5 Usage Notes

19.5.1 Limitations from Underflow or Overflow during DMA Operation

If an underflow or overflow occurs while the DMA is in operation, the module should be restarted. The transmit and receive buffers in the SSIF consists of 32-bit registers that share the L and R channels. Therefore, data to be transmitted and received at the L channel may sometimes be transmitted and received at the R channel if an underflow or overflow occurs, for example, under the following condition: the control register (SSICR) has a 32-bit setting for both data word length (DWL2 to DWL0) and system word length (SWL2 to SWL0).

If an error occurrence is confirmed with four types of error interrupts (transmit underflow, transmit overflow, receive underflow, and receive overflow) or the corresponding error status flag (the bits TUIRQ, TOIRQ, RUIRQ, and ROIRQ in SSISR), write 0 to the TEN or REN bit in SSICR to disable DMA transfer requests in this module, thus stopping the operation. (In this case, the direct memory access controller setting should also be stopped.) After this, write 0 to the error status flag bit to clear the error status, set the direct memory access controller again and restart the transfer.

19.5.2 Note on Changing Mode from Master Transceiver to Master Receiver

If a transmit underflow occurs in master transceiver mode and the TEN bit in SSICR is set to 0 in order to disable transmit operation, SSIWS output is broken. In order to receive seamlessly after changing mode to master receiver mode, write dummy data to SSITDR to suppress transmit underflow.

Section 20 Serial I/O with FIFO

This LSI includes a clock-synchronized serial I/O module with FIFO.

20.1 Features

- Serial transfer
 - 16-stage 32-bit FIFOs (independent transmission and reception)
 - Supports 8-bit monaural/16-bit monaural/16-bit stereo audio input and output
 - MSB first for data transmission
 - Supports a maximum of 48-kHz sampling rate
 - Synchronization by frame synchronization pulse
 - Connectable to linear, audio, or A-Law or μ -Law CODEC chip
 - Supports both master and slave modes
- Serial clock
 - AUDIO_CLK or AUDIO_X1 can be selected as the clock source.
- Interrupts: One type
- DMA transfer: Two types
 - Transmit FIFO transfer requests and receive FIFO transfer requests

Figure 20.1 shows a block diagram.

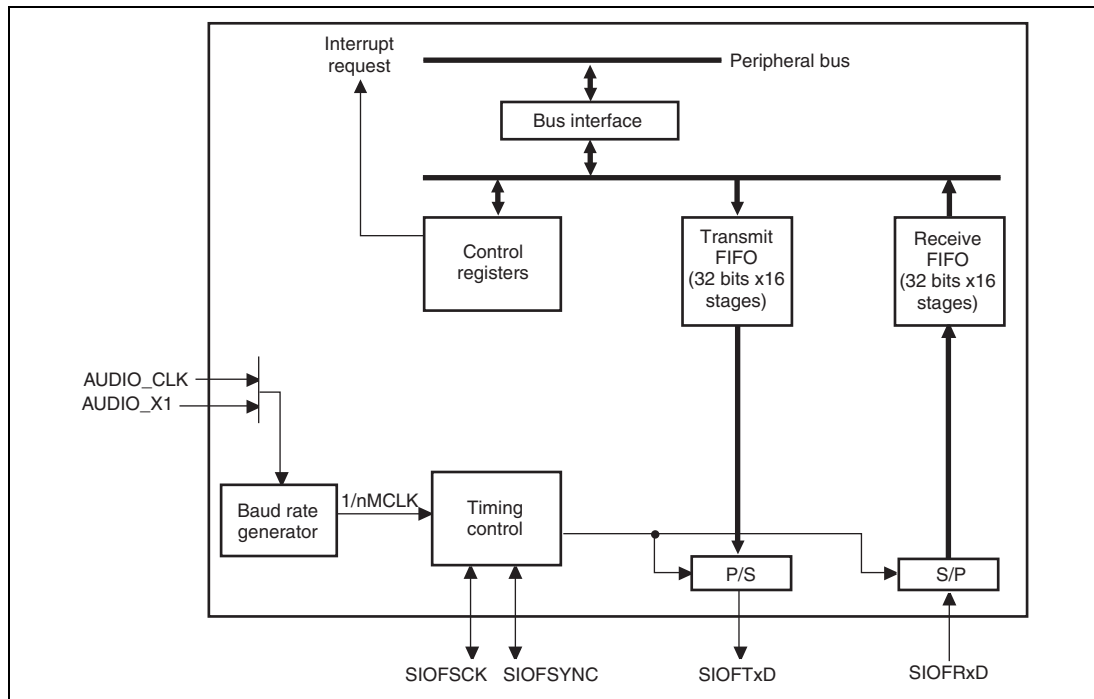

Figure 20.1 Block Diagram

20.2 Input/Output Pins

Table 20.1 shows the pin configuration.

Table 20.1 Pin Configuration

Pin Name	I/O	Function
AUDIO_CLK	Input	External clock for audio
AUDIO_X1	Input	Crystal resonator/external clock for audio
AUDIO_X2	Output	
SIOFSCK	I/O	Serial clock (common to transmission/reception)
SIOFSYNC	I/O	Frame synchronous signal (common to transmission/reception)
SIOFTxD	Output	Transmit data
SIOFRxD	Input	Receive data

20.3 Register Descriptions

Table 20.2 shows the register configuration.

Register Name	Abbreviation	R/W	Initial Value	Address	Access Size
Mode register	SIMDR	R/W	H'8000	H'FFFF4800	16
Clock select register	SISCR	R/W	H'8000	H'FFFF4802	16
Transmit data assign register	SITDAR	R/W	H'0000	H'FFFF4804	16
Receive data assign register	SIRDAR	R/W	H'0000	H'FFFF4806	16
Control register	SICTR	R/W	H'0000	H'FFFF480C	16
FIFO control register	SIFCTR	R/W*	H'1000	H'FFFF4810	16
Status register	SISTR	R/W*	H'0000	H'FFFF4814	16
Interrupt enable register	SIIER	R/W	H'0000	H'FFFF4816	16
Transmit data register	SITDR	W	Undefined	H'FFFF4820	8, 16, 32
Receive data register	SIRDR	R	Undefined	H'FFFF4824	8, 16, 32

Note: * This register has readable/writable bits and read-only bits. For details, see descriptions for each register.

20.3.1 Mode Register (SIMDR)

SIMDR sets the operating mode for this module.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TRMD1	TRMD0	SYNCAT	REDG	FL3	FL2	FL1	FL0	TXDIZ	-	SYNCAC	SYNCDL	-	-	-	-
Initial Value:	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W	R/W	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15	TRMD1	1	R/W	Transfer Mode 1, 0
14	TRMD0	0	R/W	Select transfer mode. 00: Slave mode 01: Setting prohibited 10: Master mode 11: Setting prohibited
13	SYNCAT	0	R/W	SIOFSYNC Pin Valid Timing Indicates the position where the SIOFSYNC signal is output. This bit is valid in master mode. 0: At the start-bit data of frame 1: At the last-bit data of slot Note: If this bit is set to 1, make sure that valid data is transmitted/received or transmitted.
12	REDG	0	R/W	Receive Data Sampling Edge This bit is valid in master mode. 0: The SIOFRxD signal is sampled at the falling edge of SIOFSCK (The SIOFTxD signal is transmitted at the rising edge of SIOFSCK.) 1: The SIOFRxD signal is sampled at the rising edge of SIOFSCK (The SIOFTxD signal is transmitted at the falling edge of SIOFSCK.)

Bit	Bit Name	Initial Value	R/W	Description
11	FL3	0	R/W	Frame Length 3 to 0
10	FL2	0	R/W	00xx: Data length is 8 bits and frame length is 8 bits.
9	FL1	0	R/W	0100: Data length is 8 bits and frame length is 16 bits.
8	FL0	0	R/W	0101: Data length is 8 bits and frame length is 32 bits. 0110: Data length is 8 bits and frame length is 64 bits. 0111: Data length is 8 bits and frame length is 128 bits. 10xx: Data length is 16 bits and frame length is 16 bits. 1100: Data length is 16 bits and frame length is 32 bits. 1101: Data length is 16 bits and frame length is 64 bits. 1110: Data length is 16 bits and frame length is 128 bits. 1111: Data length is 16 bits and frame length is 256 bits. Note: When data length is specified as 8 bits, control data cannot be transmitted or received. x: Don't care
7	TXDIZ	0	R/W	SIOFTxD Pin Output when Transmission is Invalid* 0: High output (1 output) when invalid 1: High-impedance state when invalid Note: Invalid means when disabled, and when a slot that is not assigned as transmit data or control data is being output.
6	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
5	SYNCAC	0	R/W	SIOFSYNC Pin Polarity This bit is valid in master mode. 0: Active-high 1: Active-low
4	SYNCDL	0	R/W	Data Pin Bit Delay for SIOFSYNC Pin Only 1-bit delay is valid in slave mode. 0: No bit delay 1: 1-bit delay
3 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

20.3.2 Control Register (SICTR)

SICTR sets the operating state for this module.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	SCKE	FSE	-	-	-	-	TXE	RXE	-	-	-	-	-	-	TXRST	RXRST
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R	R	R	R	R/W	R/W	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15	SCKE	0	R/W	<p>Serial Clock Output Enable</p> <p>This bit is valid in master mode.</p> <p>0: Disables the SIOFSCK output (outputs 0)</p> <p>1: Enables the SIOFSCK output</p> <ul style="list-style-type: none"> If this bit is set to 1, this module initializes the baud rate generator and initiates the operation. At the same time, the clock generated by the baud rate generator is output to the SIOFSCK pin.
14	FSE	0	R/W	<p>Frame Synchronous Signal Output Enable</p> <p>This bit is valid in master mode.</p> <p>0: Disables the SIOFSYNC output (outputs 0)</p> <p>1: Enables the SIOFSYNC output</p> <ul style="list-style-type: none"> If this bit is set to 1, this module initializes the frame counter and initiates the operation.
13 to 10	—	All 0	R	<p>Reserved</p> <p>These bits are always read as 0. The write value should always be 0.</p>
9	TXE	0	R/W	<p>Transmit Enable</p> <p>0: Disables data transmission from the SIOFTxD pin</p> <p>1: Enables data transmission from the SIOFTxD pin</p> <ul style="list-style-type: none"> This bit setting becomes valid at the start of the next frame (at the rising edge of the SIOFSYNC signal). When the 1 setting for this bit becomes valid, this module issues a transmit transfer request according to the setting of the TFWM bit in SIFCTR. When transmit data is stored in the transmit FIFO, transmission of data from the SIOFTxD pin begins. This bit is initialized upon a transmit reset.

Bit	Bit Name	Initial Value	R/W	Description
8	RXE	0	R/W	<p>Receive Enable</p> <p>0: Disables data reception from SIOFRxD 1: Enables data reception from SIOFRxD</p> <ul style="list-style-type: none"> This bit setting becomes valid at the start of the next frame (at the rising edge of the SIOFSYNC signal). When the 1 setting for this bit becomes valid, this module begins the reception of data from the SIOFRxD pin. When receive data is stored in the receive FIFO, a reception transfer request is issued according to the setting of the RFWM bit in SIFCTR. This bit is initialized upon receive reset.
7 to 2	—	All 0	R	<p>Reserved</p> <p>These bits are always read as 0. The write value should always be 0.</p>
1	TXRST	0	R/W	<p>Transmit Reset</p> <p>0: Does not reset transmit operation 1: Resets transmit operation</p> <ul style="list-style-type: none"> This bit setting becomes valid immediately. This bit should be cleared to 0 before setting the register to be initialized. When the 1 setting for this bit becomes valid, this module immediately sets the SIOFTxD pin output to 1, and initializes the following registers and data: <ul style="list-style-type: none"> — SITDR — Valid data in transmit FIFO — The TFEMP and TDREQ bits in SISTR — The TXE bit <p>Note: Set this bit to 1 for more than one transfer clock period.</p>

Bit	Bit Name	Initial Value	R/W	Description
0	RXRST	0	R/W	<p>Receive Reset</p> <p>0: Does not reset receive operation 1: Resets receive operation</p> <ul style="list-style-type: none">• This bit setting becomes valid immediately. This bit should be cleared to 0 before setting the register to be initialized.• When the 1 setting for this bit becomes valid, this module immediately disables reception from the SIOFRxD pin, and initializes the following registers and data:<ul style="list-style-type: none">— SIRDR— Valid data in receive FIFO— The RFFUL and RDREQ bits in SISTR— The RXE bit <p>Note: Set this bit to 1 for more than one transfer clock period.</p>

20.3.3 Transmit Data Register (SITDR)

SITDR specifies transmit data. The data set in SITDR will be stored in the transmit FIFO.

SITDR is initialized by a transmit reset caused by the TXRST bit in SICTR.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	SITDL [15:0]	Undefined	W	<p>Left-Channel Transmit Data</p> <p>Specify data to be transmitted from the SIOFTxD pin as left-channel data. The position of the left-channel data in the transmit frame is specified by the TDLA bit in SITDAR.</p> <ul style="list-style-type: none"> These bits are valid only when the TDLE bit in SITDAR is set to 1.
15 to 0	SITDR [15:0]	Undefined	W	<p>Right-Channel Transmit Data</p> <p>Specify data to be transmitted from the SIOFTxD pin as right-channel data. The position of the right-channel data in the transmit frame is specified by the TDRA bit in SITDAR.</p> <ul style="list-style-type: none"> These bits are valid only when the TDRE bit is set to 1 and the TLREP bit is cleared to 0 in SITDAR.

20.3.4 Receive Data Register (SIRDR)

SIRDR reads receive data of this module. SIRDR stores data in the receive FIFO.

SIRDR is initialized by a receive reset caused by the RXRST bit in SICTR.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
15	TDMAE	0	R/W	Transmit FIFO DMA Transfer Request Enable Uses a transmit FIFO transfer request as an interrupt or a DMA transfer request. 0: Used as an interrupt to the CPU 1: Used as a DMA transfer request to the direct memory access controller
14	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
13	TFEMPE	0	R/W	Transmit FIFO Empty Enable 0: Disables interrupts due to transmit FIFO empty 1: Enables interrupts due to transmit FIFO empty
12	TDREQE	0	R/W	Transmit FIFO Transfer Request Enable 0: Disables interrupts/DMA transfer requests due to transmit FIFO transfer requests 1: Enables interrupts/DMA transfer requests due to transmit FIFO transfer requests
11	RDMAE	0	R/W	Receive FIFO DMA Transfer Request Enable Uses a receive FIFO transfer request as an interrupt or a DMA transfer request. 0: Used as a CPU interrupt 1: Used as a DMA transfer request to the direct memory access controller
10	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
9	RFFULE	0	R/W	Receive FIFO Full Enable 0: Disables interrupts due to receive FIFO full 1: Enables interrupts due to receive FIFO full
8	RDREQE	0	R/W	Receive FIFO Transfer Request Enable 0: Disables interrupts/DMA transfer requests due to receive FIFO transfer requests 1: Enables interrupts/DMA transfer requests due to receive FIFO transfer requests
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	FSERRE	0	R/W	Frame Synchronization Error Enable 0: Disables interrupts due to frame synchronization error 1: Enables interrupts due to frame synchronization error
3	TFOVFE	0	R/W	Transmit FIFO Overflow Enable 0: Disables interrupts due to transmit FIFO overflow 1: Enables interrupts due to transmit FIFO overflow
2	TFUDFE	0	R/W	Transmit FIFO Underflow Enable 0: Disables interrupts due to transmit FIFO underflow 1: Enables interrupts due to transmit FIFO underflow
1	RFUDFE	0	R/W	Receive FIFO Underflow Enable 0: Disables interrupts due to receive FIFO underflow 1: Enables interrupts due to receive FIFO underflow
0	RFOVFE	0	R/W	Receive FIFO Overflow Enable 0: Disables interrupts due to receive FIFO overflow 1: Enables interrupts due to receive FIFO overflow

20.3.7 FIFO Control Register (SIFCTR)

SIFCTR indicates the area available for the transmit/receive FIFO transfer.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TFWM2	TFWM1	TFWM0	TFUA4	TFUA3	TFUA2	TFUA1	TFUA0	RFWM2	RFWM1	RFWM0	RFUA4	RFUA3	RFUA2	RFUA1	RFUA0
Initial Value:	0	0	0	1	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R	R	R	R	R	R/W	R/W	R/W	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15	TFWM2	0	R/W	Transmit FIFO Watermark
14	TFWM1	0	R/W	000: Issue a transfer request when 16 stages of the transmit FIFO are empty.
13	TFWM0	0	R/W	001: Setting prohibited 010: Setting prohibited 011: Setting prohibited 100: Issue a transfer request when 12 or more stages of the transmit FIFO are empty. 101: Issue a transfer request when 8 or more stages of the transmit FIFO are empty. 110: Issue a transfer request when 4 or more stages of the transmit FIFO are empty. 111: Issue a transfer request when 1 or more stages of transmit FIFO are empty. <ul style="list-style-type: none"> • A transfer request to the transmit FIFO is issued by the TDREQE bit in SISTR. • The transmit FIFO is always used as 16 stages of the FIFO regardless of these bit settings.
12	TFUA4	1	R	Transmit FIFO Usable Area
11	TFUA3	0	R	Indicate the number of stages of FIFO that can be transferred as B'00000 (full) to B'10000 (empty).
10	TFUA2	0	R	
9	TFUA1	0	R	
8	TFUA0	0	R	

Bit	Bit Name	Initial Value	R/W	Description
7	RFWM2	0	R/W	Receive FIFO Watermark
6	RFWM1	0	R/W	000: Issue a transfer request when 1 stage or more of the receive FIFO are valid.
5	RFWM0	0	R/W	001: Setting prohibited 010: Setting prohibited 011: Setting prohibited 100: Issue a transfer request when 4 or more stages of the receive FIFO are valid. 101: Issue a transfer request when 8 or more stages of the receive FIFO are valid. 110: Issue a transfer request when 12 or more stages of the receive FIFO are valid. 111: Issue a transfer request when 16 stages of the receive FIFO are valid. <ul style="list-style-type: none"> • A transfer request to the receive FIFO is issued by the RDREQE bit in SISTR. • The receive FIFO is always used as 16 stages of the FIFO regardless of these bit settings.
4	RFUA4	0	R	Receive FIFO Usable Area
3	RFUA3	0	R	Indicate the number of stages of FIFO that can be transferred as B'00000 (empty) to B'10000 (full).
2	RFUA2	0	R	
1	RFUA1	0	R	
0	RFUA0	0	R	

20.3.8 Clock Select Register (SISCR)

SISCR sets the serial clock generation conditions for the master clock. SISCR can be specified when the TRMD1 and TRMD0 bits in SIMDR are specified as B'10.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	MSEL	-	-	BRPS4	BRPS3	BRPS2	BRPS1	BRPS0	-	-	-	-	-	BRDV2	BRDV1	BRDV0
Initial Value:	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R	R	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15	MSEL	1	R/W	Master Clock Source Selection 0: Uses AUDIO_X1 as the master clock 1: Uses AUDIO_CLK as the master clock The master clock is the clock input to the baud rate generator.
14, 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
12	BRPS4	0	R/W	Prescaler Setting
11	BRPS3	0	R/W	Set the master clock division ratio according to the count value of the prescaler of the baud rate generator. The range of settings is from B'00000 ($\times 1/1$) to B'11111 ($\times 1/32$).
10	BRPS2	0	R/W	
9	BRPS1	0	R/W	
8	BRPS0	0	R/W	
7 to 3	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
2	BRDV2	0	R/W	Baud rate generator's Division Ratio Setting
1	BRDV1	0	R/W	Set the frequency division ratio for the output stage of the baud rate generator.
0	BRDV0	0	R/W	000: Prescaler output $\times 1/2$ 001: Prescaler output $\times 1/4$ 010: Prescaler output $\times 1/8$ 011: Prescaler output $\times 1/16$ 100: Prescaler output $\times 1/32$ 101: Setting prohibited 110: Setting prohibited 111: Setting prohibited The final frequency division ratio of the baud rate generator is determined by $BRPS \times BRDV$ (maximum 1/1024).

20.3.9 Transmit Data Assign Register (SITDAR)

SITDAR specifies the position of the transmit data in a frame (slot number).

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TDLE	-	-	-	TDLA3	TDLA2	TDLA1	TDLA0	TDRE	TLREP	-	-	TDRA3	TDRA2	TDRA1	TDRA0
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15	TDLE	0	R/W	Transmit Left-Channel Data Enable 0: Disables left-channel data transmission 1: Enables left-channel data transmission
14 to 12	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
11	TDLA3	0	R/W	Transmit Left-Channel Data Assigns 3 to 0
10	TDLA2	0	R/W	Specify the position of left-channel data in a transmit frame as B'0000 (0) to B'1110 (14).
9	TDLA1	0	R/W	1111: Setting prohibited
8	TDLA0	0	R/W	<ul style="list-style-type: none"> Transmit data for the left channel is specified in the SITDL bit in SITDR.
7	TDRE	0	R/W	Transmit Right-Channel Data Enable 0: Disables right-channel data transmission 1: Enables right-channel data transmission
6	TLREP	0	R/W	Transmit Left-Channel Repeat 0: Transmits data specified in the SITDL bit in SITDR as right-channel data 1: Repeatedly transmits data specified in the SITDL bit in SITDR as right-channel data <ul style="list-style-type: none"> This bit setting is valid when the TDRE bit is set to 1. When this bit is set to 1, the SITDR settings are ignored.
5, 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
3	TDRA3	0	R/W	Transmit Right-Channel Data Assigns 3 to 0
2	TDRA2	0	R/W	Specify the position of right-channel data in a transmit frame as B'0000 (0) to B'1110 (14).
1	TDRA1	0	R/W	1111: Setting prohibited
0	TDRA0	0	R/W	<ul style="list-style-type: none"> Transmit data for the right channel is specified in the SITDR bit in SITDR.

20.3.10 Receive Data Assign Register (SIRDAR)

SIRDAR specifies the position of the receive data in a frame (slot number).

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RDLE	-	-	-	RDLA3	RDLA2	RDLA1	RDLA0	RDRE	-	-	-	RDRA3	RDRA2	RDRA1	RDRA0
Initial Value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R	R	R	R/W	R/W	R/W	R/W	R/W	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15	RDLE	0	R/W	Receive Left-Channel Data Enable 0: Disables left-channel data reception 1: Enables left-channel data reception
14 to 12	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
11	RDLA3	0	R/W	Receive Left-Channel Data Assigns 3 to 0
10	RDLA2	0	R/W	Specify the position of left-channel data in a receive frame as B'0000 (0) to B'1110 (14).
9	RDLA1	0	R/W	1111: Setting prohibited
8	RDLA0	0	R/W	<ul style="list-style-type: none"> Receive data for the left channel is stored in the SIRDRL bit in SIRDR.
7	RDRE	0	R/W	Receive Right-Channel Data Enable 0: Disables right-channel data reception 1: Enables right-channel data reception
6 to 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
3	RDRA3	0	R/W	Receive Right-Channel Data Assigns 3 to 0
2	RDRA2	0	R/W	Specify the position of right-channel data in a receive frame as B'0000 (0) to B'1110 (14).
1	RDRA1	0	R/W	1111: Setting prohibited
0	RDRA0	0	R/W	<ul style="list-style-type: none"> Receive data for the right channel is stored in the SIRDR bit in SIRDR.

20.4 Operation

20.4.1 Serial Clocks

(1) Master/Slave Modes

The following two modes are available as a clock mode for this module.

- Slave mode: SIOFSCK, SIOFSYNC input
- Master mode: SIOFSCK, SIOFSYNC output

(2) Baud Rate Generator: In master mode, the baud rate generator (BRG) is used to generate the serial clock. The division ratio is from 1/2 to 1/1024.

Figure 20.2 shows connections for supply of the serial clock.

Figure 20.2 Serial Clock Supply

Table 20.3 shows an example of serial clock frequency.

Table 20.3 Serial Clock Frequency

Frame Length	Sampling Rate		
	8 kHz	44.1 kHz	48 kHz
32 bits	256 kHz	1.4112 MHz	1.536 MHz
64 bits	512 kHz	2.8224 MHz	3.072 MHz
128 bits	1.024 MHz	5.6448 MHz	6.144 MHz
256 bits	2.048 MHz	11.289 MHz	12.289 MHz

20.4.2 Serial Timing

(1) SIOFSYNC

The SIOFSYNC is a frame synchronous signal.

Figure 20.3 shows the SIOFSYNC synchronization timing.

Figure 20.3 Serial Data Synchronization Timing

(2) Transmit/Receive Timing

The SIOFTxD transmit timing and SIOFRxD receive timing relative to the SIOFSCK can be set as the sampling timing in the following ways. The transmit/receive timing is set using the REDG bit in SIMDR.

- Falling-edge sampling
- Rising-edge sampling (possible only in master mode)

Figure 20.4 shows the transmit/receive timing.

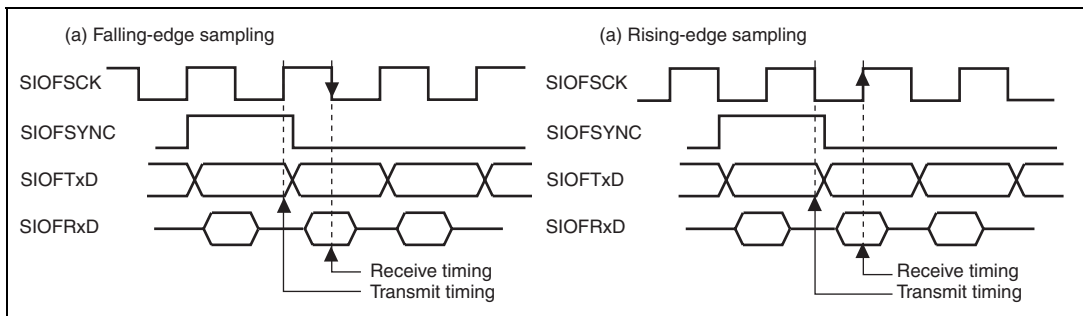

Figure 20.4 Transmit/Receive Timing

20.4.3 Transfer Data Format

This module performs the following transfer.

- Transmit/receive data: Transfer of 8-bit monaural/16-bit monaural/16-bit stereo data

(1) Transfer Mode

This module supports the following two transfer modes as listed in table 20.4. The transfer mode can be specified by the TRMD1 and TRMD0 bits in SIMDR.

Table 20.4 Serial Transfer Modes

Transfer Mode	SIOFSYNC	Bit Delay
Slave mode	Synchronous pulse	SYNCDL bit
Master mode		

(2) Frame Length

The length of the frame to be transferred by this module is specified with the FL3 to FL0 bits in SIMDR. Table 20.5 shows the relationship between the FL3 to FL0 bit settings and frame length.

Table 20.5 Frame Length

FL3 to FL0	Slot Length	Number of Bits in a Frame	Transfer Data
00xx	8	8	8-bit monaural data
0100	8	16	8-bit monaural data
0101	8	32	8-bit monaural data
0110	8	64	8-bit monaural data
0111	8	128	8-bit monaural data
10xx	16	16	16-bit monaural data
1100	16	32	16-bit monaural/stereo data
1101	16	64	16-bit monaural/stereo data
1110	16	128	16-bit monaural/stereo data
1111	16	256	16-bit monaural/stereo data

Note: x: Don't care.

(3) Slot Position

This module can specify the position of transmit data and receive data in a frame by slot numbers. The slot number of each data is specified by the following registers.

- Transmit data: SITDAR
- Receive data: SIRDAR

20.4.4 Register Allocation of Transfer Data

Writing and reading of transmit/receive data is performed for the following registers.

- Transmit data writing: SITDR (8-, 16-, or 32-bit access)
- Receive data reading: SIRDR (8-, 16-, or 32-bit access)

Figure 20.5 shows the transmit/receive data and the SITDR and SIRDR bit alignment.

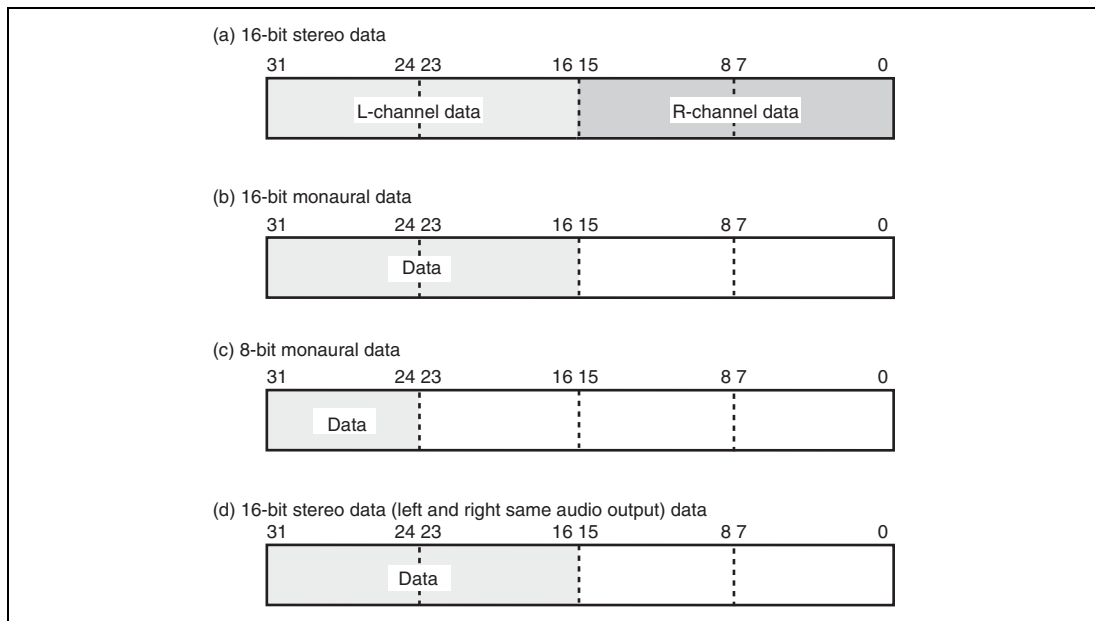

Figure 20.5 Transmit/Receive Data Bit Alignment

Note: In the figure, only the shaded areas are transmitted or received as valid data. Data in unshaded areas is not transmitted or received.

Monaural or stereo can be specified for transmit data by the TDLE bit and TDRE bit in SITDAR. Monaural or stereo can be specified for receive data by the RDLE bit and RDRE bit in SIRDAR. To achieve left and right same audio output while stereo is specified for transmit data, specify the TLREP bit in SITDAR. Tables 20.6 and 20.7 show the audio mode specifications for transmit data and that for receive data, respectively.

Table 20.6 Audio Mode Specification for Transmit Data

Mode	Bit		
	TDLE	TDRE	TLREP
Monaural	1	0	x
Stereo	1	1	0
Left and right same audio output	1	1	1

Note: x: Don't care

Table 20.7 Audio Mode Specification for Receive Data

Mode	Bit	
	RDLE	RDRE
Monaural	1	0
Stereo	1	1

Note: Left and right same audio mode is not supported in receive data.
To execute monaural transmission or reception, use the left channel.

20.4.5 FIFO

(1) Overview

The transmit and receive FIFOs of this module have the following features.

- 16-stage 32-bit FIFOs for transmission and reception
- One FIFO buffer stage is used regardless of the access size. (One-stage 32-bit FIFO access cannot be divided into multiple accesses.)

(2) Transfer Request

The following FIFO transfer requests can be issued to the CPU or direct memory access controller.

- Transmit request: TDREQ (transmit FIFO transfer request)
- Receive request: RDREQ (receive FIFO transfer request)

The conditions to issue the transmit/receive FIFO transfer requests can be specified individually. The transmit request condition is specified with the TFWM2 to TFWM0 bits in SIFCTR, and the receive FIFO transfer request is specified with the RFWM2 to RFWM0 bits in SIFCTR. Tables 20.8 and 20.9 summarize the conditions specified by SIFCTR.

Table 20.8 Conditions to Issue Transmit Request

TFWM2 to TFWM0	Number of Requested Stages	Transmit Request Issued	Used Areas
000	1	There are sixteen stages of empty area.	Smallest
100	4	There are twelve or more stages of empty area.	
101	8	There are eight or more stages of empty area.	
110	12	There are four or more stages of empty area.	
111	16	There is one or more stage of empty area.	

Table 20.9 Conditions to Issue Receive Request

RFWM2 to RFWM0	Number of Requested Stages	Receive Request Issued	Used Areas
000	1	There is one or more stage of valid data.	Smallest
100	4	There are four stages of valid data or more.	
101	8	There are eight stages of valid data or more.	
110	12	There are twelve stages of valid data or more.	
111	16	There are sixteen stages of valid data.	

The number of stages of the FIFO is sixteen. Accordingly, an overflow error or underflow error occurs if data area or empty area exceeds sixteen FIFO stages. The transfer request is canceled when the above condition is not satisfied even if the FIFO is not empty or full.

(3) Number of FIFOs

The usage state of the transmit FIFO and receive FIFO are indicated by the TFUA and FRUA bits in the FIFO control register as below:

- Transmit FIFO: The number of empty FIFO stages is indicated by the TFUA4 to TFUA0 bits in SIFCTR.
- Receive FIFO: The number of valid data stages is indicated by the RFUA4 to RFUA0 bits in SIFCTR.

The above register contents indicate the possible data numbers that can be transferred by the CPU or direct memory access controller.

20.4.6 Transmit and Receive Procedures

(1) Transmission in Master Mode

Figure 20.6 shows an example of transmission settings and operation when this module is used as a master.

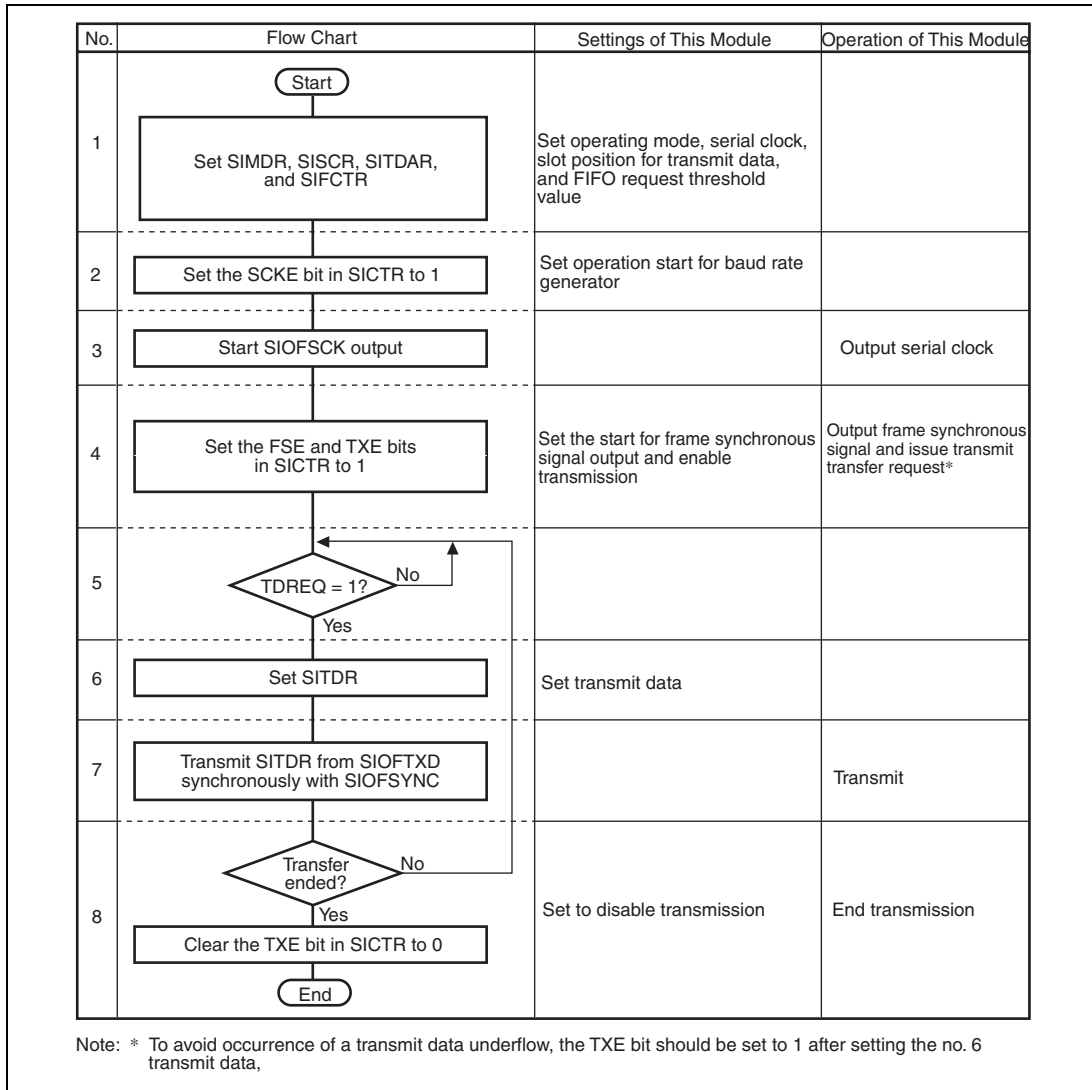

Figure 20.6 Example of Transmit Operation in Master Mode

(2) Reception in Master Mode

Figure 20.7 shows an example of reception settings and operation when this module is used as a master.

No.	Flow Chart	Settings of This Module	Operation of This Module
1	<pre> graph TD Start([Start]) --> S1[Set SIMDR, SISCR, SIRDAR, and SIFCTR] </pre>	Set operating mode, serial clock, slot position for receive data, and FIFO request threshold value	
2	<pre> graph TD S1 --> S2[Set the SCKE bit in SICTR to 1] </pre>	Set operation start for baud rate generator	
3	<pre> graph TD S2 --> S3[Start SIOFSCK output] </pre>		Output serial clock
4	<pre> graph TD S3 --> S4[Set the FSE and RXE bits in SICTR to 1] </pre>	Set the start for frame synchronous signal output and enable reception	Output frame synchronous signal
5	<pre> graph TD S4 --> S5[Store SIOFRXD receive data in SIRDR synchronously with SIOFSYNC] </pre>		Issue receive transfer request according to the receive FIFO threshold value
6	<pre> graph TD S5 --> D6{RDREQ = 1?} D6 -- No --> S5 D6 -- Yes --> S7 </pre>		Reception
7	<pre> graph TD D6 -- Yes --> S7[Read SIRDR] </pre>	Read receive data	
8	<pre> graph TD S7 --> D8{Reception ended?} D8 -- No --> D6 D8 -- Yes --> S8 </pre>	Set to disable reception	End reception
	<pre> graph TD S8[Clear the RXE bit in SICTR to 0] --> End([End]) </pre>		

Figure 20.7 Example of Receive Operation in Master Mode

(3) Transmission in Slave Mode

Figure 20.8 shows an example of transmission settings and operation for when this module is used as a slave.

No.	Flow Chart	Settings of This Module	Operation of This Module
1	<pre> graph TD Start([Start]) --> S1[Set SIMDR, SISR, SITDAR, and SIFCTR] </pre>	Set operating mode, serial clock, slot position for transmit data, and FIFO request threshold value	
2	<pre> graph TD S1 --> S2[Set the TXE bit in SICTR to 1] </pre>	Set to enable transmission	Issue transmit transfer request to enable transmission when frame synchronous signal is input
3	<pre> graph TD S2 --> D3{TDREQ = 1?} </pre>		
4	<pre> graph TD D3 -- Yes --> S4[Set SITDR] </pre>	Set transmit data	
5	<pre> graph TD S4 --> S5[Transmit SITDR from SIOFTXD synchronously with SIOFSYNC] </pre>		Transmit
6	<pre> graph TD S5 --> D6{Transfer ended?} </pre>		
	<pre> graph TD D6 -- Yes --> S6[Clear the TXE bit in SICTR to 0] </pre>	Set to disable transmission	End transmission
	<pre> graph TD S6 --> End([End]) </pre>		

Figure 20.8 Example of Transmit Operation in Slave Mode

(4) Reception in Slave Mode

Figure 20.9 shows an example of reception settings and operation when this module is used as a slave.

No.	Flow Chart	Settings of This Module	Operation of This Module
1	<pre> graph TD Start([Start]) --> S1[Set SIMDR, SISCR, SIRDAR, and SIFCTR] </pre>	Set operating mode, serial clock, slot position for receive data, and FIFO request threshold value	
2	<pre> graph TD S1 --> S2[Set the RXE bit in SICTR to 1] </pre>	Set to enable reception	Enable reception when the frame synchronous signal is input
3	<pre> graph TD S2 --> S3[Store SIOFRXD receive data in SIRDR synchronously with SIOFSYNC] </pre>		Issue receive transfer request according to the receive FIFO threshold value
4	<pre> graph TD S3 --> D4{RDREQ = 1?} D4 -- No --> S3 D4 -- Yes --> S5[Read SIRDR] </pre>		Reception
5	<pre> graph TD S5[Read SIRDR] --> D6{Reception ended?} </pre>	Read receive data	
6	<pre> graph TD D6 -- No --> D4 D6 -- Yes --> S6[Clear the RXE bit in SICTR to 0] S6 --> End([End]) </pre>	Set to disable reception	End reception

Figure 20.9 Example of Receive Operation in Slave Mode

(5) Transmit/Receive Reset

This module can separately reset the transmit and receive units by setting the following bits to 1.

- Transmit reset: TXRST bit in SICTR
- Receive reset: RXRST bit in SICTR

Table 20.10 shows the details of initialization upon the transmit or receive reset.

Table 20.10 Transmit and Receive Reset

Type	Objects Initialized
Transmit reset	SITDR Valid data in transmit FIFO The TFEMP and TDREQ bits in SISTR The TXE bit in SICTR
Receive reset	SIRDR Valid data in receive FIFO The RFFUL and RDREQ bits in SISTR The RXE bit in SICTR

20.4.7 Interrupts

This module has one type of interrupt.

(1) Interrupt Requests

Interrupts can be issued by several requests. Each source is shown as an status in SISTR. Table 20.11 lists the interrupt requests.

Table 20.11 Interrupt Requests

No.	Classification	Bit Name	Function Name	Description
1	Transmission	TDREQ	Transmit FIFO transfer request	The transmit FIFO stores data of specified size or more.
2		TFEMP	Transmit FIFO empty	The transmit FIFO is empty.
3	Reception	RDREQ	Receive FIFO transfer request	The receive FIFO stores data of specified size or more.
4		RFFUL	Receive FIFO full	The receive FIFO is full.
5	Error	TFUDF	Transmit FIFO underflow	Serial data transmit timing has arrived while the transmit FIFO is empty.
6		TFOVF	Transmit FIFO overflow	Write to the transmit FIFO is performed while the transmit FIFO is full.
7		RFOVF	Receive FIFO overflow	Serial data is received while the receive FIFO is full.
8		RFUDF	Receive FIFO underflow	The receive FIFO is read while the receive FIFO is empty.
9		FSERR	FS error	A synchronous signal is input before the specified bit number has been passed (in slave mode).

Whether the interrupt is issued or not by the request is determined by the SIIER settings. If an interrupt request is generated when the corresponding bit in SIIER is set to 1, this module issues the interrupt.

(2) Regarding Transmit and Receive Classification

The transmit request and receive request are signals indicating the state; after being set, if the state of the transmit/receive FIFO change, they are automatically cleared by this module.

When the DMA transfer is used, the signal is cleared to 0 by the direct memory access controller. If the setting condition is still satisfied after the access using the direct memory access controller, it is set to 1 again.

(3) Processing when Errors Occur

On occurrence of each of the errors indicated as a status in SISTR, this module performs the following operations.

- Transmit FIFO underflow (TFUDF)
The immediately preceding transmit data is again transmitted.
- Transmit FIFO overflow (TFOVF)
The contents of the transmit FIFO are protected, and the write operation causing the overflow is ignored.
- Receive FIFO overflow (RFOVF)
Data causing the overflow is discarded and lost.
- Receive FIFO underflow (RFUDF)
The read value is undefined.
- FS error (FSERR)
The internal counter is reset according to the sync signal in which an error occurs.

20.4.8 Transmit and Receive Timing

Examples of serial transmission and reception with this module are shown in figures 20.10 to 20.15.

(1) 8-bit Monaural Data (1)

Falling edge sampling, slot No.0 used for transmit and receive data, an frame length = 8 bits

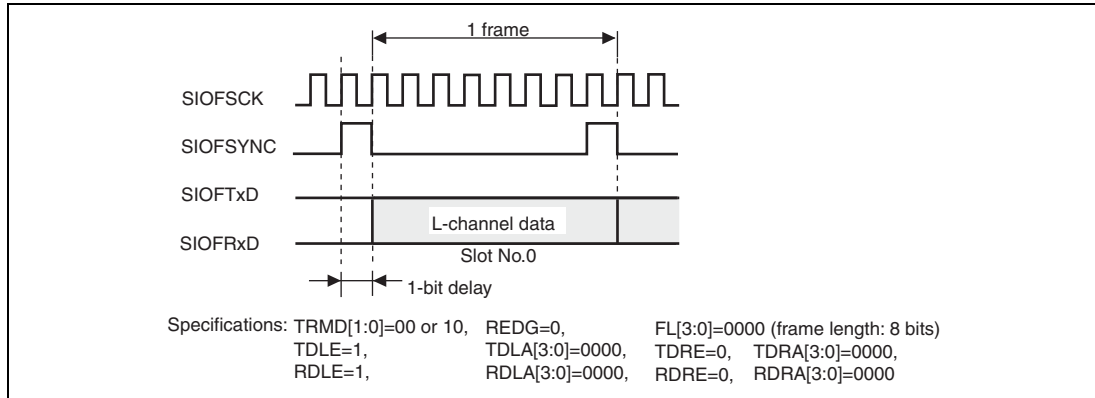

Figure 20.10 Transmit and Receive Timing (8-Bit Monaural Data (1))

(2) 8-bit Monaural Data (2)

Falling edge sampling, slot No.0 used for transmit and receive data, and frame length = 16 bits

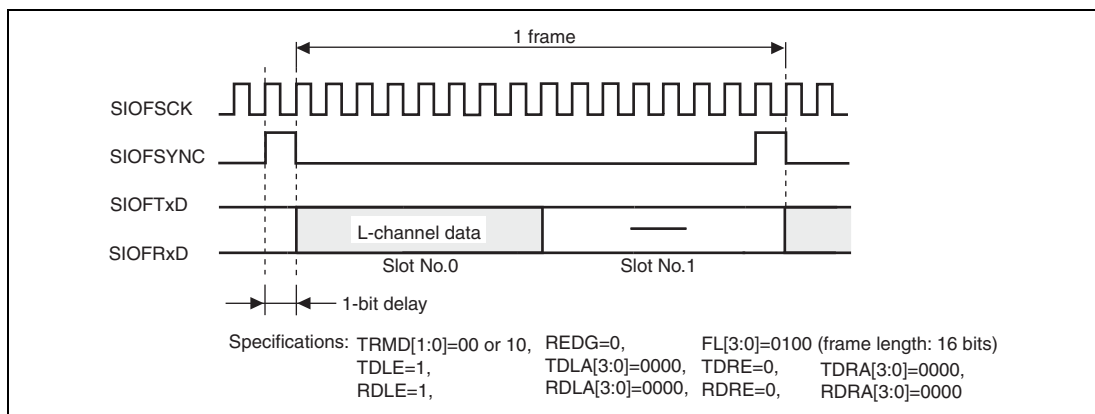

Figure 20.11 Transmit and Receive Timing (8-Bit Monaural Data (2))

(3) 16-bit Monaural Data

Falling edge sampling, slot No.0 used for transmit and receive data, and frame length = 64 bits

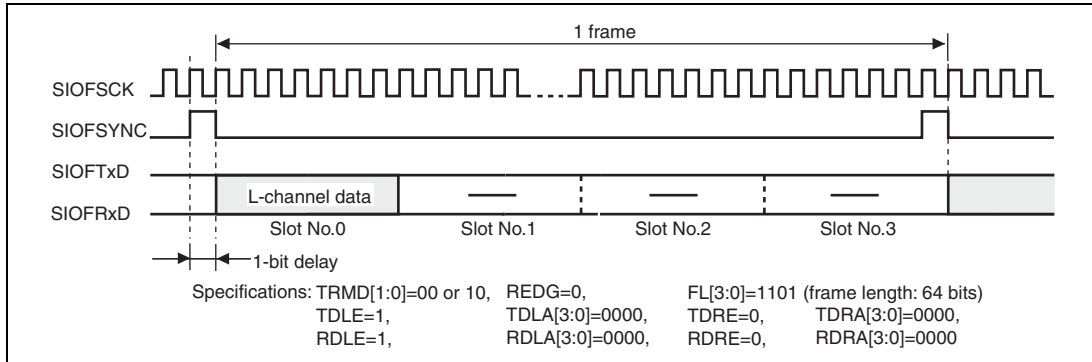

Figure 20.12 Transmit and Receive Timing (16-Bit Monaural Data)

(4) 16-bit Stereo Data (1)

Falling edge sampling, slot No.0 used for left channel data, slot No.1 used for right channel data, and frame length = 128 bits

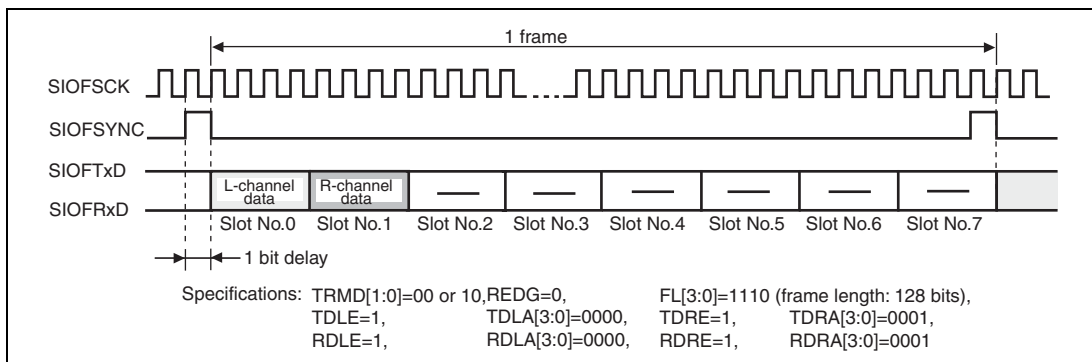

Figure 20.13 Transmit and Receive Timing (16-Bit Stereo Data (1))

(5) 16-bit Stereo Data (2)

Falling edge sampling, slot No.0 used for left channel data, slot No.2 used for right channel data, and frame length = 128 bits

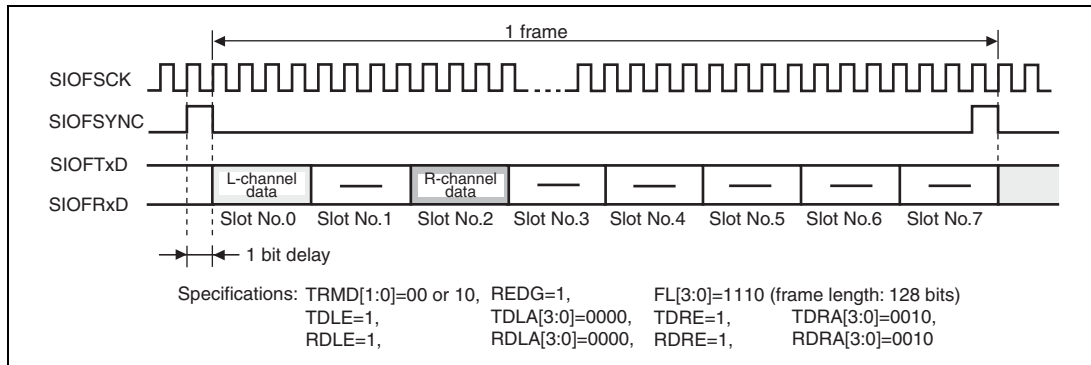

Figure 20.14 Transmit and Receive Timing (16-Bit Stereo Data (2))

(6) Synchronization-Pulse Output Mode at End of Each Slot (SYNCCAT Bit = 1)

Falling edge sampling, slot No.0 used for left channel data, slot No.1 used for right-channel data, and frame length = 128 bits

In this mode, valid data must be set to slot No. 0. In addition, make sure that valid data is transmitted/received or transmitted.

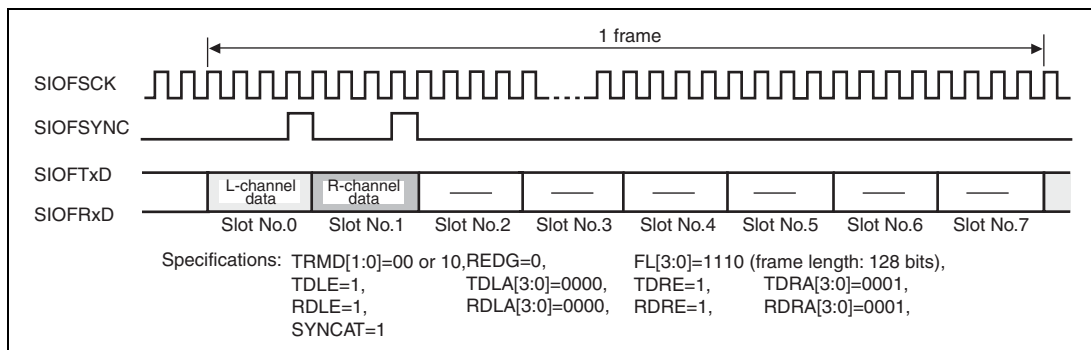

Figure 20.15 Transmit and Receive Timing (16-Bit Stereo Data)

Section 21 Controller Area Network

21.1 Summary

21.1.1 Overview

This document primarily describes the programming interface for the controller area network (Renesas CAN Time Trigger Level 1) module. It serves to facilitate the hardware/software interface so that engineers involved in this module implementation can ensure the design is successful.

Deep standby mode can be canceled by change on CRxn (PJ3, PJ1) pin. For details, refer to section 33, Power-Down Modes.

21.1.2 Scope

The CAN Data Link Controller function is not described in this document. It is the responsibility of the reader to investigate the CAN Specification Document (see references). The interfaces from the CAN Controller are described, in so far as they pertain to the connection with the User Interface.

The programming model is described in some detail. It is not the intention of this document to describe the implementation of the programming interface, but to simply present the interface to the underlying CAN functionality.

The document places no constraints upon the implementation of this module in terms of process, packaging or power supply criteria. These issues are resolved where appropriate in implementation specifications.

21.1.3 Audience

In particular this document provides the design reference for software authors who are responsible for creating a CAN application using this module.

In the creation of this module user interface LSI engineers must use this document to understand the hardware requirements.

21.1.4 References

21.1.5 Features

- Supports CAN specification 2.0B
- Bit timing compliant with ISO-11898-1
- 32 Mailbox version
- Clock frequency: Up to 36 MHz
- 31 programmable Mailboxes for transmit / receive + 1 receive-only mailbox
- Sleep mode for low power consumption and automatic recovery from sleep mode by detecting CAN bus activity
- Programmable receive filter mask (standard and extended identifier) supported by all Mailboxes
- Programmable CAN data rate up to 1MBit/s
- Transmit message queuing with internal priority sorting mechanism against the problem of priority inversion for real-time applications
- Data buffer access without SW handshake requirement in reception
- Flexible micro-controller interface
- Flexible interrupt structure
- 16-bit free running timer with flexible clock sources and pre-scaler, 3 Timer Compare Match Registers
- 6-bit Basic Cycle Counter for Time Trigger Transmission
- Timer Compare Match Registers with interrupt generation
- Timer counter clear / set capability
- Registers for Time-Trigger: Local_Time, Cycle_time, Ref_Mark, Tx_Enable Window, Ref_Trigger_Offset
- Flexible TimeStamp at SOF for both transmission and reception supported
- Time-Trigger Transmission, Periodic Transmission supported (on top of Event Trigger Transmission)
- Basic Cycle value can be embedded into a CAN frame and transmitted

21.2 Architecture

This module device offers a flexible and sophisticated way to organise and control CAN frames, providing the compliance to CAN2.0B Active and ISO-11898-1. The module is formed from 5 different functional entities. These are the Micro Processor Interface (MPI), Mailbox, Mailbox Control, Timer, and CAN Interface. The figure below shows the block diagram of the Module. The bus interface timing is designed according to the peripheral bus I/F required for each product.

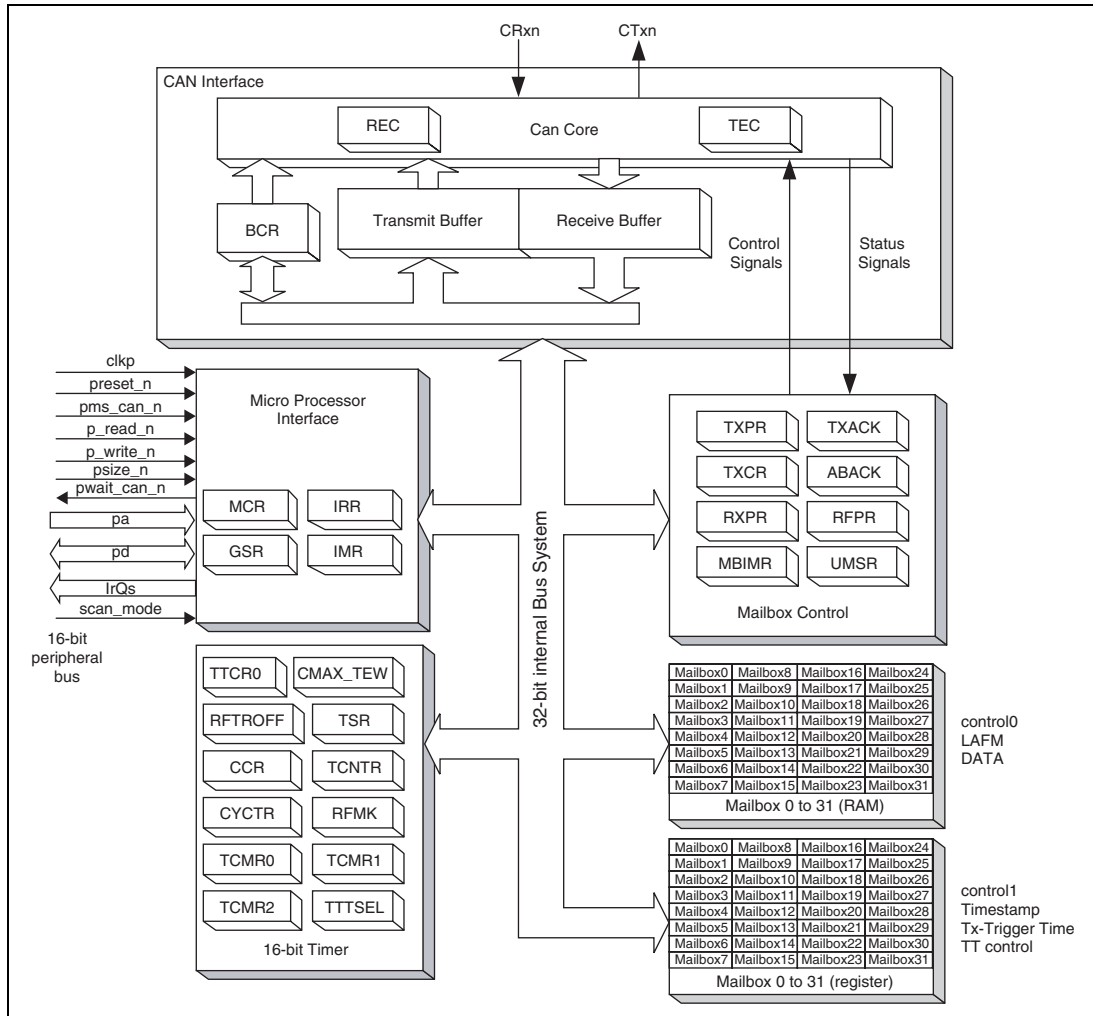

Figure 21.1 This Module Architecture

Important: Although core of this module is designed based on a 32-bit bus system, the whole this module including MPI for the CPU has 16-bit bus interface to CPU. In that case, LongWord (32-bit) access must be implemented as 2 consecutive word (16-bit) accesses. In this manual, LongWord access means the two consecutive accesses.

- Micro Processor Interface (MPI)

The MPI allows communication between the Renesas CPU and this module's registers/mailboxes to control the memory interface. It also contains the Wakeup Control logic that detects the CAN bus activities and notifies the MPI and the other parts of this module so that this module can automatically exit the Sleep mode.

It contains registers such as MCR, IRR, GSR and IMR.

- Mailbox

The Mailboxes consists of RAM configured as message buffers and registers. There are 32 Mailboxes, and each mailbox has the following information.

<RAM>

- CAN message control (identifier, rtr, ide, etc)
- CAN message data (for CAN Data frames)
- Local Acceptance Filter Mask for reception

<Registers>

- CAN message control (dlc)
- Time Stamp for message reception/transmission
- 3-bit wide Mailbox Configuration, Disable Automatic Re-Transmission bit, Auto-Transmission for Remote Request bit, New Message Control bit
- Tx-Trigger Time

- Mailbox Control

The Mailbox Control handles the following functions.

- For received messages, compare the IDs and generate appropriate RAM addresses/data to store messages from the CAN Interface into the Mailbox and set/clear appropriate registers accordingly.
- To transmit event-triggered messages, run the internal arbitration to pick the correct priority message, and load the message from the Mailbox into the Tx-buffer of the CAN Interface and set/clear appropriate registers accordingly. In the case of time-triggered transmission, compare match of Tx-Trigger time invoke loading the messages.
- Arbitrates Mailbox accesses between the CPU and the Mailbox Control.
- Contains registers such as TXPR, TXCR, TXACK, ABACK, RXPR, RFPR, UMSR and MBIMR.

- **Timer**

The Timer function is the functional entity, which provides this module with support for transmitting messages at a specific time frame and recording the result.

The Timer is a 16-bit free running up counter which can be controlled by the CPU. It provides one 16-bit Compare Match Register to compare with Local Time and two 16-bit ones to compare with Cycle Time. The Compare Match Registers can generate interrupt signals and clear the Counter.

The clock period of this Timer offers a wide selection derived from the system clock or can be programmed to be incremented with one nominal bit timing of CAN Bus.

Contains registers such as TCNTR, TTCR0, CMAX_TEW, RETROFF, TSR, CCR, CYCTR, RFMK, TCMR0, TCMR1, TCMR2 and TTTSEL.

- **CAN Interface**

This block conforms to the requirements for a CAN Bus Data Link Controller which is specified in Ref. [2, 4]. It fulfils all the functions of a standard DLC as specified by the OSI 7 Layer Reference model. This functional entity also provides the registers and the logic which are specific to a given CAN bus, which includes the Receive Error Counter, Transmit Error Counter, the Bit Configuration Registers and various useful Test Modes. This block also contains functional entities to hold the data received and the data to be transmitted for the CAN Data Link Controller.

21.3 Programming Model - Overview

The purpose of this programming interface is to allow convenient, effective access to the CAN bus for efficient message transfer. Please bear in mind that the user manual reports all settings allowed by this module IP. Different use of this module is not allowed.

21.3.1 Memory Map

The diagram of the memory map is shown below.

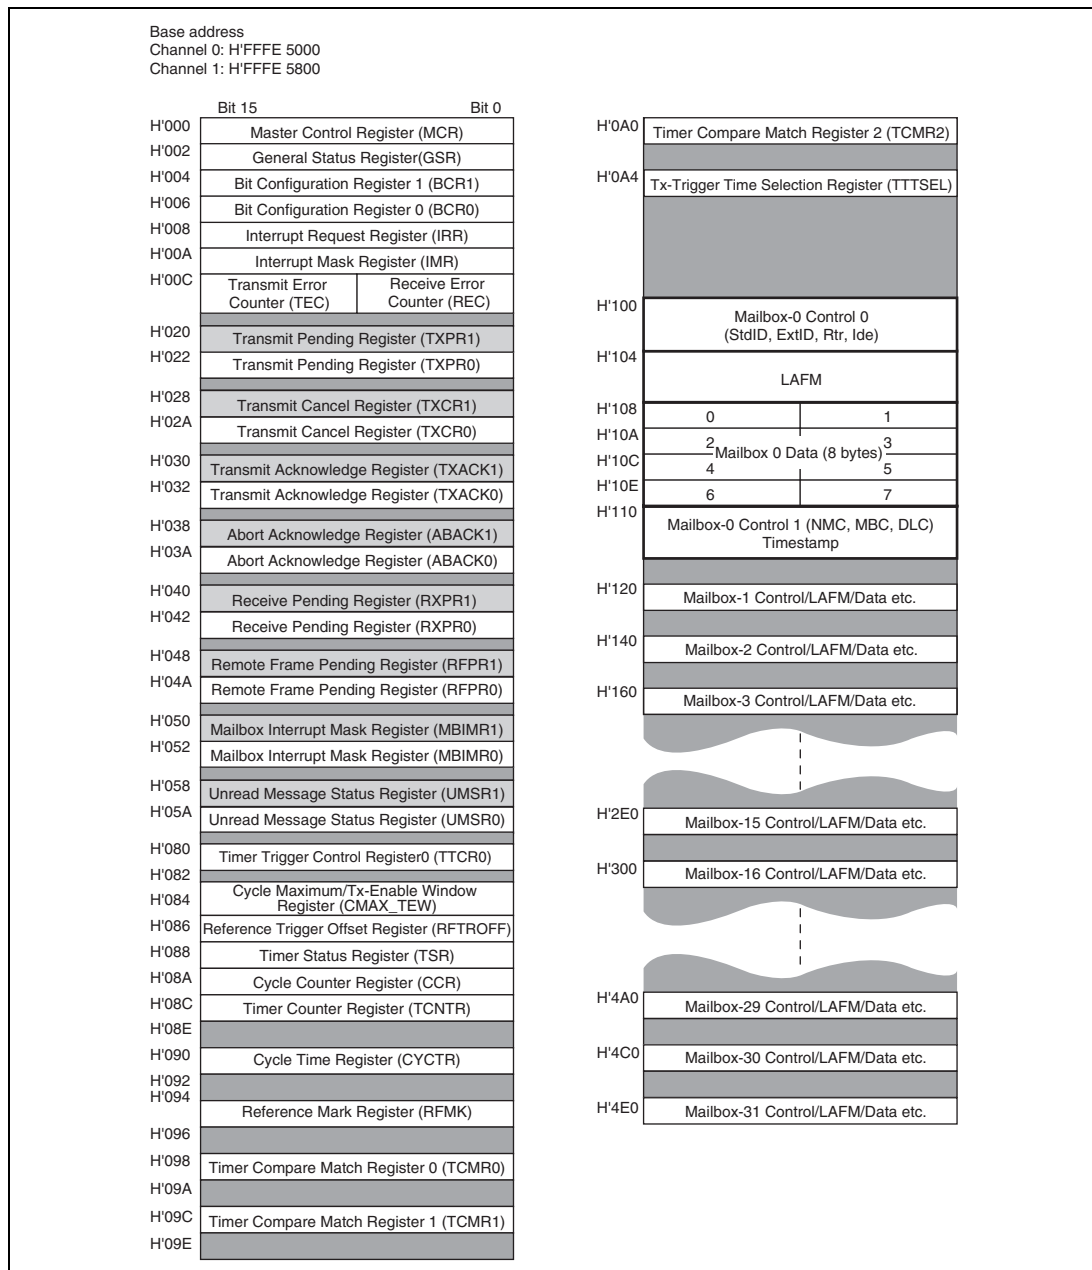

Figure 21.2 Memory Map

The locations not used (between H'000 and H'4F3) are reserved and cannot be accessed.

21.3.2 Mailbox Structure

Mailboxes play a role as message buffers to transmit/receive CAN frames. Each Mailbox is comprised of 3 identical storage fields that are 1): Message Control, 2): Local Acceptance Filter Mask, 3): Message Data. In addition some Mailboxes contain the following extra Fields: 4): Time Stamp, 5): Time Trigger configuration and 6): Time Trigger Control. The following table shows the address map for the control, LAFM, data, timestamp, Transmission Trigger Time and Time Trigger Control addresses for each mailbox.

Mailbox	Address						
	Control0 4 bytes	LAFM 4 bytes	Data 8 bytes	Control1 2 bytes	Time Stamp 2 bytes	Trigger Time 2 bytes	TT control 2 bytes
0 (Receive Only)	100 – 103	104 – 107	108 – 10F	110 – 111	112 – 113	No	No
1	120 – 123	124 – 127	128 – 12F	130 – 131	132 – 133	No	No
2	140 – 143	144 – 147	148 – 14F	150 – 151	152 – 153	No	No

24	400 – 403	404 – 407	408 – 40F	410 – 411	No	414 – 415	416 – 417
25	420 – 423	424 – 427	428 – 42F	430 – 431	No	434 – 435	436 – 437
26	440 – 443	444 – 447	448 – 44F	450 – 451	No	454 – 455	456 – 457
27	460 – 463	464 – 467	468 – 46F	470 – 471	No	474 – 475	476 – 477
28	480 – 483	484 – 487	488 – 48F	490 – 491	No	494 – 495	496 – 497
29	4A0 – 4A3	4A4 – 4A7	4A8 – 4AF	4B0 – 4B1	No	4B4 – 4B5	4B6 – 4B7
30	4C0 – 4C3	4C4 – 4C7	4C8 – 4CF	4D0 – 4D1	4D2 – 4D3 (Local Time)	4D4 – 4D5	No
31	4E0 – 4E3	4E4 – 4E7	4E8 – 4EF	4F0 – 4F1	4F2 – 4F3 (Local Time)	No	No

Mailbox-0 is a receive-only box, and all the other Mailboxes can operate as both receive and transmit boxes, dependant upon the MBC (Mailbox Configuration) bits in the Message Control. The following diagram shows the structure of a Mailbox in detail.

Table 21.1 Roles of Mailboxes

	Event Trigger		Time Trigger		TimeStamp	Remark
	Tx	Rx	Tx	Rx		
MB31	Settable	Settable	—	Time reference reception	Available	—
MB30	Settable	Settable	Time reference transmission in time master mode	Reception in time slave mode	Available	Available
MB29 - 24	Settable	Settable	Settable	Settable	—	Available
MB23 - 16	Settable	Settable	— (ET)	Settable	—	—
MB15 - 1	Settable	Settable	— (ET)	Settable	Available	—
MB0	—	Settable	—	Settable	Available	—

(ET) shows that it works during merged arbitrating window, after completion of time-triggered transmission.

Figure 21.3 Mailbox-N Structure (continued)

- Notes:
1. All bits shadowed in grey are reserved and must be written LOW. The value returned by a read may not always be '0' and should not be relied upon.
 2. ATX and DART are not supported by Mailbox-0, and the MBC setting of Mailbox-0 is limited.
 3. ID Reorder (MCR15) can change the order of STDID, RTR, IDE and EXTID of both message control and LAFM.

(1) Message Control Field

STDID[10:0]: These bits set the identifier (standard identifier) of data frames and remote frames.

EXTID[17:0]: These bits set the identifier (extended identifier) of data frames and remote frames.

RTR (Remote Transmission Request bit): Used to distinguish between data frames and remote frames. This bit is overwritten by received CAN Frames depending on Data Frames or Remote Frames.

Important: Please note that, when ATX bit is set with the setting MBC = 001(bin), the RTR bit will never be set. When a Remote Frame is received, the CPU can be notified by the corresponding RFPR set or IRR[2] (Remote Frame Receive Interrupt), however, as this module needs to transmit the current message as a Data Frame, the RTR bit remains unchanged.

Important: In order to support automatic answer to remote frame when MBC = 001 (bin) is used and ATX = 1 the RTR flag must be programmed to zero to allow data frame to be transmitted.

Note: when a Mailbox is configured to send a remote frame request the DLC used for transmission is the one stored into the Mailbox.

RTR	Description
0	Data frame
1	Remote frame

IDE (Identifier Extension bit): Used to distinguish between the standard format and extended format of CAN data frames and remote frames.

IDE	Description
0	Standard format
1	Extended format

- Mailbox-0

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	0	0	NMC	0	0	MBC[2:0]			0	0	0	0	DLC[3:0]			
Initial value:	0	0	0	0	0	1	1	1	0	0	0	0	0	0	0	0
R/W:	R	R	R/W	R	R	R/W	R	R/W	R	R	R	R	R/W	R/W	R/W	R/W

Note: MBC[1] of MB0 is always "1".

- Mailbox-31 to 1

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	0	0	NMC	ATX	DART	MBC[2:0]			0	0	0	0	DLC[3:0]			
Initial value:	0	0	0	0	0	1	1	1	0	0	0	0	0	0	0	0
R/W:	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R/W	R/W	R/W	R/W

NMC (New Message Control): When this bit is set to '0', the Mailbox of which the RXPR or RFPR bit is already set does not store the new message but maintains the old one and sets the UMSR correspondent bit. When this bit is set to '1', the Mailbox of which the RXPR or RFPR bit is already set overwrites with the new message and sets the UMSR correspondent bit.

Important: Please note that if a remote frame is overwritten with a data frame or vice versa could be that both RXPR and RFPR flags (together with UMSR) are set for the same Mailbox. In this case the RTR bit within the Mailbox Control Field should be relied upon.

Important: Please note that when the Time Triggered mode is used NMC needs to be set to '1' for Mailbox 31 to allow synchronization with all incoming reference messages even when RXPR[31] is not cleared.

NMC	Description
0	Overrun mode (Initial value)
1	Overwrite mode

ATX (Automatic Transmission of Data Frame): When this bit is set to '1' and a Remote Frame is received into the Mailbox DLC is stored. Then, a Data Frame is transmitted from the same Mailbox using the current contents of the message data and updated DLC by setting the corresponding TXPR automatically. The scheduling of transmission is still governed by ID priority or Mailbox priority as configured with the Message Transmission Priority control bit (MCR.2). In order to use this function, MBC[2:0] needs to be programmed to be '001' (Bin). When a transmission is performed by this function, the DLC (Data Length Code) to be used is the one that has been received. Application needs to guarantee that the DLC of the remote frame correspond to the DLC of the data frame requested.

Important: When ATX is used and MBC = 001 (Bin) the filter for the IDE bit cannot be used since ID of remote frame has to be exactly the same as that of data frame as the reply message.

Important: Please note that, when this function is used, the RTR bit will never be set despite receiving a Remote Frame. When a Remote Frame is received, the CPU will be notified by the corresponding RFPR set, however, as this module needs to transmit the current message as a Data Frame, the RTR bit remains unchanged.

Important: Please note that in case of overrun condition (UMSR flag set when the Mailbox has its NMC = 0) the message received is discarded. In case a remote frame is causing overrun into a Mailbox configured with ATX = 1, the transmission of the corresponding data frame may be triggered only if the related PFPR flag is cleared by the CPU when the UMSR flag is set. In such case PFPR flag would get set again.

ATX	Description
0	Automatic Transmission of Data Frame disabled (Initial value)
1	Automatic Transmission of Data Frame enabled

DART (Disable Automatic Re-Transmission): When this bit is set, it disables the automatic re-transmission of a message in the event of an error on the CAN bus or an arbitration lost on the CAN bus. In effect, when this function is used, the corresponding TXCR bit is automatically set at the start of transmission. When this bit is set to '0', this module tries to transmit the message as many times as required until it is successfully transmitted or it is cancelled by the TXCR.

DART	Description
0	Re-transmission enabled (Initial value)
1	Re-Transmission disabled

MBC[2:0] (Mailbox Configuration): These bits configure the nature of each Mailbox as follows. When MBC = 111 (Bin), the Mailbox is inactive, i.e., it does not receive or transmit a message regardless of TXPR or other settings. The MBC = '110', '101' and '100' settings are prohibited. When the MBC is set to any other value, the LAFM field becomes available. Please don't set TXPR when MBC is set as reception as there is no hardware protection, and TXPR will remain set. MBC[1] of Mailbox-0 is fixed to "1" by hardware. This is to ensure that MB0 cannot be configured to transmit Messages.

MBC[2]	MBC[1]	MBC[0]	Data Frame Transmit	Remote Frame Transmit	Data Frame Receive	Remote Frame Receive	Remarks
0	0	0	Yes	Yes	No	No	<ul style="list-style-type: none"> Not allowed for Mailbox-0 Time-Triggered transmission can be used
0	0	1	Yes	Yes	No	Yes	<ul style="list-style-type: none"> Can be used with ATX* Not allowed for Mailbox-0 LAFM can be used
0	1	0	No	No	Yes	Yes	<ul style="list-style-type: none"> Allowed for Mailbox-0 LAFM can be used
0	1	1	No	No	Yes	No	<ul style="list-style-type: none"> Allowed for Mailbox-0 LAFM can be used
1	0	0	Setting prohibited				
1	0	1	Setting prohibited				
1	1	0	Setting prohibited				
1	1	1	Mailbox inactive (Initial value)				

Notes: * In order to support automatic retransmission, RTR shall be "0" when MBC = 001(bin) and ATX = 1.

When ATX = 1 is used the filter for IDE must not be used.

DLC[3:0] (Data Length Code): These bits encode the number of data bytes from 0,1, 2, ... 8 that will be transmitted in a data frame. Please note that when a remote frame request is transmitted the DLC value to be used must be the same as the DLC of the data frame that is requested.

DLC[3]	DLC[2]	DLC[1]	DLC[0]	Description
0	0	0	0	Data Length = 0 bytes (Initial value)
0	0	0	1	Data Length = 1 byte
0	0	1	0	Data Length = 2 bytes
0	0	1	1	Data Length = 3 bytes
0	1	0	0	Data Length = 4 bytes
0	1	0	1	Data Length = 5 bytes
0	1	1	0	Data Length = 6 bytes
0	1	1	1	Data Length = 7 bytes
1	x	x	x	Data Length = 8 bytes

(2) Local Acceptance Filter Mask (LAFM)

This area is used as Local Acceptance Filter Mask (LAFM) for receive boxes.

LAFM: When MBC is set to 001, 010, 011(Bin), this field is used as LAFM Field. It allows a Mailbox to accept more than one identifier. The LAFM is comprised of two 16-bit read/write areas as follows.

Figure 21.4 Acceptance filter

If a bit is set in the LAFM, then the corresponding bit of a received CAN identifier is ignored when this module searches a Mailbox with the matching CAN identifier. If the bit is cleared, then the corresponding bit of a received CAN identifier must match to the STDID/IDE/EXTID set in the mailbox to be stored. The structure of the LAFM is same as the message control in a Mailbox. If this function is not required, it must be filled with '0'.

Important: This module starts to find a matching identifier from Mailbox-31 down to Mailbox-0. As soon as this module finds one matching, it stops the search. The message will be stored or not depending on the NMC and RXPR/RFPR flags. This means that, even using LAFM, a received message can only be stored into 1 Mailbox.

Important: When a message is received and a matching Mailbox is found, the whole message is stored into the Mailbox. This means that, if the LAFM is used, the STDID, RTR, IDE and EXTID may differ to the ones originally set as they are updated with the STDID, RTR, IDE and EXTID of the received message.

STD_LAFM[10:0] — Filter mask bits for the CAN base identifier [10:0] bits.

STD_LAFM[10:0]	Description
0	Corresponding STD_ID bit is cared
1	Corresponding STD_ID bit is "don't cared"

EXT_LAFM[17:0] — Filter mask bits for the CAN Extended identifier [17:0] bits.

EXT_LAFM[17:0]	Description
0	Corresponding EXT_ID bit is cared
1	Corresponding EXT_ID bit is "don't cared"

IDE_LAFM — Filter mask bit for the CAN IDE bit.

IDE_LAFM	Description
0	Corresponding IDE bit is cared
1	Corresponding IDE bit is "don't cared"

(3) Message Data Fields

Storage for the CAN message data that is transmitted or received. MSG_DATA[0] corresponds to the first data byte that is transmitted or received. The bit order on the CAN bus is bit 7 through to bit 0.

When CMAX!= 3'b111/MBC[30] = 3'b000 and TXPR[30] is set, Mailbox-30 is configured as transmission of time reference. Its DLC must be greater than 0 and its RTR must be zero (as specified for TTCAN Level 1) so that the Cycle_count (CCR register) is embedded in the first byte of the data field instead of MSG_DATA_0[5:0] when this Mailbox starts transmission. This function shall be used when this module is enabled to work in TTCAN mode to perform a Potential Time Master role to send the Time reference message. MSG_DATA_0[7:6] is still transmitted as stored in the Mailbox. User can set MSG_DATA_0[7] when a Next_is_Gap needs to be transmitted.

Please note that the CCR value is only embedded on the frame transmitted but not stored back into Mailbox 30.

When CMAX!= 3'b111, MBC[31] = 3'b011 and TXPR[31] is cleared, Mailbox-31 is configured as reception of time reference. When a valid reference message is received (DLC > 0) this module performs internal synchronisation (modifying its RFMK and basic cycle CCR).

Figure 21.5 Message Data Field

(4) Timestamp

Storage for the Timestamp recorded on messages for transmit/receive. The Timestamp will be a useful function to monitor if messages are received/transmitted within expected schedule.

- Timestamp

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TS15	TS14	TS13	TS12	TS11	TS10	TS9	TS8	TS7	TS6	TS5	TS4	TS3	TS2	TS1	TS0
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Message Receive: For received messages of Mailbox-15 to 0, Timestamp always captures the CYCTR (Cycle Time Register) value or Cycle_Counter CCR[5:0] + CYCTR[15:6] value, depending on the programmed value in the bit 14 of TTCR0 (Timer Trigger Control Register 0) at SOF.

For messages received into Mailboxes 30 and 31, Timestamp captures the TCNTR (Timer Counter Register) value at SOF.

Message Transmit: For transmitted messages of Mailbox-15 to 1, Timestamp always captures the CYCTR (Cycle Time Register) value or Cycle_Counter CCR[5:0] + CYCTR[15:6] value, depending on the programmed value in the bit 14 of TTCR0 (Timer Trigger Control Register 0), at SOF.

For messages transmitted from Mailboxes 30 and 31, Timestamp captures the TCNTR (Timer Counter Register) value at SOF.

Important: Please note that the TimeStamp is stored in a temporary register. Only after a successful transmission or reception the value is then copied into the related Mailbox field. The TimeStamp may also be updated if the CPU clears RXPR[N]/RFPR[N] at the same time that UMSR[N] is set in overrun, however it can be read properly before clearing RXPR[N]/RFPR[N].

(5) Tx-Trigger Time (TTT) and Time Trigger control

For Mailbox-29 to 24, when MBC is set to 000 (Bin) in time trigger mode (C_{MAX}!= 3'b111), Tx-Trigger Time works as Time_Mark to determine the boundary between time windows. The TTT and TT control are comprised of two 16-bit read/write areas as follows. Mailbox-30 doesn't have TT control and works as Time_Ref.

Mailbox 30 to 24 can be used for reception if not used for transmission in TT mode. However they cannot join the event trigger transmission queue when the TT mode is used.

- Tx-Trigger Time

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TTT15	TTT14	TTT13	TTT12	TTT11	TTT10	TTT9	TTT8	TTT7	TTT6	TTT5	TTT4	TTT3	TTT2	TTT1	TTT0
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

- Time Trigger control

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TTW[1:0]		Offset[5:0]					0	0	0	0	0	rep_factor[2:0]			
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R/W	R/W	R/W

The following figure shows the differences between all Mailboxes supporting Time Triggered mode.

Figure 21.6 Tx-Trigger control field

- **TTW[1:0] (Time Trigger Window):** These bits show the attribute of time windows. Please note that once a merged arbitrating window is opened by TTW = 2'b10, the window must be closed by TTW = 2'b11. Several messages with TTW = 2'b10 may be used within the start and the end of a merged arbitrating window.

TTW[1]	TTW[0]	Description
0	0	Exclusive window (initial value)
0	1	Arbitrating window
1	0	Start of merged arbitrating window
1	1	End of merged arbitrating window

The first 16-bit area specifies the time that triggers the transmission of the message in cycle time. The second 16-bit area specifies the basic cycle in the system matrix where the transmission must start (Offset) and the frequency for periodic transmission. When the internal TTT register matches to the CYCTR value, and the internal Offset matches to CCR value transmission is attempted from the corresponding Mailbox. In order to enable this function, the CMAX (Cycle Maximum Register) must be set to a value different from 3'b111, the Timer (TCNTR) must be running (TTCR0 bit15 = 1), the corresponding MBC must be set to 3'b000 and the corresponding TXPR bit must be set. Once TXPR is set by S/W, this module does not clear the corresponding TXPR bit (among Mailbox-30 to 24) to carry on performing the periodic transmission. In order to stop the periodic transmission, TXPR must be cleared by TXCR. Please note that in this case it is possible that both TXACK and ABACK are set for the same Mailbox if TXACK is not cleared right after completion of transmission. Please refer to figure 21.7.

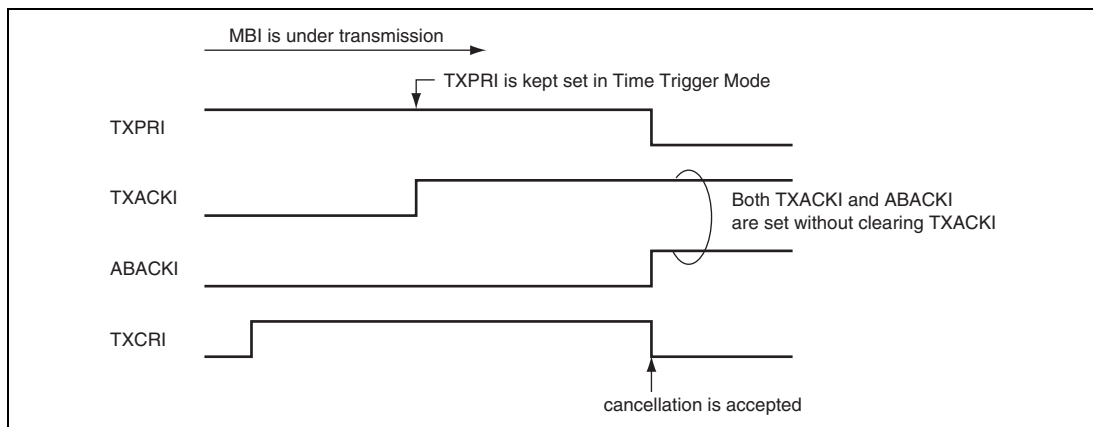

Figure 21.7 TXACK and ABACK in Time Trigger Transmission

Please note that for Mailbox 30 TTW is fixed to '01', Offset to '00' and rep_factor to '0'. The following tables report the combinations for the rep_factor and the offset.

Rep_factor	Description
3'b000	Every basic cycle (initial value)
3'b001	Every two basic cycle
3'b010	Every four basic cycle
3'b011	Every eight basic cycle
3'b100	Every sixteen basic cycle
3'b101	Every thirty two basic cycle
3'b110	Every sixty four basic cycle (once in system matrix)
3'b111	Reserved

The Offset Field determines the first cycle in which a Time Triggered Mailbox may start transmitting its Message.

Offset	Description
6'b000000	Initial Offset = 1 st Basic Cycle (initial value)
6'b000001	Initial Offset = 2 nd Basic Cycles
6'b000010	Initial Offset = 3 rd Basic Cycles
6'b000011	Initial Offset = 4 th Basic Cycles
6'b000100	Initial Offset = 5 th Basic Cycles
...	
...	
6'b111110	Initial Offset = 63 rd Basic Cycles
6'b111111	Initial Offset = 64 th Basic Cycles

The following relation must be maintained:

$$\text{Cycle_Count_Maximum} + 1 \geq \text{Repeat_Factor} > \text{Offset}$$

$$\text{Cycle_Count_Maximum} = 2^{\text{CMAX}} - 1$$

$$\text{Repeat_Factor} = 2^{\text{rep_factor}}$$

CMAX, Repeat_Factor, and Offset are register values

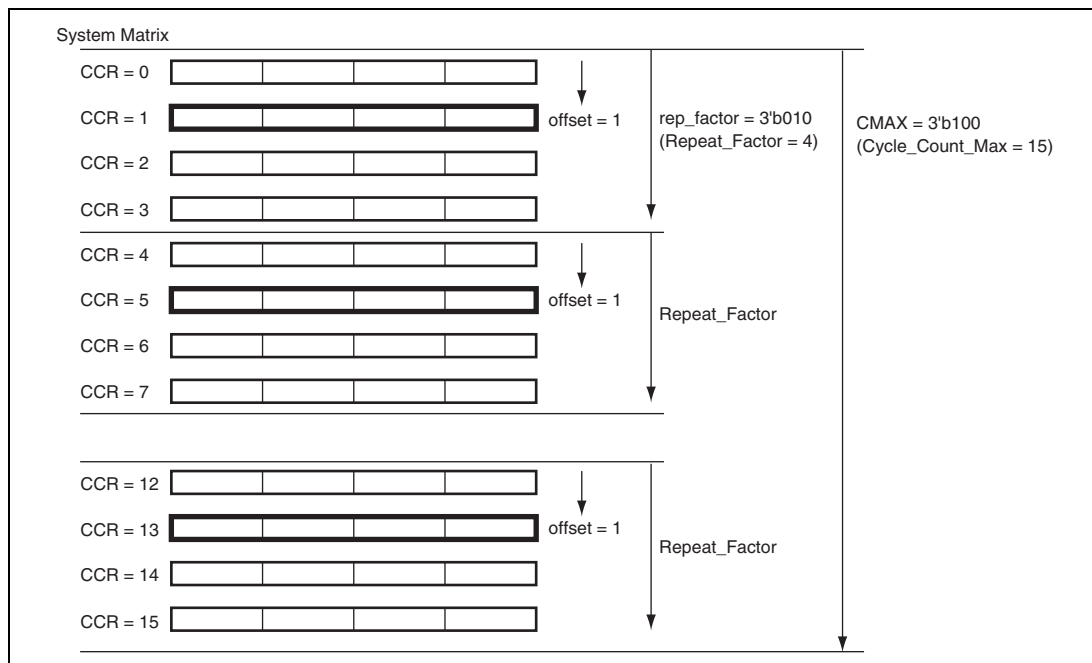

Figure 21.8 System Matrix

Tx-Trigger Times must be set in ascending order such that the difference between them satisfies the following condition.

$$TTT(\text{mailbox } i) - TTT(\text{mailbox } i-1) > TEW + \text{Maximum frame length} + 9$$

21.3.3 Control Registers

The following sections describe control registers. The address is mapped as follow.

Important: These registers can only be accessed in Word size (16-bit).

Register Name	Address	Abbreviation	Access Size (bits)
Master Control Register	000	MCR	16
General Status Register	002	GSR	16
Bit Configuration Register 1	004	BCR1	16
Bit Configuration Register 0	006	BCR0	16
Interrupt Register	008	IRR	16
Interrupt Mask Register	00A	IMR	16
Error Counter Register	00C	TEC/REC	16

Figure 21.9 Control Registers

(1) Master Control Register (MCR)

The Master Control Register (MCR) is a 16-bit read/write register that controls this module.

- MCR (Address = H'000)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	MCR15	MCR14	-	-	-	TST[2:0]		MCR7	MCR6	MCR5	-	-	MCR2	MCR1	MCR0	
Initial value:	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R/W	R/W	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R/W	R/W	R/W

Bit 15 — ID Reorder (MCR15): This bit changes the order of STDID, RTR, IDE and EXTID of both message control and LAFM.

Bit15: MCR15	Description
0	This module is the same as HCAN2
1	This module is not the same as HCAN2 (Initial value)

MCR15 (ID Reorder) = 0																		
	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0		
H'100 + N*32	0	STDID[10:0]											RTR	IDE	EXTID[17:16]		Word/LW	Control 0
H'102 + N*32	EXTID[15:0]															Word		
H'104 + N*32	0	STDID_LAFM[10:0]											0	IDE_LAFM	EXTID_LAFM [17:16]		Word/LW	LAFM Field
H'106 + N*32	EXTID_LAFM[15:0]															Word		
MCR15 (ID Reorder) = 1																		
	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0		
H'100 + N*32	IDE	RTR	0	STDID[10:0]											EXTID[17:16]		Word/LW	Control 0
H'102 + N*32	EXTID[15:0]															Word		
H'104 + N*32	IDE_LAFM	0	0	STDID_LAFM[10:0]											EXTID_LAFM [17:16]		Word/LW	LAFM Field
H'106 + N*32	EXTID_LAFM[15:0]															Word		

Figure 21.10 ID Reorder

This bit can be modified only in reset mode.

Bit 14 — Auto Halt Bus Off (MCR14): If both this bit and MCR6 are set, MCR1 is automatically set as soon as this module enters BusOff.

Bit14: MCR14	Description
0	This module remains in BusOff for normal recovery sequence (128 x 11 Recessive Bits) (Initial value)
1	This module moves directly into Halt Mode after it enters BusOff if MCR6 is set.

This bit can be modified only in reset mode.

Bit 13 — Reserved. The written value should always be '0' and the returned value is '0'.

Bit 12 — Reserved. The written value should always be '0' and the returned value is '0'.

Bit 11 — Reserved. The written value should always be '0' and the returned value is '0'.

Bit 10 - 8 — Test Mode (TST[2:0]): This bit enables/disables the test modes. Please note that before activating the Test Mode it is requested to move this module into Halt mode or Reset mode. This is to avoid that the transition to Test Mode could affect a transmission/reception in progress. For details, please refer to section 21.4.1, Test Mode Settings.

Please note that the test modes are allowed only for diagnosis and tests and not when this module is used in normal operation.

Bit10: TST2	Bit9: TST1	Bit8: TST0	Description
0	0	0	Normal Mode (initial value)
0	0	1	Listen-Only Mode (Receive-Only Mode)
0	1	0	Self Test Mode 1 (External)
0	1	1	Self Test Mode 2 (Internal)
1	0	0	Write Error Counter
1	0	1	Error Passive Mode
1	1	0	Setting prohibited
1	1	1	Setting prohibited

Bit 7 — Auto-wake Mode (MCR7): MCR7 enables or disables the Auto-wake mode. If this bit is set, this module automatically cancels the sleep mode (MCR5) by detecting CAN bus activity (dominant bit). If MCR7 is cleared this module does not automatically cancel the sleep mode.

This module cannot store the message that wakes it up.

Note: This bit can be modified only Reset or Halt mode.

Bit7: MCR7	Description
0	Auto-wake by CAN bus activity disabled (Initial value)
1	Auto-wake by CAN bus activity enabled

Bit 6 — Halt during Bus Off (MCR6): MCR6 enables or disables entering Halt mode immediately when MCR1 is set during Bus Off. This bit can be modified only in Reset or Halt mode. Please note that when Halt is entered in Bus Off the CAN engine is also recovering immediately to Error Active mode.

Bit6: MCR6	Description
0	If MCR[1] is set, this module will not enter Halt mode during Bus Off but wait up to end of recovery sequence (Initial value)
1	Enter Halt mode immediately during Bus Off if MCR[1] or MCR[14] are asserted.

Bit 5 — Sleep Mode (MCR5): Enables or disables Sleep mode transition. If this bit is set, while this module is in halt mode, the transition to sleep mode is enabled. Setting MCR5 is allowed after entering Halt mode. The two Error Counters (REC, TEC) will remain the same during Sleep mode. This mode will be exited in two ways:

1. by writing a '0' to this bit position,
2. or, if MCR[7] is enabled, after detecting a dominant bit on the CAN bus.

If Auto wake up mode is disabled, this module will ignore all CAN bus activities until the sleep mode is terminated. When leaving this mode this module will synchronise to the CAN bus (by checking for 11 recessive bits) before joining CAN Bus activity. This means that, when the No.2 method is used, this module will miss the first message to receive. CAN transceivers stand-by mode will also be unable to cope with the first message when exiting stand by mode, and the S/W needs to be designed in this manner.

In sleep mode only the following registers can be accessed: MCR, GSR, IRR and IMR.

Important: This module is required to be in Halt mode before requesting to enter in Sleep mode. That allows the CPU to clear all pending interrupts before entering sleep mode. Once all interrupts are cleared this module must leave the Halt mode and enter Sleep mode simultaneously (by writing MCR[5] = 1 and MCR[1] = 0 at the same time).

Bit 5: MCR5	Description
0	This module sleep mode released (Initial value)
1	Transition to this module sleep mode enabled

Bit 4 — Reserved. The written value should always be '0' and the returned value is '0'.

Bit 3 — Reserved. The written value should always be '0' and the returned value is '0'.

Bit 2 — Message Transmission Priority (MCR2): MCR2 selects the order of transmission for pending transmit data. If this bit is set, pending transmit data are sent in order of the bit position in the Transmission Pending Register (TXPR). The order of transmission starts from Mailbox-31 as the highest priority, and then down to Mailbox-1 (if those mailboxes are configured for transmission). Please note that this feature cannot be used for time trigger transmission of the Mailboxes 24 to 30.

If MCR2 is cleared, all messages for transmission are queued with respect to their priority (by running internal arbitration). The highest priority message has the Arbitration Field (STDID + IDE bit + EXTID (if IDE = 1) + RTR bit) with the lowest digital value and is transmitted first. The internal arbitration includes the RTR bit and the IDE bit (internal arbitration works in the same

way as the arbitration on the CAN Bus between two CAN nodes starting transmission at the same time).

This bit can be modified only in Reset or Halt mode.

Bit 2: MCR2	Description
0	Transmission order determined by message identifier priority (Initial value)
1	Transmission order determined by mailbox number priority (Mailbox-31 → Mailbox-1)

Bit 1—Halt Request (MCR1): Setting the MCR1 bit causes the CAN controller to complete its current operation and then enter Halt mode (where it is cut off from the CAN bus). This module remains in Halt Mode until the MCR1 is cleared. During the Halt mode, the CAN Interface does not join the CAN bus activity and does not store messages or transmit messages. All the user registers (including Mailbox contents and TEC/REC) remain unchanged with the exception of IRR0 and GSR4 which are used to notify the halt status itself. If the CAN bus is in idle or intermission state regardless of MCR6, this module will enter Halt Mode within one Bit Time. If MCR6 is set, a halt request during Bus Off will be also processed within one Bit Time. Otherwise the full Bus Off recovery sequence will be performed beforehand. Entering the Halt Mode can be notified by IRR0 and GSR4.

If both MCR14 and MCR6 are set, MCR1 is automatically set as soon as this module enters BusOff.

In the Halt mode, this module configuration can be modified with the exception of the Bit Timing setting, as it does not join the bus activity. MCR[1] has to be cleared by writing a '0' in order to re-join the CAN bus. After this bit has been cleared, this module waits until it detects 11 recessive bits, and then joins the CAN bus.

- Notes:
1. After issuing a Halt request the CPU is not allowed to set TXPR or TXCR or clear MCR1 until the transition to Halt mode is completed (notified by IRR0 and GSR4). After MCR1 is set this can be cleared only after entering Halt mode or through a reset operation (SW or HW).
 2. Transition into or recovery from HALT mode, is only possible if the BCR1 and BCR0 registers are configured to a proper Baud Rate.

Bit 1: MCR1	Description
0	Clear Halt request (Initial value)
1	Halt mode transition request

Bit 0 — Reset Request (MCR0): Controls resetting of this module. When this bit is changed from '0' to '1' this module controller enters its reset routine, re-initialising the internal logic, which then sets GSR3 and IRR0 to notify the reset mode. During a re-initialisation, all user registers are initialised.

This module can be re-configured while this bit is set. This bit has to be cleared by writing a '0' to join the CAN bus. After this bit is cleared, this module waits until it detects 11 recessive bits, and then joins the CAN bus. The Baud Rate needs to be set up to a proper value in order to sample the value on the CAN Bus.

After Power On Reset, this bit and GSR3 are always set. This means that a reset request has been made and this module needs to be configured.

The Reset Request is equivalent to a Power On Reset but controlled by Software.

Bit 0: MCR0	Description
0	Clear Reset Request
1	CAN Interface reset mode transition request (Initial value)

(2) General Status Register (GSR)

The General Status Register (GSR) is a 16-bit read-only register that indicates the status of this module.

- GSR (Address = H'002)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	GSR5	GSR4	GSR3	GSR2	GSR1	GSR0
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	1	1	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bits 15 to 6: Reserved. The written value should always be '0' and the returned value is '0'.

Bit 5 — Error Passive Status Bit (GSR5): Indicates whether the CAN Interface is in Error Passive or not. This bit will be set high as soon as this module enters the Error Passive state and is cleared when the module enters again the Error Active state (this means the GSR5 will stay high during Error Passive and during Bus Off). Consequently to find out the correct state both GSR5 and GSR0 must be considered.

Bit 5: GSR5	Description
0	This module is not in Error Passive or in Bus Off status (Initial value) [Reset condition] This module is in Error Active state
1	This module is in Error Passive (if GSR0 = 0) or Bus Off (if GSR0 = 1) [Setting condition] When TEC • 128 or REC • 128 or if Error Passive Test Mode is selected

Bit 4 — Halt/Sleep Status Bit (GSR4): Indicates whether the CAN engine is in the halt/sleep state or not. Please note that the clearing time of this flag is not the same as the setting time of IRR12.

Please note that this flag reflects the status of the CAN engine and not of the full this module IP. This module exits sleep mode and can be accessed once MCR5 is cleared. The CAN engine exits sleep mode only after two additional transmission clocks on the CAN Bus.

Bit 4: GSR4	Description
0	This module is not in the Halt state or Sleep state (Initial value)
1	Halt mode (if MCR1 = 1) or Sleep mode (if MCR5 = 1) [Setting condition] If MCR1 is set and the CAN bus is either in intermission or idle or MCR5 is set and this module is in the halt mode or this module is moving to Bus Off when MCR14 and MCR6 are both set

Bit 3 — Reset Status Bit (GSR3): Indicates whether this module is in the reset state or not.

Bit 3: GSR3	Description
0	This module is not in the reset state
1	Reset state (Initial value) [Setting condition] After an internal reset of this module (due to SW or HW reset)

Bit 2 — Message Transmission in progress Flag (GSR2): Flag that indicates to the CPU if this module is in Bus Off or transmitting a message or an error/overload flag due to error detected during transmission. The timing to set TXACK is different from the time to clear GSR2. TXACK is set at the 7th bit of End Of Frame. GSR2 is set at the 3rd bit of intermission if there are no more messages ready to be transmitted. It is also set by arbitration lost, bus idle, reception, reset or halt transition.

Bit 2: GSR2	Description
0	This module is in Bus Off or a transmission is in progress
1	[Setting condition] Not in Bus Off and no transmission in progress (Initial value)

Bit 1—Transmit/Receive Warning Flag (GSR1): Flag that indicates an error warning.

Bit 1: GSR1	Description
0	[Reset condition] When (TEC < 96 and REC < 96) or Bus Off (Initial value)
1	[Setting condition] When $96 \leq \text{TEC} \cdot 256$ or $96 \leq \text{REC} \cdot 256$

Note: REC is incremented during Bus Off to count the recurrences of 11 recessive bits as requested by the Bus Off recovery sequence. However the flag GSR1 is not set in Bus Off.

Bit 0—Bus Off Flag (GSR0): Flag that indicates that this module is in the bus off state.

Bit 0: GSR0	Description
0	[Reset condition] Recovery from bus off state or after a HW or SW reset (Initial value)
1	[Setting condition] When $\text{TEC} \cdot 256$ (bus off state)

Note: Only the lower 8 bits of TEC are accessible from the user interface. The 9th bit is equivalent to GSR0.

(3) Bit Configuration Register (BCR0, BCR1)

The bit configuration registers (BCR0 and BCR1) are 2 X 16-bit read/write register that are used to set CAN bit timing parameters and the baud rate pre-scaler for the CAN Interface.

The Time quanta is defined as:

$$Timequanta = \frac{2 * BRP}{f_{clk}}$$

Where: BRP (Baud Rate Pre-scaler) is the value stored in BCR0 incremented by 1 and f_{clk} is the used peripheral bus frequency.

- BCR1 (Address = H'004)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TSG1[3:0]				-	TSG2[2:0]			-	-	SJW[1:0]		-	-	-	BSP
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R	R	R/W	R/W	R	R	R	R/W

Bits 15 to 12 — Time Segment 1 (TSG1[3:0] = BCR1[15:12]): These bits are used to set the segment TSEG1 (= PRSEG + PHSEG1) to compensate for edges on the CAN Bus with a positive phase error. A value from 4 to 16 time quanta can be set.

Bit 15: Bit 14: Bit 13: Bit 12:
TSG1[3] TSG1[2] TSG1[1] TSG1[0] Description

0	0	0	0	Setting prohibited (Initial value)
0	0	0	1	Setting prohibited
0	0	1	0	Setting prohibited
0	0	1	1	PRSEG + PHSEG1 = 4 time quanta
0	1	0	0	PRSEG + PHSEG1 = 5 time quanta
:	:	:	:	:
:	:	:	:	:
1	1	1	1	PRSEG + PHSEG1 = 16 time quanta

Bit 11: Reserved. The written value should always be '0' and the returned value is '0'.

Bits 10 to 8 — Time Segment 2 (TSG2[2:0] = BCR1[10:8]): These bits are used to set the segment TSEG2 (= PHSEG2) to compensate for edges on the CAN Bus with a negative phase error. A value from 2 to 8 time quanta can be set as shown below.

Bit 10: TSG2[2]	Bit 9: TSG2[1]	Bit 8: TSG2[0]	Description
0	0	0	Setting prohibited (Initial value)
0	0	1	PHSEG2 = 2 time quanta (conditionally prohibited)
0	1	0	PHSEG2 = 3 time quanta
0	1	1	PHSEG2 = 4 time quanta
1	0	0	PHSEG2 = 5 time quanta
1	0	1	PHSEG2 = 6 time quanta
1	1	0	PHSEG2 = 7 time quanta
1	1	1	PHSEG2 = 8 time quanta

Bits 7 and 6: Reserved. The written value should always be '0' and the returned value is '0'.

Bits 5 and 4 - ReSynchronisation Jump Width (SJW[1:0] = BCR0[5:4]): These bits set the synchronisation jump width.

Bit 5: SJW[1]	Bit 4: SJW[0]	Description
0	0	Synchronisation Jump width = 1 time quantum (Initial value)
0	1	Synchronisation Jump width = 2 time quanta
1	0	Synchronisation Jump width = 3 time quanta
1	1	Synchronisation Jump width = 4 time quanta

Bits 3 to 1: Reserved. The written value should always be '0' and the returned value is '0'.

Bit 0 — Bit Sample Point (BSP = BCR1[0]): Sets the point at which data is sampled.

Bit 0 : BSP	Description
0	Bit sampling at one point (end of time segment 1) (Initial value)
1	Bit sampling at three points (rising edge of the last three clock cycles of PHSEG1)

- BCR0 (Address = H'006)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	BRP[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bits 8 to 15: Reserved. The written value should always be '0' and the returned value is '0'.

Bits 7 to 0—Baud Rate Pre-scale (BRP[7:0] = BCR0 [7:0]): These bits are used to define the peripheral bus clock periods contained in a Time Quantum.

Bit 7: BRP[7]	Bit 6: BRP[6]	Bit 5: BRP[5]	Bit 4: BRP[4]	Bit 3: BRP[3]	Bit 2: BRP[2]	Bit 1: BRP[1]	Bit 0: BRP[0]	Description
0	0	0	0	0	0	0	0	2 X peripheral bus clock (Initial value)
0	0	0	0	0	0	0	1	4 X peripheral bus clock
0	0	0	0	0	0	1	0	6 X peripheral bus clock
:	:	:	:	:	:	:	:	2*(register value + 1) X peripheral bus clock
1	1	1	1	1	1	1	1	512 X peripheral bus clock

- Requirements of Bit Configuration Register

SYNC_SEG: Segment for establishing synchronisation of nodes on the CAN bus. (Normal bit edge transitions occur in this segment.)

PRSEG: Segment for compensating for physical delay between networks.

PHSEG1: Buffer segment for correcting phase drift (positive). (This segment is extended when synchronisation (resynchronisation) is established.)

PHSEG2: Buffer segment for correcting phase drift (negative). (This segment is shortened when synchronisation (resynchronisation) is established)

TSEG1: TSG1 + 1

TSEG2: TSG2 + 1

The Bit Rate Calculation is:

$$\text{Bit Rate} = \frac{f_{clk}}{2 \times (\text{BRP} + 1) \times (\text{TSEG1} + \text{TSEG2} + 1)}$$

Where BRP is given by the register value and TSEG1 and TSEG2 are derived values from TSG1 and TSG2 register values. The '+1' in the above formula is for the Sync-Seg which duration is 1 time quanta.

$$f_{CLK} = \text{Peripheral Clock}$$

BCR Setting Constraints

$$\text{TSEG1}_{min} > \text{TSEG2} \geq \text{SJW}_{max} \quad (\text{SJW} = 1 \text{ to } 4)$$

$$8 \leq \text{TSEG1} + \text{TSEG2} + 1 \leq 25 \text{ time quanta} \quad (\text{TSEG1} + \text{TSEG2} + 1 = 7 \text{ is not allowed})$$

$$\text{TSEG2} \geq 2$$

These constraints allow the setting range shown in the table below for TSEG1 and TSEG2 in the Bit Configuration Register. The number in the table shows possible setting of SJW. "No" shows that there is no allowed combination of TSEG1 and TSEG2.

		001	010	011	100	101	110	111	TSG2
		2	3	4	5	6	7	8	TSEG2
TSG1	TSEG1								
0011	4	No	1-3	No	No	No	No	No	
0100	5	1-2	1-3	1-4	No	No	No	No	
0101	6	1-2	1-3	1-4	1-4	No	No	No	
0110	7	1-2	1-3	1-4	1-4	1-4	No	No	
0111	8	1-2	1-3	1-4	1-4	1-4	1-4	No	
1000	9	1-2	1-3	1-4	1-4	1-4	1-4	1-4	
1001	10	1-2	1-3	1-4	1-4	1-4	1-4	1-4	
1010	11	1-2	1-3	1-4	1-4	1-4	1-4	1-4	
1011	12	1-2	1-3	1-4	1-4	1-4	1-4	1-4	
1100	13	1-2	1-3	1-4	1-4	1-4	1-4	1-4	
1101	14	1-2	1-3	1-4	1-4	1-4	1-4	1-4	
1110	15	1-2	1-3	1-4	1-4	1-4	1-4	1-4	
1111	16	1-2	1-3	1-4	1-4	1-4	1-4	1-4	

Example 1: To have a Bit rate of 500Kbps with a frequency of fclk = 24MHz it is possible to set: BRP = 1, TSEG1 = 6, TSEG2 = 5.

Then the configuration to write is BCR1 = H'5400 and BCR0 = H'0001.

Example 2: To have a Bit rate of 500Kbps with a frequency of fclk = 36MHz it is possible to set: BRP = 1, TSEG1 = 10, TSEG2 = 7.

Then the configuration to write is BCR1 = H'9600 and BCR0 = H'0001.

(4) Interrupt Request Register (IRR)

The interrupt register (IRR) is a 16-bit read/write-clearable register containing status flags for the various interrupt sources.

- IRR (Address = H'008)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	IRR15	IRR14	IRR13	IRR12	IRR11	IRR10	IRR9	IRR8	IRR7	IRR6	IRR5	IRR4	IRR3	IRR2	IRR1	IRR0
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R/W	R/W	R/W	R/W	R/W	R	R	R/W

Bit 15 — Timer Compare Match Interrupt 1 (IRR15): Indicates that a Compare-Match condition occurred to the Timer Compare Match Register 1 (TCMR1). When the value set in the TCMR1 matches to Cycle Time (TCMR1 = CYCTR), this bit is set.

Bit 15: IRR15	Description
0	Timer Compare Match has not occurred to the TCMR1 (Initial value) [Clearing condition] Writing 1
1	Timer Compare Match has occurred to the TCMR1 [Setting condition] TCMR1 matches to Cycle Time (TCMR1 = CYCTR)

Bit 14 — Timer Compare Match Interrupt 0 (IRR14): Indicates that a Compare-Match condition occurred to the Timer Compare Match Register 0 (TCMR0). When the value set in the TCMR0 matches to Local Time (TCMR0 = TCNTR), this bit is set.

Bit 14: IRR14	Description
0	Timer Compare Match has not occurred to the TCMR0 (Initial value) [Clearing condition] Writing 1
1	Timer Compare Match has occurred to the TCMR0 [Setting condition] TCMR0 matches to the Timer value (TCMR0 = TCNTR)

Bit 13 - Timer Overrun Interrupt/Next_is_Gap Reception Interrupt/Message Error Interrupt (IRR13): This interrupt assumes a different meaning depending on this module mode. It indicates that:

- The Timer (TCNTR) has overrun when this module is working in event-trigger mode (including test modes)

- Time reference message with Next_is_Gap set has been received when working in time-trigger mode. Please note that when a Next_is_Gap is received the application is responsible to stop all transmission at the end of the current basic cycle (including test modes)
- Message error has occurred when in test mode. Note: If a Message Overload condition occurs when in Test Mode, then this bit will not be set.

Bit 13: IRR13	Description
0	Timer (TCNTR) has not overrun in event-trigger mode (including test modes) (Initial value) Time reference message with Next_is_Gap has not been received in time-trigger mode (including test modes) Message error has not occurred in test mode [Clearing condition] Writing 1
1	[Setting condition] Timer (TCNTR) has overrun and changed from H'FFFF to H'0000 in event-trigger mode (including test modes) Time reference message with Next_is_Gap has been received in time-trigger mode (including test modes) Message error has occurred in test mode

Bit 12 – Bus activity while in sleep mode (IRR12): IRR12 indicates that a CAN bus activity is present. While this module is in sleep mode and a dominant bit is detected on the CAN bus, this bit is set. This interrupt is cleared by writing a '1' to this bit position. Writing a '0' has no effect. If auto wakeup is not used and this interrupt is not requested it needs to be disabled by the related interrupt mask register. If auto wake up is not used and this interrupt is requested it should be cleared only after recovering from sleep mode. This is to avoid that a new falling edge of the reception line causes the interrupt to get set again.

Please note that the setting time of this interrupt is different from the clearing time of GSR4.

Bit 12: IRR12	Description
0	Bus idle state (Initial value) [Clearing condition] Writing 1
1	CAN bus activity detected in this module sleep mode [Setting condition] Dominant bit level detection on the Rx line while in sleep mode

Bit 11 — Timer Compare Match Interrupt 2 (IRR11): Indicates that a Compare-Match condition occurred to the Timer Compare Match Register 2 (TCMR2). When the value set in the TCMR2 matches to Cycle Time (TCMR2 = CYCTR), this bit is set.

Bit 11: IRR11	Description
0	Timer Compare Match has not occurred to the TCMR2 (initial value) [Clearing condition] Writing 1
1	Timer Compare Match has occurred to the TCMR2 [Setting condition] TCMR2 matches to Cycle Time (TCMR2 = CYCTR)

Bit 10 — Start of new system matrix Interrupt (IRR10): Indicates that a new system matrix is starting.

When CCR = 0, this bit is set at the successful completion of reception/transmission of time reference message. Please note that when CMAX = 0 this interrupt is set at every basic cycle.

Bit 10: IRR10	Description
0	A new system matrix is not starting (initial value) [Clearing condition] Writing 1
1	Cycle counter reached zero. [Setting condition] Reception/transmission of time reference message is successfully completed when CMAX!= 3'b111 and CCR = 0

Bit 9 – Message Overrun/Overwrite Interrupt Flag (IRR9): Flag indicating that a message has been received but the existing message in the matching Mailbox has not been read as the corresponding RXPR or RFPR is already set to '1' and not yet cleared by the CPU. The received message is either abandoned (overrun) or overwritten dependant upon the NMC (New Message Control) bit. This bit is cleared when all bit in UMSR (Unread Message Status Register) are cleared (by writing '1') or by setting MBIMR (MailBox interrupt Mast Register) for all UMSR flag set. It is also cleared by writing a '1' to all the correspondent bit position in MBIMR. Writing to this bit position has no effect.

Bit 9: IRR9	Description
0	No pending notification of message overrun/overwrite [Clearing condition] Clearing of all bit in UMSR/setting MBIMR for all UMSR set (initial value)
1	A receive message has been discarded due to overrun condition or a message has been overwritten [Setting condition] Message is received while the corresponding RXPR and/or RFPR = 1 and MBIMR = 0

Bit 8 - Mailbox Empty Interrupt Flag (IRR8): This bit is set when one of the messages set for transmission has been successfully sent (corresponding TXACK flag is set) or has been successfully aborted (corresponding ABACK flag is set). In Event Triggered mode the related TXPR is also cleared and this mailbox is now ready to accept a new message data for the next transmission. In Time Trigger mode TXPR for the Mailboxes from 30 to 24 is not cleared after a successful transmission in order to keep transmitting at each programmed basic cycle. In effect, this bit is set by an OR'ed signal of the TXACK and ABACK bits not masked by the corresponding MBIMR flag. Therefore, this bit is automatically cleared when all the TXACK and ABACK bits are cleared. It is also cleared by writing a '1' to all the correspondent bit position in MBIMR. Writing to this bit position has no effect.

Bit 8: IRR8	Description
0	Messages set for transmission or transmission cancellation request NOT progressed. (Initial value) [Clearing Condition] All the TXACK and ABACK bits are cleared/setting MBIMR for all TXACK and ABACK set
1	Message has been transmitted or aborted, and new message can be stored (in TT mode Mailbox 24 to 30 can be programmed with a new message only in case of abortion) [Setting condition] When a TXACK or ABACK bit is set (if related MBIMR = 0).

Bit 7 - Overload Frame (IRR7): Flag indicating that this module has detected a condition that should initiate the transmission of an overload frame. Note that in the condition of transmission being prevented, such as listen only mode, an Overload Frame will NOT be transmitted, but IRR7 will still be set. IRR7 remains asserted until reset by writing a '1' to this bit position - writing a '0' has no effect.

Bit 7: IRR7	Description
0	[Clearing condition] Writing 1 (Initial value)
1	[Setting conditions] Overload condition detected

Bit 6 - Bus Off Interrupt Flag (IRR6): This bit is set when this module enters the Bus-off state or when this module leaves Bus-off and returns to Error-Active. The cause therefore is the existing condition $TEC \geq 256$ at the node or the end of the Bus-off recovery sequence (128X11 consecutive recessive bits) or the transition from Bus Off to Halt (automatic or manual). This bit remains set even if this module node leaves the bus-off condition, and needs to be explicitly cleared by S/W. The S/W is expected to read the GSR0 to judge whether this module is in the bus-off or error active status. It is cleared by writing a '1' to this bit position even if the node is still bus-off. Writing a '0' has no effect.

Bit 6: IRR6	Description
0	[Clearing condition] Writing 1 (Initial value)
1	Enter Bus off state caused by transmit error or Error Active state returning from Bus-off [Setting condition] When TEC becomes ≥ 256 or End of Bus-off after 128X11 consecutive recessive bits or transition from Bus Off to Halt

Bit 5 - Error Passive Interrupt Flag (IRR5): Interrupt flag indicating the error passive state caused by the transmit or receive error counter or by Error Passive forced by test mode. This bit is reset by writing a '1' to this bit position, writing a '0' has no effect. If this bit is cleared the node may still be error passive. Please note that the SW needs to check GSR0 and GSR5 to judge whether this module is in Error Passive or Bus Off status.

Bit 5: IRR5	Description
0	[Clearing condition] Writing 1 (Initial value)
1	Error passive state caused by transmit/receive error [Setting condition] When $TEC \geq 128$ or $REC \geq 128$ or Error Passive test mode is used

Bit 4 - Receive Error Counter Warning Interrupt Flag (IRR4): This bit becomes set if the receive error counter (REC) reaches a value greater than 95 when this module is not in the Bus Off status. The interrupt is reset by writing a '1' to this bit position, writing '0' has no effect.

Bit 4: IRR4	Description
0	[Clearing condition] Writing 1 (Initial value)
1	Error warning state caused by receive error [Setting condition] When $REC \geq 96$ and this module is not in Bus Off

Bit 3 - Transmit Error Counter Warning Interrupt Flag (IRR3): This bit becomes set if the transmit error counter (TEC) reaches a value greater than 95. The interrupt is reset by writing a '1' to this bit position, writing '0' has no effect.

Bit 3: IRR3	Description
0	[Clearing condition] Writing 1 (Initial value)
1	Error warning state caused by transmit error [Setting condition] When $TEC \geq 96$

Bit 2 - Remote Frame Receive Interrupt Flag (IRR2): Flag indicating that a remote frame has been received in a mailbox. This bit is set if at least one receive mailbox, with related MBIMR not set, contains a remote frame transmission request. This bit is automatically cleared when all bits in the Remote Frame Receive Pending Register (RFPR), are cleared. It is also cleared by writing a '1' to all the correspondent bit position in MBIMR. Writing to this bit has no effect.

Bit 2: IRR2	Description
0	[Clearing condition] Clearing of all bits in RFPR (Initial value)
1	At least one remote request is pending [Setting condition] When remote frame is received and the corresponding MBIMR = 0

Bit 1 - Data Frame Received Interrupt Flag (IRR1): IRR1 indicates that there are pending Data Frames received. If this bit is set at least one receive mailbox contains a pending message. This bit is cleared when all bits in the Data Frame Receive Pending Register (RXPR) are cleared, i.e. there is no pending message in any receiving mailbox. It is in effect a logical OR of the RXPR flags from each configured receive mailbox with related MBIMR not set. It is also cleared by writing a '1' to all the correspondent bit position in MBIMR. Writing to this bit has no effect.

Bit 1: IRR1	Description
0	[Clearing condition] Clearing of all bits in RXPR (Initial value)
1	Data frame received and stored in Mailbox [Setting condition] When data is received and the corresponding MBIMR = 0

Bit 0 – Reset/Halt/Sleep Interrupt Flag (IRR0): This flag can get set for three different reasons. It can indicate that:

1. Reset mode has been entered after a SW (MCR0) or HW reset
2. Halt mode has been entered after a Halt request (MCR1)
3. Sleep mode has been entered after a sleep request (MCR5) has been made while in Halt mode.

The GSR may be read after this bit is set to determine which state this module is in.

Important: When a Sleep mode request needs to be made, the Halt mode must be used beforehand. Please refer to the MCR5 description and Figure 21.15 Halt Mode/Sleep Mode.

IRR0 is set by the transition from "0" to "1" of GSR3 or GSR4 or by transition from Halt mode to Sleep mode. So, IRR0 is not set if this module enters Halt mode again right after exiting from Halt mode, without GSR4 being cleared. Similarly, IRR0 is not set by direct transition from Sleep mode to Halt Request. At the transition from Halt/Sleep mode to Transition/Reception, clearing GSR4 needs (one-bit time - TSEG2) to (one-bit time * 2 - TSEG2).

In the case of Reset mode, IRR0 is set, however, the interrupt to the CPU is not asserted since IMR0 is automatically set by initialisation.

Bit 0: IRR0	Description
0	[Clearing condition] Writing 1
1	Transition to S/W reset mode or transition to halt mode or transition to sleep mode (Initial value) [Setting condition] When reset/halt/sleep transition is completed after a reset (MCR0 or HW) or Halt mode (MCR1) or Sleep mode (MCR5) is requested

(5) Interrupt Mask Register (IMR)

The interrupt mask register is a 16 bit register that protects all corresponding interrupts in the Interrupt Request Register (IRR) from generating an output signal on the IRQ. An interrupt request is masked if the corresponding bit position is set to '1'. This register can be read or written at any time. The IMR directly controls the generation of IRQ, but does not prevent the setting of the corresponding bit in the IRR.

- IMR (Address = H'00A)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	IMR15	IMR14	IMR13	IMR12	IMR11	IMR10	IMR9	IMR8	IMR7	IMR6	IMR5	IMR4	IMR3	IMR2	IMR1	IMR0
Initial value:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit 15 to 0: Maskable interrupt sources corresponding to IRR[15:0] respectively. When a bit is set, the interrupt signal is not generated, although setting the corresponding IRR bit is still performed.

Bit[15:0]: IMRn	Description
0	Corresponding IRR is not masked (IRQ is generated for interrupt conditions)
1	Corresponding interrupt of IRR is masked (Initial value)

(6) Transmit Error Counter (TEC) and Receive Error Counter (REC)

The Transmit Error Counter (TEC) and Receive Error Counter (REC) is a 16-bit read/(write) register that functions as a counter indicating the number of transmit/receive message errors on the CAN Interface. The count value is stipulated in the CAN protocol specification Refs. [1], [2], [3] and [4]. When not in (Write Error Counter) test mode this register is read only, and can only be modified by the CAN Interface. This register can be cleared by a Reset request (MCR0) or entering to bus off.

In Write Error Counter test mode (i.e. TST[2:0] = 3'b100), it is possible to write to this register. The same value can only be written to TEC/REC, and the value written into TEC is set to TEC and REC. When writing to this register, this module needs to be put into Halt Mode. This feature is only intended for test purposes.

- TEC/REC (Address = H'00C)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TEC7	TEC6	TEC5	TEC4	TEC3	TEC2	TEC1	TEC0	REC7	REC6	REC5	REC4	REC3	REC2	REC1	REC0
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*

Note: * It is only possible to write the value in test mode when TST[2:0] in MCR is 3'b100.
REC is incremented during Bus Off to count the recurrences of 11 recessive bits as requested by the Bus Off recovery sequence.

21.3.4 Mailbox Registers

The following sections describe Mailbox registers that control/flag individual Mailboxes. The address is mapped as follows.

Important: LongWord access is carried out as two consecutive Word accesses.

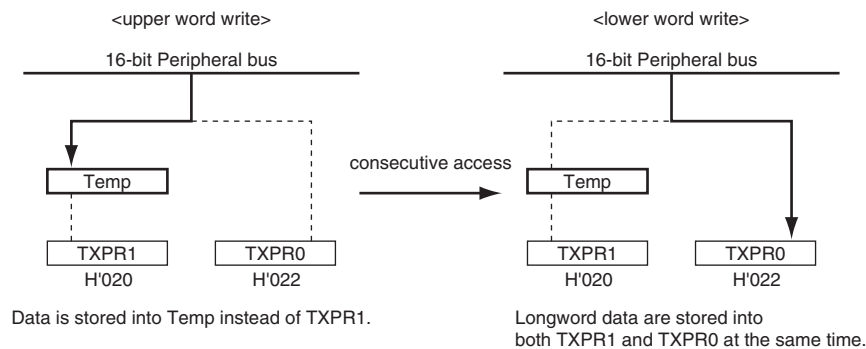

32-Mailboxes version			
Description	Address	Name	Access Size (bits)
Transmit Pending 1	020	TXPR1	LW
Transmit Pending 0	022	TXPR0	—
	024		
	026		
Transmit Cancel 1	028	TXCR1	Word/LW
Transmit Cancel 0	02A	TXCR0	Word
	02C		
	02E		
Transmit Acknowledge 1	030	TXACK1	Word/LW
Transmit Acknowledge 0	032	TXACK0	Word
	034		
	036		
Abort Acknowledge 1	038	ABACK1	Word/LW
Abort Acknowledge 0	03A	ABACK0	Word
	03C		
	03E		
Data Frame Receive Pending 1	040	RXPR1	Word/LW
Data Frame Receive Pending 0	042	RXPR0	Word
	044		
	046		
Remote Frame Receive Pending 1	048	RFPR1	Word/LW
Remote Frame Receive Pending 0	04A	RFPR0	Word
	04C		
	04E		
Mailbox Interrupt Mask Register 1	050	MBIMR1	Word/LW
Mailbox Interrupt Mask Register 0	052	MBIMR0	Word
	054		
	056		
Unread message Status Register 1	058	UMSR1	Word/LW
Unread message Status Register 0	05A	UMSR0	Word
	05C		
	05E		

Figure 21.11 Mailbox Registers

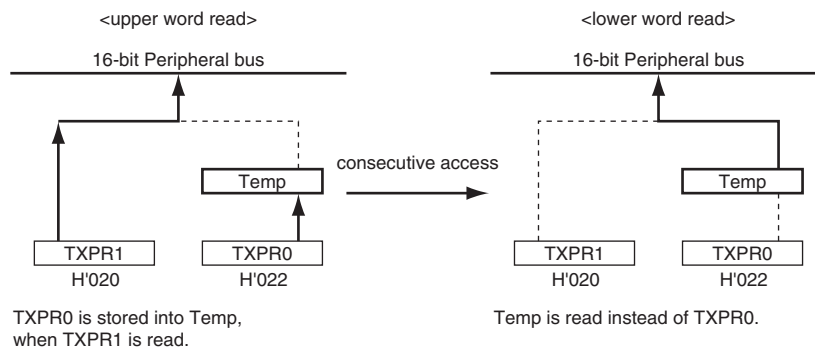

(1) Transmit Pending Register (TXPR1, TXPR0)

The concatenation of TXPR1 and TXPR0 is a 32-bit register that contains any transmit pending flags for the CAN module. In the case of 16-bit bus interface, Long Word access is carried out as two consecutive word accesses.

<Longword Write Operation>

<Longword Read Operation>

The TXPR1 controls Mailbox-31 to Mailbox-16, and the TXPR0 controls Mailbox-15 to Mailbox-1. The CPU may set the TXPR bits to affect any message being considered for transmission by writing a '1' to the corresponding bit location. Writing a '0' has no effect, and TXPR cannot be cleared by writing a '0' and must be cleared by setting the corresponding TXCR bits. TXPR may be read by the CPU to determine which, if any, transmissions are pending or in progress. In effect there is a transmit pending bit for all Mailboxes except for the Mailbox-0. Writing a '1' to a bit location when the mailbox is not configured to transmit is not allowed.

In Event Triggered Mode this module will clear a transmit pending flag after successful transmission of its corresponding message or when a transmission abort is requested successfully from the TXCR. In Time Trigger Mode, TXPR for the Mailboxes from 30 to 24 is NOT cleared after a successful transmission, in order to keep transmitting at each programmed basic cycle. The TXPR flag is not cleared if the message is not transmitted due to the CAN node losing the arbitration process or due to errors on the CAN bus, and this module automatically tries to transmit it again unless its DART bit (Disable Automatic Re-Transmission) is set in the Message-Control of the corresponding Mailbox. In such case (DART set), the transmission is cleared and notified through Mailbox Empty Interrupt Flag (IRR8) and the correspondent bit within the Abort Acknowledgement Register (ABACK).

If the status of the TXPR changes, this module shall ensure that in the identifier priority scheme (MCR2 = 0), the highest priority message is always presented for transmission in an intelligent way even under circumstances such as bus arbitration losses or errors on the CAN bus. Please refer to the Application Note for details.

When this module changes the state of any TXPR bit position to a '0', an empty slot interrupt (IRR8) may be generated. This indicates that either a successful or an aborted mailbox transmission has just been made. If a message transmission is successful it is signalled in the TXACK register, and if a message transmission abortion is successful it is signalled in the ABACK register. By checking these registers, the contents of the Message of the corresponding Mailbox may be modified to prepare for the next transmission.

- TXPR1

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TXPR1[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*

Note: * It is possible only to write a '1' for a Mailbox configured as transmitter.

Bit 15 to 0 — Requests the corresponding Mailbox to transmit a CAN Frame. The bit 15 to 0 corresponds to Mailbox-31 to 16 respectively. When multiple bits are set, the order of the transmissions is governed by the MCR2 – CAN-ID or Mailbox number.

Bit[15:0]: TXPR1	Description
0	Transmit message idle state in corresponding mailbox (Initial value) [Clearing Condition] Completion of message transmission (for Event Triggered Messages) or message transmission abortion (automatically cleared)
1	Transmission request made for corresponding mailbox

- TXPR0

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
	TXPR0[15:1]															-	
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R

Note: * It is possible only to write a '1' for a Mailbox configured as transmitter.

Bit 15 to 1 — Indicates that the corresponding Mailbox is requested to transmit a CAN Frame. The bit 15 to 1 corresponds to Mailbox-15 to 1 respectively. When multiple bits are set, the order of the transmissions is governed by the MCR2 – CAN-ID or Mailbox number.

Bit[15:1]: TXPR0	Description
0	Transmit message idle state in corresponding mailbox (Initial value) [Clearing Condition] Completion of message transmission (for Event Triggered Messages) or message transmission abortion (automatically cleared)
1	Transmission request made for corresponding mailbox

Bit 0— Reserved: This bit is always '0' as this is a receive-only Mailbox. Writing a '1' to this bit position has no effect. The returned value is '0'.

(2) Transmit Cancel Register (TXCR1, TXCR0)

The TXCR1 and TXCR0 are 16-bit read/conditionally-write registers. The TXCR1 controls Mailbox-31 to Mailbox-16, and the TXCR0 controls Mailbox-15 to Mailbox-1. This register is used by the CPU to request the pending transmission requests in the TXPR to be cancelled. To clear the corresponding bit in the TXPR the CPU must write a '1' to the bit position in the TXCR. Writing a '0' has no effect.

When an abort has succeeded the CAN controller clears the corresponding TXPR + TXCR bits, and sets the corresponding ABACK bit. However, once a Mailbox has started a transmission, it cannot be cancelled by this bit. In such a case, if the transmission finishes in success, the CAN controller clears the corresponding TXPR + TXCR bit, and sets the corresponding TXACK bit, however, if the transmission fails due to a bus arbitration loss or an error on the bus, the CAN controller clears the corresponding TXPR + TXCR bit, and sets the corresponding ABACK bit. If an attempt is made by the CPU to clear a mailbox transmission that is not transmit-pending it has no effect. In this case the CPU will be not able at all to set the TXCR flag.

- TXCR1

Note: * Only writing a '1' to a Mailbox that is requested for transmission and is configured as transmit.

Bit 15 to 0 — Requests the corresponding Mailbox, that is in the queue for transmission, to cancel its transmission. The bit 15 to 0 corresponds to Mailbox-31 to 16 (and TXPR1[15:0]) respectively.

Bit[15:0]:TXCR1	Description
0	Transmit message cancellation idle state in corresponding mailbox (Initial value) [Clearing Condition] Completion of transmit message cancellation (automatically cleared)
1	Transmission cancellation request made for corresponding mailbox

- TXCR0

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TXCR0[15:1]															-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R

Note: * Only writing a '1' to a Mailbox that is requested for transmission and is configured as transmit.

Bit 15 to 1 — Requests the corresponding Mailbox, that is in the queue for transmission, to cancel its transmission. The bit 15 to 1 corresponds to Mailbox-15 to 1 (and TXPR0[15:1]) respectively.

Bit[15:1]: TXCR0	Description
0	Transmit message cancellation idle state in corresponding mailbox (Initial value) [Clearing Condition] Completion of transmit message cancellation (automatically cleared)
1	Transmission cancellation request made for corresponding mailbox

Bit 0 — This bit is always '0' as this is a receive-only mailbox. Writing a '1' to this bit position has no effect and always read back as a '0'.

(3) Transmit Acknowledge Register (TXACK1, TXACK0)

The TXACK1 and TXACK0 are 16-bit read/conditionally-write registers. These registers are used to signal to the CPU that a mailbox transmission has been successfully made. When a transmission has succeeded this module sets the corresponding bit in the TXACK register. The CPU may clear a TXACK bit by writing a '1' to the corresponding bit location. Writing a '0' has no effect.

- TXACK1

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TXACK1[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*

Note: * Only when writing a '1' to clear.

Bit 15 to 0 — Notifies that the requested transmission of the corresponding Mailbox has been finished successfully. The bit 15 to 0 corresponds to Mailbox-31 to 16 respectively.

Bit[15:0]:TXACK1	Description
0	[Clearing Condition] Writing '1' (Initial value)
1	Corresponding Mailbox has successfully transmitted message (Data or Remote Frame) [Setting Condition] Completion of message transmission for corresponding mailbox

- TXACK0

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TXACK0[15:1]															-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*

Note: * Only when writing a '1' to clear.

Bit 15 to 1 — Notifies that the requested transmission of the corresponding Mailbox has been finished successfully. The bit 15 to 1 corresponds to Mailbox-15 to 1 respectively.

Bit[15:1]:TXACK0	Description
0	[Clearing Condition] Writing '1' (Initial value)
1	Corresponding Mailbox has successfully transmitted message (Data or Remote Frame) [Setting Condition] Completion of message transmission for corresponding mailbox

Bit 0 — This bit is always '0' as this is a receive-only mailbox. Writing a '1' to this bit position has no effect and always read back as a '0'.

(4) Abort Acknowledge Register (ABACK1, ABACK0)

The ABACK1 and ABACK0 are 16-bit read/conditionally-write registers. These registers are used to signal to the CPU that a mailbox transmission has been aborted as per its request. When an abort has succeeded this module sets the corresponding bit in the ABACK register. The CPU may clear the Abort Acknowledge bit by writing a '1' to the corresponding bit location. Writing a '0' has no effect. An ABACK bit position is set by this module to acknowledge that a TXPR bit has been cleared by the corresponding TXCR bit.

- ABACK1

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ABACK1[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*

Note: * Only when writing a '1' to clear.

Bit 15 to 0 — Notifies that the requested transmission cancellation of the corresponding Mailbox has been performed successfully. The bit 15 to 0 corresponds to Mailbox-31 to 16 respectively.

Bit[15:0]:ABACK1	Description
0	[Clearing Condition] Writing '1' (Initial value)
1	Corresponding Mailbox has cancelled transmission of message (Data or Remote Frame) [Setting Condition] Completion of transmission cancellation for corresponding mailbox

- ABACK0

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ABACK0[15:1]															-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R

Note: * Only when writing a '1' to clear.

Bit 15 to 1 — Notifies that the requested transmission cancellation of the corresponding Mailbox has been performed successfully. The bit 15 to 1 corresponds to Mailbox-15 to 1 respectively.

Bit[15:1]:ABACK0	Description
0	[Clearing Condition] Writing '1' (Initial value)
1	Corresponding Mailbox has cancelled transmission of message (Data or Remote Frame) [Setting Condition] Completion of transmission cancellation for corresponding mailbox

Bit 0 — This bit is always '0' as this is a receive-only mailbox. Writing a '1' to this bit position has no effect and always read back as a '0'.

(5) Data Frame Receive Pending Register (RXPR1, RXPR0)

The RXPR1 and RXPR0 are 16-bit read/conditionally-write registers. The RXPR is a register that contains the received Data Frames pending flags associated with the configured Receive Mailboxes. When a CAN Data Frame is successfully stored in a receive mailbox the corresponding bit is set in the RXPR. The bit may be cleared by writing a '1' to the corresponding bit position. Writing a '0' has no effect. However, the bit may only be set if the mailbox is configured by its MBC (Mailbox Configuration) to receive Data Frames. When a RXPR bit is set, it also sets IRR1 (Data Frame Received Interrupt Flag) if its MBIMR (Mailbox Interrupt Mask Register) is not set, and the interrupt signal is generated if IMR1 is not set. Please note that these bits are only set by receiving Data Frames and not by receiving Remote frames.

- RXPR1

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RXPR1[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*

Note : * Only when writing a '1' to clear.

Bit 15 to 0 — Configurable receive mailbox locations corresponding to each mailbox position from 31 to 16 respectively.

Bit[15:0]: RXPR1	Description
0	[Clearing Condition] Writing '1' (Initial value)
1	Corresponding Mailbox received a CAN Data Frame [Setting Condition] Completion of Data Frame receive on corresponding mailbox

- **RXPR0**

Note: * Only when writing a '1' to clear.

Bit 15 to 0 — Configurable receive mailbox locations corresponding to each mailbox position from 15 to 0 respectively.

Bit[15:0]: RXPR0	Description
0	[Clearing Condition] Writing '1' (Initial value)
1	Corresponding Mailbox received a CAN Data Frame [Setting Condition] Completion of Data Frame receive on corresponding mailbox

(6) Remote Frame Receive Pending Register (RFPR1, RFPR0)

The RFPR1 and RFPR0 are 16-bit read/conditionally-write registers. The RFPR is a register that contains the received Remote Frame pending flags associated with the configured Receive Mailboxes. When a CAN Remote Frame is successfully stored in a receive mailbox the corresponding bit is set in the RFPR. The bit may be cleared by writing a '1' to the corresponding bit position. Writing a '0' has no effect. In effect there is a bit position for all mailboxes. However, the bit may only be set if the mailbox is configured by its MBC (Mailbox Configuration) to receive Remote Frames. When a RFPR bit is set, it also sets IRR2 (Remote Frame Receive Interrupt Flag) if its MBIMR (Mailbox Interrupt Mask Register) is not set, and the interrupt signal is generated if IMR2 is not set. Please note that these bits are only set by receiving Remote Frames and not by receiving Data frames.

- **RFPR1**

Note: * Only when writing a '1' to clear.

Bit 15 to 0 — Remote Request pending flags for mailboxes 31 to 16 respectively.

Bit[15:0]: RFPR1	Description
0	[Clearing Condition] Writing '1' (Initial value)
1	Corresponding Mailbox received Remote Frame [Setting Condition] Completion of remote frame receive in corresponding mailbox

- RFPR0

Note: * Only when writing a '1' to clear.

Bit 15 to 0 — Remote Request pending flags for mailboxes 15 to 0 respectively.

Bit[15:0]: RFPR0	Description
0	[Clearing Condition] Writing '1' (Initial value)
1	Corresponding Mailbox received Remote Frame [Setting Condition] Completion of remote frame receive in corresponding mailbox

(7) Mailbox Interrupt Mask Register (MBIMR)

The MBIMR1 and MBIMR0 are 16-bit read/write registers. The MBIMR only prevents the setting of IRR related to the Mailbox activities, that are IRR[1] – Data Frame Received Interrupt, IRR[2] – Remote Frame Receive Interrupt, IRR[8] – Mailbox Empty Interrupt, and IRR[9] – Message OverRun/OverWrite Interrupt. If a mailbox is configured as receive, a mask at the corresponding bit position prevents the generation of a receive interrupt (IRR[1] and IRR[2] and IRR[9]) but does not prevent the setting of the corresponding bit in the RXPR or RFPR or UMSR. Similarly when a mailbox has been configured for transmission, a mask prevents the generation of an Interrupt signal and setting of an Mailbox Empty Interrupt due to successful transmission or abortion of transmission (IRR[8]), however, it does not prevent this module from clearing the corresponding TXPR/TXCR bit + setting the TXACK bit for successful transmission, and it does not prevent this module from clearing the corresponding TXPR/TXCR bit + setting the ABACK bit for abortion of the transmission.

A mask is set by writing a '1' to the corresponding bit position for the mailbox activity to be masked. At reset all mailbox interrupts are masked.

- MBIMR1

Bit 15 to 0 — Enable or disable interrupt requests from individual Mailbox-31 to Mailbox-16 respectively.

Bit[15:0]: MBIMR1 Description

0	Interrupt Request from IRR1/IRR2/IRR8/IRR9 enabled
1	Interrupt Request from IRR1/IRR2/IRR8/IRR9 disabled (initial value)

- MBIMR0

Bit 15 to 0 — Enable or disable interrupt requests from individual Mailbox-15 to Mailbox-0 respectively.

Bit[15:0]: MBIMR0 Description

0	Interrupt Request from IRR1/IRR2/IRR8/IRR9 enabled
1	Interrupt Request from IRR1/IRR2/IRR8/IRR9 disabled (initial value)

(8) Unread Message Status Register (UMSR)

This register is a 32-bit read/conditionally write register and it records the mailboxes whose contents have not been accessed by the CPU prior to a new message being received. If the CPU has not cleared the corresponding bit in the RXPR or RFPR when a new message for that mailbox is received, the corresponding UMSR bit is set to '1'. This bit may be cleared by writing a '1' to the corresponding bit location in the UMSR. Writing a '0' has no effect.

If a mailbox is configured as transmit box, the corresponding UMSR will not be set.

- UMSR1

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	UMSR1[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*

Note: * Only when writing a '1' to clear.

Bit 15 to 0 — Indicate that an unread received message has been overwritten or overrun condition has occurred for Mailboxes 31 to 16.

Bit[15:0]: UMSR1	Description
0	[Clearing Condition] Writing '1' (initial value)
1	Unread received message is overwritten by a new message or overrun condition [Setting Condition] When a new message is received before RXPR or RFPR is cleared

- UMSR0

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	UMSR0[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*

Note: * Only when writing a '1' to clear.

Bit 15 to 0 — Indicate that an unread received message has been overwritten or overrun condition has occurred for Mailboxes 15 to 0.

Bit[15:0]: UMSR0	Description
0	[Clearing Condition] Writing '1' (initial value)
1	Unread received message is overwritten by a new message or overrun condition [Setting Condition] When a new message is received before RXPR or RFPR is cleared

21.3.5 Timer Registers

The Timer is 16 bits and supports several source clocks. A pre-scale counter can be used to reduce the speed of the clock. It also supports three Compare Match Registers (TCMR2, TCMR1, TCMR0). The address map is as follows.

Important: These registers can only be accessed in Word size (16-bit).

Description	Address	Name	Access Size (bits)
Timer Trigger Control Register 0	080	TTCR0	Word (16)
Cycle Maximum/Tx-Enable Window Register	084	CMAX_TEW	Word (16)
Reference Trigger Offset Register	086	RFTROFF	Word (16)
Timer Status Register	088	TSR	Word (16)
Cycle Counter Register	08A	CCR	Word (16)
Timer Counter Register	08C	TCNTR	Word (16)
Cycle Time Register	090	CYCTR	Word (16)
Reference Mark Register	094	RFMK	Word (16)
Timer Compare Match Register 0	098	TCMR0	Word (16)
Timer Compare Match Register 1	09C	TCMR1	Word (16)
Timer Compare Match Register 2	0A0	TCMR2	Word (16)
Tx-Trigger Time Selection Register	0A4	TTTSEL	Word (16)

Figure 21.12 Timer Registers

(1) Time Trigger Control Register0 (TTCR0)

The Time Trigger Control Register0 is a 16-bit read/write register and provides functions to control the operation of the Timer. When operating in Time Trigger Mode, please refer to section 21.4.3 (1), Time Triggered Transmission.

- TTCR0 (Address = H'080)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TCR15	TCR14	TCR13	TCR12	TCR11	TCR10	-	-	-	TCR6	TPSC5	TPSC4	TPSC3	TPSC2	TPSC1	TPSC0
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit 15 — Enable Timer: When this bit is set, the timer TCNTR is running. When this bit is cleared, TCNTR and CCR are cleared.

Bit15: TTCR0 15 Description

0	Timer and CCR are cleared and disabled (initial value)
1	Timer is running

Bit 14 — TimeStamp value: Specifies if the TimeStamp for transmission and reception in Mailboxes 15 to 1 must contain the Cycle Time (CYCTR) or the concatenation of CCR[5:0] + CYCTR[15:6]. This feature is very useful for time triggered transmission to monitor Rx_Trigger.

This register does not affect the TimeStamp for Mailboxes 30 and 31.

Bit14: TTCR0 14 Description

0	CYCTR[15:0] is used for the TimeStamp in Mailboxes 15 to 1 (initial value)
1	CCR[5:0] + CYCTR[15:6] is used for the TimeStamp in Mailboxes 15 to 1

Bit 13 — Cancellation by TCMR2: The messages in the transmission queue are cancelled by setting TXCR, when both this bit and bit12 are set and compare match occurs when this module is not in the Halt status, causing the setting of all TXCR bits with the corresponding TXPR bits set.

Bit13: TTCR0 13 Description

0	Cancellation by TCMR2 compare match is disabled (initial value)
1	Cancellation by TCMR2 compare match is enabled

Bit 12 — TCMR2 compare match enable: When this bit is set, IRR11 is set by TCMR2 compare match.

Bit12 TTCR0 12	Description
0	IRR11 isn't set by TCMR2 compare match (initial value)
1	IRR11 is set by TCMR2 compare match

Bit 11 — TCMR1 compare match enable: When this bit is set, IRR15 is set by TCMR1 compare match.

Bit11 TTCR0 11	Description
0	IRR15 isn't set by TCMR1 compare match (initial value)
1	IRR15 is set by TCMR1 compare match

Bit 10 — TCMR0 compare match enable: When this bit is set, IRR14 is set by TCMR0 compare match.

Bit10 TTCR0 10	Description
0	IRR14 isn't set by TCMR0 compare match (initial value)
1	IRR14 is set by TCMR0 compare match

Bits 9 to 7: Reserved. The written value should always be '0' and the returned value is '0'.

Bit 6 — Timer Clear-Set Control by TCMR0: Specifies if the Timer is to be cleared and set to H'0000 when the TCMR0 matches to the TCNTR. Please note that the TCMR0 is also capable to generate an interrupt signal to the CPU via IRR14.

Note: If this module is working in TTCAN mode (CMAX isn't 3'b111), TTCR0 bit6 has to be '0' to avoid clearing Local Time.

Bit6: TTCR0 6	Description
0	Timer is not cleared by the TCMR0 (initial value)
1	Timer is cleared by the TCMR0

Bit5 to 0 — Timer Prescaler (TPSC[5:0]): This control field allows the timer source clock (4*[this module system clock]) to be divided before it is used for the timer. This function is available only in event-trigger mode. In time trigger mode (CMAX is not 3'b111), one nominal Bit Timing (= one bit length of CAN bus) is automatically chosen as source clock of TCNTR.

The following relationship exists between source clock period and the timer period.

Bit[5:0]: TPSC[5:0]	Description
0 0 0 0 0	1 X Source Clock (initial value)
0 0 0 0 1	2 X Source Clock
0 0 0 1 0	3 X Source Clock
0 0 0 1 1	4 X Source Clock
0 0 1 0 0	5 X Source Clock
.....
.....
1 1 1 1 1	64 X Source Clock

(2) Cycle Maximum/Tx-Enable Window Register (CMAX_TEW)

This register is a 16-bit read/write register. CMAX specifies the maximum value for the cycle counter (CCR) for TT Transmissions to set the number of basic cycles in the matrix system. When the Cycle Counter reaches the maximum value (CCR = CMAX), after a full basic cycle, it is cleared to zero and an interrupt is generated on IRR.10.

TEW specifies the width of Tx-Enable window.

- CMAX_TEW (Address = H'084)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	CMAX[2:0]			-	-	-	-	TEW[3:0]			
Initial value:	0	0	0	0	0	1	1	1	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R	R	R	R	R/W	R/W	R/W	R/W

Bits 15 to 11: Reserved. The written value should always be '0' and the returned value is '0'.

Bit 10 to 8 — Cycle Count Maximum (CMAx): Indicates the maximum number of CCR. The number of basic cycles available in the matrix cycle for Timer Triggered transmission is (Cycle Count Maximum + 1).

Unless CMAx = 3'b111, this module is in time-trigger mode and time trigger function is available. If CMAx = 3'b111, this module is in event-trigger mode.

Bit[10:8]: CMAx[2:0]	Description
0 0 0	Cycle Count Maximum = 0
0 0 1	Cycle Count Maximum = 1
0 1 0	Cycle Count Maximum = 3
0 1 1	Cycle Count Maximum = 7
1 0 0	Cycle Count Maximum = 15
1 0 1	Cycle Count Maximum = 31
1 1 0	Cycle Count Maximum = 63
1 1 1	CCR is cleared and this module is in event-trigger mode. (initial value)

Important: Please set CMAx = 3'b111 when event-trigger mode is used.

Bits 7 to 4: Reserved. The written value should always be '0' and the returned value is '0'.

Bit 3 to 0 — Tx-Enable Window (TEW): Indicates the width of Tx-Enable Window. TEW = H'00 shows the width is one nominal Bit Timing. All values from 0 to 15 are allowed to be set.

Bit[3:0]: TEW[3:0]	Description
0 0 0 0	The width of Tx-Enable Window = 1 (initial value)
0 0 0 1	The width of Tx-Enable Window = 2
0 0 1 0	The width of Tx-Enable Window = 3
0 0 1 1	The width of Tx-Enable Window = 4
.....
.....
1 1 1 1	The width of Tx-Enable Window = 16

Note: The CAN core always needs a time between 1 to 2 bit timing to initiate transmission. The above values are not considering this accuracy.

(3) Reference Trigger Offset Register (RFTROFF)

This is a 8-bit read/write register that affects Tx-Trigger Time (TTT) of Mailbox-30. The TTT of Mailbox-30 is compared with CYCTR after RFTROFF extended with sign is added to the TTT. However, the value of TTT is not modified. The offset value doesn't affect others except Mailbox-30.

- RFTROFF (Address = H'086)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RFTROFF[7:0]								-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R

Bit 15 to 8 — Indicate the value of Reference Trigger Offset.

Bits 7 to 0: Reserved. The written value should always be '0' and the returned value is '0'.

Bit15	Bit14	Bit13	Bit12	Bit11	Bit10	Bit9	Bit8	Description
0	0	0	0	0	0	0	0	Ref_trigger_offset = +0 (initial value)
0	0	0	0	0	0	0	1	Ref_trigger_offset = +1
0	0	0	0	0	0	1	0	Ref_trigger_offset = +2
.	
0	1	1	1	1	1	1	1	Ref_trigger_offset = +127
.	
1	1	1	1	1	1	1	1	Ref_trigger_offset = -1
1	1	1	1	1	1	1	0	Ref_trigger_offset = -2
.	
1	0	0	0	0	0	0	1	Ref_trigger_offset = -127
1	0	0	0	0	0	0	0	Prohibited

(4) Timer Status Register (TSR)

This register is a 16-bit read-only register, and allows the CPU to monitor the Timer Compare Match status and the Timer Overrun Status.

- TSR (Address = H'088)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	TSR4	TSR3	TSR2	TSR1	TSR0
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bits 15 to 5: Reserved. The written value should always be '0' and the returned value is '0'.

Bit 4 to 0 — Timer Status (TSR[4:0]): This read-only field allows the CPU to monitor the status of the Cycle Counter, the Timer and the Compare Match registers. Writing to this field has no effect.

Bit 4 — Start of New System Matrix (TSR4): Indicates that a new system matrix is starting. When CCR = 0, this bit is set at the successful completion of reception/transmission of time reference message.

Bit4: TSR4	Description
0	A new system matrix is not starting (initial value) [Clearing condition] Writing '1' to IRR10 (Cycle Counter Overflow Interrupt)
1	Cycle counter reached zero [Setting condition] When the Cycle Counter value changes from the maximum value (CMAX) to H'0. Reception/transmission of time reference message is successfully completed when CMAX!= 3'b111 and CCR = 0

Bit 3 — Timer Compare Match Flag 2 (TSR3): Indicates that a Compare-Match condition occurred to the Timer Compare Match Register 2 (TCMR2). When the value set in the TCMR2 matches to Cycle Time Register (TCMR2 = CYCTR), this bit is set if TTCR0 bit12 = 1. Please note that this bit is read-only and is cleared when IRR11 (Timer Compare Match Interrupt 2) is cleared.

Bit3: TSR3	Description
0	Timer Compare Match has not occurred to the TCMR2 (Initial value) [Clearing condition] Writing '1' to IRR11 (Timer Compare Match Interrupt 1)
1	Timer Compare Match has occurred to the TCMR2 [Setting condition] TCMR2 matches to Cycle Time (TCMR2 = CYCTR), if TTCR0 bit12 = 1.

Bit 2 — Timer Compare Match Flag 1 (TSR2): Indicates that a Compare-Match condition occurred to the Timer Compare Match Register 1 (TCMR1). When the value set in the TCMR1 matches to Cycle Time Register (TCMR1 = CYCTR), this bit is set if TTCR0 bit11 = 1. Please note that this bit is read-only and is cleared when IRR15 (Timer Compare Match Interrupt 1) is cleared.

Bit2: TSR2	Description
0	Timer Compare Match has not occurred to the TCMR1 (Initial value) [Clearing condition] Writing '1' to IRR15 (Timer Compare Match Interrupt 1)
1	Timer Compare Match has occurred to the TCMR1 [Setting condition] TCMR1 matches to Cycle Time (TCMR1 = CYCTR), if TTCR0 bit11 = 1.

Bit 1 — Timer Compare Match Flag 0 (TSR1): Indicates that a Compare-Match condition occurred to the Compare Match Register 0 (TCMR0). When the value set in the TCMR0 matches to the Timer value (TCMR0 = TCNTR), this bit is set if TTCR0 bit10 = 1. Please note that this bit is read-only and is cleared when IRR14 (Timer Compare Match Interrupt 0) is cleared.

Bit1: TSR1	Description
0	Compare Match has not occurred to the TCMR0 (Initial value) [Clearing condition] Writing '1' to IRR14 (Timer Compare Match Interrupt 0)
1	Compare Match has occurred to the TCMR0 [Setting condition] TCMR0 matches to the Timer value (TCMR0 = TCNTR)

Bit 0 — Timer Overrun/Next_is_Gap Reception/Message Error (TSR0): This flag is assigned to three different functions. It indicates that the Timer has overrun when working in event-trigger mode, time reference message with Next_is_Gap set has been received in time-trigger mode, and error detected on the CAN bus has occurred in test mode, respectively. Test mode has higher priority with respect to the other settings.

Bit0: TSR0	Description
0	Timer (TCNTR) has not overrun in event-trigger mode (Initial value) Time reference message with Next_is_Gap has not been received in time-trigger mode message error has not occurred in test mode. [Clearing condition] Writing '1' to IRR13
1	[Setting condition] Timer (TCNTR) has overrun and changed from H'FFFF to H'0000 in event-trigger mode.time reference message with Next_is_Gap has been received in time-trigger mode message error has occurred in test mode

(5) Cycle Counter Register (CCR)

This register is a 6-bit read/write register. Its purpose is to store the number of the basic cycle for Time -Triggered Transmissions. Its value is updated in different fashions depending if this module is programmed to work as a potential time master or as a time slave. If this module is working as (potential) time master, CCR is:

- Incremented by one every time the cycle time (CYCTR) matches to Tx-Trigger Time of Mailbox-30 or
- Overwritten with the value contained in MSG_DATA_0[5:0] of Mailbox 31 when a valid reference message is received.

If this module is working as a time slave, CCR is only overwritten with the value of MSG_DATA_0[5:0] of Mailbox 31 when a valid reference message is received.

If CMAX = 3'111, CCR is always H'0000.

- CCR (Address = H'08A)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	CCR[5:0]					
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Bits 15 to 6: Reserved. The written value should always be '0' and the returned value is '0'.

Bit 5 to 0 — Cycle Counter Register (CCR): Indicates the number of the current Base Cycle of the matrix cycle for Timer Triggered transmission.

(6) Timer Counter Register (TCNTR)

This is a 16-bit read/write register that allows the CPU to monitor and modify the value of the Free Running Timer Counter. When the Timer meets TCMR0 (Timer Compare Match Register 0) + TTCR0 [6] is set to '1', the TCNTR is cleared to H'0000 and starts running again. In Time-Trigger mode, this timer can be used as Local Time and TTCR0[6] has to be cleared to work as a free running timer.

- Notes:
1. It is possible to write into this register only when it is enabled by the bit 15 in TTCR0. If TTCR0 bit15 = 0, TCNTR is always H'0000.
 2. There could be a delay of a few clock cycles between the enabling of the timer and the moment where TCNTR starts incrementing. This is caused by the internal logic used for the pre-scaler.

- TCNTR (Address = H'08C)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TCNTR[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*

Note: * The register can be written only when enabled in TTCR0[15]. Write operation is not allowed in Time Trigger mode (i.e. CMAX is not 3'b111).

Bit 15 to 0 — Indicate the value of the Free Running Timer.

(7) Cycle Time register (CYCTR)

This register is a 16-bit read-only register. This register shows Cycle Time = Local Time (TCNTR) - Reference_Mark (RFMK). In ET mode this register is the exact copy of TCNTR as RFMK is always fixed to zero.

- CYCTR (Address = H'090)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CYCTR[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

(8) Reference Mark Register (RFMK)

This register is a 16-bit read-only register. The purpose of this register is to capture Local Time (TCNTR) at SOF of the reference message when the message is received or transmitted successfully. In ET mode this register is not used and it is always cleared to zero.

- RFMK (Address = H'094)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RFMK[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit 15 to 0 — Reference Mark Register (RFMK): Indicates the value of TCNTR at SOF of time reference message.

(9) Timer Compare Match Registers (TCMR0, TCMR1, TCMR2)

These three registers are 16-bit read/write registers and are capable of generating interrupt signals, clearing-setting the Timer value (only supported by TCMR0) or clear the transmission messages in the queue (only supported by TCMR2). TCMR0 is compared with TCNTR, however, TCMR1 and TCMR2 are compared with CYCTR.

The value used for the compare can be configured independently for each register. In order to set flags, TTCR0 bit 12-10 needs to be set.

In Time-Trigger mode, TTCR0 bit6 has to be cleared by software to prevent TCNTR from being cleared.

TCMR0 is for Init_Watch_Trigger, and TCMR2 is for Watch_Trigger.

Interrupt:

The interrupts are flagged by the Bit11, Bit15 and 14 in the IRR accordingly when a Compare Match occurs, and setting these bits can be enabled by Bit12, Bit11, Bit10 in TTCR0. The generation of interrupt signals itself can be prevented by the Bit11, Bit15 and Bit14 in the IMR. When a Compare Match occurs and the IRR11 (or IRR15 or IRR14) is set, the Bit3 or Bit2 or Bit1 in the TSR (Timer Status Register) is also set. Clearing the IRR bit also clears the corresponding bit of TSR.

Timer Clear-Set:

The Timer value can only be cleared when a Compare Match occurs if it is enabled by the Bit6 in the TTCR0. TCMR1 and TCMR2 do not have this function.

Cancellation of the messages in the transmission queue:

The messages in the transmission queue can only be cleared by the TCMR2 through setting TXCR when a Compare Match occurs while this module is not in the halt status. TCMR1 and TCMR0 do not have this function.

- TCMR0 (Address = H'098)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TCMR0[15:0]															
Initial value:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit 15 to 0 — Timer Compare Match Register (TCMR0): Indicates the value of TCNTR when compare match occurs.

- TCMR1 (Address = H'09C)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TCMR1[15:0]															
Initial value:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit 15 to 0 — Timer Compare Match Register (TCMR1): Indicates the value of CYCTR when compare match occurs.

- TCMR2 (Address = H'0A0)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TCMR2[15:0]															
Initial value:	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit 15 to 0 — Timer Compare Match Register (TCMR2): Indicates the value of CYCTR when compare match occurs.

(10) Tx-Trigger Time Selection Register (TTTSEL)

This register is a 16-bit read/write register and specifies the Tx-Trigger Time waiting for compare match with Cycle Time. Only one bit is allowed to be set. Please don't set more bits than one, or clear all bits.

This register may only be modified during configuration mode. The modification algorithm is shown in figure 21.13.

Please note that this register is only indented for test and diagnosis. When not in test mode, this register must not be written to and the returned value is not guaranteed.

- TTTSEL (Address = H'0A4)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0	
	-	TTTSEL[14:8]								-	-	-	-	-	-	-	-
Initial value:	0	1	0	0	0	0	0	0	0	0	0	0	0	0	0	0	
R/W:	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R	R	R	R	R	

Note: Only one bit is allowed to be set.

Bit 15: Reserved. The written value should always be '0' and the returned value is '0'.

Bit 14 to 8 — Specifies the Tx-Trigger Time waiting for compare match with CYCTR. The bit 14 to 8 corresponds to Mailbox-30 to 24, respectively.

Bits 7 to 0: Reserved. The written value should always be '0' and the returned value is '0'.

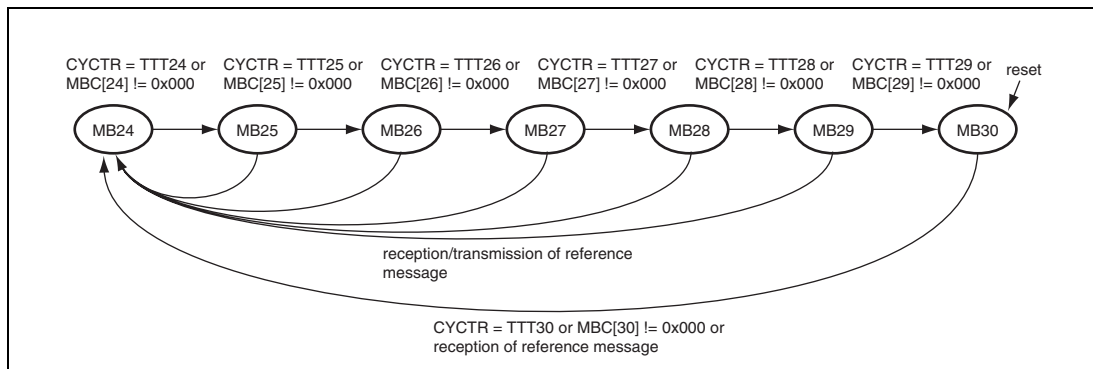

Figure 21.13 TTTSEL modification algorithm

21.4 Application Note

21.4.1 Test Mode Settings

This module has various test modes. The register TST[2:0] (MCR[10:8]) is used to select this module test mode. The default (initialised) settings allow this module to operate in Normal mode. The following table is examples for test modes.

Test Mode can be selected only while in configuration mode. The user must then exit the configuration mode (ensuring BCR0/BCR1 is set) in order to run the selected test mode.

Bit10: TST2	Bit9: TST1	Bit8: TST0	Description
0	0	0	Normal Mode (initial value)
0	0	1	Listen-Only Mode (Receive-Only Mode)
0	1	0	Self Test Mode 1 (External)
0	1	1	Self Test Mode 2 (Internal)
1	0	0	Write Error Counter
1	0	1	Error Passive Mode
1	1	0	Setting prohibited
1	1	1	Setting prohibited

Normal Mode: This module operates in the normal mode.

Listen-Only Mode: ISO-11898 requires this mode for baud rate detection. The Error Counters are cleared and disabled so that the TEC/REC does not increase the values, and the CT_{xn} (n = 0, 1) Output is disabled so that this module does not generate error frames or acknowledgment bits. IRR13 is set when a message error occurs.

Self Test Mode 1: This module generates its own Acknowledge bit, and can store its own messages into a reception mailbox (if required). The CR_{xn}/CT_{xn} (n = 0, 1) pins must be connected to the CAN bus.

Self Test Mode 2: This module generates its own Acknowledge bit, and can store its own messages into a reception mailbox (if required). The CRxn/CTxn (n = 0, 1) pins do not need to be connected to the CAN bus or any external devices, as the internal CTxn (n = 0, 1) is looped back to the internal CRxn (n = 0, 1). CTxn (n = 0, 1) pin outputs only recessive bits and CRxn (n = 0, 1) pin is disabled.

Write Error Counter: TEC/REC can be written in this mode. This module can be forced to become an Error Passive mode by writing a value greater than 127 into the Error Counters. The value written into TEC is used to write into REC, so only the same value can be set to these registers. Similarly, this module can be forced to become an Error Warning by writing a value greater than 95 into them.

This module needs to be in Halt Mode when writing into TEC/REC (MCR1 must be "1" when writing to the Error Counter). Furthermore this test mode needs to be exited prior to leaving Halt mode.

Error Passive Mode: This module can be forced to enter Error Passive mode.
Note: The REC will not be modified by implementing this Mode. However, once running in Error Passive Mode, the REC will increase normally should errors be received. In this Mode, this module will enter BusOff if TEC reaches 256 (Dec). However when this mode is used this module will not be able to become Error Active. Consequently, at the end of the Bus Off recovery sequence, this module will move to Error Passive and not to Error Active.

When message error occurs, IRR13 is set in all test modes.

21.4.2 Configuration of This Module

This module is considered in configuration mode or after a H/W (Power On Reset)/S/W (MCR[0]) reset or when in Halt mode. In both conditions this module cannot join the CAN Bus activity and configuration changes have no impact on the traffic on the CAN Bus.

- After a Reset request

The following sequence must be implemented to configure this module after (S/W or H/W) reset. After reset, all the registers are initialised, therefore, this module needs to be configured before joining the CAN bus activity. Please read the notes carefully.

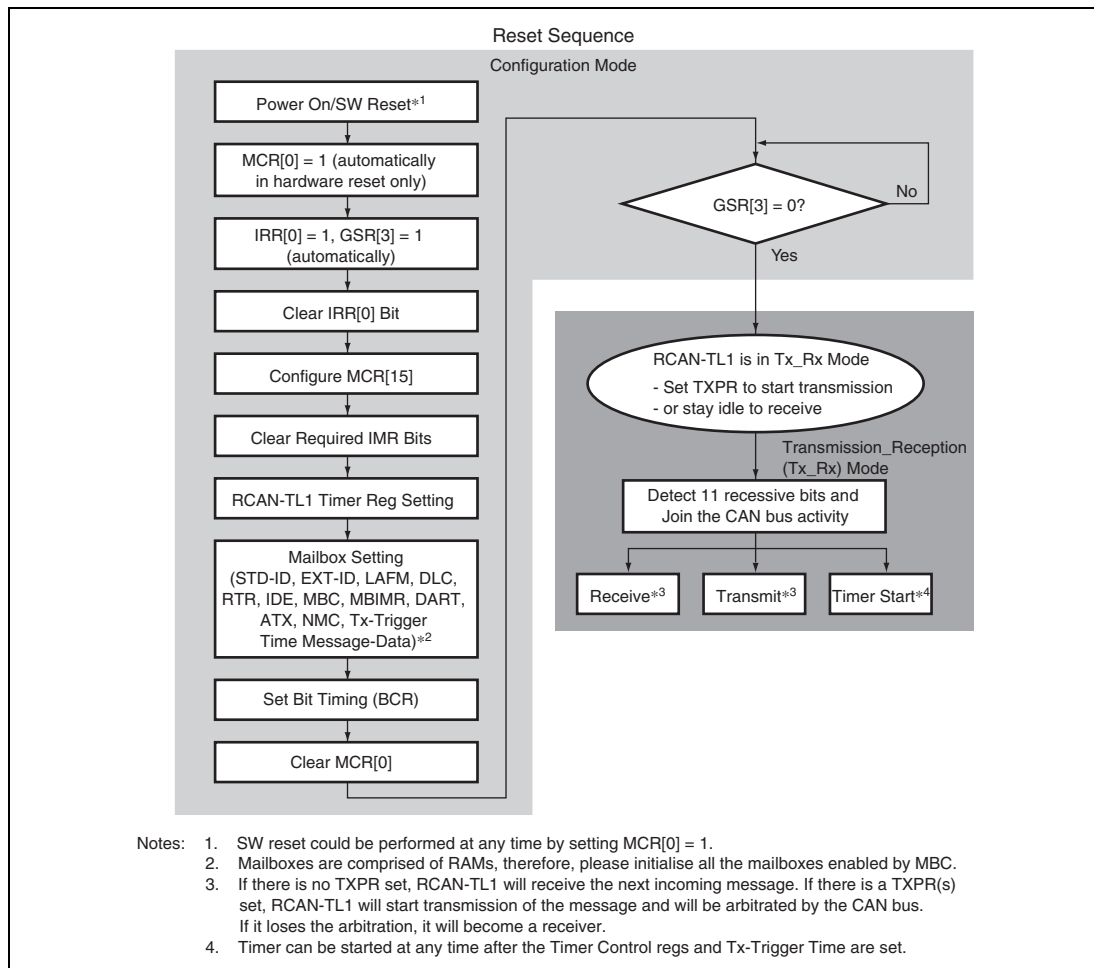

Figure 21.14 Reset Sequence

- Halt mode

When this module is in Halt mode, it cannot take part to the CAN bus activity. Consequently the user can modify all the requested registers without influencing existing traffic on the CAN Bus. It is important for this that the user waits for this module to be in halt mode before to modify the requested registers - note that the transition to Halt Mode is not always immediate (transition will occur when the CAN Bus is idle or in intermission). After this module transit to Halt Mode, GSR4 is set.

Once the configuration is completed the Halt request needs to be released. This module will join CAN Bus activity after the detection of 11 recessive bits on the CAN Bus.

- Sleep mode

When this module is in sleep mode the clock for the main blocks of the IP is stopped in order to reduce power consumption. Only the following user registers are clocked and can be accessed: MCR, GSR, IRR and IMR. Interrupt related to transmission (TXACK and ABACK) and reception (RXPR and RFPR) cannot be cleared when in sleep mode (as TXACK, ABACK, RXPR and RFPR are not accessible) and must to be cleared beforehand.

The following diagram shows the flow to follow to move this module into sleep mode.

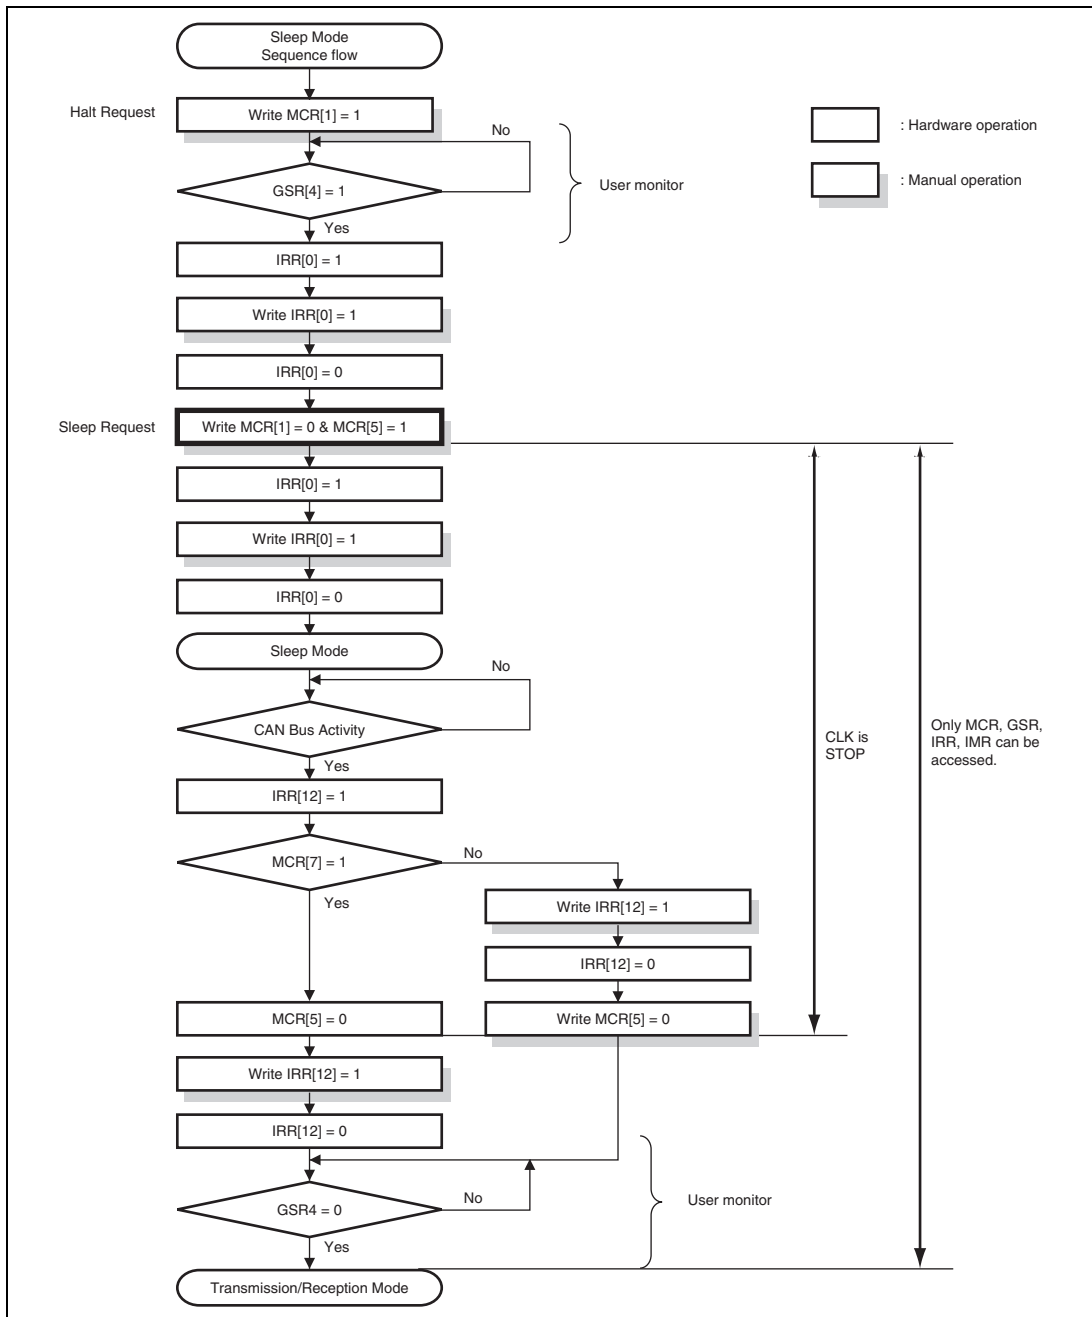

Figure 21.15 shows allowed state transitions.

- Please don't set MCR5 (Sleep Mode) without entering Halt Mode.
- After MCR1 is set, please don't clear it before GSR4 is set and this module enters Halt Mode.

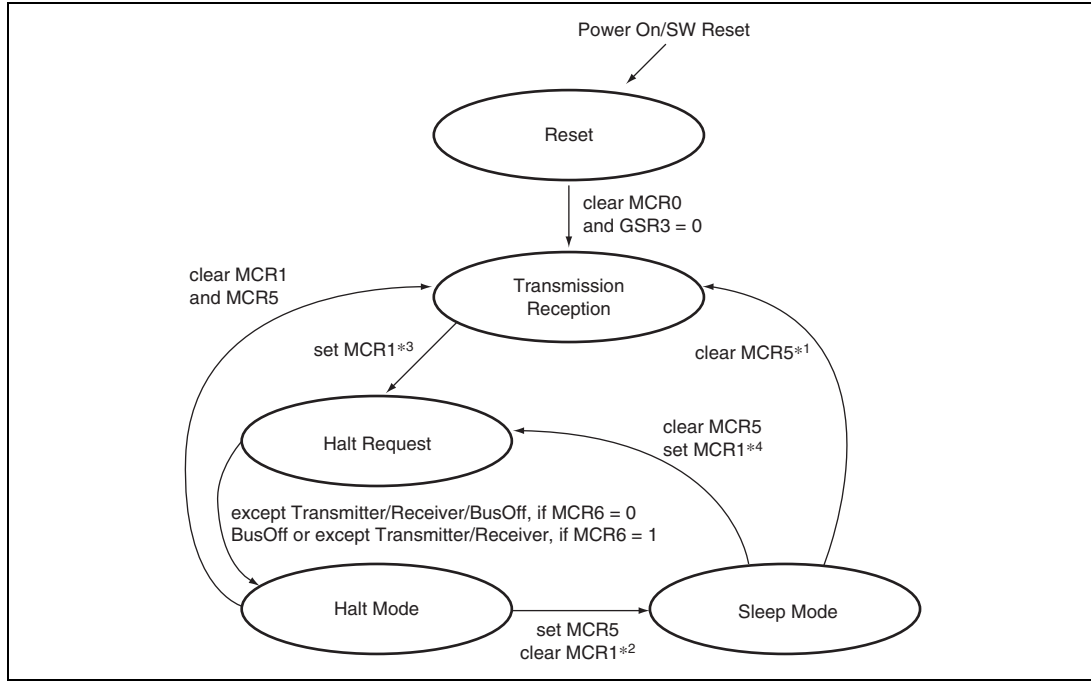

Figure 21.15 Halt Mode/Sleep Mode

- Notes:
1. MCR5 can be cleared by automatically by detecting a dominant bit on the CAN Bus if MCR7 is set or by writing '0'.
 2. MCR1 is cleared in SW. Clearing MCR1 and setting MCR5 have to be carried out by the same instruction.
 3. MCR1 must not be cleared in SW, before GSR4 is set. MCR1 can be set automatically in HW when this module moves to Bus Off and MCR14 and MCR6 are both set.
 4. When MCR5 is cleared and MCR1 is set at the same time, this module moves to Halt Request. Right after that, it moves to Halt Mode with no reception/transmission.

The following table shows conditions to access registers.

Registers

Status Mode	MBIMR				Flag_ register	Mailbox (ctrl0, LAFM)	Mailbox (data)	Mailbox (ctrl1)	Mailbox Trigger Time TT control		
	MCR GSR	IRR IMR	BCR	timer TT_register							
Reset	yes	yes	yes	yes	yes	yes	yes	yes	yes		
Transmission Reception Halt Request	yes	yes	no* ¹	yes	yes	no* ¹	yes* ²	yes* ²	no* ¹	yes* ²	yes* ²
Halt	yes	yes	no* ¹	yes	yes	yes	yes	yes	yes	yes	
Sleep	yes	yes	no	no	no	no	no	no	no	no	

Notes: 1. No hardware protection.
2. When TXPR is not set.

21.4.3 Message Transmission Sequence

- Message Transmission Request

The following sequence is an example to transmit a CAN frame onto the bus. As described in the previous register section, please note that IRR8 is set when one of the TXACK or ABACK bits is set, meaning one of the Mailboxes has completed its transmission or transmission abortion and is now ready to be updated for the next transmission, whereas, the GSR2 means that there is currently no transmission request made (No TXPR flags set).

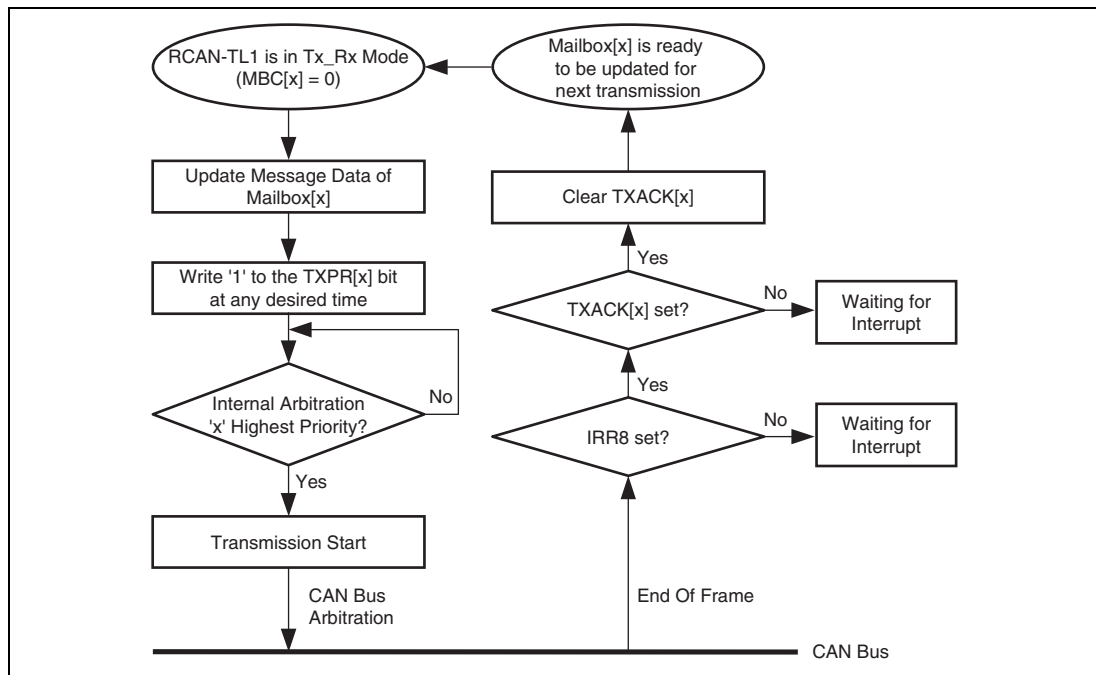

Figure 21.16 Transmission request

- Internal Arbitration for transmission

The following diagram explains how this module manages to schedule transmission-requested messages in the correct order based on the CAN identifier. 'Internal arbitration' picks up the highest priority message amongst transmit-requested messages.

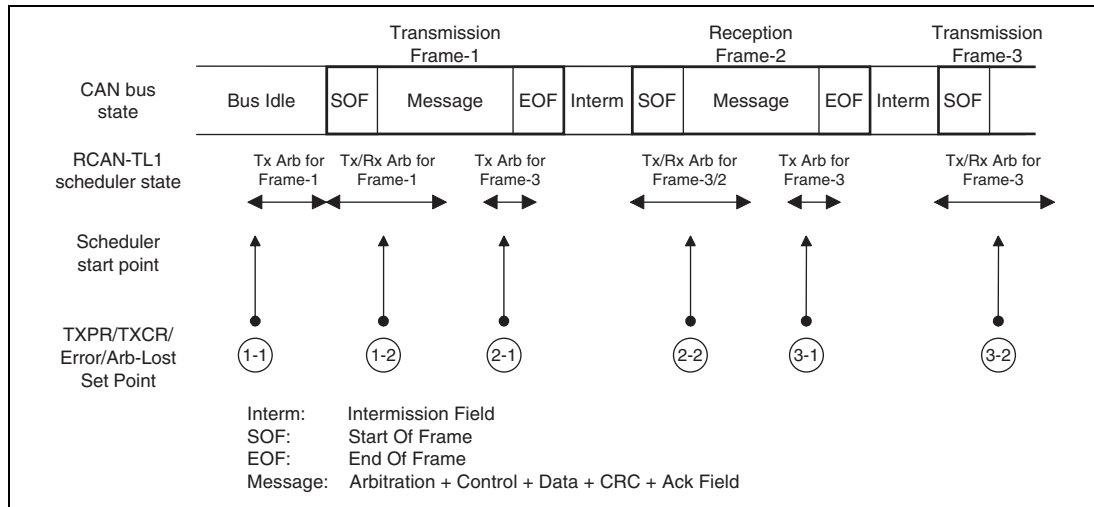

Figure 21.17 Internal Arbitration for transmission

This module has two state machines. One is for transmission, and the other is for reception.

- 1-1: When a TXPR bit(s) is set while the CAN bus is idle, the internal arbitration starts running immediately and the transmission is started.
- 1-2: Operations for both transmission and reception starts at SOF. Since there is no reception frame, this module becomes transmitter.
- 2-1: At crc delimiter, internal arbitration to search next message transmitted starts.
- 2-2: Operations for both transmission and reception starts at SOF. Because of a reception frame with higher priority, this module becomes receiver. Therefore, Reception is carried out instead of transmitting Frame-3.
- 3-1: At crc delimiter, internal arbitration to search next message transmitted starts.
- 3-2: Operations for both transmission and reception starts at SOF. Since a transmission frame has higher priority than reception one, this module becomes transmitter.

Internal arbitration for the next transmission is also performed at the beginning of each error delimiter in case of an error is detected on the CAN Bus. It is also performed at the beginning of error delimiters following overload frame.

As the arbitration for transmission is performed at CRC delimiter, in case a remote frame request is received into a Mailbox with ATX = 1 the answer can join the arbitration for transmission only at the following Bus Idle, CRC delimiter or Error Delimiter.

Depending on the status of the CAN bus, following the assertion of the TXCR, the corresponding Message abortion can be handled with a delay of maximum 1 CAN Frame.

(1) Time Triggered Transmission

This module offers a H/W support to perform communication in Time Trigger mode in line with the emerging ISO-11898-4 Level 1 Specification.

This section reports the basic procedures to use this mode.

- Setting Time Trigger Mode

In order to set up the time trigger mode the following settings need to be used.

- CMAX in CMAX_TEW must be programmed to a value different from 3'b111.
- Bit 15 in TTCR0 has to be set, to start TCNTR.
- Bit 6 in TTCR0 has to be cleared to prevent TCNTR from being cleared after a match.
- DART in Mailboxes used for time-triggered transmission cannot be used, since for Time Triggered Mailboxes, TXPR is not cleared to support periodic transmission.

- Roles of Registers

The user registers of this module can be used to handle the main functions requested by the TTCAN standard.

TCNTR	Local Time
RFMK	Ref_Mark
CYCTR	Cycle Time = TCNTR - RFMK
RFTROFF	Ref_Trigger_Offset for Mailbox-30
Mailbox-31	Mailbox dedicated to the reception of time reference message
Mailbox-30	Mailbox dedicated to the transmission of time reference message when working as a potential time master
Mailbox-29 to 24	Mailboxes supporting time-triggered transmission
Mailbox-23 to 16	Mailboxes supporting reception without timestamp (may also be implemented as Mailboxes supporting Event Triggered transmission)
Mailbox-15 to 0	Mailboxes supporting reception with timestamp (may also be implemented as Mailboxes supporting Event Triggered transmission)
Tx-Trigger Time	Time_Mark to specify when a message should be transmitted

CMAX	Specifies the maximum number of basic cycles when working as potential time master
TEW	Specify the width of Tx_Enable
TCMR0	Init_Watch_Trigger (compare match with Local Time)
TCMR1	Compare match with Cycle Time to monitor users-specified events
TCMR2	Watch_Trigger (compare match with Cycle Time). This can be programmed to abort all pending transmissions
TTW	Specifies the attribute of a time window used for transmission
TTTSEL	Specifies the next Mailbox waiting for transmission

- Time Master/Time Slave

This module can be programmed to work as a potential time master of the network or as a time slave. The following table shows the settings and the operation automatically performed by this module in each mode.

mode	requested setting	function
Time Slave	TXPR[30] = 0 & MBC[30] != 3'b000 & CMAx != 3'b111 & MBC[31] = 3'b011	TCNTR is sampled at each SOF detected on the CAN Bus and stored into an internal register. When a valid Time Reference Message is received into Mailbox-31 the value of TCNTR (stored at the SOF) is copied into Ref_Mark. CCR embedded in the received Reference Message is copied to CCR. If Next_is_Gap = 1, IRR13 is set.
(Potential) Time Master	TXPR[30] = 1 & MBC[30] = 3'b000 & DLC[30] > 0 & CMAx != 3'b111 & MBC[31] = 3'b011	Two cases are covered: (1) When a valid Time Reference message is received into Mailbox-31 the value of TCNTR stored into an internal register at the SOF is copied into Ref_Mark. CCR embedded in the received Reference Message is copied to CCR. If Next_is_Gap = 1, IRR13 is set. (2) When a Time Reference message is transmitted from Mailbox-30 the value of TCNTR stored into an internal register at the SOF is copied into Ref_Mark. CCR is incremented when TTT of Mailbox-30 matches with CYCTR . CCR is embedded into the first data byte of the time reference message { Data0[7:6], CCR[5:0] } .

- Setting Tx-Trigger Time

The Tx-Trigger Time(TTT) must be set in ascending order shown below, and the difference between them has to satisfy the following expressions. TEW in the following expressions is the register value.

$$\text{TTT (Mailbox-24)} < \text{TTT (Mailbox-25)} < \text{TTT (Mailbox-26)} < \text{TTT (Mailbox-27)} < \text{TTT (Mailbox-28)} < \text{TTT (Mailbox-29)} < \text{TTT (Mailbox-30)}$$

and

$$\text{TTT (Mailbox-i)} - \text{TTT (Mailbox- i-1)} > \text{TEW} + \text{the maximum frame length} + 9$$

TTT (Mailbox-24) to TTT (Mailbox-29) correspond to Time_Marks, and TTT (Mailbox-30) corresponds to Time_Ref showing the length of a basic cycle, respectively when working as potential time master.

The above limitation is not applied to mailboxes which are not set as time-triggered transmission.

Important: Because of limitation on setting Tx-Trigger Time, only one Mailbox can be assigned to one time window.

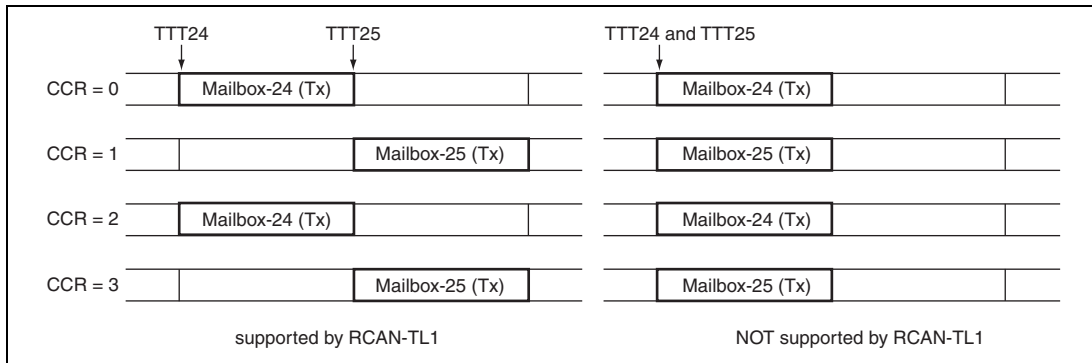

Figure 21.18 Limitation on Tx-Trigger Time

The value of TCMR2 as Watch_Trigger has to be larger than TTT(Mailbox-30), which shows the length of a basic cycle.

Figures 21.19 and 21.20 show examples of configurations for (Potential) Time Master and Time Slave. "L" in diagrams shows the length in time of the time reference messages.

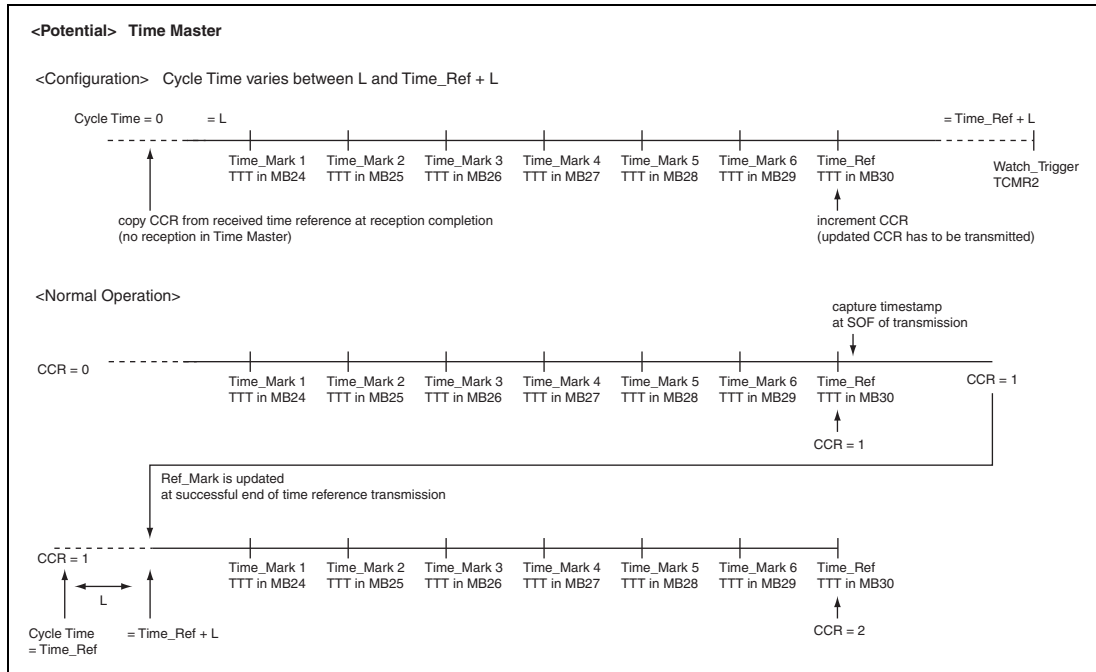

Figure 21.19 (Potential) Time Master

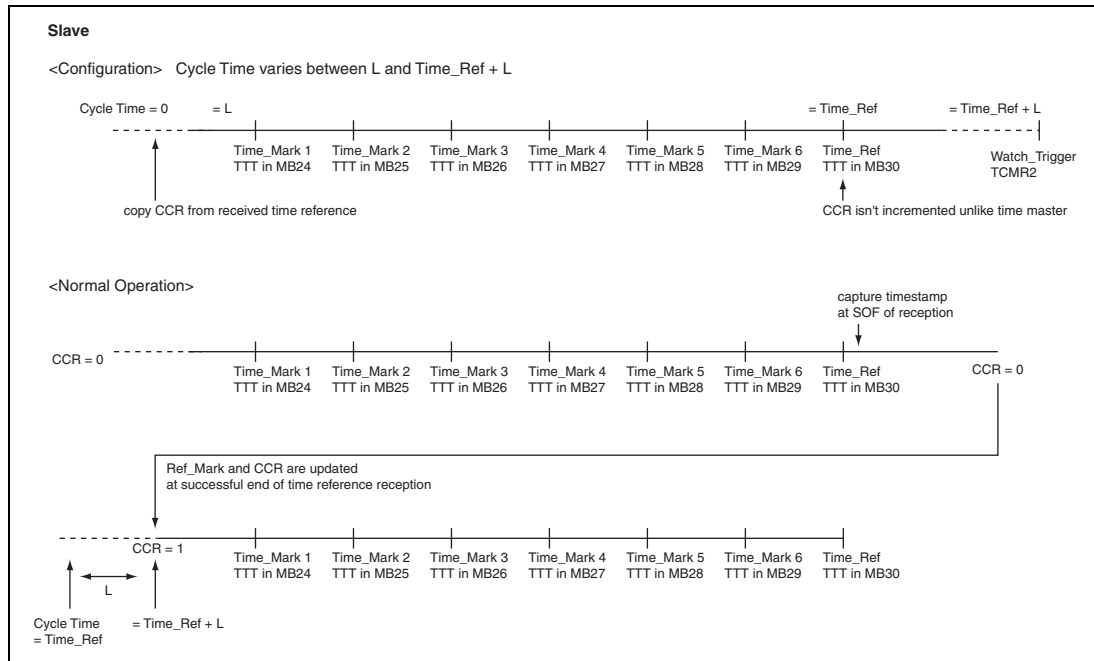

Figure 21.20 Time Slave

- Function to be implemented by software

Some of the TTCAN functions need to be implemented in software. The main details are reported hereafter. Please refer to ISO-11898-4 for more details.

— Change from Init_Watch_Trigger to Watch_Trigger

This module offers the two registers TCMR0 and TCMR2 as H/W support for Init_Watch_Trigger and Watch_Trigger respectively. The SW is requested to enable TCMR0 and disable TCMR2 up to the first reference message is detected on the CAN Bus and then disable TCMR0 and enable TCMR2.- Schedule Synchronization state machine.

Only reception of Next_is_Gap interrupt is supported. The application needs to take care of stopping all transmission at the end of the current basic cycle by setting the related TXCR flags.Master-Slave Mode control.

Only automatic cycle time synchronization and CCR increment is supported.

— Message status count

Software has to count scheduling errors for periodic messages in exclusive windows.

- Message Transmission Request for Time Triggered communication

When the Time Triggered mode is used communications must fulfil the ISO11898-4 requirements.

The following procedure should be used.

- Send this module to reset or halt mode
- Set TCMR0 to the Init_Watch_Trigger (0xFFFF)
- Enable TCMR0 compare match setting bit 10 of TTCR0
- Set TCMR2 to the specified Watch_Trigger value
- Keep TCMR2 compare match disabled by keeping cleared the bit 12 of TTCR0
- Set CMAX to the requested value (different from 111 bin)
- Set TEW to the requested value
- Configure the necessary Mailboxes for Time Trigger transmission and reception
- Set LAFM for the 3 LSBs of Mailbox 31
- Configure MCR, BCR1 and BCR0 to the requested values
- If working as a potential time master:
 - Set RFTROFF to the requested Init_Ref_Offset value
 - Set TXPR for Mailbox 30
 - Write H'4000 into TTTSEL
 - Enable the TCNTR timer through the bit 15 of TTCR0
 - Move to Transmission_Reception mode
 - Wait for the reception or transmission of a valid reference message or for TCMR0 match
 - If the local time reaches the value of TCMR0 the Init_Watch_Trigger is reached and the application needs to set TXCR for Mailbox 30 and start again
 - If the reference message is transmitted (TXACK[30] is set) set RFTROFF to zero
 - If a valid reference message is received (RXPR[31] is set) then:
 - If 3 LSBs of ID of Mailbox 31 have high priority than the 3 LSBs of Mailbox 30 (if working as potential time master) keep RFTROFF to Init_Ref_Offset
 - If 3 LSBs of ID of Mailbox 31 have lower priority than the 3 LSBs of Mailbox 30 (if working as potential time master) decrement by 1 the value in RFTROFF
 - Disable TCMR0 compare match by clearing bit 10 of TTCR0
 - Enable TCMR2 compare match by setting bit 12 of TTCR0
 - Only after two reference messages have been detected on the CAN Bus (transmitted or received) can the application set TXPR for the other Time Triggered Mailboxes.

If, at any time, a reference message cannot be detected on the CAN Bus, and the cycle time CYCTR reaches TCMR2, this module automatically aborts all pending transmissions (including the Reference Message).

The following is the sequence to request further transmission in Time Triggered mode.

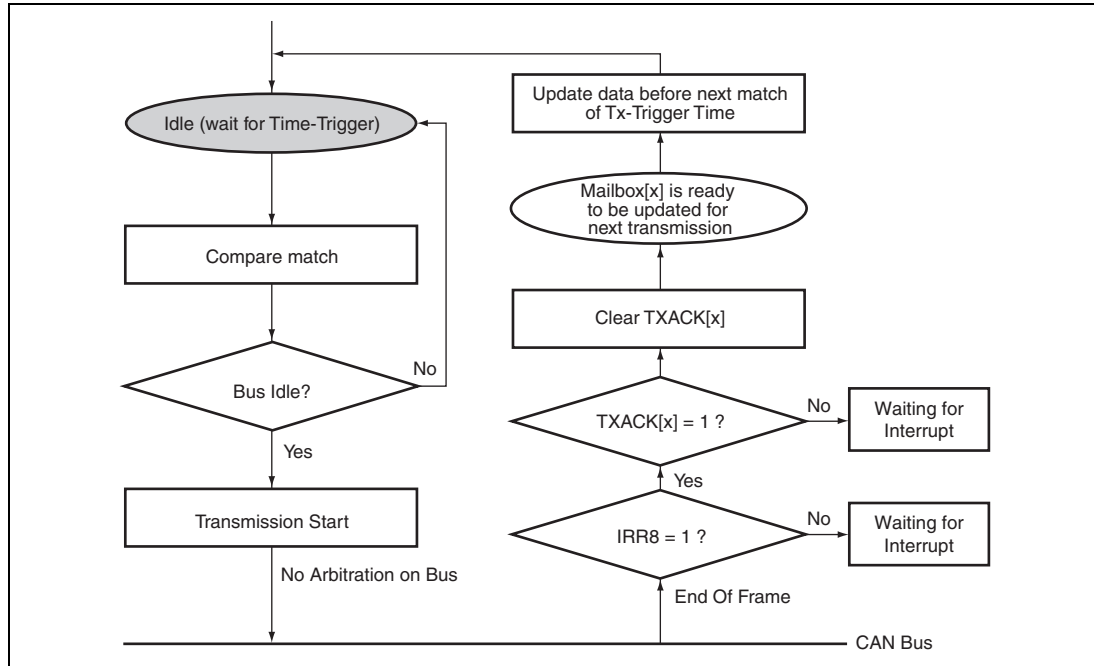

Figure 21.21 Message transmission request

S/W has to ensure that a message is updated before a Tx trigger for transmission occurs.

When the CYCTR reaches to TTT (Tx-Trigger Time) of a Mailbox and CCR matches with the programmed cycle for transmission, this module immediately transfers the message into the Tx buffer. At this point, this module will attempt a transmission within the specified Time Enable Window. If this module misses this time slot, it will suspend the transmission request up to the next Tx Trigger, keeping the corresponding TXPR bit set to '1' if the transmission is periodic (Mailbox-24 to 30). There are three factors that may cause this module to miss the time slot –

1. The CAN bus currently used
2. An error on the CAN bus during the time triggered message transmission
3. Arbitration loss during the time triggered message transmission

In case of Merged Arbitrating Window the slot for transmission goes from the Tx_Trig of the Mailbox opening the Window (TTW = 10 bin) to the end to the TEW of the Mailbox closing the Window (TTW = 11 bin). The TXPR can be modified at any time. This module ensures the transmission of Time Triggered messages is always scheduled correctly. However, in order to guarantee the correct schedule, there are some important rules that are :

- TTT (Tx Trigger Time) can be modified during configuration mode.
 - TTT cannot be set outside the range of Time_Ref, which specifies the length of basic cycle. This could cause a scheduling problem.
 - TXPR is not automatically cleared for periodic transmission. If a periodic transmission needs to be cancelled, the corresponding TXCR bit needs to be set by the application.
- Example of Time Triggered System

The following diagram shows a simple example of how time trigger system works using this module in time slave mode.

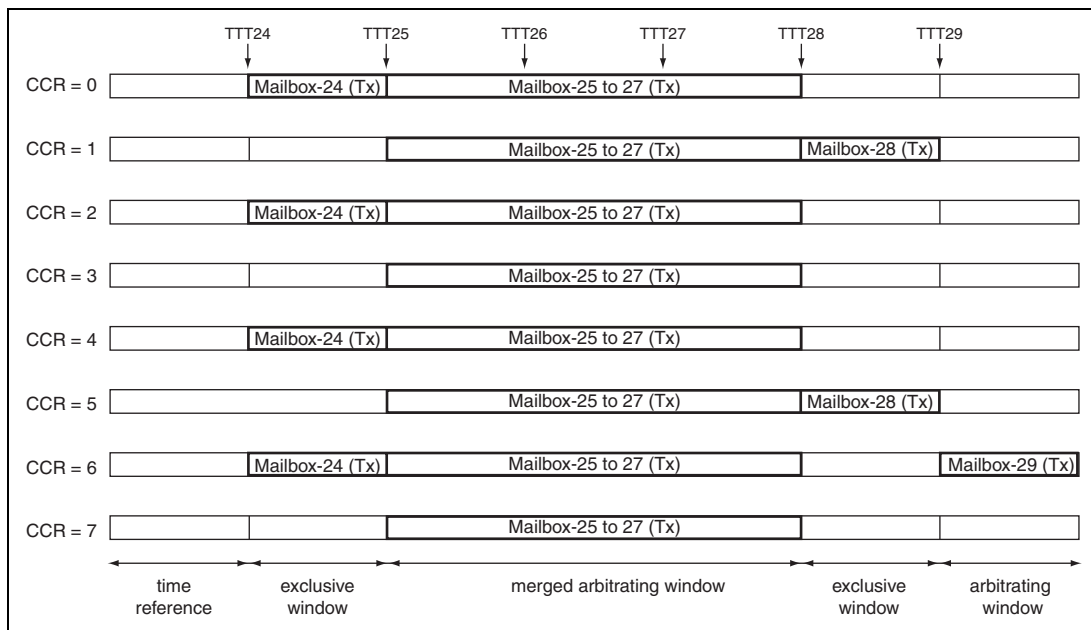

Figure 21.22 Example of Time trigger system as Time Slave

The following settings were used in the above example:

	rep_factor (register)	Offset	TTW[1:0]	MBC[2:0]
Mailbox-24	3'b001	6'b000000	2'b00	3'b000
Mailbox-25	3'b000	6'b000000	2'b10	3'b000
Mailbox-26	3'b000	6'b000000	2'b10	3'b000
Mailbox-27	3'b000	6'b000000	2'b11	3'b000
Mailbox-28	3'b010	6'b000001	2'b00	3'b000
Mailbox-29	3'b011	6'b000110	2'b01	3'b000
Mailbox-30	—	—	—	3'b111
Mailbox-31	—	—	—	3'b011

CMAX = 3'b011, TXPR[30] = 0

During merged arbitrating window, request by time-triggered transmission is served in the way of FCFS (First Come First Served). For example, if Mailbox-25 cannot be transmitted between Tx-Trigger Time 25 (TTT25) and TTT26, Mailbox-25 has higher priority than Mailbox-26 between TTT26 and 28.

MBC needs to be set into 3'b111, in order to disable time-triggered transmission. If this module is Time Master, MBC[30] has to be 3'b000 and time reference window is automatically recognized as arbitrating window.

- Timer Operation

Figure 21.23 shows the timing diagram of the timer. By setting Tx-Trigger Time = n, time trigger transmission starts between CYCTR = n + 2 and CYCTR = n + 3.

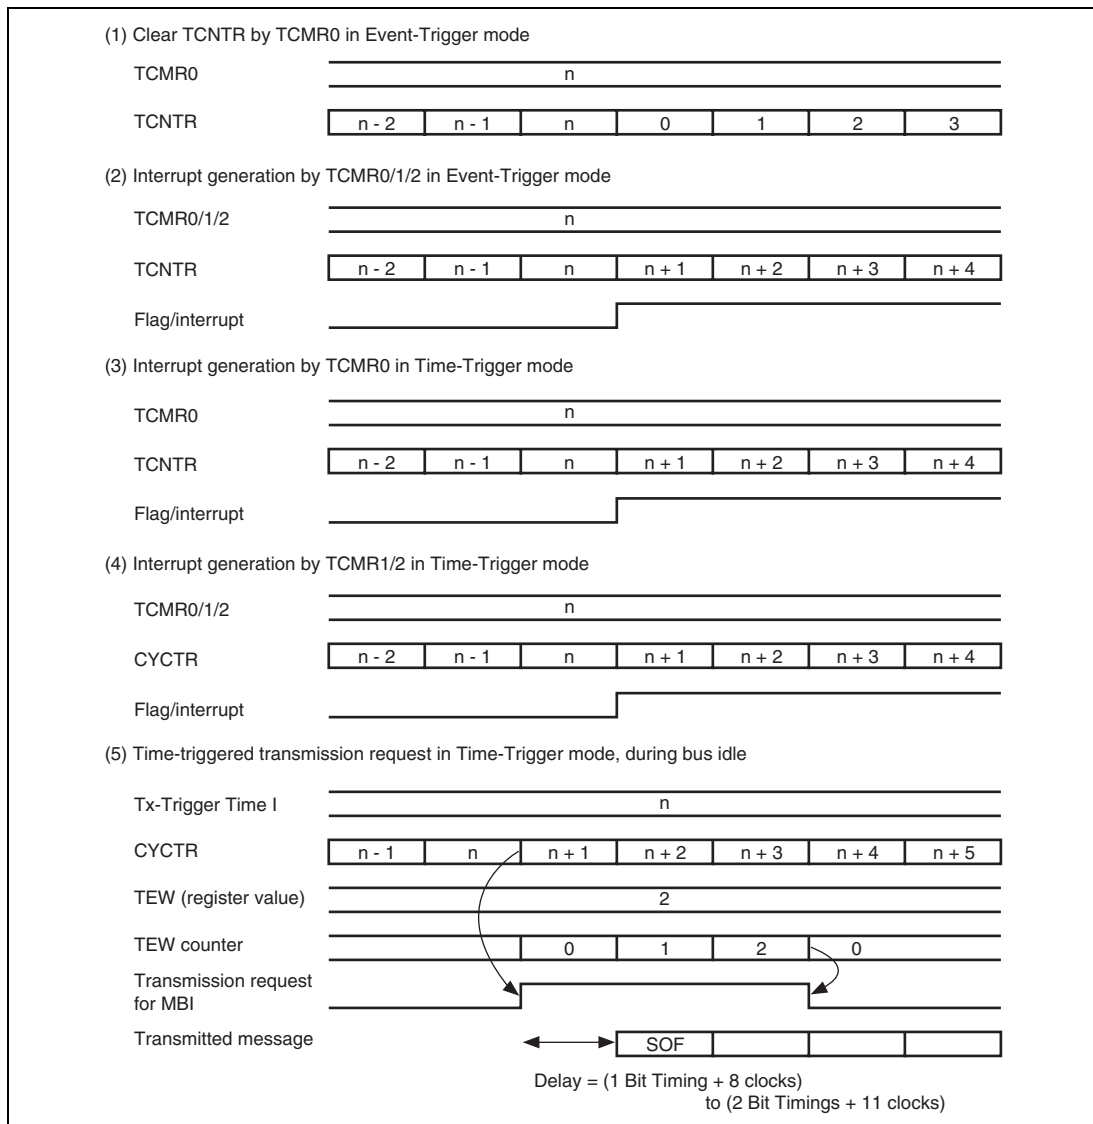

Figure 21.23 Timing Diagram of Timer

During merged arbitrating window, event-trigger transmission is served after completion of time-triggered transmission. For example, If transmission of Mailbox-25 is completed and CYCTR doesn't reach TTT26, event-trigger transmission starts based on message transmission priority specified by MCR2. TXPR of time-triggered transmission is not cleared after transmission completion, however, that of event-triggered transmission is cleared.

Note: that in the case that the TXPR is not set for the Mailbox which is assigned to close the Merged Arbitrating Window (MAW), then the MAW will still be closed (at the end of the TEW following the TTT of the assigned Mailbox.

Please refer to Table Roles of Mailboxes in section 21.3.2, Mailbox Structure.

21.4.4 Message Receive Sequence

The diagram below shows the message receive sequence.

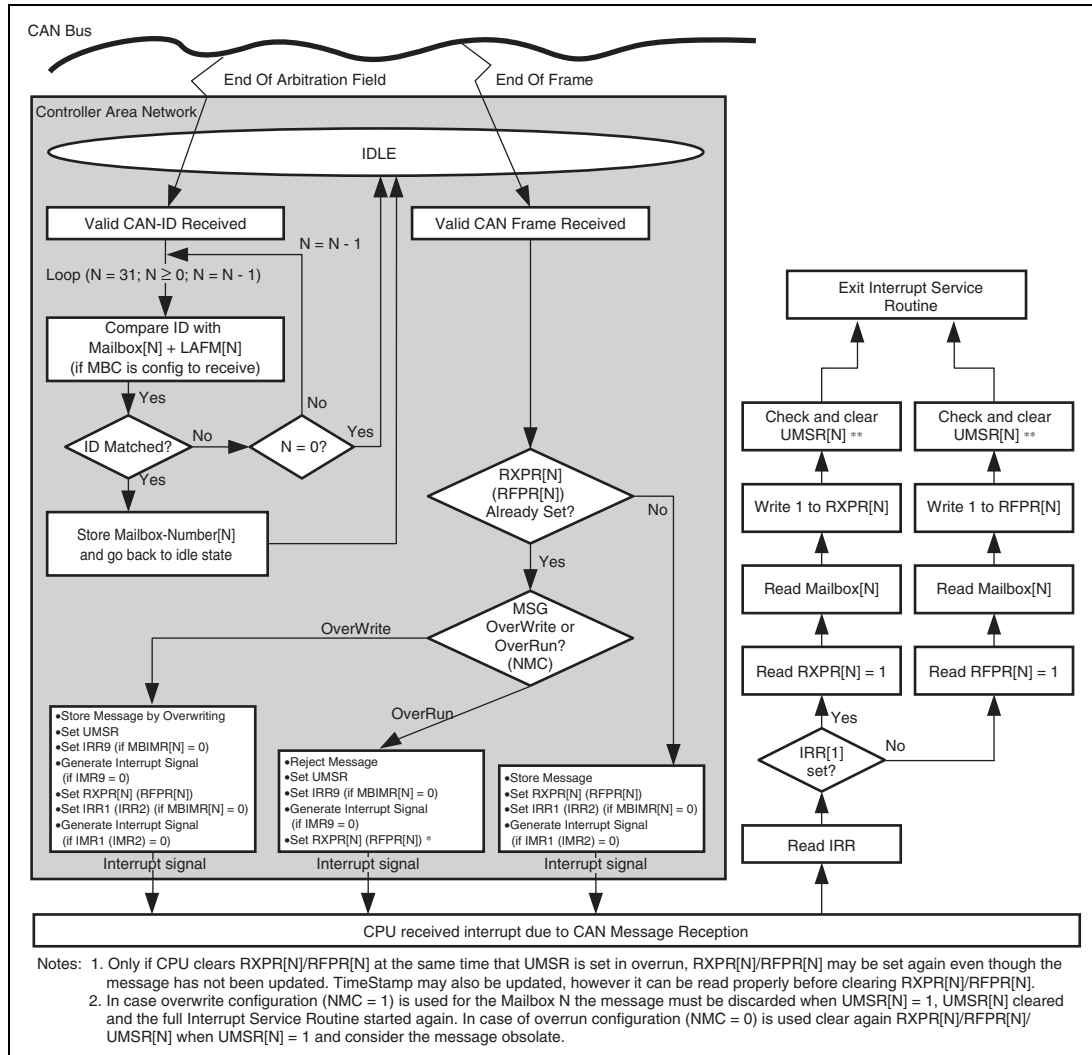

Figure 21.24 Message receive sequence

When this module recognises the end of the Arbitration field while receiving a message, it starts comparing the received identifier to the identifiers set in the Mailboxes, starting from Mailbox-31 down to Mailbox-0. It first checks the MBC if it is configured as a receive box, and reads LAFM, and reads the CAN-ID of Mailbox-31 (if configured as receive) to finally compare them to the received ID. If it does not match, the same check takes place at Mailbox-30 (if configured as receive). Once this module finds a matching identifier, it stores the number of Mailbox-[N] into an internal buffer, stops the search, and goes back to idle state, waiting for the EndOfFrame (EOF) to come. When the 6th bit of EOF is notified by the CAN Interface logic, the received message is written or abandoned, depending on the NMC bit. No modification of configuration during communication is allowed. Entering Halt Mode is one of ways to modify configuration. If it is written into the corresponding Mailbox, including the CAN-ID, i.e., there is a possibility that the CAN-ID is overwritten by a different CAN-ID of the received message due to the LAFM used. This also implies that, if the identifier of a received message matches to ID + LAFM of 2 or more Mailboxes, the higher numbered Mailbox will always store the relevant messages and the lower numbered Mailbox will never receive messages. Therefore, the settings of the identifiers and LAFMs need to be carefully selected.

With regards to the reception of data and remote frames described in the above flow diagram the clearing of the UMSR flag after the reading of IRR is to detect situations where a message is overwritten by a new incoming message stored in the same mailbox (if its NMC = 1) while the interrupt service routine is running. If during the final check of UMSR a overwrite condition is detected the message needs to be discarded and read again.

In case UMSR is set and the Mailbox is configured for overrun (NMC = 0) the message is still valid, however it is obsolete as it is not reflecting the latest message monitored on the CAN Bus.

Please access the full Mailbox content before clearing the related RXPR/RFPR flag.

Please note that in the case a received remote frame is overwritten by a data frame, both the remote frame receive interrupt (IRR2) and data frame received interrupt (IRR1) and also the Receive Flags (RXPR and RFPR) are set. In an analogous way, the overwriting of a data frame by a remote frame, leads to setting both IRR2 and IRR1.

When a message is received and stored into a Mailbox all the fields of the data not received are stored as zero. The same applies when a standard frame is received. The extended identifier part (EXTID[17:0]) is written as zero.

21.4.5 Reconfiguration of Mailbox

When re-configuration of Mailboxes is required, the following procedures should be taken.

- Change configuration of transmit box

Two cases are possible.

— Change of ID, RTR, IDE, LAFM, Data, DLC, NMC, ATX, DART

This change is possible only when MBC = 3'b000. Confirm that the corresponding TXPR is not set. The configuration (except MBC bit) can be changed at any time.

— Change from transmit to receive configuration (MBC)

Confirm that the corresponding TXPR is not set. The configuration can be changed only in Halt or reset state. Please note that it might take longer for this module to transit to halt state if it is receiving or transmitting a message (as the transition to the halt state is delayed until the end of the reception/transmission), and also this module will not be able to receive/transmit messages during the Halt state.

In case this module is in the Bus Off state the transition to halt state depends on the configuration of the bit 6 of MCR and also bit and 14 of MCR.

- Change configuration (ID, RTR, IDE, LAFM, Data, DLC, NMC, ATX, DART, MBC) of receiver box or Change receiver box to transmitter box

The configuration can be changed only in Halt Mode.

This module will not lose a message if the message is currently on the CAN bus and this module is a receiver. This module will be moving into Halt Mode after completing the current reception. Please note that it might take longer if this module is receiving or transmitting a message (as the transition to the halt state is delayed until the end of the reception/transmission), and also this module will not be able to receive/transmit messages during the Halt Mode.

In case this module is in the Bus Off state the transition to halt mode depends on the configuration of the bit 6 and 14 of MCR.

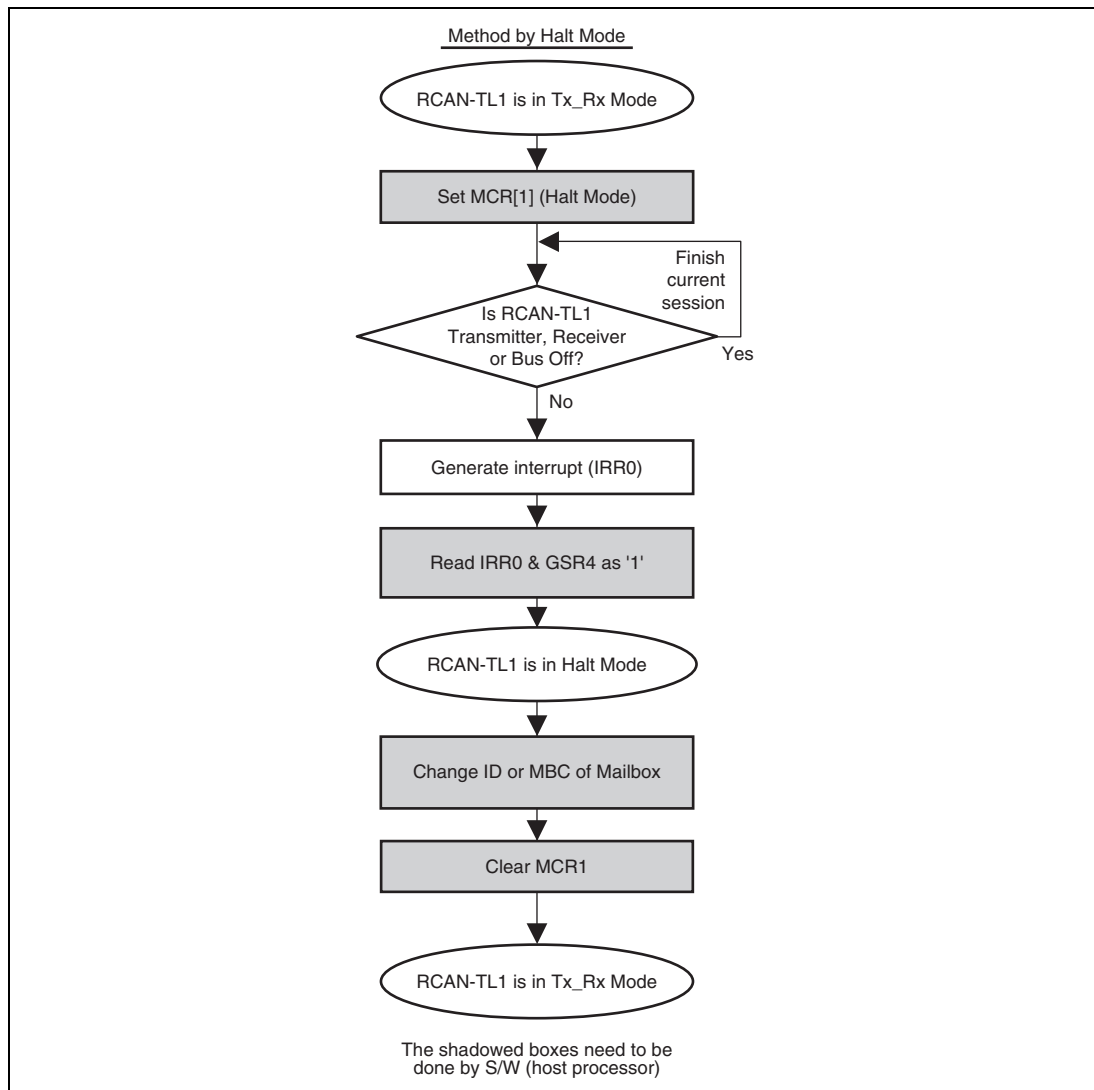

Figure 21.25 Change ID of receive box or Change receive box to transmit box

21.5 Interrupt Sources

Table 21.2 lists this module interrupt sources. These sources can be masked. Masking is implemented using the mailbox interrupt mask registers (MBIMR) and interrupt mask register (IMR). For details on the interrupt vector of each interrupt source, see section 7, Interrupt Controller.

Table 21.2 Interrupt Sources

Interrupt	Description	Interrupt Flag	DMAC Activation
ERSn* ¹	Error Passive Mode (TEC ≥ 128 or REC ≥ 128)	IRR5	Not possible
	Bus Off (TEC ≥ 256)/Bus Off recovery	IRR6	
	Error warning (TEC ≥ 96)	IRR3	
	Error warning (REC ≥ 96)	IRR4	
OVRn* ¹	Reset/halt/CAN sleep transition	IRR0	
	Overload frame transmission	IRR7	
	Unread message overwrite (overrun)	IRR9	
	Start of new system matrix	IRR10	
	TCMR2 compare match	IRR11	
	Bus activity while in sleep mode	IRR12	
	Timer overrun/Next_is_Gap reception/message error	IRR13	
	TCMR0 compare match	IRR14	
RM0n* ^{1,*2} , RM1n* ^{1,*2}	Data frame reception	IRR1* ³	Possible* ⁴
	Remote frame reception	IRR2* ³	
SLEn* ¹	Message transmission/transmission disabled (slot empty)	IRR8	Not possible

- Notes: 1. n = 0, 1
2. RM0 is an interrupt generated by the remote request pending flag for mailbox 0 (RFPR0[0]) or the data frame receive flag for mailbox 0 (RXPR0[0]). RM1 is an interrupt generated by the remote request pending flag for mailbox n (RFPR0[n]) or the data frame receive flag for mailbox n (RXPR0[n]) (n = 1 to 31).
3. IRR1 is a data frame received interrupt flag for mailboxes 0 to 31, and IRR2 is a remote frame request interrupt flag for mailboxes 0 to 31.
4. The direct memory access controller is activated only by an RM0n interrupt.

21.6 DMAC Interface

The DMAC can be activated by the reception of a message in mailbox 0. When DMAC transfer ends after DMAC activation has been set, flags of RXPR and RFPR are cleared automatically. An interrupt request due to a receive interrupt from this module cannot be sent to the CPU in this case. Figure 21.26 shows a DMAC transfer flowchart.

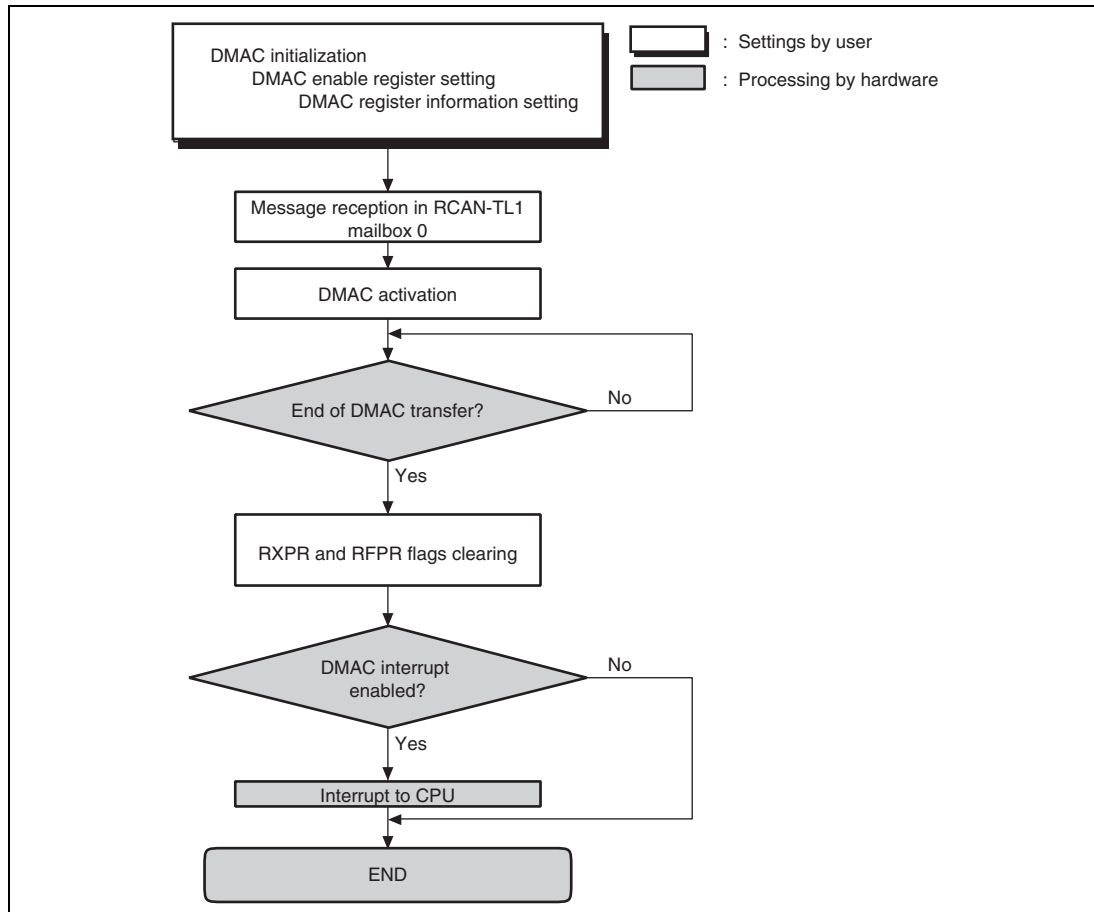

Figure 21.26 DMAC Transfer Flowchart

21.7 CAN Bus Interface

A bus transceiver IC is necessary to connect this LSI to a CAN bus. A Renesas HA13721 transceiver IC and its compatible products are recommended. As the CRx and CTx pins use 3 V, an external level shifter is necessary. Figure 21.27 shows a sample connection diagram.

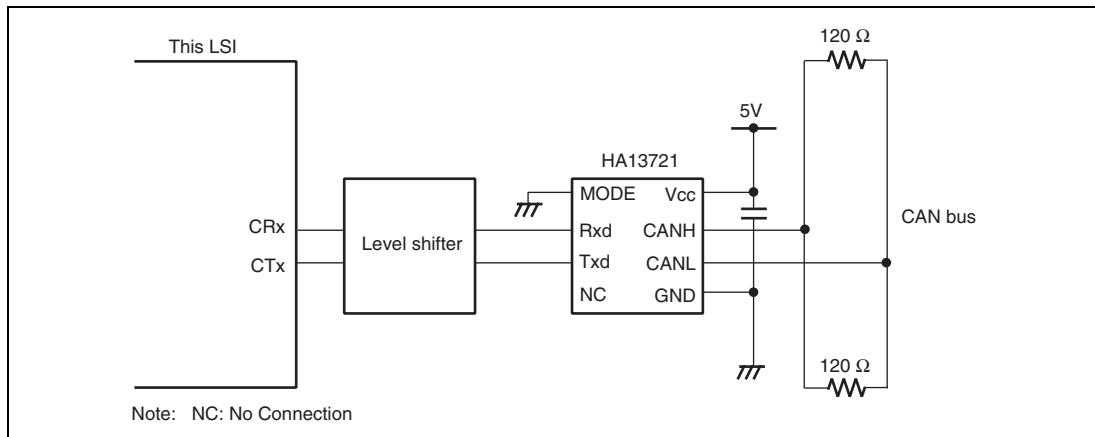

Figure 21.27 High-Speed CAN Interface Using HA13721

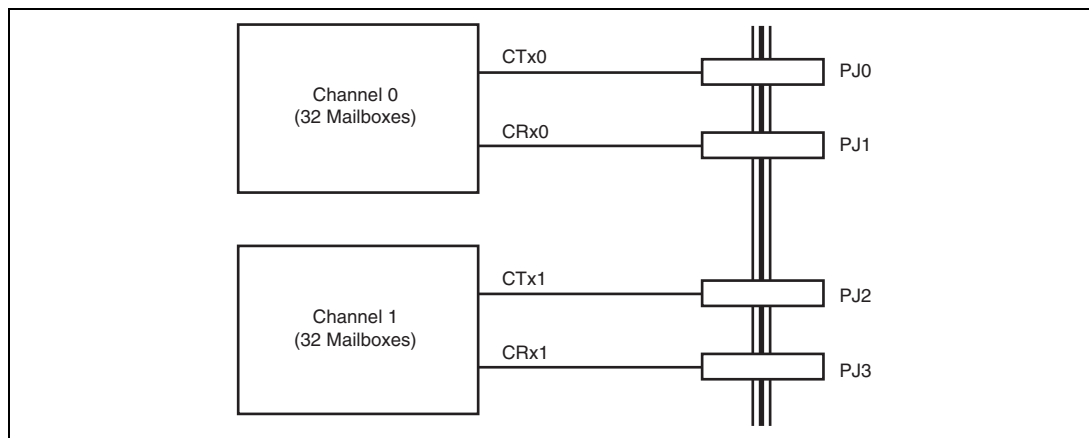

21.8 Setting I/O Ports

The I/O ports for this module must be specified before or during the configuration mode. For details on the settings of I/O ports, see section 32, General Purpose I/O Ports. Two methods are available using two channels of this module in this LSI.

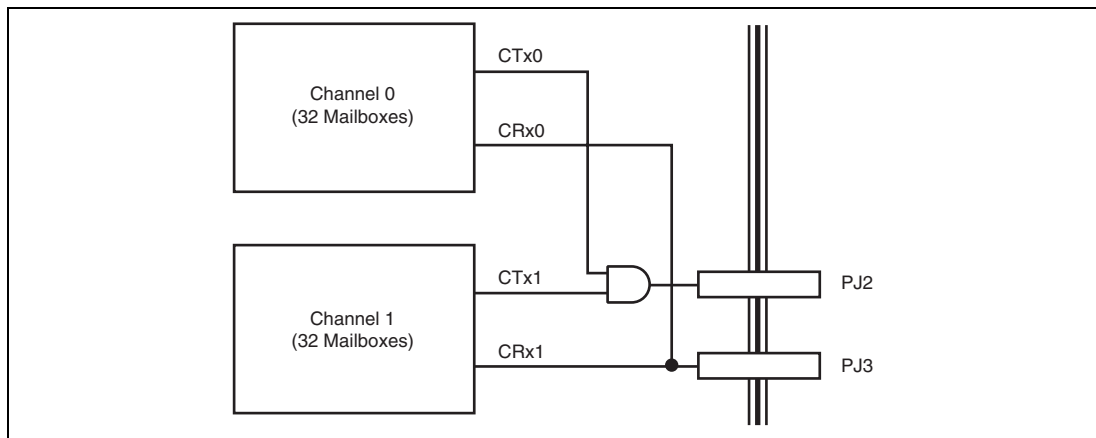

- Using this module as a 2-channel module (channels 0 and 1)
Each channel has 32 Mailboxes.
- Using this module as a 1-channel module (channels 0 and 1 functioning as a single channel)

When the second method is used, see section 21.9.1, Notes on Port Setting for Multiple Channels Used as Single Channel.

Figures 21.28 and 21.29 show connection examples for individual port settings.

**Figure 21.28 Connection Example when Using This Module as 2-Channel Module
(32 Mailboxes × 2 Channels)**

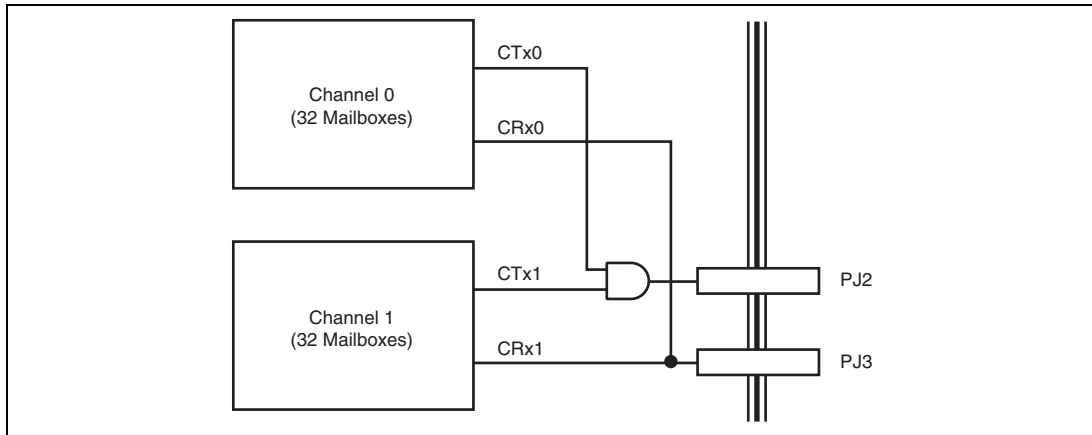

**Figure 21.29 Connection Example when Using This Module as 1-Channel Module
(64 Mailboxes × 1 Channel)**

21.9 Usage Notes

21.9.1 Notes on Port Setting for Multiple Channels Used as Single Channel

This module in this LSI has two channels and some of these channels can be used as a single channel. When using multiple channels as a single channel, keep the following in mind.

**Figure 21.30 Connection Example when Using This Module as 1-Channel Module
(64 Mailboxes × 1 Channel)**

1. No ACK error is detected even when any other nodes are not connected to the CAN bus. This occurs when channel 1 transmits an ACK in the ACK field in response to a message channel 0 has transmitted.

Channel 1 receives a message which channel 0 has transmitted on the CAN bus and then transmits an ACK in the ACK field. After that, channel 0 receives the ACK.

To avoid this, make channel 1 which is not currently used for transmission the listen-only mode (TST[2:0] = B'001) or the reset state (MCR0 = 1). With this setting, only a channel which transmits a message transmits an ACK.

2. Internal arbitration for channels 0 and 1 is independently controlled to determine the order of transmission.

Although the internal arbitration is performed on 31 Mailboxes at a time, it is not performed on 64 Mailboxes at a time even though multiple channels function as a single channel.

3. Do not set the same transmission message ID in both channels 0 and 1.

Two messages may be transmitted from the two channels after arbitration on the CAN bus.

Section 22 IEBus™ Controller

This LSI has an on-chip one-channel IEBus controller. The Inter Equipment Bus™ (IEBus™)* is a small-scale digital data transfer system for inter-equipment data transfer.

This LSI does not have an on-chip IEBus driver/receiver, so it is necessary to mount a dedicated driver/receiver externally. In addition, as the IERxD and IETxD pins need 3V to operate, a dedicated external level shifter is necessary.

Note: * The Inter Equipment Bus™ (IEBus™) is a trademark of Renesas Electronics Corporation.

22.1 Features

- IEBus protocol control (layer 2) supported
 - Half-duplex asynchronous communications
 - Multi-master system
 - Broadcast communications function
 - Selectable mode (three types) with different transfer speeds
- On-chip buffers for data transmission and reception
 - Transmission and reception buffers: 128 bytes each
 - Up to 128 bytes of consecutive transmit/reception (maximum number of transfer bytes in mode 2)
- Operating frequency
 - 12 MHz, 12.58 MHz (This module uses 1/2 divided clocks of Pφ, or AUDIO_X1*, AUDIO_X2*.)
 - 18 MHz, 18.87 MHz (This module uses 1/3 divided clocks of Pφ, or AUDIO_X1*, AUDIO_X2*.)
 - 24 MHz (This module uses 1/4 divided clocks of Pφ, or AUDIO_X1*, AUDIO_X2*.)
 - 25.16 MHz (This module uses 1/4 divided clocks of Pφ.)
 - 30 MHz, 31.45 MHz (This module uses 1/5 divided clocks of Pφ.)
 - 36 MHz (This module uses 1/6 divided clocks of Pφ.)

Note: * Available as this module clock input only when not used as the clock input for serial sound interface, serial I/O with FIFO, or Renesas SPDIF interface.

- Module standby mode can be set.

22.1.1 IEBus Communications Protocol

An overview of the IEBus is provided below.

- Communications method: Half-duplex asynchronous communications
- Multi-master system
 - All units connected to the IEBus can transfer data to other units.
- Broadcast communications function (one-to-many communications)
 - Group broadcast communications: Broadcast communications to group unit
 - General broadcast communications: Broadcast communications to all units
- Mode is selectable (three modes with different transfer speeds)

Table 22.1 Mode Types

Mode	IEB ϕ * ¹ = 12, 18, 24* ² , 30, 36 MHz	IEB ϕ * ¹ = 12.58, 18.87* ² , 25.16, 31.45 MHz	Maximum Number of Transfer Bytes (byte/frame)
0	About 3.9 kbps	About 4.1 kbps	16
1	About 17 kbps	About 18 kbps	32
2	About 26 kbps	About 27 kbps	128

Notes: 1. Peripheral clock (P ϕ), or clocks for AUDIO_X1 and AUDIO_X2
 2. Oscillation frequency when this LSI is used

- Access control: CSMA/CD (Carrier Sense Multiple Access with Collision Detection)
 - Priority of bus mastership is as follows.
 - Broadcast communications (one-to-many communications) have priority over normal communications (one-to-one communications).
 - A smaller master address has priority.
- Communications scale
 - Number of units: Up to 50
 - Cable length: Up to 150 m (when using a twisted-pair cable)

Note: The communications scale of the actual system depends on the characteristics of the externally mounted IEBus driver/receiver and the cable used.

(1) Determination of Bus Mastership (Arbitration)

A unit connected to the IEBus performs an operation to get the bus to control other units. This operation is called arbitration. In arbitration, when multiple units start transferring simultaneously, the bus mastership is given to one unit among them.

Only one unit can obtain bus mastership through arbitration, so the following priority for bus mastership is determined.

(a) Priority according to communications type

Broadcast communications (one-to-many communications) has priority over normal communications (one-to-one communications).

(b) Priority according to master address

The unit with the smallest master address has priority among units of the same communications type.

Example: The master address is configured with 12 bits. A unit with H'000 has the highest priority, while a unit with H'FFF has the lowest priority.

Note: When a unit loses in arbitration, the unit can automatically enter retransfer mode (0 to 7 retransfer times can be selected by the RN bit in IEMCR).

(2) Communications Mode

The IEBus has three communications modes with different transfer speeds. Table 22.2 shows the transfer speed in each communications mode and the maximum number of transfer bytes in one communications frame.

Table 22.2 Transfer Speed and Maximum Number of Transfer Bytes in Each Communications Mode

Communications Mode	Maximum Number of Transfer Bytes (bytes/frame)	Effective Transfer Speed* ¹ (kbps)	
		IEB ϕ * ² = 12, 18, 24* ³ , 30, 36 MHz	IEB ϕ * ² = 12.58, 18.87* ³ , 25.16, 31.45 MHz
0	16	About 3.9	About 4.1
1	32	About 17	About 18
2	128	About 26	About 27

Notes: Each unit connected to the IEBus should select a communications mode prior to performing communications. Note that correct communications is not guaranteed if the master and slave units do not adopt the same communications mode.

In the case of communications between a unit with IEB ϕ = 6 MHz and a unit with IEB ϕ = 6.29 MHz, correct communications are not possible even if the same communications mode is adopted. Communications must be done with the same oscillation frequency.

1. Effective transfer speed when the maximum number of transfer bytes is transmitted.
2. Peripheral clock (P ϕ), or clocks for AUDIO_X1 and AUDIO_X2
3. Oscillation frequency when this LSI is used

(3) Communications Address

In the IEBus, a specific 12-bit communications address is allocated to each individual unit. A communications address is configured as follows.

- Upper four bits: group number (number identifying a group to which the unit belongs)
- Lower eight bits: unit number (number identifying individual units in a group)

(4) Broadcast Communications

In normal transfer, a single master unit communicates with a single slave unit, so one-to-one transfer or reception takes place. In broadcast communications, a single master unit communicates with multiple slave units. Since there are multiple slave units, no acknowledgements are returned from the slave units during communications.

A broadcast bit decides whether broadcast or normal communications is done. (For details of the broadcast bit, see section 22.1.2 (1) (b), Broadcast Bit.

There are two types of broadcast communications.

(a) Group broadcast communications

Broadcast communications is aimed at units with the same group number, meaning that those units have the same upper four bits of the communications address.

(b) General broadcast communications

Broadcast communications is aimed at all units regardless of group number.

Group broadcast and general broadcast communications are identified by a slave address. (For details on the slave address, see section 22.1.2 (3), Slave Address Field.)

22.1.2 Communications Protocol

Figure 22.1 shows an IEBus transfer signal format.

Communications data is transferred as a series of signals referred to as a communications frame. The number of data, which can be transmitted in a single communications frame and the transfer speed, differs according to the communications mode.

(When IEB ϕ = 12, 18, 24, 30, or 36 MHz)																			
Field name	Header		Master address field		Slave address field			Control field			Message length field			Data field					
Number of bits	1	1	12	1	12	1	1	4	1	1	8	1	1	8	1	1	8	1	1
Transfer time	Start bit	Broad-cast bit	Master address	P	Slave address	P	A	Control bits	P	A	Message length bits	P	A	Data bits	P	A	Data bits	P	A
Mode 0	Approximately 7330 μ s										Approximately 1590 \times N μ s								
Mode 1	Approximately 2090 μ s										Approximately 410 \times N μ s								
Mode 2	Approximately 1590 μ s										Approximately 300 \times N μ s								

P: Parity bit (1 bit)
A: Acknowledge bit (1 bit)
When A = 0: ACK
When A = 1: NAK
N: Number of bytes

Note: The value of acknowledge bit is ignored in broadcast communications.

Figure 22.1 Transfer Signal Format

(1) Header

A header is comprised of a start bit and a broadcast bit.

(a) Start Bit

The start bit is a signal to inform other units of the start of data transfer. A unit attempting to start data transfer outputs a low-level signal (the start bit) for a specified period and then outputs the broadcast bit.

If another unit is already outputting a start bit when a unit attempts to output a start bit, the unit waits for completion of the start bit from the other unit without outputting its own start bit, and then outputs the broadcast bit synchronized with the completion timing.

Other units enter the receive state after detecting the start bit.

(b) Broadcast Bit

The broadcast bit is a bit to identify the type of communications: broadcast or normal.

When this bit is cleared to 0, it indicates broadcast communications. When it is set to 1, it indicates normal communications. Broadcast communications includes group broadcast and general broadcast, which are identified by a value of the slave address. (For details of the slave address, see section 22.1.2 (3), Slave Address Field.)

Since multiple slave units are communications destination units, in the case of broadcast communications, the acknowledge bit is not returned from each field described in (2) and below.

When more than one unit starts to transfer a communications frame with the same timing, broadcast communications has priority over normal communications, and arbitration occurs.

(2) Master Address Field

The master address field is a field for transmitting the unit address (master address) to other units. The master address field is comprised of master address bits and a parity bit.

The master address consists of 12 bits and the MSB is output first.

When more than one unit start to transfer broadcast bits having the same value with the same timing, arbitration is decided by the master address field.

In the master address field, self-output data and data on the bus are compared for every one-bit transfer. If the self-output master address and data on the bus are different, the unit that loses arbitration will stop its transfer and enter the receive state.

Since the IEBus is configured with wired AND, the unit having the smallest master address of the units in arbitration (arbitration master) wins in arbitration.

Finally, only a single unit remains in the transfer state as a master unit after outputting a 12-bit master address.

Next, this master unit outputs a parity bit*, defines the master address for other units, and then enters the slave address field output state.

Note: * Since even parity is used, when the number of one bit in the master address is odd, the parity bit is 1.

(3) Slave Address Field

The slave address field is a field to transmit an address (the slave address) of a unit (the slave unit) to be transmitted. The slave address field is comprised of slave address bits, a parity bit, and an acknowledge bit.

The slave address consists of 12 bits and the MSB is output first. The parity bit is output after the 12-bit slave address is transmitted to avoid receiving the slave address accidentally. The master unit then detects the acknowledgement from the slave unit to confirm that the slave unit exists on the bus. When the acknowledgement is detected, the master unit enters the control field output state. However, the master unit enters the control field output state without detecting the acknowledgement in broadcast communications.

The slave unit returns an acknowledgement when the slave addresses match and the parities of the master and slave addresses are correct. When the parity of either the master or slave address is incorrect, the slave unit decides that the master or slave address was not correctly received and does not return the acknowledgement. In this case, the master unit enters the waiting (monitor) state and communications ends.

In the case of broadcast communications, the slave address is used to identify the type of broadcast communications (group or general) as follows:

- When the slave address is H'FFF: General broadcast communications
- When the slave address is other than H'FFF: Group broadcast communications

Note: The group number is the upper 4-bit value of the slave address in group broadcast communications.

(4) Control Field

The control field is a field for transmitting the type and direction of the following data field. The control field is comprised of control bits, a parity bit, and an acknowledge bit.

The control bits consist of four bits and the MSB is output first.

The parity bit is output following the control bits. When the parity is correct, and the slave unit can implement the function required from the master unit, the slave unit returns an acknowledgement and enters the message length field output state. However, if the slave unit cannot implement the requirements from the master unit even though the parity is correct, or if the parity is not correct, the slave unit does not return an acknowledgement and returns to the waiting (monitor) state.

The master unit enters the subsequent message length field output state after confirming the acknowledgement.

When the acknowledgement is not confirmed, the master unit enters the waiting (monitor) state, and communications ends. However, in the case of broadcast communications, the master unit enters the following message length field output state without confirming the acknowledgement. For details of the contents of the control bit, see table 22.4.

(5) Message Length Field

The message length field is a field for specifying the number of transfer bytes. The message length field is comprised of message length bits, a parity bit, and an acknowledge bit.

The message length has eight bits and the MSB is output first. Table 22.3 shows the number of transfer bytes.

Table 22.3 Contents of Message Length bits

Message Length bits (Hexadecimal)	Number of Transfer Bytes
H'01	1 byte
H'02	2 bytes
:	:
H'FF	255 bytes
H'00	256 bytes

Note: If a number greater than the maximum number of transfer bytes in one frame is specified, communications are done in multiple frames depending on the communications mode. In this case, the message length bits indicate the number of remaining communications data after the first transfer. In this LSI, the message length bits must be smaller than the maximum number of transfer bytes in one frame. Set these within the ranges shown below.

Mode 0: 1 to 16 bytes

Mode 1: 1 to 32 bytes

Mode 2: 1 to 128 bytes

This field operation differs depending on the value of bit 3 in the control field: master transmission (the bit 3 of the control bits is 1) or master reception (the bit 3 of the control bits is 0).

(a) Master Transmission

The master unit outputs the message length bits and the parity bit. When the parity is even, the slave unit returns an acknowledgement and enters the following data field. Note that the slave unit does not return an acknowledgement in broadcast communications.

When the parity is odd, the slave unit decides that the message length field is not correctly received, does not return an acknowledgement, and returns to the waiting (monitor) state. In this case, the master unit also returns to the waiting state and communications end.

(b) Master Reception

The slave unit outputs the message length bits and parity bit. When even parity is confirmed, the master unit returns an acknowledgement.

When the parity is not correct, the master unit decides that the message length bits are not correctly received, does not return an acknowledgement, and returns to the waiting state. In this case, the slave unit also returns to the waiting state and communications end.

(6) Data Field

The data field is a field for data transmission/reception to and from the slave unit. The master unit transmits/receives data to and from the slave unit using the data field. The data field is comprised of data bits, a parity bit, and an acknowledge bit.

The data bits consist of eight bits and the MSB is output first.

The parity and acknowledge bits are output following the data bits from the master unit and slave unit, respectively.

Broadcast communications are performed only for the transmission of the master unit. In this case, the acknowledge bit is ignored. Operations in master transmission and master reception are described below.

(a) Master Transmission

The master unit transmits the data bits and parity bit to the slave unit to write data from the master unit to the slave unit. The slave unit receives the data bits and parity bit, and returns an acknowledgement if the parity bit is even and the receive buffer is empty. If the parity bit is odd or the receive buffer is not empty, the slave unit does not accept the corresponding data and does not return an acknowledgement.

When the slave unit does not return an acknowledgement, the master unit retransmits the data. This operation is repeated until either an acknowledgement from the slave unit is detected or the maximum number of data transfer bytes is reached.

When the parity is even and the acknowledgement is output from the slave unit, the master unit transmits the subsequent data if data remains and the maximum number of transfer bytes is not exceeded.

In the case of broadcast communications, the slave unit does not return the acknowledgement, and the master unit transfers data byte by byte.

(b) Master Reception

The master unit outputs synchronous signals corresponding to all data bits to be read from the slave unit.

The slave unit outputs the data bits and parity bit on the bus in accordance with the synchronous signals from the master unit.

The master unit reads the parity bit output from the slave unit, and checks the parity. If the parity is not even, or the receive buffer is not empty, the master unit rejects acceptance of the data, and does not return the acknowledgement. The master unit reads the same data repeatedly if the number of data does not exceed the maximum number of transfer bytes in one frame. If the parity is even and the receive buffer is empty, the master unit accepts data and returns an acknowledgement. The master unit reads in the subsequent data if the number of data does not exceed the maximum number of transfer bytes in one frame.

(7) Parity bit

The parity bit is used to confirm that transfer data occurs with no errors.

The parity bit is added to respective data of the master address, slave address, control, message length, and data bits.

Even parity is used. When the number of bits having the value 1 is odd, the parity bit is 1. When the number of bits having the value 1 is even, the parity bit is 0.

(8) Acknowledge bit

In normal communications (single unit to single unit communications), the acknowledge bit is added in the following positions to confirm that data is correctly accepted.

- At the end of the slave address field
- At the end of the control field
- At the end of the message length field
- At the end of the data field

The acknowledge bit is defined below.

- 0: indicates that the transfer data is acknowledged. (ACK)
- 1: indicates that the transfer data is not acknowledged. (NAK)

Note that the acknowledge bit is ignored in the case of broadcast communications.

(a) Acknowledge bit at the End of the Slave Address Field

The acknowledge bit at the end of the slave address field becomes NAK in the following cases and transfer is stopped.

- When the parity of the master address or slave address bits is incorrect
- When a timing error (an error in bit format) occurs
- When there is no slave unit

(b) Acknowledge bit at the End of the Control Field

The acknowledge bit at the end of the control field becomes NAK in the following cases and transfer is stopped.

- When the parity of the control bits is incorrect
- When the bit 3 of the control bits is 1 (data write) although the slave receive buffer* is not empty
- When the control bits are set to data read (H'3, H'7) although the slave transmit buffer* is empty
- When another unit which locked the slave unit requests H'3, H'6, H'7, H'A, H'B, H'E, or H'F in the control bits although the slave unit has been locked
- When the control bits are the locked address read (H'4, H'5) although the unit is not locked
- When a timing error occurs
- When the control bits are undefined

Note: See section 22.1.3 (1), Slave Status Read (Control Bits: H'0, H'6).

(c) Acknowledge Bit at the End of the Message Length Field

The acknowledge bit at the end of the message length field becomes NAK in the following cases and transfer is stopped.

- When the parity of the message length bits is incorrect
- When a timing error occurs

(d) Acknowledge Bit at the End of the Data Field

The acknowledge bit at the end of the data field becomes NAK in the following cases and transfer is stopped.

- When the parity of the data bits is incorrect*
- When a timing error occurs after the previous transfer of the acknowledge bit
- When the receive buffer becomes full and cannot accept further data*

Note: * In this case, the data field is transferred repeatedly until the number of data reaches the maximum number of transfer bytes if the number of data does not exceed the maximum number of transfer bytes in one frame.

22.1.3 Transfer Data (Data Field Contents)

The data field contents are specified by the control bits.

Table 22.4 Control Bit Contents

Setting Value	Bit 3* ¹	Bit 2	Bit 1	Bit 0	Function* ²
H'0	0	0	0	0	Reads slave status (SSR)
H'1	0	0	0	1	Undefined.
H'2	0	0	1	0	Undefined.
H'3	0	0	1	1	Reads data and locks
H'4	0	1	0	0	Reads locked address (lower 8 bits)
H'5	0	1	0	1	Reads locked address (upper 4 bits)
H'6	0	1	1	0	Reads slave status (SSR) and unlocks
H'7	0	1	1	1	Reads data
H'8	1	0	0	0	Undefined.
H'9	1	0	0	1	Undefined.
H'A	1	0	1	0	Writes command and locks
H'B	1	0	1	1	Writes data and locks
H'C	1	1	0	0	Undefined.
H'D	1	1	0	1	Undefined.
H'E	1	1	1	0	Writes command
H'F	1	1	1	1	Writes data

- Notes: 1. Depending on the value of bit 3 (MSB), the transfer directions of the message length bits in the following message length field and data in the data field vary.
 When bit 3 is 1: Data is transferred from the master unit to the slave unit.
 When bit 3 is 0: Data is transferred from the slave unit to the master unit.
2. H'3, H'6, H'A, and H'B are control bits to specify lock setting and cancellation.
 When the undefined values of H'1, H'2, H'8, H'9, H'C, and H'D are transmitted, the acknowledge signal is not returned.

When the control bits received from another unit which locked are not included in table 22.5, the slave unit which has been locked by the master unit does not accept the control bits and does not return the acknowledge bit.

Table 22.5 Control Field for Locked Slave Unit

Setting Value	Bit 3	Bit 2	Bit 1	Bit 0	Function
H'0	0	0	0	0	Reads slave status
H'4	0	1	0	0	Reads locked address (upper 8 bits)
H'5	0	1	0	1	Reads locked address (lower 4 bits)

(1) Slave Status Read (Control Bits: H'0, H'6)

The master unit can decide the reason the slave unit does not return the acknowledgement (ACK) by reading the slave status (H'0, H'6). The slave status indicates the result of the last communications that the slave unit performed. All slave units can provide slave status information. Figure 22.2 shows the bit configuration of the slave status.

MSB								LSB
Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0	
Bit	Value	Description						
Bit 7, bit 6	00	Mode 0						
	01	Mode 1						
	10	Mode 2						
	11	For future use						
Bit 5	0	Fixed 0						
Bit 4* ²	0	Slave transmission halted						
	1	Slave transmission enabled						
Bit 3	0	Fixed 0						
Bit 2	0	Unit is unlocked						
	1	Unit is locked						
Bit 1* ³	0	Slave receive buffer is empty						
	1	Slave receive buffer is not empty						
Bit 0* ⁴	0	Slave transmit buffer is empty						
	1	Slave transmit buffer is not empty						

Notes: 1. Since this LSI can support up to mode 2, bits 6 and 7 are fixed to 10.
2. The value of bit 4 can be selected by the STE bit in the IEBus master unit address register 1 (IEAR1).
3. The slave receive buffer is a buffer which is accessed during data write (control bits: H'A, H'B, H'E, H'F).
In this LSI, the slave receive buffer corresponds to the IEBus receive buffer register (IERB001 to IERB128); and bit 1 is the value of the RXBSY bit in the IEBus receive status register (IERSR).
4. The slave transmit buffer is a buffer which is accessed during data read (control bits: H'3, H'7).
In this LSI, the slave transmit buffer corresponds to the IEBus transmit buffer register (IETB001 to IETB128) and bit 0 is the value of the SRQ bit in the IEBus general flag registers (IEFLG).

Figure 22.2 Bit Configuration of Slave Status (SSR)

(2) Data Command Transfer (Control Bits: Read (H'3, H'7), Write (H'A, H'B, H'E, H'F))

In the case of data read (H'3, H'7), data in the data buffer of the slave unit is read in the master unit. In the case of data write (H'B or H'F) or command write (H'A or H'E), data received in the slave unit is processed in accordance with the operation specification of the slave unit.

- Notes: 1. The user can select data and commands freely in accordance with the system.
2. H'3, H'A, or H'B may lock depending on the communications condition and status.

(3) Locked Address Read (Control Bits: H'4, H'5)

In the case of the locked address read (H'4 or H'5), the address (12 bits) of the master unit, which issues the lock instruction, is configured in bytes as shown in figure 22.3.

Figure 22.3 Locked Address Configuration

(4) Locking/Unlocking (Control Bits: Setting (H'3, H'A, H'B), Cancellation: (H'6))

The lock function is used for message transfer over multiple communications frames. A locked unit receives data only from the unit which locked it.

Locking and unlocking are described below.

(a) Locking

When an acknowledge bit of 0 in the message length field is transmitted/received with the control bits (H'3, H'A, H'B) indicating the lock operation, and then the communications frame is completed before completion of data transmission/reception for the number of bytes specified by the message length bits, the slave unit is locked by the master unit. In this case, the bit (bit 2) relevant to locking in the byte data indicating the slave status is set to 1.

Lock is set only when the number of data exceeds the maximum number of transfer bytes in one frame. Lock is not set by other error terminations.

(b) Unlocking

When the control bits indicate the lock (H'3, H'A, or H'B) or unlock (H'6) operation and the byte data for the number of bytes specified by the message length bits are transmitted/received in a single communications frame, the slave unit is unlocked by the master unit. In this case, the bit (bit 2) relevant to locking in the byte indicating the slave status is cleared to 0.

Note that locking and unlocking are not done in broadcast communications.

Note: * There are three ways to cause a locked unit to unlock itself.

- Perform a power-on reset
- Put the unit in deep standby mode
- Issue an unlock command through the IEBus command register (IECMR)

Note that the LCK flag in IEFLG can be used to check whether the unit is locked or unlocked.

22.1.4 Bit Format

Figure 22.4 shows the bit format (conceptual diagram) configuring the IEBus communications frame.

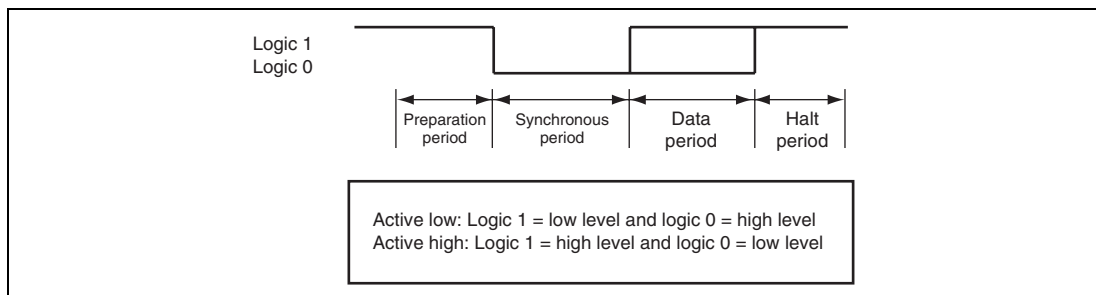

Figure 22.4 IEBus Bit Format (Conceptual Diagram)

Each period of the bit format for use of active high signals is described below.

- Preparation period: first logic 1 period (high level)
- Synchronous period: subsequent logic 0 period (low level)
- Data period: period indicating bit value (logic 1: high level, logic 0: low level)
- Halt period: last logic 1 period (high level)

For use of active low signals, levels are reversed from the active high signals.

The synchronous and data periods have approximately the same length.

The IEBus is synchronized bit by bit. The specifications for the time of all bits and the periods allocated to the bits differ depending on the type of transfer bits and the unit (master or slave unit).

22.1.5 Configuration

Figure 22.5 shows the entire block configuration and table 22.6 lists the functions of each block.

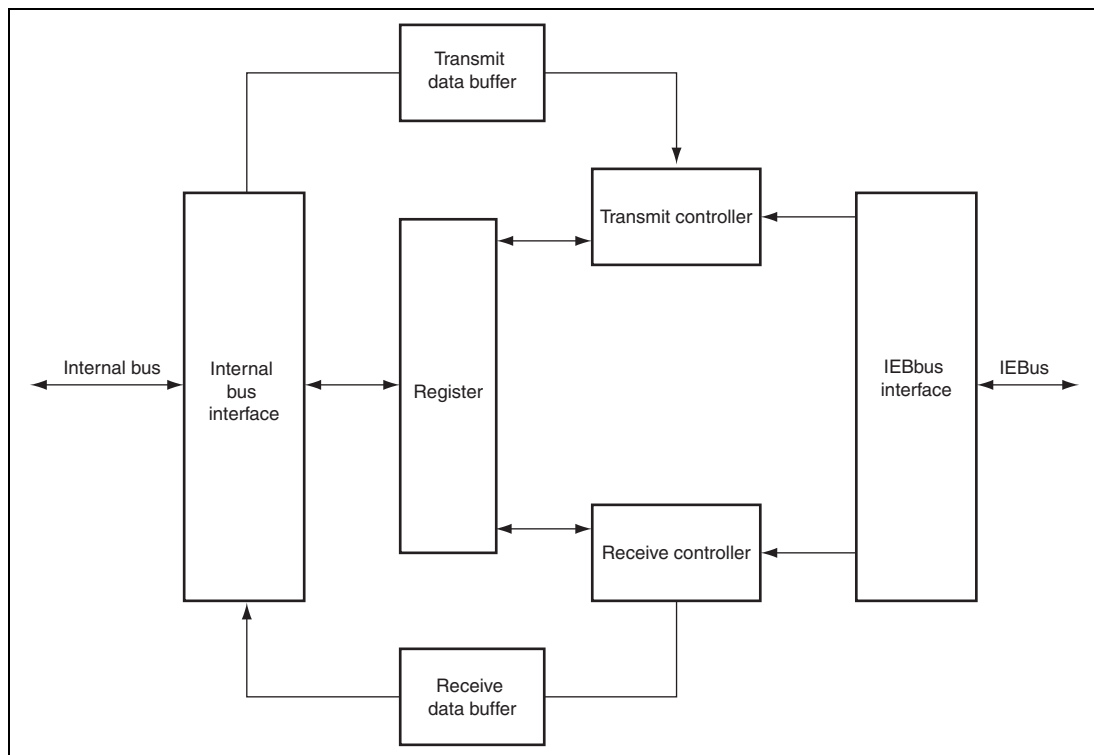

Figure 22.5 Block Diagram

Table 22.6 Functions of Each Block

Block	Function
Internal bus interface	Internal bus interface <ul style="list-style-type: none"> • Data width: 8 bits • Register access
IEBus interface	Interface conforms to IEBus specifications <ul style="list-style-type: none"> • Outputs data from transmit controller to IEBus in IEBus specification bit format • Picks out frame data in IEBus specification bit format to transfer to receive controller
Register	Control register <ul style="list-style-type: none"> • Register to control this module • Readable/writable from internal bus
Transmit controller	Transmits data in transmit buffer to IEBus <ul style="list-style-type: none"> • Generates transmit frame combining header information in register and data in transmit buffer to transmits • Detects transmit error
Receive controller	Stores data from IEBus in receive buffer <ul style="list-style-type: none"> • Stores header information and data in received frame in register and receive buffer, respectively • Detects receive error
Transmit data buffer	Buffer for data transmission <ul style="list-style-type: none"> • Buffer that stores data to be transmitted to IEBus • Buffer size: 128 bytes
Receive data buffer	Buffer for data reception <ul style="list-style-type: none"> • Buffer that stores data received from IEBus • Buffer size: 128 bytes

22.2 Input/Output Pins

Table 22.7 Pin Configuration

Name	Abbreviation	I/O	Function
IEBus receive data pin	IERxD	Input	Receive data input pin
IEBus transmit data pin	IETxD	Output	Transmit data output pin

22.3 Register Descriptions

Table 22.8 shows the register configuration.

Table 22.8 Register Configuration

Register Name	Abbreviation	R/W	Initial Value	Address	Access Size
IEBus control register	IECTR	R/W	H'00	H'FFFE F000	8
IEBus command register	IECMR	W	H'00	H'FFFE F001	8

Note: * Only 1 can be written to clear the flag.

22.3.1 IEBus Control Register (IECTR)

IECTR is used to control the operation of this module.

Bit:	7	6	5	4	3	2	1	0
	-	IOL	DEE	-	RE	-	-	-
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R/W	R/W	R	R/W	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
6	IOL	0	R/W	Input/Output Level Selects input/output pin level (polarity) for the IERxD and IETxD pins. 0: Pin input/output is set to active low. (Logic 1 is low level and logic 0 is high level.) 1: Pin input/output is set to active high. (Logic 1 is high level and logic 0 is low level.)
5	DEE	0	R/W	Broadcast Receive Error Interrupt Enable If this bit is set to 1, a reception error interrupt occurs when the receive buffer is not in the receive enabled state during broadcast reception (when the RE bit is not set to 1 or the RXBSY flag is set.). At this time, the master address is stored in IEBus reception master address register 1 and 2. While this bit is 0, a reception error interrupt does not occur when the receive buffer is not in the receive enabled state, and the reception stops and enters the wait state. The master address is not saved. 0: A broadcast receive error is not generated up to the control field. 1: A broadcast receive error is generated up to the control field.

Bit	Bit Name	Initial Value	R/W	Description
4	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
3	RE	0	R/W	Receive Enable Enables/disables reception. This bit must be set at the initial setting before frame reception. 0: Reception is disabled. 1: Reception is enabled.
2 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

22.3.2 IEBus Command Register (IECMR)

IECMR issues commands to control communications. Since this register is a write-only register, the read value is undefined.

Bit:	7	6	5	4	3	2	1	0
	-	-	-	-	-	CMD		
Initial value:	0	0	0	0	0	0	0	0
R/W:	-	-	-	-	-	W	W	W

Bit	Bit Name	Initial Value	R/W	Description
7 to 3	—	All 0	—	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
2 to 0	CMD	000	W	<p>Command</p> <p>These bits issue a command to control communications. When the CMX flag in IEFLG is set after the command issuance, the command is indicated to be in execution. When the CMX flag becomes 0, the operation state is entered.</p> <p>000: No operation. Operation is not affected. 001: Unlock (required from other units)*¹ 010: Requires communications as the master 011: Stops master communications*² 100: Undefined bits*⁴ 101: Requires data transfer from the slave 110: Stops data transfer from the slave*³ 111: Undefined bits*⁴</p>

- Notes:
1. Do not execute this command in slave communications.
 2. This command is valid during master communications (MRQ = 1). In other states, this command issuance is ignored. If this command is issued in master communications, the communications controller immediately enters the wait state. At this time, the issued master transmission request ends (MRQ = 0).
 3. This command is valid during slave communications (SRQ = 1). In other states, this command issuance is ignored. Once this command is issued in slave transmission, the SRQ flag is 0 before slave transmission. Therefore, a transmit request from the master is not responded to. If a transmit request is issued during slave transmission, the transmission stops and the wait state is entered (SRQ = 0).
 4. Undefined bits. Issuing this command does not affect operation.

22.3.3 IEBus Master Control Register (IEMCR)

IEMCR sets the communication conditions for master communications.

Bit:	7	6	5	4	3	2	1	0
	SS	RN			CTL*1			
Initial value:	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7	SS	0	R/W	Broadcast/Normal Communications Select Selects broadcast or normal communications for master communications. 0: Broadcast communications for master communications 1: Normal communications for master communications
6 to 4	RN	000	R/W	Retransmission Counts Set the number of times retransmission is done when arbitration is lost in master communications. If arbitration is lost, the TXEAL flag in IETSR is set and transmission ends. 000: 0 001: 1 010: 2 011: 3 100: 4 101: 5 110: 6 111: 7

Bit	Bit Name	Initial Value	R/W	Description
3 to 0	CTL* ¹	0000	R/W	<p>Control</p> <p>Set the control bits in the control field for master transmission.</p> <p>0000: Reads slave status</p> <p>0001: Undefined*³</p> <p>0010: Undefined*³</p> <p>0011: Reads data and locks*²</p> <p>0100: Reads locked address (lower 8 bits)</p> <p>0101: Reads locked address (upper 4 bits)</p> <p>0110: Reads slave status and unlocks*²</p> <p>0111: Reads data</p> <p>1000: Undefined*³</p> <p>1001: Undefined*³</p> <p>1010: Writes command and locks*²</p> <p>1011: Writes data and locks*²</p> <p>1100: Undefined*³</p> <p>1101: Undefined*³</p> <p>1110: Writes command</p> <p>1111: Writes data</p>

Notes: 1. CTL3 decides the data transfer direction of the message length bits in the message length field and data bits in the data field:

CTL3 = 1: Transfer is from master unit to slave unit

CTL3 = 0: Transfer is from slave unit to master unit

2. Control bits to lock and unlock

3. Setting prohibited.

22.3.4 IEBus Master Unit Address Register 1 (IEAR1)

IEAR1 sets the lower four bits of the master unit address and communications mode. In master communications, the master unit address becomes the master address field value. In slave communications, the master unit address is compared with the received slave address field.

Bit:	7	6	5	4	3	2	1	0
	IARL4				IMD		-	STE
Initial value:	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
7 to 4	IARL4	0000	R/W	Lower 4 Bits of IEBus Master Unit Address Set the lower 4 bits of the master unit address. This register becomes the master address field value. In slave communications, the master unit address is compared with the received slave address field.
3, 2	IMD	00	R/W	IEBus Communications Mode Set IEBus communications mode. 00: Communications mode 0 01: Communications mode 1 10: Communications mode 2 11: Setting prohibited
1	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
0	STE	0	R/W	Slave Transmission Setting Sets bit 4 in the slave status register. Transmitting the slave status register informs the master unit that the slave transmission enabled state is entered by setting this bit to 1. Note that this bit only sets the slave status register value and does not directly affect slave transmission. 0: Bit 4 in the slave status register is 0 (slave transmission stop state) 1: Bit 4 in the slave status register is 1 (slave transmission enabled state)

22.3.5 IEBus Master Unit Address Register 2 (IEAR2)

IEAR2 sets the upper eight bits of the master unit address. In master communications, this register becomes the master address field value. In slave communications, this register is compared with the received slave address field.

Bit	Bit Name	Initial Value	R/W	Description
7 to 0	IARU8	All 0	R/W	Upper 8 Bits of IEBus Master Unit Address Set the upper 8 bits of the master unit address. This register becomes the master address field value. In slave communications, the master unit address is compared with the received slave address field.

22.3.6 IEBus Slave Address Setting Register 1 (IESA1)

IESA1 sets the lower four bits of the communications destination slave unit address.

Bit	Bit Name	Initial Value	R/W	Description
7 to 4	ISAL4	0000	R/W	Lower 4 Bits of IEBus Slave Address These bits set the lower 4 bits of the communication destination slave unit address.
3 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

22.3.7 IEBus Slave Address Setting Register 2 (IESA2)

IESA2 sets the upper eight bits of the communications destination slave unit address.

Bit	Bit Name	Initial Value	R/W	Description
7 to 0	ISAU8	All 0	R/W	Upper 8 Bits of IEBus Slave Address Set upper 8 bits of the communications destination slave unit address

22.3.8 IEBus Transmit Message Length Register (IETBFL)

IETBFL sets the message length for master or slave transmission.

Bit	Bit Name	Initial Value	R/W	Description
7 to 0	IBFL	All 0	R/W	Transmit Message Length Set the message length for master transmission. Set the message length that does not exceed the maximum transmit bytes in communications mode. H'01: 1 byte H'02: 2 bytes : H'7F: 127 bytes H'80: 128 bytes H'81: Undefined* : H'FF: Undefined* H'00: Undefined*

Note: * Setting prohibited

22.3.9 IEBus Reception Master Address Register 1 (IEMA1)

IEMA1 indicates the lower four bits of the communication destination master unit address in slave/broadcast reception.

Bit:	7	6	5	4	3	2	1	0
	IMAL4				-	-	-	-
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7 to 4	IMAL4	0000	R	<p>Lower Four Bits of IEBus Reception Master Address</p> <p>Indicates the lower four bits of the communication destination master unit address in slave/broadcast reception. This register is enabled when slave/broadcast reception starts, and the contents are changed at the time of setting the RXS flag. If a broadcast receive error interrupt is selected by the DEE bit in IECTR and the receive buffer is not in the receive enabled state at control field reception, a receive error interrupt is generated and the lower four bits of the master address are stored in IEMA1.</p>
3 to 0	—	All 0	R	<p>Reserved</p> <p>These bits are always read as 0. The write value should always be 0.</p>

22.3.10 IEBus Reception Master Address Register 2 (IEMA2)

IEMA2 indicates the upper eight bits of the communications destination master unit address in slave/broadcast reception. This register is enabled when slave/broadcast reception starts, and the contents are changed at the time of setting the RXS flag in IERSR.

If a broadcast receive error interrupt is selected with the DEE bit in IECTR and the receive buffer is not in the receive enabled state at control field reception, a receive error interrupt is generated and the upper eight bits of the master address are stored in IEMA2. This register cannot be modified.

Bit:	7	6	5	4	3	2	1	0
	<div style="display: flex; justify-content: space-between; width: 100%;"> IMAUS </div>							
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7 to 0	IMAUS	All 0	R	Upper Eight Bits of IEBus Reception Master Address Indicates the upper eight bits of the communications destination master unit address in slave/broadcast reception. This register is enabled when slave/broadcast reception starts, and the contents are changed at the time of setting the RXS flag. If a broadcast receive error interrupt is selected by the DEE bit in IECTR and the receive buffer is not in the receive enabled state at control field reception, a receive error interrupt is generated and the upper eight bits of the master address are stored in IEMA2.

22.3.11 IEBus Receive Control Field Register (IERCTL)

IERCTL indicates the control field value in slave/broadcast reception. This register is enabled when slave/broadcast receive starts, and the contents are changed at the time of setting the RXS flag in IERSR. This register cannot be modified.

Bit:	7	6	5	4	3	2	1	0
	-	-	-	-	RCTL			
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7 to 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
3 to 0	RCTL	0000	R	IEBus Receive Control Field Indicates the control field value in slave/broadcast reception. This register is enabled when slave/broadcast reception starts, and the contents are changed at the time of setting the RXS flag.

22.3.12 IEBus Receive Message Length Register (IERBFL)

IERBFL indicates the message length field in slave/broadcast reception. This register is enabled when slave/broadcast receive starts, and the contents are changed at the time of setting the RXS flag in IERSR.

This register cannot be modified.

Bit:	7	6	5	4	3	2	1	0
	RBFL							
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7 to 0	RBFL	All 0	R	IEBus Receive Message Length Indicates the contents of the message length field in slave/broadcast reception.

22.3.13 IEBus Lock Address Register 1 (IELA1)

IELA1 specifies the lower eight bits of a locked address when a unit is locked.

Bit:	7	6	5	4	3	2	1	0
	ILAL8							
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7 to 0	ILAL8	All 0	R	Lower Eight Bits of IEBus Lock Address Indicates the lower eight bits of the master unit address when a unit is locked. These bits are valid only when the LCK bit in IEFLG is set.

22.3.14 IEBus Lock Address Register 2 (IELA2)

IELA2 specifies the upper four bits of a locked address when a unit is locked.

Bit:	7	6	5	4	3	2	1	0
	-	-	-	-	ILAU4			
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7 to 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
3 to 0	ILAU4	0000	R	Upper Four Bits of IEBus Locked Address Stores the upper four bits of the master unit address when a unit is locked. These bits are valid only when the LCK bit in IEFLG is set

22.3.15 IEBus General Flag Register (IEFLG)

IEFLG indicates the command execution status, lock status and slave address match, and broadcast reception detection.

Bit:	7	6	5	4	3	2	1	0
	CMX	MRQ	SRQ	SRE	LCK	-	RSS	GG
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7	CMX	0	R	Command Execution Status Indicates the command execution status. 0: Command execution is completed 1: A command is being executed [Setting condition] <ul style="list-style-type: none"> When a master communications request or slave transmit request command is issued while the MRQ, SRQ, or SRE flag is set [Clearing condition] <ul style="list-style-type: none"> When a command execution has been completed
6	MRQ	0	R	Master Communications Request Indicates whether the unit is in the communications request state as a master unit. 0: The unit is not in the communications request state as a master unit 1: The unit is in the communications request state as a master unit [Setting condition] <ul style="list-style-type: none"> When the CMX flag is cleared to 0 after the master communications request command is issued [Clearing condition] <ul style="list-style-type: none"> When the master communications have been completed

Bit	Bit Name	Initial Value	R/W	Description
5	SRQ	0	R	<p>Slave Transmission Request</p> <p>Indicates whether the unit is in the transmit request state as a slave unit.</p> <p>0: The unit is not in the transmit request state as a slave unit</p> <p>1: The unit is in the transmit request state as a slave unit</p> <p>[Setting condition]</p> <ul style="list-style-type: none"> When the CMX flag is cleared to 0 after the slave transmit request command is issued. <p>[Clearing condition]</p> <ul style="list-style-type: none"> When a slave transmission has been completed.
4	SRE	0	R	<p>Slave Receive Status</p> <p>Indicates the execution status in slave/broadcast reception.</p> <p>0: Slave/broadcast reception is not being executed</p> <p>1: Slave/broadcast reception is being executed</p> <p>[Setting condition]</p> <ul style="list-style-type: none"> When the slave/broadcast reception is started while the RE bit in IECTR is set to 1. <p>[Clearing condition]</p> <ul style="list-style-type: none"> When the slave/broadcast reception has been completed.

Bit	Bit Name	Initial Value	R/W	Description
3	LCK	0	R	<p>Lock Status Indication</p> <p>Set to 1 when a unit is locked by a lock request from the master unit. IELA1 and IELA2 values are valid only when this flag is set to 1.</p> <p>0: A unit is unlocked 1: A unit is locked</p> <p>[Setting condition]</p> <ul style="list-style-type: none"> When data for the number of bytes specified by the message length is not received after the control bits that make the unit locked are received from the master unit. (The LCK flag is set to 1 only when the message length exceeds the maximum number of transfer bytes in one frame. This flag is not set by completion of other errors.) <p>[Clearing condition]</p> <ul style="list-style-type: none"> When an unlock condition is satisfied or when an unlock command is issued.
2	—	0	R	<p>Reserved</p> <p>This bit is always read as 0. The write value should always be 0.</p>
1	RSS	0	R	<p>Receive Broadcast Bit Status</p> <p>Indicates the received broadcast bit value. This flag is valid when the slave/broadcast reception is started. (This flag is changed at the time of setting the RXS flag.)</p> <p>The previous value remains unchanged until the next slave/broadcast reception is started.</p> <p>0: Received broadcast bit is 0 1: Received broadcast bit is 1</p>

Bit	Bit Name	Initial Value	R/W	Description
0	GG	0	R	<p>General Broadcast Reception Acknowledgement</p> <p>Set to 1 when the slave address is acknowledged as H'FFF in broadcast reception. Like the receive broadcast bit, this flag is valid when the slave/broadcast reception is started. (This flag is changed at the time of setting the RXS flag in IERSR.)</p> <p>The previous value remains unchanged until the next slave/broadcast reception is started. This flag is cleared to 0 in slave normal reception.</p> <p>0: (1) A unit is in slave reception (2) When H'FFF is not acknowledged in the slave address field in broadcast reception</p> <p>1: When H'FFF is acknowledged in the slave address field in broadcast reception</p>

22.3.16 IEBus Transmit Status Register (IETSR)

IETSR detects events such as transmit start, transmit normal completion, and transmit error end. Each status flag in IETSR corresponds to a bit in the IEBus transmit interrupt enable register (IEIET) that enables or disables each interrupt. This register is cleared by writing 1 to each bit.

Bit:	7	6	5	4	3	2	1	0
	-	TXS	TXF	-	TXEAL	TXETTME	TXERO	TXEACK
Initial value:	0	0	0	0	0	0	0	0

0	TXEACKE	0	R/W	<p>Acknowledge Bit Interrupt Enable</p> <p>Enables/disables an acknowledge bit (TXEACKE) interrupt.</p> <p>0: Disables an acknowledge bit (TXEACKE) interrupt</p> <p>1: Enables an acknowledge bit (TXEACKE) interrupt</p>

22.3.18 IEBus Receive Status Register (IERSR)

IERSR detects receive busy, receive start, receive normal completion, or receive completion with an error. Each status flag in IERSR corresponds to a bit in the IEIER that enables/disables each interrupt. This register is cleared by writing 1 to each bit.

Bit:	7	6	5	4	3	2	1	0
	RXBSY	RXS	RXF	RXEDE	RXEOVE	RXE RTME	RXEDLE	RXEPE
Initial value:	0	0	0	0	0	0	0	0

22.3.20 IEBus Clock Selection Register (IECKSR)

IECKSR is a readable/writable 8-bit register that specifies the clock used in this module.

Bit:	7	6	5	4	3	2	1	0
	-	-	-	CKS3	-	CKS[2:0]		
Initial value:	0	0	0	0	0	0	0	1
R/W:	R	R	R	R/W	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	CKS3	0	R/W	Input Clock Selection 3* ¹ * ² Specifies the clock for this module 0: Peripheral clock (P ϕ) 1: AUDIO_X1, AUDIO_X2
3	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
2 to 0	CKS[2:0]	001	R/W	Input Clock Selection 2 to 0* ¹ Specifies the division ratio of the clock for this module 000: Setting prohibited 001: This module uses the 1/2 divided clock of IEB ϕ specified by CKS3 (IEB ϕ = 12 MHz, 12.58 MHz). 010: This module uses the 1/3 divided clock of IEB ϕ specified by CKS3 (IEB ϕ = 18 MHz, 18.87 MHz). 011: This module uses the 1/4 divided clock of IEB ϕ specified by CKS3 (IEB ϕ = 24 MHz, 25.16 MHz). 100: This module uses the 1/5 divided clock of IEB ϕ specified by CKS3 (IEB ϕ = 30 MHz, 31.45 MHz). 101: This module uses the 1/6 divided clock of IEB ϕ specified by CKS3 (IEB ϕ = 36 MHz). 110: Setting prohibited 111: Setting prohibited

- Notes:
1. Do not change the setting of CKS3 and CKS[2:0] while IEBus is in transmit/receive operation.
 2. When the CKS3 bit is set to 1, be sure to set the MSTP36 bit in STBCR3 to 0. For the setting of STBCR3, see section 33, Power-Down Modes.

22.3.21 IEBus Transmit Data Buffer 001 to 128 (IETB001 to IETB128)

IETB001 to IETB128 are 128-byte (8×128) buffers to which data to be transmitted during master transmission is written.

The initial values in IETB001 to IETB128 are undefined.

Bit	Bit Name	Initial Value	R/W	Description
7 to 0	TBn	Undefined	W*	IEBus Transmit Data Buffer Data to be transmitted in the data field during master transmission is written to TB001 to TB128. Data is written starting with TB001 for the start 1-byte data, followed by TB002 and TB003 and so on according to the transmission order, and TB128 stores the last data.

Note: * Writing to these bits during master transmission (MRQ in IEFLG is 1) is prohibited

22.3.22 IEBus Receive Data Buffer 001 to 128 (IERB001 to IERB128)

IERB001 to IERB128 are 128-byte (8×128) buffers to which data to be transmitted during slave transmission is written.

The initial values in IERB001 to IERB128 are undefined.

Bit	Bit Name	Initial Value	R/W	Description
7 to 0	RBn	Undefined	R*	<p>IEBus Receive Data Buffer</p> <p>Data in RB001 to RB128 can be read when the RXBSY bit in the IEBus receive status register (IERSR) is set to 1. Data read from RB001 to RB128 is the field data during slave receive.</p> <p>Receive data is written starting with RB001 for the start 1-byte data, followed by RB002 and RB003 and so on, and RB128 stores the last data.</p>

Note: * Reading these bits during slave reception (SRE in IEFLG is 1 and RXBSY in IERSR is 0) is prohibited. (Read value is undefined.)

22.6.4 Slave Transmit Operation

Figure 22.16 shows the timing for slave transmit operation.

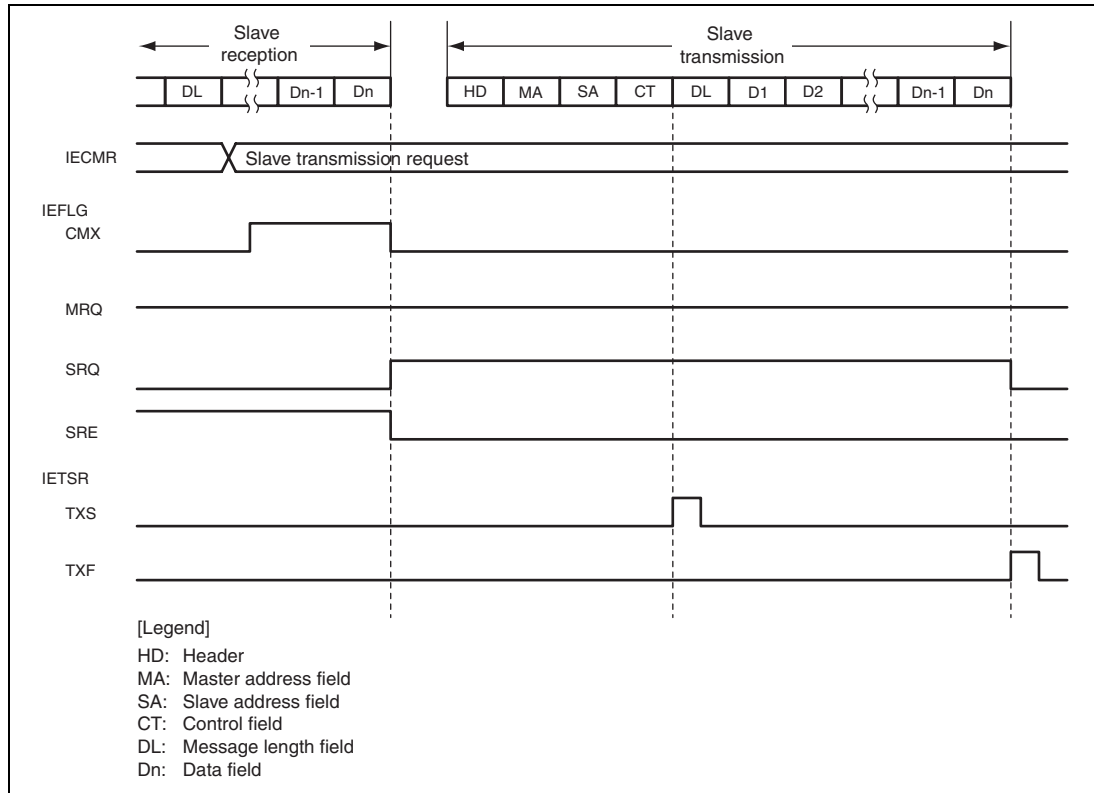

Figure 22.16 Slave Transmit Operation Timing

22.7 Interrupt Sources

Interrupt sources for this module include the following:

- Transmit start (TXS)
- Transmit normal completion (TXF)
- Arbitration loss (TXEAL)
- Transmit timing error (TXETTME)
- Overflow of the maximum number of transmit bytes in one frame (TXERO)
- Acknowledge bits (TXEACK)
- Receive busy (RXBSY)
- Receive start (RXS)
- Receive normal completion (RXF)
- Broadcast Receive Error (RXEDE)
- Receive overrun flag (RXEOVE)
- Receive timing error (RXERTME)
- Overflow of the maximum number of receive bytes in one frame (RXEDLE)
- Parity error (RXEPE)

Each source has bits corresponding to the IEBus transmit interrupt enable register (IEIET) and the IEBus receive interrupt enable register (IEIER) and can enable/disable interrupts. Each source also has status flags corresponding to the IEBus transmit status register (IETSR) and IEBus receive status register (IERSR). Reading the status flags allows determination of the interrupt sources.

Figure 22.17 shows the relations between the interrupt sources.

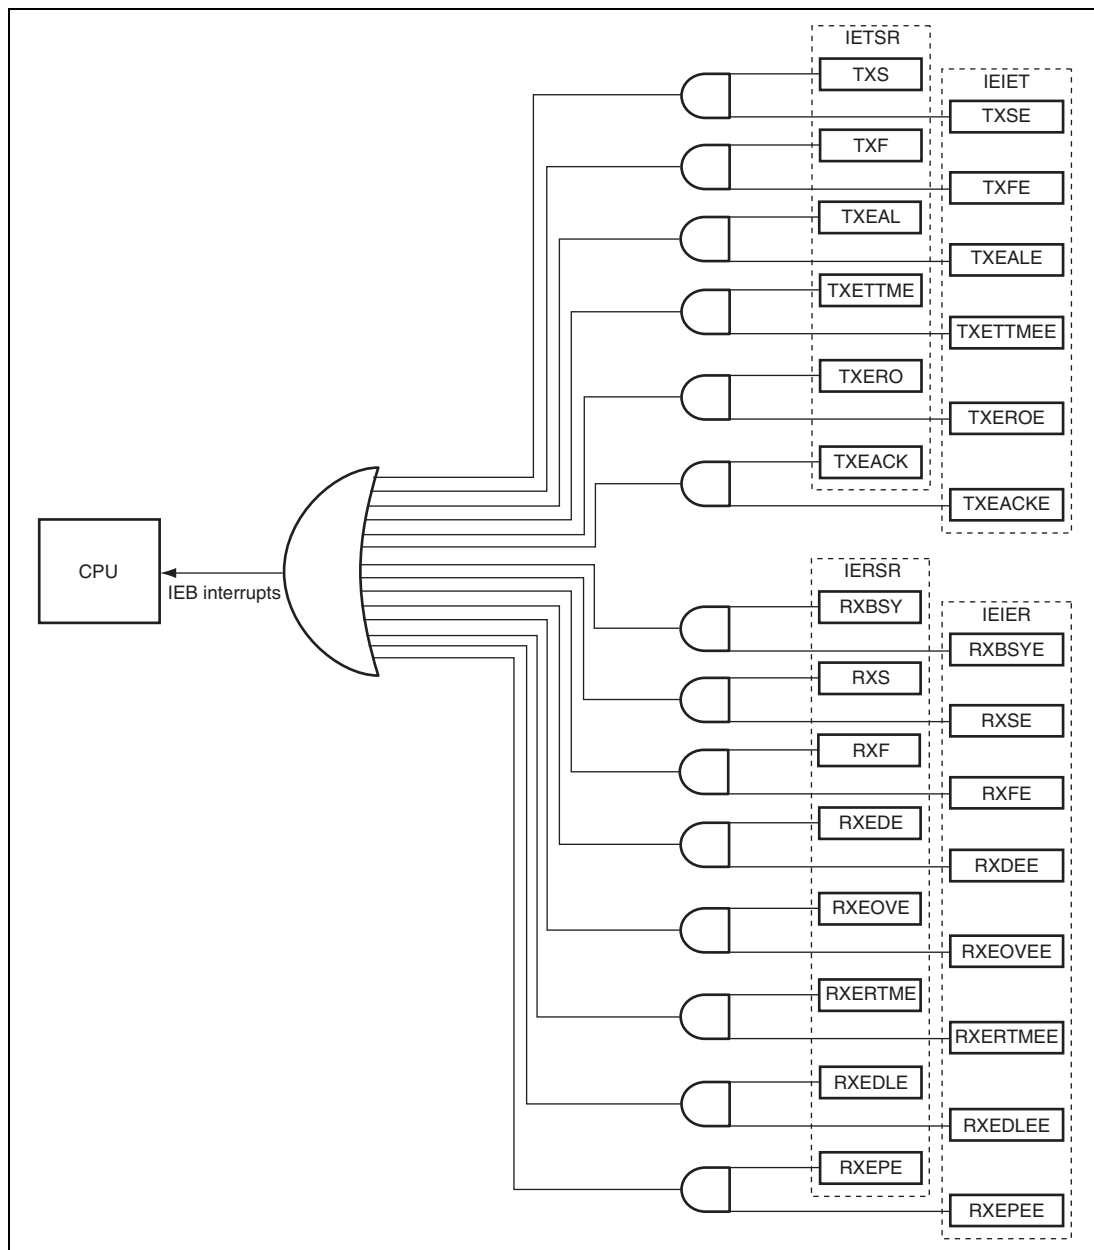

Figure 22.17 Relations between Interrupt Sources

22.8 Usage Notes

22.8.1 Note on Operation when Transfer is Incomplete after Transfer of the Maximum Number of Bytes

(1) Data Transmission

When the maximum number of bytes defined by the communications mode have been transmitted because a NAK has been received from the receive unit or transmission has not been completed because the message length value exceeds the maximum number of transfer bytes in one frame, this module sets the error flag and enters a wait state. At this time, transfer proceeds until the (n + 1)th byte has been transmitted, where n is the maximum number of transfer bytes. Then, when NAK is received via the acknowledge bit of the (n + 1)th byte, the TXERO flag is set. If ACK is received rather than NAK, the TXF flag is set.

Figure 22.18 shows the timing of operations when the maximum number of transfer bytes is reached but transmission has not been completed.

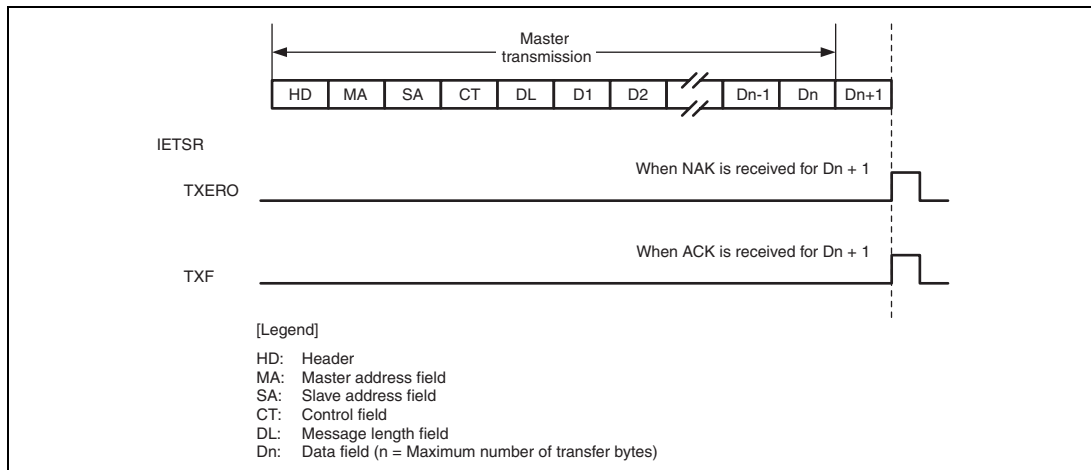

Figure 22.18 Timing of Operations when Transmission Has Not Been Completed Within the Maximum Number of Transfer Bytes

(2) Data Reception

When the data reception has not finished within the maximum number of bytes defined by the communications mode because of a parity error or overrun error causing the retransfer of data, or reception has not been completed because the message length value exceeds the maximum number of transfer bytes in one frame, this module sets the error flag and enters a state of waiting for the (n + 1)th byte of data, where n is the maximum number of transfer bytes. Thus, when data of the (n + 1)th byte cannot be received, the receive timing error is detected and the RXERTME flag is set. At this time, the RXEDLE flag is not set. The RXEDLE flag is set when the (n + 1)th byte is received.

In the same way, when the maximum number of transfer bytes has been received and a parity error has not been cleared, and the (n + 1)th byte cannot be received, the RXERTME flag is set. At this time, the RXEPE flag is not set. The RXEPE flag is set when the (n + 1)th byte is received.

Figure 22.19 shows the timing of operations when the maximum number of transfer bytes has been reached but reception is not complete.

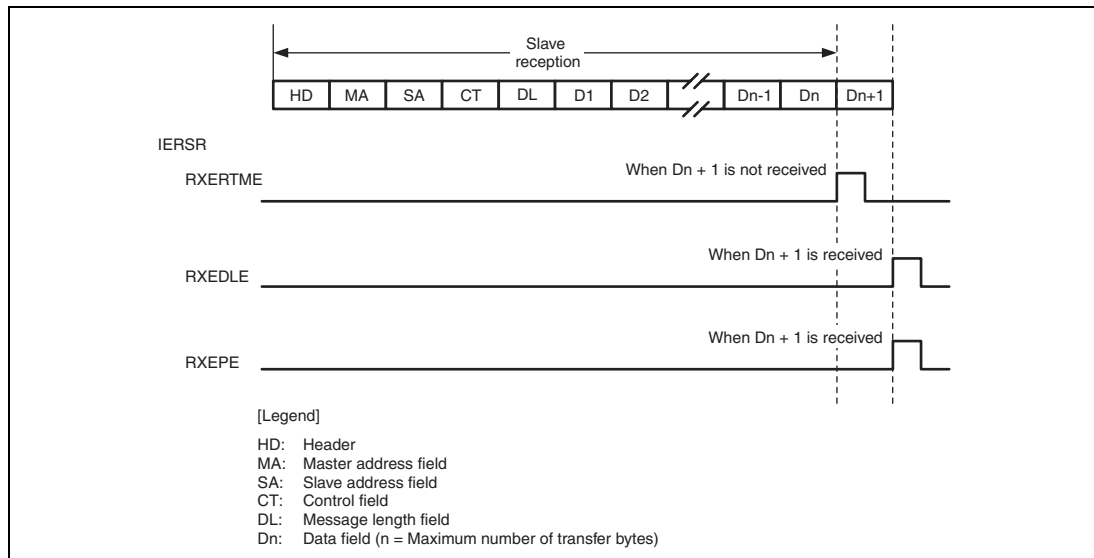

Figure 22.19 Timing of Operations when Reception Has Not Been Completed Within the Maximum Number of Transfer Bytes

Section 23 Renesas SPDIF Interface

23.1 Overview

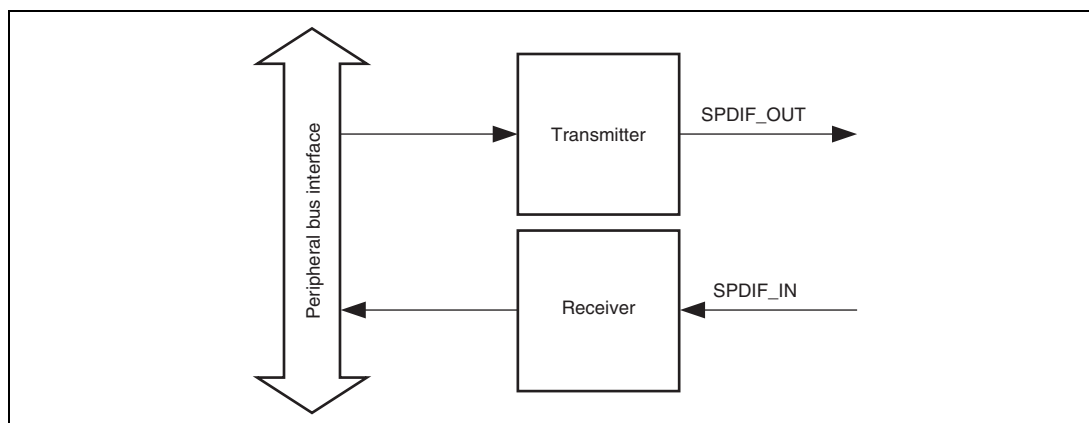

Figure 23.1 Overview Block Diagram

23.2 Features

- Supports the IEC 60958 standard (stereo and consumer use modes only).
- Supports sampling frequencies of 32 kHz, 44.1 kHz, and 48 kHz.
- Supports audio word sizes of 16 to 24 bits per sample.
- Biphase mark encoding.
- Double buffered data.
- Parity encoded serial data.
- Simultaneous transmit and receive
- Receiver autodetects IEC 61937 compressed mode data

23.3 Functional Block Diagram

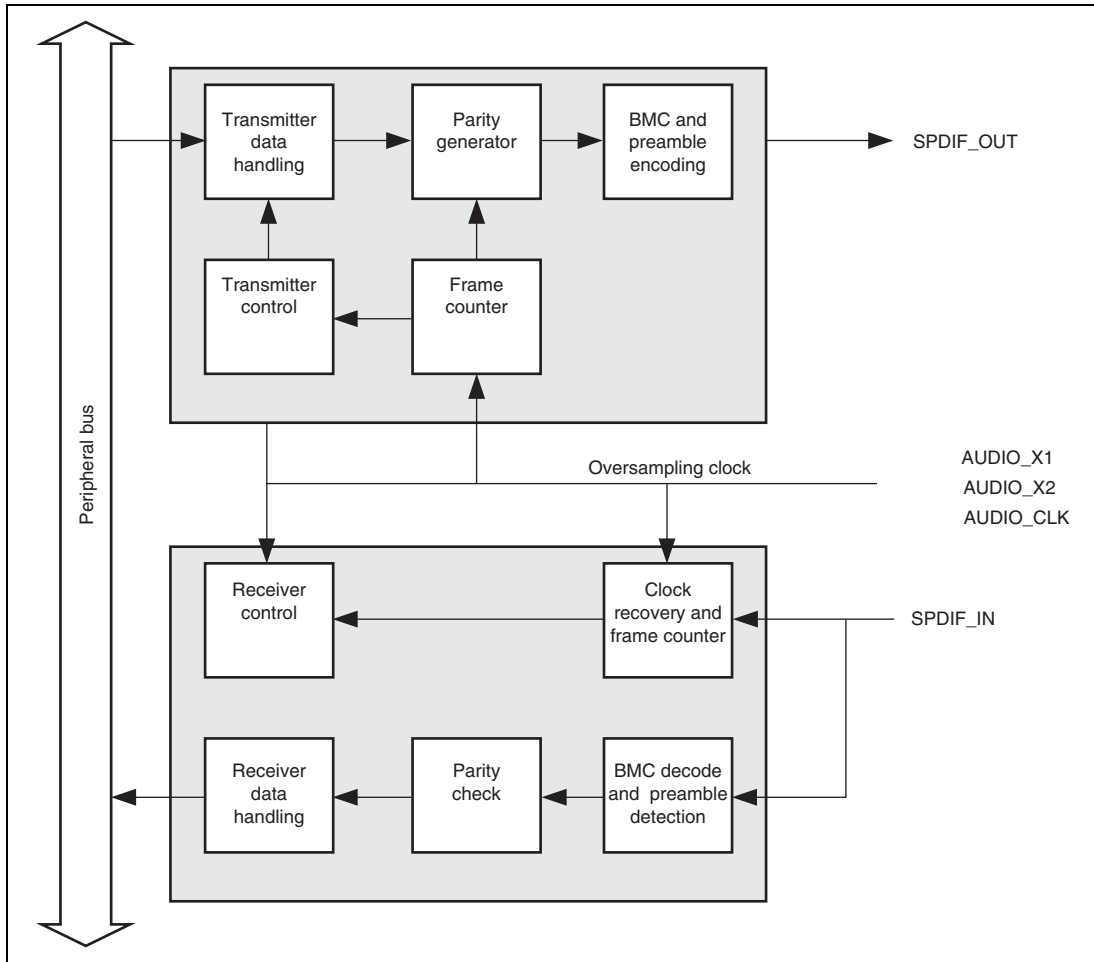

Figure 23.2 Functional Block Diagram

23.4 Input/Output Pins

Table 23.1 shows the pin configuration.

Table 23.1 Pin Configuration

Channel	Pin Name	I/O	Description
0	SPDIF_IN	Input	Transmitter biphasemark encoded SPDIF bitstream
1	SPDIF_OUT	Output	Receiver biphasemark encoded SPDIF bitstream
0, 1 (Common)	AUDIO_CLK	Input	External clock for audio
	AUDIO_X1	Input	Crystal resonator/external clock for audio
	AUDIO_X2	Output	

23.5 Renesas SPDIF (IEC60958) Frame Format

The Renesas SPDIF frame consists of two subframes (for channels 1 and 2), each of which contains a 4-bit preamble, audio data of up to 24 bits, a V flag, a user bit, a channel status bit, and an even parity bit. Figure 23.3 shows the subframe format. According to this format, the Renesas SPDIF performs biphasemark modulation (channel coding) that will make the transmission line's DC component a minimum value.

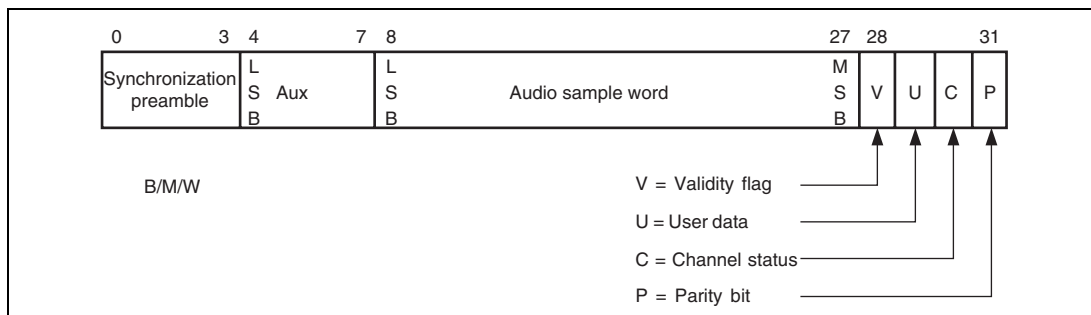

Figure 23.3 Subframe Format

Figure 23.4 shows the block format, which consists of 192 continuous frames. One block begins at the starting frame (preamble B) and ends at the 192nd frame (frame 191), and the preamble is used to identify all subframes. Each block has a total of 384 subframes, which are classified into three categories: subframe 0 indicating the beginning of a new block, subframe 1 (usually the channel 1), and subframe 2 (usually the channel 2). Usually, the music data sent and received by the SPDIF is continuous so that continuous blocks appear.

Figure 23.4 Block Format

Table 23.2 shows the binary values of the Renesas SPDIF preambles. The polarity of these preambles differs depending on the status of the preceding symbol (parity bit).

Table 23.2 Binary Preamble Values

Preamble	Preceding Symbol's Status = 0	Preceding Symbol's Status = 1
B	11101000	00010111
M	11100010	00011101
W	11100100	00011011

Note: As shown in figure 23.3, the even parity bit at time slot 31 of a subframe determines the type of a preamble for one cycle of transmission. Usually, therefore, any one is selected from the set states that are sent through the Renesas SPDIF. However, IEC60958 requires decoding both types in view of connection with the preamble polarity reversed; the Renesas SPDIF has preambles decoded according to table 23.2.

Channel status information is encoded at the rate of one bit per subframe, making the channel status information per block have a total of 192 bits for each of subframes 1 and 2. For the format of the channel status, refer to the IEC 60958 standard.

23.6 Register

Table 23.3 shows the register configuration.

Table 23.3 Register Configuration

Channel	Register Name	Abbreviation	Address	Access Size
0 (Transmit)	Transmitter channel 1 audio register	TLCA	H'FFFF 5800	32
	Transmitter channel 2 audio register	TRCA	H'FFFF 5804	32
	Transmitter channel 1 status register	TLCS	H'FFFF 5808	32
	Transmitter channel 2 status register	TRCS	H'FFFF 580C	32
	Transmitter user data register	TUI	H'FFFF 5810	32
1 (Receive)	Receiver channel 1 audio register	RLCA	H'FFFF 5814	32
	Receiver channel 2 audio register	RRCA	H'FFFF 5818	32
	Receiver channel 1 status register	RLCS	H'FFFF 581C	32
	Receiver channel 2 status register	RRCS	H'FFFF 5820	32
	Receiver user data register	RUI	H'FFFF 5824	32
0, 1 (Common)	Control register	CTRL	H'FFFF 5828	32
	Status register	STAT	H'FFFF 582C	32
0, 1 (Common)	Transmitter DMA audio data register	TDAD	H'FFFF 5830	32
	Receiver DMA audio data register	RDAD	H'FFFF 5834	32

Note: All registers are longword registers and must be accessed as such.

A register diagram containing a 0 indicates that the write value should always be 0 (if the register is writeable) and that the read value should always be 0 (if readable).

23.7 Register Descriptions

Legend:

Initial Value: Register value after reset

—: Undefined value

R/W: Readable/writable register. The write value can be read.

R: Read only register. The write value should always be 0.

R/WC0: Readable/writable register. Writing 0 initializes the bit, but writing 1 is ignored.

R/WC1: Readable/writable register. Writing 1 initializes the bit, but writing 0 is ignored.

W: Write only register. Reading is prohibited. If this bit is reserved, the write value should always be 0.

—/W: Write only, Read value undefined

23.7.1 Control Register (CTRL)

Bit:	31	30	29	28	27	26	25	24

1	TCSI	0	R/W	<p>Transmitter Channel Status Interrupt Enable</p> <p>Enables the transmitter channel status register empty interrupts.</p> <p>0: Transmitter channel status interrupt disabled</p> <p>1: Transmitter channel status interrupt enabled</p>
0	TCBI	0	R/W	<p>Transmitter Channel Buffer Interrupt Enable</p> <p>Enables the transmitter audio channel buffer empty interrupts.</p> <p>0: Transmitter audio channel interrupt disabled</p> <p>1: Transmitter audio channel interrupt enabled</p>

23.7.2 Status Register (STAT)

Bit:	31	30	29	28	27	26	25	24
	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R
Bit:	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	CMD
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8
	RIS	TIS	UBO	UBU	CE	PARE	PREE	CSE
Initial value:	1	1	0	0	0	0	0	0
R/W:	R	R	R/WC0	R/WC0	R/WC0	R/WC0	R/WC0	R/WC0
Bit:	7	6	5	4	3	2	1	0
	ABO	ABU	RUIR	TUIR	CSRX	CBRX	CSTX	CBTX
Initial value:	0	0	0	0	0	0	0	0
R/W:	R/WC0	R/WC0	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved
16	CMD	0	R	Compressed Mode Data Sets if the data being received is compressed mode data (When bit 1 = 1 in the V flag and channel status). 0: Data is not in compressed mode 1: Data is in compressed mode
15	RIS	1	R	Receiver Idle State Sets if the receiver is in the idle state. 0: Receiver is not in idle state 1: Receiver in idle state
14	TIS	1	R	Transmitter Idle State Sets if the transmitter is in the idle state. 0: Transmitter is not in idle state 1: Transmitter is in idle state

Bit	Bit Name	Initial Value	R/W	Description
13	UBO	0	R/WC0	<p>User Buffer Overrun*</p> <p>Sets if the receiver user buffer overruns. This bit is cleared by writing 0 to the register. If bit REIE and bit UBOI in the control register are set this causes an interrupt.</p> <p>0: User buffer has not overrun 1: User buffer has overrun</p>
12	UBU	0	R/WC0	<p>User Buffer Underrun*</p> <p>Sets if the transmitter user buffer underrun. This bit is cleared by writing 0. If bits TEIE and UBUI in the control register are set this causes an interrupt.</p> <p>0: User buffer has not underrun 1: User buffer has underrun</p>
11	CE	0	R/WC0	<p>Clock Error*</p> <p>Sets when the clock recovery falls out of synchronization. This bit is cleared by writing 0. If bits REIE and CREI in the control register are set this causes an interrupt.</p> <p>0: Clock recovery stable 1: Clock recovery error</p>
10	PARE	0	R/WC0	<p>Parity Error*</p> <p>Sets when the parity checker produces a fail result. This bit is cleared by writing 0. If bits REIE and PAEI in the control register are set this causes an interrupt.</p> <p>0: Parity check correct 1: Parity error</p>
9	PREE	0	R/WC0	<p>Preamble Error*</p> <p>Sets when the start of word preamble fails to appear in the correct place. This bit is cleared by writing 0. If bits REIE and PREI in the control register are set this causes an interrupt.</p> <p>Note: Only set after a start of block preamble has occurred.</p> <p>0: Preamble is in the correct place 1: Preamble error</p>

Bit	Bit Name	Initial Value	R/W	Description
8	CSE	0	R/WC0	<p>Channel Status Error*</p> <p>Sets when the channel status information is written before the 32nd frame of the current block. This bit is cleared by writing 0. If bits TEIE and CSEI in the control register are set this causes an interrupt.</p> <p>0: Channel status correct 1: Channel status error</p>
7	ABO	0	R/WC0	<p>Audio Buffer Overrun*</p> <p>Indicates that the receiver audio buffer is full in both the first and second stages and that data has been overwritten. This bit is cleared by writing 0. If bits REIE and ABOI in the control register are set then this causes an interrupt.</p> <p>0: Receiver audio buffer has not overrun 1: Receiver audio buffer has overrun</p>
6	ABU	0	R/WC0	<p>Audio Buffer Underrun*</p> <p>Indicates that the transmitter audio buffer is empty in both the first and second stages and that the last data transmission has been repeated. This bit is cleared by writing 0. If bits TEIE and ABUI in the control register are set then this causes an interrupt.</p> <p>0: Transmitter audio buffer has not underrun 1: Transmitter audio buffer has underrun</p>
5	RUIR	0	R	<p>Receiver User Information Register Status</p> <p>Indicates the status of the receiver user information register. This bit is cleared by reading from the receiver user register. If bit RUII in the control register is set then this causes an interrupt.</p> <p>0: Receiver user information register is empty 1: Receiver user information register is full</p>
4	TUIR	0	R	<p>Transmitter User Information Register Status</p> <p>Indicates the status of the transmitter user information register. This bit is cleared by writing to the transmitter user register. If bit TUII in the control register is set then this causes an interrupt.</p> <p>0: Transmitter user information register is full 1: Transmitter user information register is empty</p>

Bit	Bit Name	Initial Value	R/W	Description
3	CSRX	0	R	<p>Channel 1 and Channel 2 Status for Receiver</p> <p>Indicates the status of the receiver channel status registers. This bit is cleared by reading from the receiver channel status registers. If bit RCSI in the control register is set this causes an interrupt.</p> <p>0: Receiver channel status registers are empty 1: Receiver channel status registers are full</p>
2	CBRX	0	R	<p>Channel 1 and Channel 2 Buffers for Receiver</p> <p>Indicates the status of the receiver audio channel registers. This bit is cleared by reading from the receiver audio channel registers. If bit RCBI in the control register is set this causes an interrupt.</p> <p>0: Receiver audio channel registers are empty 1: Receiver audio channel registers are full</p>
1	CSTX	0	R	<p>Channel 1 and Channel 2 Status for Transmitter</p> <p>Indicates the status of the transmitter channel status registers. This bit is cleared by writing to the transmitter channel status registers. If bit TCSI in the control register is set this causes an interrupt.</p> <p>0: Transmitter channel status register is full 1: Transmitter channel status register is empty</p>
0	CBTX	0	R	<p>Channel 1 and Channel 2 Buffers for Transmitter</p> <p>Indicates the status of the transmitter audio channel registers. This bit is cleared by writing to the transmitter audio channel registers. If bit TCBI in the control register is set this causes an interrupt.</p> <p>0: Transmitter audio channel registers are full 1: Transmitter audio channel registers are empty</p>

Note: * When an error bit is detected during DMA transfer, DMA transfer settings must be made again. In this case, the Renesas SPDIF's module enable bit (either the RME or TME bit) and the DMA enable bit (either the RDE or TDE bit) must be disabled and the error status must be cleared before making DMA transfer settings again. Then the module enable bit should be set and DMA transfer can be started again.

23.7.3 Transmitter Channel 1 Audio Register (TLCA)

Bit:	31	30	29	28	27	26	25	24
	-	-	-	-	-	-	-	-

31 to 24	—	—	W	Reserved
23 to 0	Audio PCM Data	All 0	W	Audio PCM Data LSB aligned PCM encoded audio data.

23.7.6 Transmitter User Data Register (TUI)

U-bit data in subframes is written in to this register. Because U-bit data is transmitted in a sequence of subframes 1 and 2, you need to update the data on a 16-frame basis. For the contents of the user bytes refer to the appropriate standard for the device in use. The user bits to be transmitted are set in sequence starting at the LSB.

Bit:	31	30	29	28	27	26	25	24

23.7.7 Transmitter Channel 1 Status Register (TLCS)

The 30-bit register stores the channel status information to be transmitted. For each channel, channel status information per frame consists of 192 bits. Because necessary data covers only the 30 bits that are set in the following register, zeros continue to be sent after the transmission of the first 30 bits.

23.8 Functional Description—Transmitter

23.8.1 Transmitter Module

The transmitter module transmits PCM data and auxiliary information after encoding it according to the method of biphasemark modulation that complies with the IEC60958 standard (SPDIF).

The clock for the transmitter module is an oversampling clock supplied from the outside. This clock usually selects a value that serves as an oversample at a frequency eight times larger than the clock frequency required for biphasemark encoding. In this case, the clock frequency required to transmit 32 time slots in a subframe is 512 times as large as the sample frequency for audio data.

Audio data and channel status information are first written into the module's channel 1 and then into channel 2. Generally, the channel status need to be written only when the information changes. The SPDIF module requests that the channel status be written in 30 frames -- when all the current channel status data have been transmitted. You need to write somewhere between frame 31 and the beginning of the next block of 192 frames.

The audio data is stored in a double buffer arrangement. To make sure that the first stage buffer is empty, you can send an interrupt request or poll the status register. DMA transfers send channel 1 audio data on the first request and channel 2 data on the second.

The channel status information is stored in the 30-bit registers of channels 1 and 2. For each channel, the channel status information per frame consists of 192 bits. Because necessary data covers only 30 bits, zeros continue to be sent after the transmission of the first 30 bits until the block is completed.

User data forms a 32-bit double buffer arrangement. You can make sure that the first stage buffer is empty by either sending an interrupt request or polling the status register. Usually, information about the user data will become insufficient with the length of data between blocks. Transmission takes place in a sequence of channels 1 and 2. For the user data within a block, 384 bits are transmitted before the next block is continuously transmitted.

The audio data handled by the Renesas SPDIF module is a linear PCM, making it possible to set up to 24 bits. For this reason, the V flag indicating that audio data is a linear PCM remains to be 0. The V flag involves no register-based setting. An even parity is created for each 32 bits of serial output data (excluding the preamble).

Note: When transmitter user buffer underrun occurs, the current data in the buffer data of SPDIF is transmitted until the next data is filled.

23.8.2 Transmitter Module Initialization

The device defaults to an idle state when it comes out of reset, or can be put into an idle state when 0 is written to the TME bit in the CTRL register. When the transmitter module is idle, it has the following settings:

- The transmitter idle status bit (TIS) is set to 1, all other status bits are cleared to 0.
- Preamble generation is invalid.
- Synchronization between channels 1 and 2 is set to 0 (0 for channel 1, 1 for channel 2).
- Both word_count and frame_count are set to 0.
- The output from the biphasemark encoder is set to 0.

Channel status, user and audio data registers will retain its value prior to putting the module into idle. To exit the idle state the user must write 1 to the TME bit in the CTRL register.

23.8.3 Initial Settings for Transmitter Module

When the TME bit is set to 1, the TUIR and CSTX bits are set to 1. After that, if data is written in the order of 1) TUI and 2) TLCS and TRCS, a channel status error will occur. To avoid this, be sure to write data in the order of 1) TLCS and TRCS and 2) TUI.

Before writing the first audio data (write access to TLCA or TRCA by the CPU or write access to TDAD by the DMA transfer) after setting the TME bit to 1, be sure to check that the CSTX and TUIR bits are cleared by writing to TLCS, TRCS, and TUI.

23.8.4 Transmitter Module Data Transfer

Once the transmitter module has left the idle state, it is ready for data transfer. Data transfer timing can be achieved in three ways. Either the transfer is done by interrupts, DMA requests or by polling the status register. There is a shared interrupt line (for both transmit and receive) and a single transmitter DMA request line.

Figure 23.5 shows a data transfer with an interrupt for the transmitter.

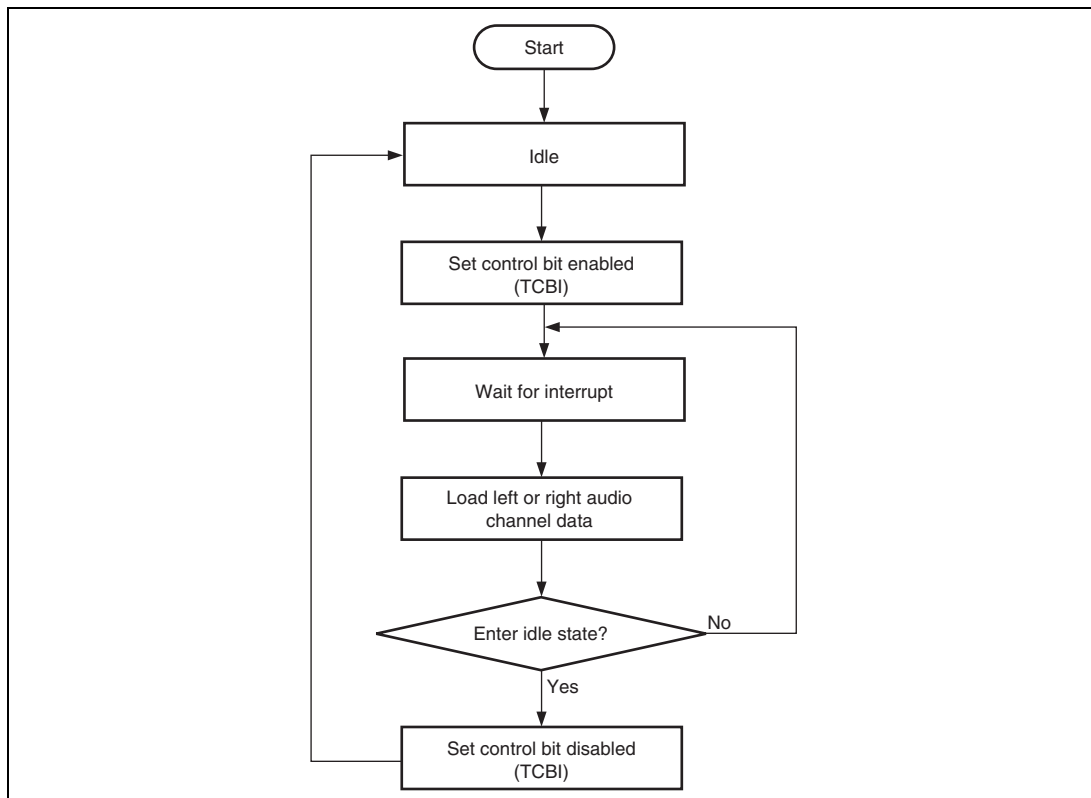

Figure 23.5 Transmitter Data Transfer Flow Diagram - Interrupt Driven

Figure 23.6 shows a data transfer with a DMA transfer for the transmitter.

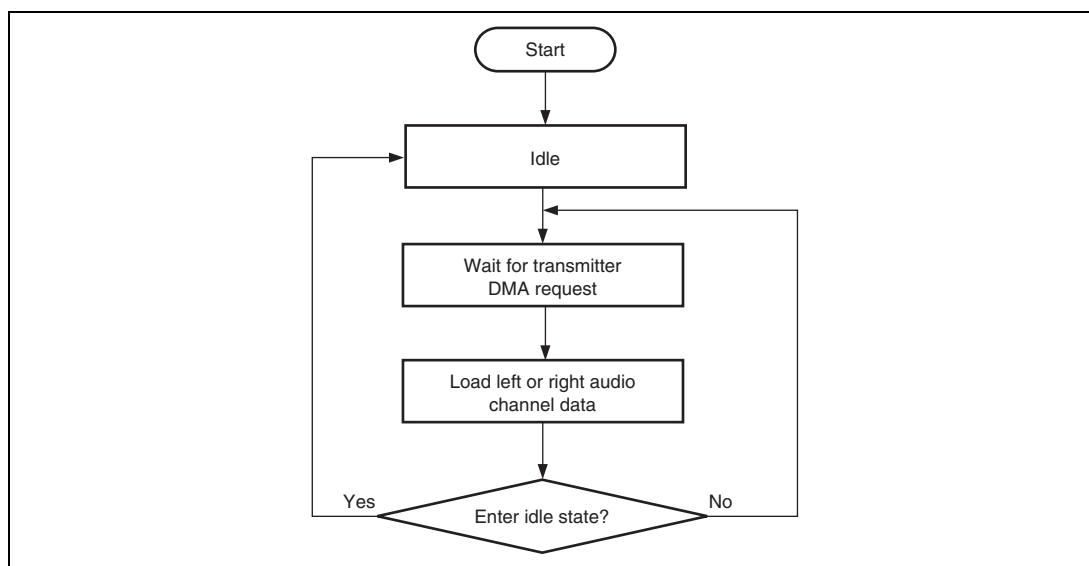

Figure 23.6 Transmitter Data Transfer Flow Diagram—DMA Request Driven

Channel status information is required to be updated when the information has changed. Because the updating needs to be done before the transmission of the next block, the channel status to be updated should be written after 30 frames have been sent; this is indicated either by an interrupt or by polling the status bit. If channel status is written before 30 frames have been sent (while current information is being sent) then an interrupt indicates that the channel status error bit (CSE) in the status register has been set.

Note: 30 frames contains all the valid information in a single channel status block.

23.9 Functional Description—Receiver

23.9.1 Receiver Module

The receiver module demodulates data and clock signals from the input encoded according to the IEC60958 standard. The encoded data, shown in linear PCM format, is stored into the audio data register. The register also stores the channel status and user information being received simultaneously as auxiliary information.

The main clock for the receiver module is an oversampling clock supplied from the outside. The module operates at a frequency four times as large as the oversampling clock.

Note: The oversampling clock is the same for the transmitter and receiver.

Clock recovery is performed using a pulse width counter and averaging filters to produce a sampling pulse in the middle of each bit in the datastream. A clock error status bit indicates clock synchronization loss. Synchronization is achieved when a preamble occurs on the data stream for the first time. Continuous adjustment prevents jitter and/or clock drift from affecting clock recovery, provided that they fall within the clock recovery specifications.

Once the clock recovery is successful the biphase-mark decoder initiates its preamble detection. The decoder searches for the start of block preamble (see table 23.2). A preamble error status bit indicates that following preambles have not appeared at the correct time, such failures are most likely caused by transmission loss or interference.

Even parity checking is performed on the decoded data. A discrepancy will result in the parity error status bit being set.

The SPDIF module acquires user data and channel status information in addition to audio data. The audio is stored in a double buffer arrangement. Either an interrupt request because of a full buffer or polling of the status bit will indicate when the data is ready to be read. DMA transfers receive channel 1 audio data on the first request and channel 2 data on the second.

Channel status is stored in a 30-bit register. Channel status information is received at 1-bit per subframe. Therefore the registers will not be full until a total of 30 frames for each channel have been received. New channel status is compared with the current data to see if it has changed and is only read by the processor if it has. User data, which is also received at the same time, is stored into the register on a subframe basis, so that the reception is completed when 16 frames are reached.

- Notes: 1. Channel status data requests do not support DMA.
 2. When receiver user buffer overrun occurs, the current data in the buffer data of SPDIF is overwritten by the next incoming data from SPDIF interface.

23.9.2 Receiver Module Initialization

The device defaults to an idle state when it comes out of reset, or can be put into an idle state by writing 0 to bit RME in the CTRL register. Whilst idle the module has the following settings:

- The receiver idle status bit is set to 1, all other status bits are cleared to 0.
- Synchronization between channels 1 and 2 is set to 0 (0 for channel 1, 1 for channel 2).
- Both Word_count and frame_count are set to 0.

Channel status registers, user data registers and audio data registers will retain its value prior to putting the module into idle. To exit the idle state the user must write 1 to the bit RME in the CTRL register.

23.9.3 Receiver Module Data Transfer

Once the module has left the idle state it is ready for data transfer. Data transfer timing can be achieved in three ways. The transfer can be done by interrupts, or by polling the status register, or by DMA. There is a shared interrupt line (transmit and receive) and a single receiver DMA request line. Data transfer for the receiver can be interrupted by error signals caused by:

1. Clock recovery failure.
2. Transmission loss or interference – indicated by a preamble error.
3. Parity check failure.

Transmission loss or interference can cause the start of subframe or start of block preamble to be misplaced or not present.

Parity check failure occurs when the parity bit is incorrect, this can be caused by any of the above.

- Clock Recovery Deviation

The receive margin for clock recovery is based on the following equation:

$$M = \left| \left(0.5 - \frac{1}{2N} \right) - (L - 0.5) F - \frac{|D - 0.5|}{N} (1 + F) \right| \times 100\%$$

where M = receive margin

N = oversampling rate

L = frame length = 33

D = duty cycle = 0.6

F = oversampling clock deviation = Level II accuracy = $1000 \text{ in } 10e^{-6}$

Figure 23.7 indicates what the receive margin M represents

Figure 23.7 Receive Margin

Introducing jitter into the equation gives the following inequality.

$$j \leq \left| \left(0.5 - \frac{1}{2N} \right) - (L - 0.5) F - \frac{|D - 0.5|}{N} (1 + F) \right| \times 100\%$$

J = clock jitter

Eight times oversampling produces a receive margin = 39.25%

Four times oversampling produces a receive margin = 31.75%

Two times oversampling produces a receive margin = 16.75%

The fastest sample frequency is 48 kHz. This requires a clock speed of $128 \times 48 \text{ kHz} = 6.144 \text{ MHz}$. The worst case jitter in one cycle is specified at $40 \text{ ns} = 24.5\%$ of the period. This means that an oversampling rate of 4 or more will satisfy the inequality and therefore be sufficient for clock recovery.

Figure 23.8 illustrates the receiver data transfer using interrupts.

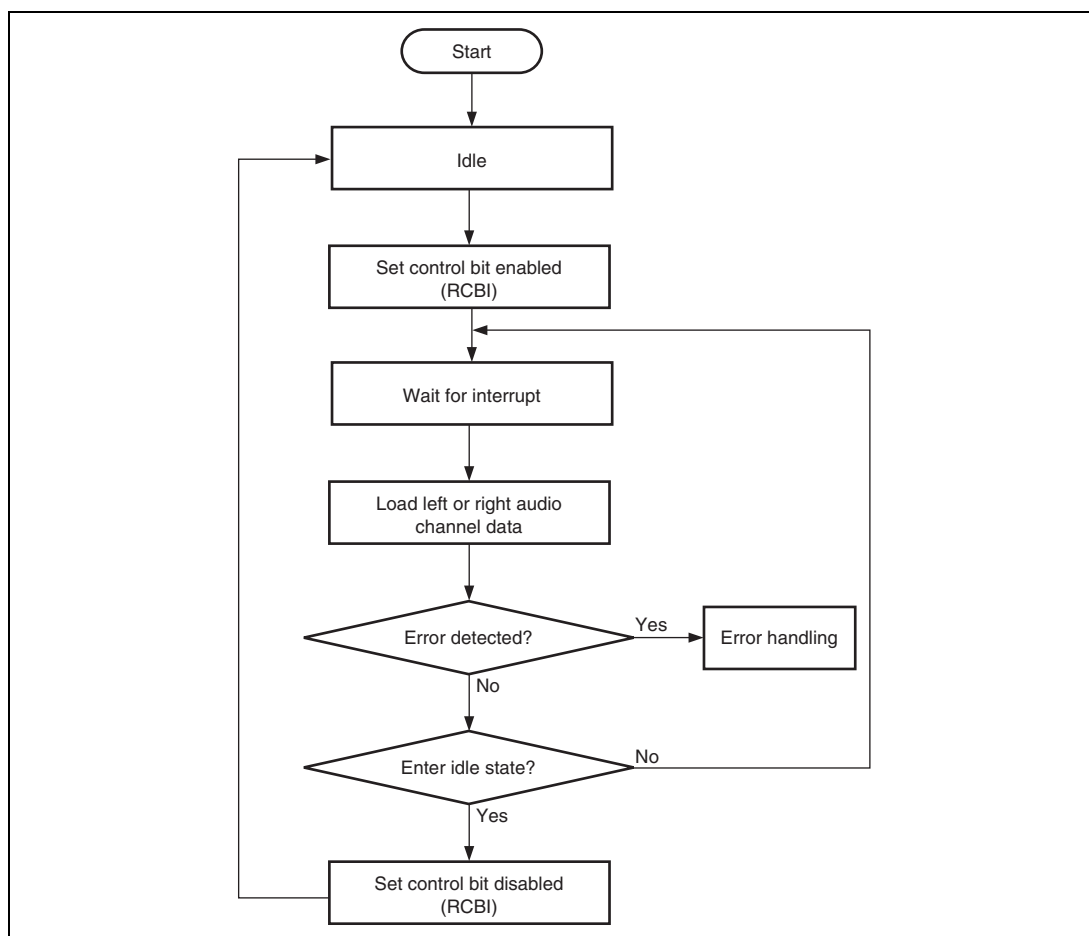

Figure 23.8 Receiver Data Transfer Flow Diagram - Interrupt Driven

Interrupts to indicate that the channel status information register is full occur after frame 30 has been received and only if the information has changed. When the first four bytes have been stored an interrupt occurs.

23.10 Disabling the Module

23.10.1 Transmitter and Receiver Idle

The transmitter or receiver modules can be disabled by writing 0 to the idle bit in the control register (TME for the transmitter and RME for the receiver). The idle state can be detected by polling the idle bit in the status register (TIS and RIS).

23.11 Compressed Mode Data

Compressed mode data is defined in the IEC 61937 specification. This module only detects compressed mode data. This is done by checking the parity flag (V flag) and bit 1 in the channel status data. If both are one then the data is in compressed mode. This is indicated by the setting of the CMD bit in the status register.

Note: Only the receiver detects compressed mode data since the information is not relevant to the transmitter.

23.13 Usage Notes

23.13.1 Clearing TUIR

After TUI is written to, the TUIR bit is cleared only after transmission of a maximum of one frame is completed. When using a transmitter user information interrupt to write data to TUI, check that the TUIR bit is cleared before terminating the interrupt handling routine so that the interrupt is not unexpectedly accepted again.

23.13.2 Frequency of Clock Input for Audio

The frequency of the clock input to the AUDIO_X1 and AUDIO_X2 or AUDIO_CLK must be lower than the P ϕ frequency.

Section 24 CD-ROM Decoder

The CD-ROM decoder decodes streams of data transferred from the CD-DSP. When the medium is CD-DA*¹, the data stream is not input to the CD-ROM decoder because it consists of PCM data. In the case of CD-ROM*², the stream of data is input and the CD-ROM decoder performs sync code detection and maintenance, descrambling, ECC correction, and EDC checking, and outputs the resulting stream of data.

However, since the stream received by the CD-ROM decoder is assumed to consist of data from a CD-ROM transferred via the serial sound interface, the decoder does not bother with the subcodes defined in the CD-DA standard.

Notes: 1. Compliant with JIS S 8605 (Red Book)
2. Compliant with JIS X 6281 (Yellow Book)

24.1 Features

- Sync-code detection and maintenance

Detects sync codes from the CD-ROM and is capable of providing sync-code maintenance (automatic interpolation of sync codes) when the sync code cannot be detected because of defects such as scratches on the disc.

Five sector-synchronization modes are supported: automatic sync maintenance mode, external sync mode, interpolated sync mode, and interpolated sync plus external sync mode.

- Descrambling
- ECC support

P-parity-based correction, Q-parity-based correction, PQ correction, and QP correction are available.

PQ correction and QP correction can be applied repeatedly up to three times. This, however, depends on the speed of the CD. For example, three iterations are possible when the CD-ROM decoder is operating at 60 MHz with a double-speed CD drive.

Two buffers are provided due to the need for ECC correction. This allows parallel operation, where ECC correction is performed in one buffer while the data stream is being received in the other.

- EDC checking

The EDC is checked before and after correction based on the ECC. Furthermore, an operating mode is available in which, if the result of pre-correction EDC checking indicates no errors, ECC correction is not performed regardless of the result of syndrome calculation.

- Data buffering control

The CD-ROM decoder outputs data to the buffer area in a specific format where the sync code is at the head of the data for each sector.

24.1.1 Formats Supported by CD-ROM Decoder

This module supports the five formats shown in figure 24.1.

Mode0	Sync (12 bytes)	Header (4 bytes)	All 0				
Mode1	Sync (12 bytes)	Header (4 bytes)	Data (2048 bytes)	EDC (4 bytes)	0 (8 bytes)	P-parity (172 bytes)	Q-parity (104 bytes)
Mode2 (not XA)	Sync (12 bytes)	Header (4 bytes)	Data (2336 bytes)				
Mode2 Form1	Sync (12 bytes)	Header (4 bytes)	Sub-header (8 bytes)	Data (2048 bytes)	EDC (4 bytes)	P-parity (172 bytes)	Q-parity (104 bytes)
Mode2 Form2	Sync (12 bytes)	Header (4 bytes)	Sub-header (8 bytes)	Data (2324 bytes)	EDC (4 bytes)		

Figure 24.1 Formats Supported by CD-ROM Decoder

24.2 Block Diagrams

Figure 24.2 is a block diagram of the CD-ROM decoder functions of this LSI and the bus bridge for connection to the bus, that is, of the elements required to implement the CD-ROM decoder function.

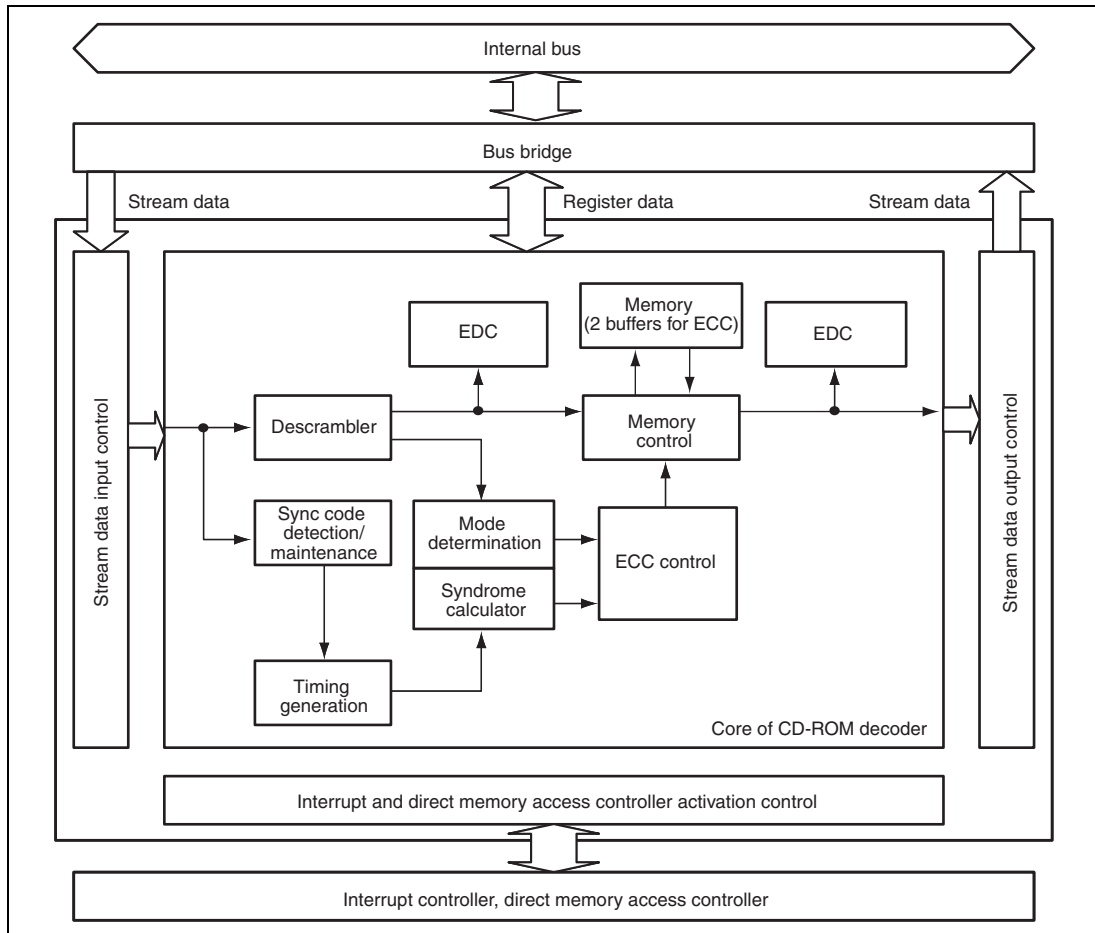

Figure 24.2 Block Diagram

The core of the CD-ROM decoder executes a series of processing required for CD-ROM decoding, including descrambling, sync code detection, ECC correction (P- and Q-parity-based correction), and EDC checking. The core includes sufficient memory to hold two sectors.

Input data come from the internal bus and output data go out via the internal bus along a single line each, but the bus bridge logic sets up branches for the register access port and stream data port.

The stream data from the CD-DSP are transferred via the serial sound interface to the stream data input control block. They are then subjected to descrambling, ECC correction, and EDC checking as they pass through the CD-ROM decoder. After these processes, data from one sector are obtained. The data are subsequently transferred to the stream-data buffer via the stream-data output control block. Data can be transferred by either the direct memory access controller or the CPU.

Figure 24.3 is a block diagram of the bus-bridge logic.

Since the input stream is transferred over the serial sound interface, transfer is relatively slow. On the other hand, data from the output stream can be transferred at high speeds because they are already in the core of the CD-ROM decoder. Since the data for output are buffered in SDRAM or other memory, they must be transferred at high speeds in order to reduce the busy rate of the SDRAM. For this reason, the data for the output stream are read out before the CD-ROM decoder receives an output stream data read request from the internal bus. This allows the accumulation of streaming data in the registers of the bus bridge, so that the data are ready for immediate output to the internal bus upon a request from the internal bus. Accordingly, the reception of a request to read from registers other than the stream-data registers after the stream data has already been read out and stored in the register of the bus bridge is possible. To cope with this, the CD-ROM decoder is provided with separate intermediary registers for the output stream-data register and the other registers.

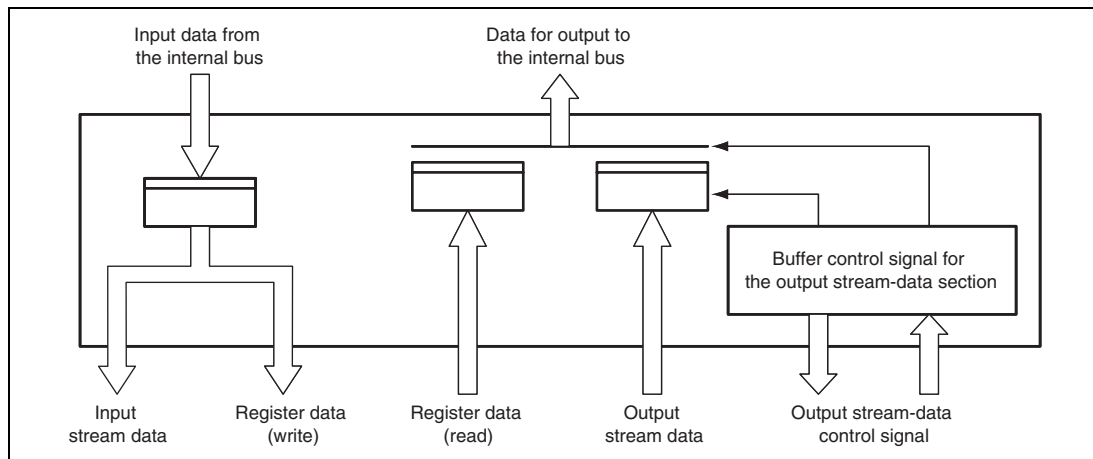

Figure 24.3 Schematic Diagram of the Bus Bridge

Figure 24.4 is a schematic diagram of the stream-data input control block. The stream-data input controller contains logic that controls the stream of input data and a register that is used to change the control mode of the CD-ROM decoder.

The serial sound interface mode used to transfer the stream data may affect the order (through the endian setting) or lead to padding before the data is transferred. To handle the different arrangements of data appropriately, the stream-data input control block includes a register for changing the operating mode and generates signals to control the core of the CD-ROM decoder.

The data holding registers for the input stream consists of two 16-bit registers. The data holding registers are controlled according to the mode set in the control register. For example, controlling the order in which 16-bit data is supplied to the core of the CD-ROM decoder (sending the second 16-bytes first or vice versa). It is also possible to stop the supply of padding data to the core of the CD-ROM decoder.

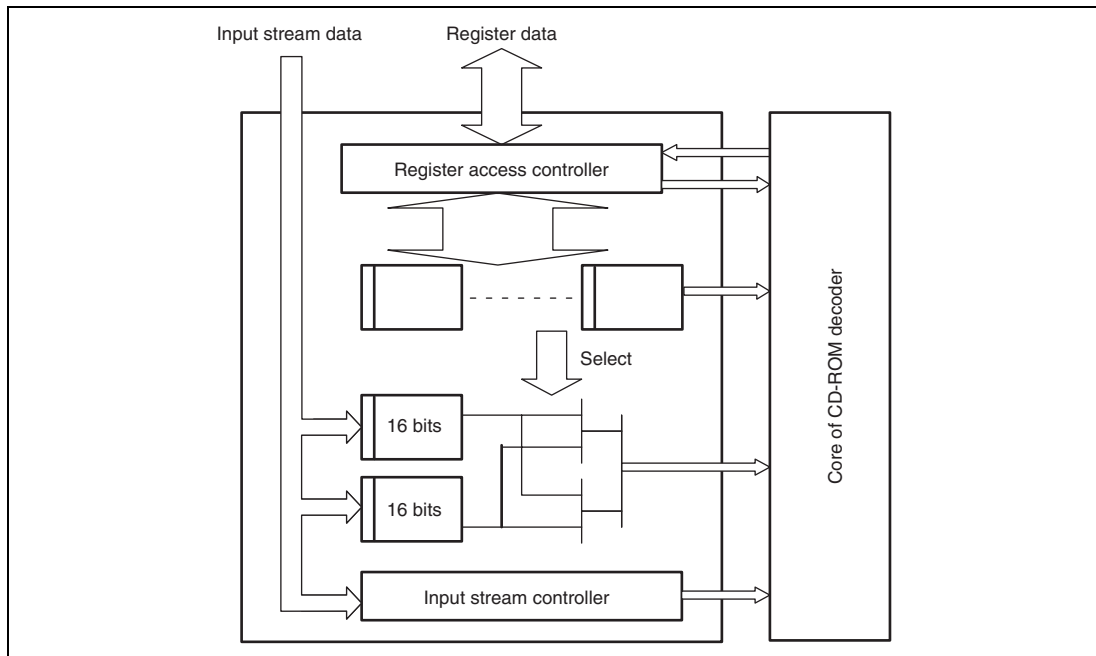

Figure 24.4 Schematic Diagram of the Stream-Data Input Control Block

Figure 24.5 is a schematic diagram of the stream-data output control block.

On recognizing that one sector of CD-ROM data is ready in the core of the CD-ROM decoder, this block ensures that the output stream-data register in the bus bridge section is empty and then starts to acquire the data for output from the core of the CD-ROM decoder.

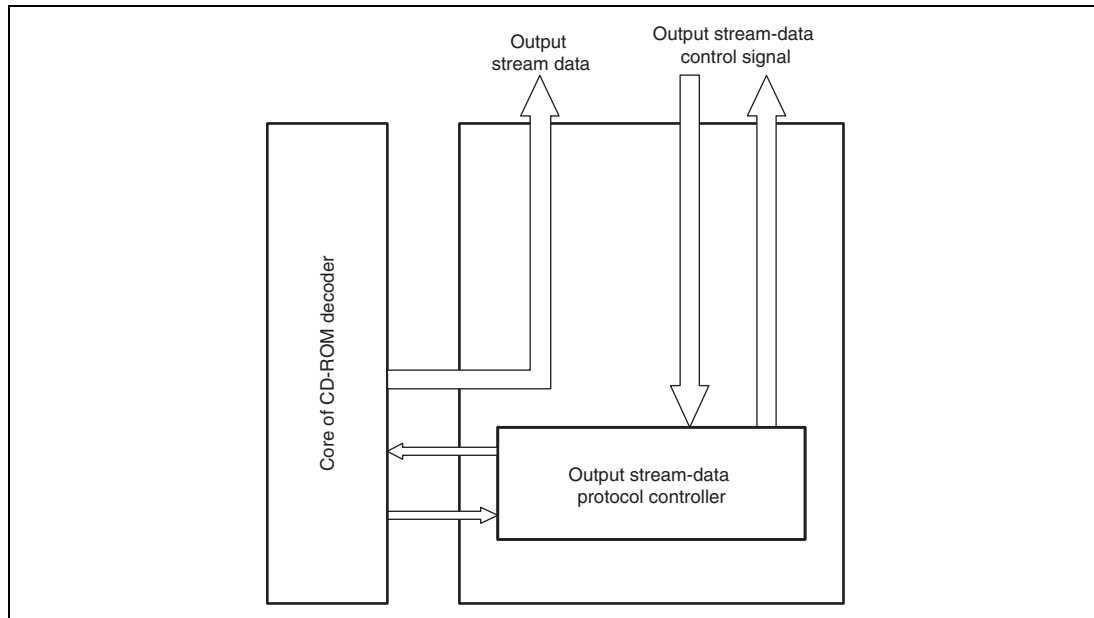

Figure 24.5 Schematic Diagram of the Stream-Data Output Control Block

This block has functions related to interrupts and direct memory access controller activation control such as suspending and masking of interrupts, turning interrupt flags off after they are read, asserting the activation signal to the direct memory access controller, and negating the activation signal according to the detected amount of data that has been transferred.

24.3 Register Descriptions

This module has the following registers.

Table 24.1 Register Configuration

Name	Abbreviation	R/W	Initial Value	Address	Access Size
Enable control register	CROMEN	R/W	H'00	H'FFFF9000	8
Sync code-based synchronization control register	CROMSY0	R/W	H'89	H'FFFF9001	8
Decoding mode control register	CROMCTL0	R/W	H'82	H'FFFF9002	8
EDC/ECC check control register	CROMCTL1	R/W	H'D1	H'FFFF9003	8
Automatic decoding stop control register	CROMCTL3	R/W	H'00	H'FFFF9005	8
Decoding option setting control register	CROMCTL4	R/W	H'00	H'FFFF9006	8
HEAD20 to HEAD22 representation control register	CROMCTL5	R/W	H'00	H'FFFF9007	8
Sync code status register	CROMST0	R	H'00	H'FFFF9008	8
Post-ECC header error status register	CROMST1	R	H'00	H'FFFF9009	8
Post-ECC subheader error status register	CROMST3	R	H'00	H'FFFF900B	8
Header/subheader validity check status register	CROMST4	R	H'00	H'FFFF900C	8
Mode determination and link sector detection status register	CROMST5	R	H'00	H'FFFF900D	8
ECC/EDC error status register	CROMST6	R	H'00	H'FFFF900E	8
Buffer status register	CBUFST0	R	H'00	H'FFFF9014	8
Decoding stoppage source status register	CBUFST1	R	H'00	H'FFFF9015	8
Buffer overflow status register	CBUFST2	R	H'00	H'FFFF9016	8
Pre-ECC correction header: minutes data register	HEAD00	R	H'00	H'FFFF9018	8
Pre-ECC correction header: seconds data register	HEAD01	R	H'00	H'FFFF9019	8
Pre-ECC correction header: frames (1/75 second) data register	HEAD02	R	H'00	H'FFFF901A	8
Pre-ECC correction header: mode data register	HEAD03	R	H'00	H'FFFF901B	8

Name	Abbreviation	R/W	Initial Value	Address	Access Size
Pre-ECC correction subheader: file number (byte 16) data register	SHEAD00	R	H'00	H'FFFF901C	8
Pre-ECC correction subheader: channel number (byte 17) data register	SHEAD01	R	H'00	H'FFFF901D	8
Pre-ECC correction subheader: sub-mode (byte 18) data register	SHEAD02	R	H'00	H'FFFF901E	8
Pre-ECC correction subheader: data type (byte 19) data register	SHEAD03	R	H'00	H'FFFF901F	8
Pre-ECC correction subheader: file number (byte 20) data register	SHEAD04	R	H'00	H'FFFF9020	8
Pre-ECC correction subheader: channel number (byte 21) data register	SHEAD05	R	H'00	H'FFFF9021	8
Pre-ECC correction subheader: sub-mode (byte 22) data register	SHEAD06	R	H'00	H'FFFF9022	8
Pre-ECC correction subheader: data type (byte 23) data register	SHEAD07	R	H'00	H'FFFF9023	8
Post-ECC correction header: minutes data register	HEAD20	R	H'00	H'FFFF9024	8
Post-ECC correction header: seconds data register	HEAD21	R	H'00	H'FFFF9025	8
Post-ECC correction header: frames (1/75 second) data register	HEAD22	R	H'00	H'FFFF9026	8
Post-ECC correction header: mode data register	HEAD23	R	H'00	H'FFFF9027	8
Post-ECC correction subheader: file number (byte 16) data register	SHEAD20	R	H'00	H'FFFF9028	8
Post-ECC correction subheader: channel number (byte 17) data register	SHEAD21	R	H'00	H'FFFF9029	8
Post-ECC correction subheader: sub-mode (byte 18) data register	SHEAD22	R	H'00	H'FFFF902A	8
Post-ECC correction subheader: data type (byte 19) data register	SHEAD23	R	H'00	H'FFFF902B	8
Post-ECC correction subheader: file number (byte 20) data register	SHEAD24	R	H'00	H'FFFF902C	8

Name	Abbreviation	R/W	Initial Value	Address	Access Size
Post-ECC correction subheader: channel number (byte 21) data register	SHEAD25	R	H'00	H'FFFF902D	8
Post-ECC correction subheader: sub-mode (byte 22) data register	SHEAD26	R	H'00	H'FFFF902E	8
Post-ECC correction subheader: data type (byte 23) data register	SHEAD27	R	H'00	H'FFFF902F	8
Automatic buffering setting control register	CBUFCTL0	R/W	H'04	H'FFFF9040	8
Automatic buffering start sector setting: minutes control register	CBUFCTL1	R/W	H'00	H'FFFF9041	8
Automatic buffering start sector setting: seconds control register	CBUFCTL2	R/W	H'00	H'FFFF9042	8
Automatic buffering start sector setting: frames control register	CBUFCTL3	R/W	H'00	H'FFFF9043	8
ISY interrupt source mask control register	CROMST0M	R/W	H'00	H'FFFF9045	8
CD-ROM decoder reset control register	ROMDECRST	R/W	H'00	H'FFFF9100	8
CD-ROM decoder reset status register	RSTSTAT	R	H'00	H'FFFF9101	8
Serial sound interface data control register	SSI	R/W	H'18	H'FFFF9102	8
Interrupt flag register	INTHOLD	R/W	H'00	H'FFFF9108	8
Interrupt source mask control register	INHINT	R/W	H'00	H'FFFF9109	8
CD-ROM decoder stream data input register	STRMDIN0	R/W	H'0000	H'FFFF9200	Read: 16 Write: 16/32
CD-ROM decoder stream data input register	STRMDIN2	R/W	H'0000	H'FFFF9202	16
CD-ROM decoder stream data output register	STRMDOUT0	R	H'0000	H'FFFF9204	16, 32

24.3.1 Enable Control Register (CROMEN)

The enable control register (CROMEN) enables subcode processing and CD-ROM decoding, and stops CD-ROM decoding forcibly.

Bit:	7	6	5	4	3	2	1	0
	SUBC_EN	CROM_EN	CROM_STP	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7	SUBC_EN	0	R/W	<p>Subcode Processing Enable</p> <p>This bit should be set and cleared simultaneously with CROM_EN. It is automatically cleared when decoding is automatically stopped due to an abnormal condition or when CROM_STP = 1</p>
6	CROM_EN	0	R/W	<p>CD-ROM Decoding Enable</p> <p>When this bit is set to 1, CD-ROM decoding starts after detection of a valid sync code. When the bit is cleared to 0, decoding stops on completion of the processing for the sector currently being decoded.</p> <p>This bit is automatically cleared when the automatic decode-stopping function works or when CROM_STP = 1.</p>
5	CROM_STP	0	R/W	<p>Forcible Stop of CD-ROM Decoding</p> <p>When this bit is set to 1, CD-ROM decoding is stopped immediately and the SUBC_EN and CROM_EN bits are automatically reset to 0. Before decoding can resume, this bit must be cleared to 0.</p>
4 to 0	—	All 0	R/W	<p>Reserved</p> <p>These bits are always read as 0. The write value should always be 0.</p>

24.3.2 Sync Code-Based Synchronization Control Register (CROMSY0)

The sync code-based synchronization control register (CROMSY0) selects the sync code maintenance function.

Bit:	7	6	5	4	3	2	1	0
	SY AUT	SY IEN	SY DEN	-	-	-	-	-
Initial value:	1	0	0	0	1	0	0	1
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7	SY_AUT	1	R/W	Automatic CD-ROM Sync Code Maintenance Mode When this bit is set to 1, automatic sync maintenance (insertion of sync codes) is applied to obtain the CD-ROM sync codes. While this bit is set, the settings of the SY_IEN and SY_DEN bits are invalid.
6	SY_IEN	0	R/W	Internal Sync Signal Enable Enables the internal sync signal that is produced by the counter in the CD-ROM decoder. When this bit is set while SY_AUT = 0, synchronization of the CD-ROM data is in interpolated mode, i.e. driven by the internal counter.
5	SY_DEN	0	R/W	Synchronization with External Sync Code Selects constant monitoring for the sync code in the input data and bases synchronization solely on detection of the code, regardless of the value of the internal counter. The setting of this bit is valid when SY_AUT = 0.
4	—	0	R/W	Reserved This bit is always read as 0. The write value should always be 0.
3	—	1	R/W	Reserved This bit is always read as 1. The write value should always be 1.

Bit	Bit Name	Initial Value	R/W	Description
2, 1	—	All 0	R/W	Reserved These bits are always read as 0. The write value should always be 0.
0	—	1	R/W	Reserved This bit is always read as 1. The write value should always be 1.

Table 24.2 Register Settings for Sync Code Maintenance Function

SY_AUT	SY_IEN	SY_DEN	Operating Mode
1	—	—	Automatic sync maintenance mode
0	0	1	External sync mode
0	1	0	Interpolated sync mode
0	1	1	Interpolated sync plus external sync mode
0	0	0	Setting prohibited

24.3.3 Decoding Mode Control Register (CROMCTL0)

The decoding mode control register (CROMCTL0) enables/disables the various functions, selects criteria for mode or form determination, and specifies the sector type. The setting of this register becomes valid at the sector-to-sector transition

Bit:	7	6	5	4	3	2	1	0
	MD_DESC	-	MD_AUTO	MD_AUTOS1	MD_AUTOS2	MD_SEC[2:0]		
Initial value:	1	0	0	0	0	0	1	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7	MD_DESC	1	R/W	Descrambling Function ON/OFF 0: Disables descrambling function 1: Enables descrambling function

Bit	Bit Name	Initial Value	R/W	Description
6	—	0	R/W	Reserved This bit is always read as 0. The write value should always be 0.
5	MD_AUTO	0	R/W	Automatic Mode/Form Detection ON/OFF 0: OFF 1: ON Detectable formats are Mode 0, Mode 1, Mode 2 (non-XA), Mode 2 Form 1, and Mode 2 Form 2. If the mode and form cannot be detected, the sector is taken to be in the same mode and form as the previous sector. If the mode and form of the first sector after decoding starts is undetectable, the setting of the MD_SEC[2:0] bits is used as the initial value.
4	MD_AUTOS1	0	R/W	Criteria for Mode Determination when MD_AUTO = 1 0: Mode determination is made only when the sync code is detected 1: Mode determination is always made The setting of this bit is valid only when the MD_AUTO bit is 1. If the mode cannot be determined, the mode of the previous sector is used. When this bit is cleared to 0, mode determination is made only when the sync code is detected for the sector.
3	MD_AUTOS2	0	R/W	Criteria for Mode 2 Form Determination when MD_AUTO = 1 0: The sector is assumed to be non-XA if the two form code bytes in the subheader do not match 1: No determination of XA or non-XA for the sector. The first form byte is regarded as valid. However, the two form bytes are compared, and the result is reflected in a status bit. The setting of this bit is valid only when the MD_AUTO bit is 1.

Bit	Bit Name	Initial Value	R/W	Description
2 to 0	MD_SEC [2:0]	010	R/W	Sector Type 000: Setting prohibited 001: Mode 0 010: Mode 1 011: Long (Mode 0, Mode 1, or Mode 2 with no EDC/ECC data) 100: Setting prohibited 101: Mode 2 Form 1 110: Mode 2 Form 2 111: Mode 2 with automatic form detection If the form cannot be determined when set to B'111, it is processed as Mode 2 not XA.

24.3.4 EDC/ECC Check Control Register (CROMCTL1)

The EDC/ECC check control register (CROMCTL1) controls EDC/ECC checking. The setting of this register becomes valid at the sector-to-sector transition

Bit:	7	6	5	4	3	2	1	0
	M2F2 EDC	MD_DEC[2:0]			-	-	MD_PQREP[1:0]	
Initial value:	1	1	0	1	0	0	0	1
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7	M2F2EDC	1	R/W	For Mode 2 Form 2, disables the EDC function for sectors where all bits of the EDC are 0. When this bit set to 1 and all bits of the EDC for a Mode 2 Form 2 sector are 0, an IERR interrupt is not generated even if the result of EDC checking is 'fail'.

Bit	Bit Name	Initial Value	R/W	Description
6 to 4	MD_DEC [2:0]	101	R/W	EDC/ECC Checking Mode Select 000: No checking 001: EDC only 010: Q correction + EDC 011: P correction + EDC 100: QP correction + EDC 101: PQ correction + EDC 110: Setting prohibited 111: Setting prohibited
3, 2	—	All 0	R/W	Reserved These bits are always read as 0. The write value should always be 0.
1, 0	MD_ PQREP [1:0]	01	R/W	Number of Iterations of PQ or QP Correction Number of correction iterations when PQ- or QP- correction is specified by MD_DEC[2:0]. 00: Setting prohibited 01: One iteration 10: Two iterations 11: Three iterations

24.3.5 Automatic Decoding Stop Control Register (CROMCTL3)

The automatic decoding stop control register (CROMCTL3) is used to select abnormal conditions on which decoding will be automatically stopped. When decoding is stopped in response to any of the selected conditions, an IBUF interrupt is generated and the condition is indicated in the CBUFST1 register. The setting of this register becomes valid at the sector-to-sector transition

Bit:	7	6	5	4	3	2	1	0
	STP_ ECC	STP_ EDC	-	STP_ MD	STP_ MIN	-	-	-
Initial value:	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7	STP_ECC	0	R/W	When this bit is set to 1, decoding is stopped if an error is found to be not correctable by ECC correction.
6	STP_EDC	0	R/W	When this bit is set to 1, decoding is stopped if post-correction EDC checking indicates an error.
5	—	0	R/W	Reserved This bit is always read as 0. The write value should always be 0.
4	STP_MD	0	R/W	When this bit is set to 1, decoding is stopped if the sector has a mode or form setting that does not match those of the immediately preceding sector.
3	STP_MIN	0	R/W	When this bit is set to 1, decoding is stopped if a non-sequential minutes, seconds, or frames (1/75 second) value is encountered.
2 to 0	—	All 0	R/W	Reserved These bits are always read as 0. The write value should always be 0.

24.3.6 Decoding Option Setting Control Register (CROMCTL4)

The decoding option setting control register (CROMCTL4) enables/disables buffering control at link block detection, specifies the information indicated by the status register, and controls the ECC correction mode. The setting of this register becomes valid at the sector-to-sector transition

Bit:	7	6	5	4	3	2	1	0
	LINKOFF	LINK2	-	ER0SEL	NO_ECC	-	-	-
Initial value:	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7	LINKOFF	0	R/W	<p>Buffering Control at Link Block Detection</p> <p>0: ON 1: OFF</p> <p>When this bit is set to 1, buffering control is not performed when a link block is detected. The link block is processed as normal sectors.</p> <p>However, link-block detection processing does proceed, and the results are reflected in the values of bits 3 to 0 in the CROMST5 register.</p>
6	LINK2	0	R/W	<p>Link Block Detection Condition</p> <p>0: The block is regarded as a link block when either run-out 1 or 2 and both run-in 3 and 4 have been detected.</p> <p>1: The block is regarded as a link block when two out of run-out 1 and 2 and "link" have been detected.</p> <p>When this bit is set to 1, buffering control for link blocks is disabled (link blocks are processed as normal sectors). The condition for setting of the LINK_ON bit in CROMST5 is decoding of the link sector.</p>
5	—	0	R/W	<p>Reserved</p> <p>This bit is always read as 0. The write value should always be 0.</p>
4	ER0SEL	0	R/W	<p>CD-ROM Data-Related Status Register Setting Condition</p> <p>0: Information is on the sector being decoded. 1: Information is on the latest sector that has been buffered.</p> <p>This condition affects the information given by bits 5 to 0 in the CROMST0 register, bits 7 to 1 in the CROMST4 and CROMST5 registers, and HEAD00 to HEAD02.</p>
3	NO_ECC	0	R/W	<p>ECC correction mode when the result of the EDC check before ECC correction was 'pass'</p> <p>When this bit is set to 1, ECC correction is not performed if the result of pre-correction EDC checking is a 'pass', regardless of the results of syndrome calculation.</p>

Bit	Bit Name	Initial Value	R/W	Description
2 to 0	—	All 0	R/W	Reserved These bits are always read as 0. The write value should always be 0.

24.3.7 HEAD20 to HEAD22 Representation Control Register (CROMCTL5)

The HEAD20 to HEAD22 representation control register (CROMCTL5) specifies the representation mode for HEAD20 to HEAD22.

Bit:	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	MSF_LBA_SEL
Initial value:	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7 to 1	—	All 0	R/W	Reserved These bits are always read as 0. The write value should always be 0.
0	MSF_LBA_0 SEL		R/W	HEAD20 to HEAD22 Representation Mode 0: Header MSF is represented in BCD (decimal) as is 1: Total sector number is represented in HEX (hexadecimal)

24.3.8 Sync Code Status Register (CROMST0)

The sync code status register (CROMST0) indicates various status information in sync code maintenance modes

Bit:	7	6	5	4	3	2	1	0
	-	-	ST_	ST_	ST_	ST_	ST_	ST_
			SYIL	SYNO	BLKS	BLKL	SECS	SECL
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7, 6	—	All 0	R	Reserved These bits are always read as 0 and cannot be modified.
5	ST_SYIL	0	R	Indicates that a sync code was detected at a position where the value in the word counter (used to measure intervals between sync codes) was not correct, but the sync code was ignored and not taken into account in synchronization. This bit is only valid in automatic sync maintenance mode and interpolated sync mode.
4	ST_SYNO	0	R	Indicates that a sync code has not been detected despite the word counter having reached the final value, and synchronization has been continued with the aid of an interpolated sync code. This bit is only valid in automatic sync maintenance mode and interpolated sync mode.
3	ST_BLKs	0	R	Indicates that a sync code was detected at a position where the value in the word counter was not correct, and the sync code was used in synchronization. This bit is only valid in automatic sync maintenance mode and external sync mode.
2	ST_BLKl	0	R	Indicates that a sync code has not been detected despite the word counter having reached the final value, and the period of the sector has been prolonged. This bit is only valid in external sync mode.

Bit	Bit Name	Initial Value	R/W	Description
1	ST_SECS	0	R	Indicates that a sector has been processed as a short sector with the aid of interpolated sync codes. If this bit is set to 1, stop decoding immediately and retry the procedure starting from the sector prior to the currently being decoded sector.
0	ST_SECL	0	R	Indicates that a sector has been processed as a long sector with the aid of interpolated sync codes. If this bit is set to 1, stop decoding immediately and retry the procedure starting from two sectors prior to the sector currently being decoded.

24.3.9 Post-ECC Header Error Status Register (CROMST1)

The post-ECC header error status register (CROMST1) indicates error status in the post-ECC header.

Bit:	7	6	5	4	3	2	1	0
	-	-	-	-	ER2_	ER2_	ER2_	ER2_
					HEAD0	HEAD1	HEAD2	HEAD3
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7 to 4	—	All 0	R	Reserved These bits are always read as 0 and cannot be modified.
3	ER2_ HEAD0	0	R	Indicates an error in the minutes field of the header after ECC correction.
2	ER2_ HEAD1	0	R	Indicates an error status in the seconds field of the header after ECC correction.
1	ER2_ HEAD2	0	R	Indicates an error in the frames (1/75 second) field of the header after ECC correction.
0	ER2_ HEAD3	0	R	Indicates an error in the mode field of the header after ECC correction.

24.3.10 Post-ECC Subheader Error Status Register (CROMST3)

The post-ECC subheader error status register (CROMST3) indicates error status in the post-ECC subheader.

Bit:	7	6	5	4	3	2	1	0
	ER2_ SHEAD0	ER2_ SHEAD1	ER2_ SHEAD2	ER2_ SHEAD3	ER2_ SHEAD4	ER2_ HEAD5	ER2_ HEAD6	ER2_ HEAD7
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7	ER2_ SHEAD0	0	R	Indicates that the subheader (file number) still has an error after ECC correction. Indicates the error of the SHEAD20 register.
6	ER2_ SHEAD1	0	R	Indicates that the subheader (channel number) still has an error after ECC correction. Indicates the error of the SHEAD21 register.
5	ER2_ SHEAD2	0	R	Indicates that the subheader (sub-mode) still has an error after ECC correction. Indicates the error of the SHEAD22 register.
4	ER2_ SHEAD3	0	R	Indicates that the subheader (data type) still has an error after ECC correction. Indicates the error of the SHEAD23 register.
3	ER2_ SHEAD4	0	R	Indicates that the subheader (file number) still has an error after ECC correction. Indicates the error of the SHEAD24 register.
2	ER2_ SHEAD5	0	R	Indicates that the subheader (channel number) still has an error after ECC correction. Indicates the error of the SHEAD25 register.
1	ER2_ SHEAD6	0	R	Indicates that the subheader (sub-mode) still has an error after ECC correction. Indicates the error of the SHEAD26 register.
0	ER2_ SHEAD7	0	R	Indicates that the subheader (data type) still has an error after ECC correction. Indicates the error of the SHEAD27 register.

24.3.11 Header/Subheader Validity Check Status Register (CROMST4)

The header/subheader validity check status register (CROMST4) indicates errors relating to the automatic mode determination or form determination for Mode 2.

Bit:	7	6	5	4	3	2	1	0
	NG_MD	NG_ MDCMP1	NG_ MDCMP2	NG_ MDCMP3	NG_ MDCMP4	NG_ MDDEF	NG_ MDTIM1	NG_ MDTIM2
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7	NG_MD	0	R	Indicates that the sector mode could not be determined according to the automatic mode determination criteria.
6	NG_ MDCMP1	0	R	Indicates a mismatch between the file number bytes (bytes 16 and 20) during the form determination for Mode 2.
5	NG_ MDCMP2	0	R	Indicates a mismatch between the channel number bytes (bytes 17 and 21) during the form determination for Mode 2.
4	NG_ MDCMP3	0	R	Indicates a mismatch between the sub-mode bytes (bytes 18 and 22) during the form determination for Mode 2.
3	NG_ MDCMP4	0	R	Indicates a mismatch between the data-type bytes (bytes 19 and 23) during the form determination for Mode 2.
2	NG_ MDDEF	0	R	Indicates that the mode and form differ from those of the previous sector.
1	NG_ MDTIM1	0	R	Indicates that the minutes, seconds, or frames (1/75 second) value is out of sequence. In the continuity check for the next and subsequent sectors, the updated values will be used.
0	NG_ MDTIM2	0	R	Indicates that the minutes, seconds, or frames (1/75 second) value was not a BCD value. Specifically, this bit means that any half-byte was beyond the range for BCD (i.e. was A to F), HEAD01 was greater than H'59, or HEAD02 was greater than H'74. In the continuity check for the next and subsequent sectors, interpolated values will be used.

24.3.12 Mode Determination and Link Sector Detection Status Register (CROMST5)

The mode determination and link sector detection status register (CROMST5) indicates the result of automatic mode determination and link block detection.

Bit:	7	6	5	4	3	2	1	0
	ST_AMD[2:0]			ST_MDX	LINK_ON	LINK_DET	LINK_SDET	LINK_OUT1
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7 to 5	ST_AMD [2:0]	000	R	<p>Result of Automatic Mode Determination</p> <p>These bits indicate the result of mode determination when the automatic mode determination function is used.</p> <p>000: Automatic mode determination function is not used 001: Mode 0 010: Mode 1 011: — 100: Mode 2 not XA 101: Mode 2 Form 1 110: Mode 2 Form 2 111: —</p>
4	ST_MDX	0	R	<p>Indicates that, when the mode has been manually set rather than automatically determined, the mode setting disagrees with the mode as recognized by the logic. In this case, the manually set value takes priority.</p>
3	LINK_ON	0	R	<p>This bit is set to 1 when a link block was recognized in link block determination.</p> <p>For the criteria for link block determination, refer to the LINK2 bit in the CROMCTL4 register.</p> <p>When this bit is set to 1, buffering control is performed according to the setting of the CBUF_LINK bit in the CBUFCTL0 register.</p>

Bit	Bit Name	Initial Value	R/W	Description
2	LINK_DET	0	R	Indicates that a link block (run-out 1 to run-in 4) was detected. Since detection is based on the data before ECC correction, LINK_DET may also be set to 1 if data erroneously happens to contain the same code as a link block.
1	LINK_SDET	0	R	Indicates that a link block was detected within seven sectors after the start of decoding.
0	LINK_OUT1	0	R	Indicates that the sector after ECC correction has been identified as a run-out 1 sector. This bit is only valid when an IERR interrupt is not generated (i.e. when ECC correction was successful).

24.3.13 ECC/EDC Error Status Register (CROMST6)

The ECC/EDC error status register (CROMST6) indicates ECC processing error or EDC check error before/after ECC correction.

Bit:	7	6	5	4	3	2	1	0
	ST_ERR	-	ST_ECCABT	ST_ECCNG	ST_ECCP	ST_ECCO	ST_EDC1	ST_EDC2
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7	ST_ERR	0	R	Indicates that the decoded block after ECC correction contains any error (even in a single byte).
6	—	0	R	Reserved This bit is always read as 0 and cannot be modified.
5	ST_ECCABT	0	R	Indicates that ECC processing was discontinued. This bit is set to 1 when a transition from sector to sector occurs while ECC correction is in progress. This does not indicate a problem for ECC correction if the BUF_NG bit in the CBUFST2 register is 0 at the same time. Whether or not this is so depends on the timing of the sector transition.

Bit	Bit Name	Initial Value	R/W	Description
4	ST_ECCNG	0	R	Indicates that error correction was not possible. This bit is also set to 1 on detection of a short sector.
3	ST_ECCP	0	R	Indicates that P-parity errors were not corrected in ECC correction. This bit is only valid when synchronization is normal (the sector is neither short nor long). This bit is set to 1 when the result of syndrome calculation for P parity is non-0.
2	ST_ECCQ	0	R	Indicates that Q-parity errors were not corrected in ECC correction. This bit is only valid when synchronization is normal (the sector is neither short nor long). This bit is set to 1 when the result of syndrome calculation for Q parity is other than all 0s.
1	ST_EDC1	0	R	Indicates that the result of the EDC check before ECC correction was 'fail'. This bit is also set to 1 if a short sector is encountered while EDC is enabled.
0	ST_EDC2	0	R	Indicates that the result of the EDC check after ECC correction was 'fail'.

24.3.14 Buffer Status Register (CBUFST0)

The buffer status register (CBUFST0) indicates that the system is searching for the first sector to be buffered, or that buffering is in progress.

Bit:	7	6	5	4	3	2	1	0
	BUF REF	BUF ACT	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7	BUF_REF	0	R	Indicates that the search for the first sector to be buffered is in progress. This bit is only valid when the automatic buffering function is used (CBUF_AUT = 1).
6	BUF_ACT	0	R	Indicates that buffering is in progress.
5 to 0	—	All 0	R	Reserved These bits are always read as 0 and cannot be modified.

24.3.15 Decoding Stoppage Source Status Register (CBUFST1)

The decoding stoppage source status register (CBUFST1) indicates that decoding/buffering has been stopped due to some errors.

A bit in this register can only be set when the corresponding bit in the CROMCTL3 register is set to 1.

Bit:	7	6	5	4	3	2	1	0
	BUF_ECC	BUF_EDC	-	BUF_MD	BUF_MIN	-	-	-
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7	BUF_ECC	0	R	Indicates that decoding and buffering have been stopped because of an error that is not correctable by using the ECC.
6	BUF_EDC	0	R	Indicates that decoding and buffering have been stopped because the post-correction EDC check indicated an error.
5	—	0	R	Reserved This bit is always read as 0 and cannot be modified.
4	BUF_MD	0	R	Indicates that decoding and buffering have been stopped because the current sector is in a mode or form differing from that of the previous sectors.
3	BUF_MIN	0	R	Indicates that decoding and buffering have been stopped because a non-sequential minutes, seconds, or frames (1/75 second) value has been encountered.
2 to 0	—	All 0	R	Reserved These bits are always read as 0 and cannot be modified.

24.3.16 Buffer Overflow Status Register (CBUFST2)

The buffer overflow status register (CBUFST2) indicates that a sector-to-sector transition occurred before data transfer to the buffer is completed.

Bit:	7	6	5	4	3	2	1	0
	BUF_	-	-	-	-	-	-	-
	NG							
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7	BUF_NG	0	R	Indicates that a sector-to-sector transition has occurred before the data transfer to the buffer is completed. This bit is set to 1 when the data of a third sector are input while data for the output stream from the CD-ROM decoder remains unread. No interrupt is generated. Once this bit has been set, its value will not recover unless it is reset by the LOGICRST bit in the ROMDECRST register.
6 to 0	—	All 0	R	Reserved These bits are always read as 0 and cannot be modified.

24.3.17 Pre-ECC Correction Header: Minutes Data Register (HEAD00)

The pre-ECC correction header: minutes data register (HEAD00) indicates the minutes value in the header before ECC correction.

Bit:	7	6	5	4	3	2	1	0
	HEAD00[7:0]							
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7 to 0	HEAD00 [7:0]	All 0	R	Minutes Value in Header Before ECC Correction

24.3.18 Pre-ECC Correction Header: Seconds Data Register (HEAD01)

The pre-ECC correction header: seconds data register (HEAD01) indicates the seconds value in the header before ECC correction.

Bit:	7	6	5	4	3	2	1	0
	HEAD01[7:0]							
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7 to 0	HEAD01 [7:0]	All 0	R	Seconds Value in Header Before ECC Correction

24.3.19 Pre-ECC Correction Header: Frames (1/75 Second) Data Register (HEAD02)

The pre-ECC correction header: frames (1/75 second) data register (HEAD02) indicates the frames value (1 frame = 1/75 second) in the header before ECC correction.

Bit:	7	6	5	4	3	2	1	0
	HEAD02[7:0]							
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7 to 0	HEAD02 [7:0]	All 0	R	Frames Value in Header Before ECC Correction

24.3.20 Pre-ECC Correction Header: Mode Data Register (HEAD03)

The pre-ECC correction header: mode data register (HEAD03) indicates the mode value in the header before ECC correction.

Bit:	7	6	5	4	3	2	1	0
	HEAD03[7:0]							
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7 to 0	HEAD03 [7:0]	All 0	R	Mode value in the header before ECC correction

24.3.21 Pre-ECC Correction Subheader: File Number (Byte 16) Data Register (SHEAD00)

The pre-ECC correction subheader: file number (byte 16) data register (SHEAD00) indicates the file number value in the subheader before ECC correction (byte 16).

Bit:	7	6	5	4	3	2	1	0
	SHEAD00[7:0]							
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7 to 0	SHEAD00 [7:0]	All 0	R	Indicates file number value in the subheader before ECC correction (byte 16). For sectors not in Mode 2, this register contains the byte of data at the corresponding position.

24.3.22 Pre-ECC Correction Subheader: Channel Number (Byte 17) Data Register (SHEAD01)

The pre-ECC correction subheader: channel number (byte 17) data register (SHEAD01) indicates the channel number value in the subheader before ECC correction (byte 17).

Bit:	7	6	5	4	3	2	1	0
	SHEAD01[7:0]							
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7 to 0	SHEAD01 [7:0]	All 0	R	Indicate channel number value in the subheader before ECC correction (byte 17). For sectors not in Mode 2, this register contains the byte of data at the corresponding position.

24.3.23 Pre-ECC Correction Subheader: Sub-Mode (Byte 18) Data Register (SHEAD02)

The pre-ECC correction subheader: sub-mode (byte 18) data register (SHEAD02) indicates the sub-mode value in the subheader before ECC correction (byte 18).

Bit:	7	6	5	4	3	2	1	0
	SHEAD02[7:0]							
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7 to 0	SHEAD02 [7:0]	All 0	R	Indicate sub-mode value in the subheader before ECC correction (byte 18). For sectors not in Mode 2, this register contains the byte of data at the corresponding position.

24.3.24 Pre-ECC Correction Subheader: Data Type (Byte 19) Data Register (SHEAD03)

The pre-ECC correction subheader: data type (byte 19) data register (SHEAD03) indicates the data type value in the subheader before ECC correction (byte 19).

Bit:	7	6	5	4	3	2	1	0
	SHEAD03[7:0]							
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7 to 0	SHEAD03 [7:0]	All 0	R	Indicate data type value in the subheader before ECC correction (byte 19). For sectors not in Mode 2, this register contains the byte of data at the corresponding position.

24.3.25 Pre-ECC Correction Subheader: File Number (Byte 20) Data Register (SHEAD04)

The pre-ECC correction subheader: file number (byte 20) data register (SHEAD04) indicates the file number value in the subheader before ECC correction (byte 20).

Bit:	7	6	5	4	3	2	1	0
	SHEAD04[7:0]							
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7 to 0	SHEAD04 [7:0]	All 0	R	Indicate file number value in the subheader before ECC correction (byte 20). For sectors not in Mode 2, this register contains the byte of data at the corresponding position.

24.3.26 Pre-ECC Correction Subheader: Channel Number (Byte 21) Data Register (SHEAD05)

The pre-ECC correction subheader: channel number (byte 21) data register (SHEAD05) indicates the channel number value in the subheader before ECC correction (byte 21).

Bit:	7	6	5	4	3	2	1	0
	SHEAD05[7:0]							
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7 to 0	SHEAD05 [7:0]	All 0	R	Indicate channel number value in the subheader before ECC correction (byte 21). For sectors not in Mode 2, this register contains the byte of data at the corresponding position.

24.3.27 Pre-ECC Correction Subheader: Sub-Mode (Byte 22) Data Register (SHEAD06)

The pre-ECC correction subheader: sub-mode (byte 22) data register (SHEAD06) indicates the sub-mode value in the subheader before ECC correction (byte 22).

Bit:	7	6	5	4	3	2	1	0
	SHEAD06[7:0]							
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7 to 0	SHEAD06 [7:0]	All 0	R	Sub-Mode Value in Subheader Before ECC Correction (Byte 22) For sectors not in Mode 2, this register contains the byte of data at the corresponding position.

24.3.28 Pre-ECC Correction Subheader: Data Type (Byte 23) Data Register (SHEAD07)

The pre-ECC correction subheader: data type (byte 23) data register (SHEAD07) indicates the data type value in the subheader before ECC correction (byte 23).

Bit:	7	6	5	4	3	2	1	0
	SHEAD07[7:0]							
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7 to 0	SHEAD07 [7:0]	All 0	R	Data Type Value in Subheader Before ECC Correction (Byte 23) For sectors not in Mode 2, this register contains the byte of data at the corresponding position.

24.3.29 Post-ECC Correction Header: Minutes Data Register (HEAD20)

The post-ECC correction header: minutes data register (HEAD20) indicates the minutes value in the header after ECC correction.

Bit:	7	6	5	4	3	2	1	0
	HEAD20[7:0]							
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7 to 0	HEAD20 [7:0]	All 0	R	Minutes Value in Header After ECC Correction When MSF_LBA_SEL = 1, this register indicates the first byte of the total number of sectors calculated from M, S, and F.

24.3.30 Post-ECC Correction Header: Seconds Data Register (HEAD21)

The post-ECC correction header: seconds data register (HEAD21) indicates the seconds value in the header after ECC correction.

Bit:	7	6	5	4	3	2	1	0
	HEAD21[7:0]							
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7 to 0	HEAD21 [7:0]	All 0	R	Seconds Value in Header After ECC Correction When MSF_LBA_SEL = 1, this register indicates the second byte of the total number of sectors calculated from M, S, and F.

24.3.31 Post-ECC Correction Header: Frames (1/75 Second) Data Register (HEAD22)

The post-ECC correction header: frames (1/75 second) data register (HEAD22) indicates the frames value (1 frame = 1/75 seconds) in the header after ECC correction.

Bit:	7	6	5	4	3	2	1	0
	HEAD22[7:0]							
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7 to 0	HEAD22 [7:0]	All 0	R	Frames Value in Header After ECC Correction When MSF_LBA_SEL = 1, this register indicates the third byte of the total number of sectors calculated from M, S, and F.

24.3.32 Post-ECC Correction Header: Mode Data Register (HEAD23)

The post-ECC correction header: mode data register (HEAD23) indicates the mode value in the header after ECC correction.

Bit:	7	6	5	4	3	2	1	0
	HEAD23[7:0]							
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7 to 0	HEAD23 [7:0]	All 0	R	Mode Value in Header After ECC Correction

24.3.33 Post-ECC Correction Subheader: File Number (Byte 16) Data Register (SHEAD20)

The post-ECC correction subheader: file number (byte 16) data register (SHEAD20) indicates the file number value in the subheader after ECC correction (byte 16).

Bit:	7	6	5	4	3	2	1	0
	SHEAD20[7:0]							
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7 to 0	SHEAD20 [7:0]	All 0	R	Indicate file number value in the subheader after ECC correction (byte 16).

24.3.34 Post-ECC Correction Subheader: Channel Number (Byte 17) Data Register (SHEAD21)

The post-ECC correction subheader: channel number (byte 17) data register (SHEAD21) indicates the channel number value in the subheader after ECC correction (byte 17).

Bit:	7	6	5	4	3	2	1	0
	SHEAD21[7:0]							
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7 to 0	SHEAD21 [7:0]	All 0	R	Indicate channel number value in the subheader after ECC correction (byte 17).

24.3.35 Post-ECC Correction Subheader: Sub-Mode (Byte 18) Data Register (SHEAD22)

The post-ECC correction subheader: sub-mode (byte 18) data register (SHEAD22) indicates the sub-mode value in the subheader after ECC correction (byte 18).

Bit:	7	6	5	4	3	2	1	0
	SHEAD22[7:0]							
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7 to 0	SHEAD22 [7:0]	All 0	R	Indicates sub-mode value in the subheader after ECC correction (byte 18).

24.3.36 Post-ECC Correction Subheader: Data Type (Byte 19) Data Register (SHEAD23)

The post-ECC correction subheader: data type (byte 19) data register (SHEAD23) indicates the data type value in the subheader after ECC correction (byte 19).

Bit:	7	6	5	4	3	2	1	0
	SHEAD23[7:0]							
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7 to 0	SHEAD23 [7:0]	All 0	R	Indicate data type value in the subheader after ECC correction (byte 19).

24.3.37 Post-ECC Correction Subheader: File Number (Byte 20) Data Register (SHEAD24)

The post-ECC correction subheader: file number (byte 20) data register (SHEAD24) indicates the file number value in the subheader after ECC correction (byte 20).

Bit:	7	6	5	4	3	2	1	0
	SHEAD24[7:0]							
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7 to 0	SHEAD24 [7:0]	All 0	R	Indicate file number value in the subheader after ECC correction (byte 20).

24.3.38 Post-ECC Correction Subheader: Channel Number (Byte 21) Data Register (SHEAD25)

The post-ECC correction subheader: channel number (byte 21) data register (SHEAD25) indicates the channel number value in the subheader after ECC correction (byte 21).

Bit:	7	6	5	4	3	2	1	0
	SHEAD25[7:0]							
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7 to 0	SHEAD25 [7:0]	All 0	R	Indicate channel number value in the subheader after ECC correction (byte 21).

24.3.39 Post-ECC Correction Subheader: Sub-Mode (Byte 22) Data Register (SHEAD26)

The post-ECC correction subheader: sub-mode (byte 22) data register (SHEAD26) indicates the sub-mode value in the subheader after ECC correction (byte 22).

Bit:	7	6	5	4	3	2	1	0
	SHEAD26[7:0]							
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7 to 0	SHEAD26 [7:0]	All 0	R	Indicate sub-mode value in the subheader after ECC correction (byte 22).

24.3.40 Post-ECC Correction Subheader: Data Type (Byte 23) Data Register (SHEAD27)

The post-ECC correction subheader: data type (byte 23) data register (SHEAD27) indicates the data type value in the subheader after ECC correction (byte 23).

Bit:	7	6	5	4	3	2	1	0
	SHEAD27[7:0]							
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7 to 0	SHEAD27 [7:0]	All 0	R	Data Type Value in Subheader After ECC Correction (byte 23)

24.3.41 Automatic Buffering Setting Control Register 0 (CBUFCTL0)

Bit:	7	6	5	4	3	2	1	0
	CBUF_ AUT	CBUF_ EN	CBUF_ LINK	CBUF_MD[1:0]	CBUF_ TS	CBUF_ Q	-	-
Initial value:	0	0	0	0	0	1	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7	CBUF_ AUT	0	R/W	Automatic Buffering Function ON/OFF When this bit is to be set or cleared while CROM_EN = 1, CBUF_EN should also be set or cleared simultaneously. Otherwise, the validity of the status indications in CBUFST0, CBUFST1 and CBUFST2 cannot be guaranteed. 0: Automatic buffering is OFF 1: Automatic buffering is ON

Bit	Bit Name	Initial Value	R/W	Description
6	CBUF_EN	0	R/W	<p>Buffering to Buffer RAM Enable</p> <p>This bit turns on/off buffering in both automatic and manual buffering modes. In manual buffering mode, set this bit after generation of the ISEC interrupt. This bit is automatically reset when automatic buffering stops.</p> <p>0: Buffering is OFF 1: Buffering is ON</p>
5	CBUF_LINK	0	R/W	<p>Buffering Control on Link Block Detection</p> <p>0: Allocates area for seven sectors 1: Data are buffered, skipping the link block</p>
4, 3	CBUF_MD [1:0]	00	R/W	<p>Start-sector detection mode when the automatic buffering function is in use</p> <p>00: The header values for the previous and current sectors must be in sequence. 01: The header value detected in the current sector must be in sequence with the interpolated value. 10: A current sector with any header value is OK. 11: Start-sector detection is based on the interpolated value even if the current sector is not detected.</p>
2	CBUF_TS	1	R/W	<p>CBUFCTL1 to CBUFCTL3 Setting Mode</p> <p>0: CBUFCTL1 to CBUFCTL3: BCD (in decimal) 1: Total number of sectors (in hexadecimal)</p>
1	CBUF_Q	0	R/W	<p>Q-channel code buffering data specification in the case of a CRC error in the Q-channel code</p> <p>0: The values for the last sector for which the CRC returned a correct result are buffered. 1: The erroneous data is buffered as is.</p> <p>Note: Since subcodes are not input with this LSI, always set this bit to 1.</p>
0	—	0	R/W	<p>Reserved</p> <p>This bit is always read as 0. The write value should always be 0.</p>

24.3.42 Automatic Buffering Start Sector Setting: Minutes Control Register (CBUFCTL1)

The automatic buffering start sector setting: minutes control register (CBUFCTL1) indicates the minutes value in the header for the first sector to be buffered.

Bit	Bit Name	Initial Value	R/W	Description
7 to 0	BS_MIN [7:0]	All 0	R/W	Indicate setting of the minutes value in the header for the first sector to be buffered.

24.3.43 Automatic Buffering Start Sector Setting: Seconds Control Register (CBUFCTL2)

The automatic buffering start sector setting: seconds control register (CBUFCTL2) indicates the seconds value in the header for the first sector to be buffered.

Bit	Bit Name	Initial Value	R/W	Description
7 to 0	BS_SEC [7:0]	All 0	R/W	Indicate setting of the seconds value in the header for the first sector to be buffered.

24.3.44 Automatic Buffering Start Sector Setting: Frames Control Register (CBUFCTL3)

The automatic buffering start sector setting: frames control register (CBUFCTL3) indicates the frames (1 frame = 1/75 second) value in the header for the first sector to be buffered

Bit	Bit Name	Initial Value	R/W	Description
7 to 0	BS_FRM [7:0]	All 0	R/W	Indicate setting of the frames (1/75 second) value in the header for the first sector to be buffered.

24.3.45 ISY Interrupt Source Mask Control Register (CROMST0M)

The ISY interrupt source mask control register (CROMST0M) masks the ISY interrupt sources specified by the bits in CROMST0.

Bit	Bit Name	Initial Value	R/W	Description
7, 6	—	All 0	R/W	Reserved These bits are always read as 0. The write value should always be 0.
5	ST_SYILM	0	R/W	ISY interrupt ST_SYIL (bit 5 in the CROMST0 register) source mask
4	ST_ SYNOM	0	R/W	ISY interrupt ST_SYNO (bit 4 in the CROMST0 register) source mask
3	ST_ BLKSM	0	R/W	ISY interrupt ST_BLKSM (bit 3 in the CROMST0 register) source mask

Bit	Bit Name	Initial Value	R/W	Description
2	ST_BLKLM	0	R/W	ISY interrupt ST_BLKL (bit 2 in the CROMST0 register) source mask
1	ST_SECSM	0	R/W	ISY interrupt ST_SECS (bit 1 in the CROMST0 register) source mask
0	ST_SECLM	0	R/W	ISY interrupt ST_SECL (bit 0 in the CROMST0 register) source mask

24.3.46 CD-ROM Decoder Reset Control Register (ROMDECRST)

The CD-ROM decoder reset control register (ROMDECRST) resets the random logic of the CD-ROM decoder and clears the RAM in the CD-ROM decoder.

Bit:	7	6	5	4	3	2	1	0
	LOGI CRST	RAM RST	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7	LOGICRST	0	R/W	CD-ROM Decoder Random Logic Reset Signal A reset signal is output while this bit is set to 1.
6	RAMRST	0	R/W	CD-ROM Decoder RAM Clearing Signal Refer to the RAMCLRST bit in the RSTSTAT register to confirm that RAM clearing is complete.
5 to 0	—	All 0	R/W	Reserved These bits are always read as 0. The write value should always be 0.

Note: Before setting LOGICRST to 1, make sure that the RAMRST bit is cleared to 0 and then write B'10000000 to this register.

24.3.47 CD-ROM Decoder Reset Status Register (RSTSTAT)

The CD-ROM decoder reset status register (RSTSTAT) indicates that the RAM in the CD-ROM decoder has been cleared.

Bit:	7	6	5	4	3	2	1	0
	RAM CLRST	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7	RAMCLRST	0	R	This bit is set to 1 on completion of RAM clearing after the RAMRST bit in ROMDECRST is set to 1. The bit is cleared by writing a 0 to the RAMRST bit.
6 to 0	—	All 0	R	Reserved These bits are always read as 0 and cannot be modified.

24.3.48 Serial Sound Interface Data Control Register (SSI)

The serial sound interface data control register (SSI) provides various settings related to the data stream. For the operation corresponding to the setting of this register, refer to section 24.4.1, Endian Conversion for Data in the Input Stream.

Bit:	7	6	5	4	3	2	1	0
	BYTEND	BITEND	BUFEND0[1:0]	BUFEND1[1:0]	-	-	-	-
Initial value:	0	0	0	1	1	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7	BYTEND	0	R/W	Specifies the endian of input data from the serial sound interface. When this bit is set to 1, byte 0 and byte 1 in STRMDIN0 are swapped. This is the same for STRMDIN2.

Bit	Bit Name	Initial Value	R/W	Description
6	BITEND	0	R/W	<p>Specifies treatment of the bit order of the input data from the serial sound interface.</p> <p>When this bit is set to 1, the bits within each byte are rearranged to place them in reverse order, bit 0 → bit 7 to bit 7 → bit 0.</p>
5, 4	BUFEND0 [1:0]	01	R/W	<p>These bits select whether to change the order of 16-bit units of data transferred from the serial sound interface or suppress the stream data. In the serial sound interface, either “padding mode” or “non-padding mode” is selectable. In non-padding mode, each 32 bits of data transferred from the serial sound interface are CD-ROM data. Since the CD-ROM decoder has two 16-bit input data registers, the order of the 16-bit data can be swapped within the 32 bits. On the other hand, in padding mode each 32 bits of data transferred from the serial sound interface includes padding. Since the padding is without meaning, it should be kept out of the input stream to the decoder. This suppression can be specified by the setting of this register.</p> <p>The CD-ROM decoder handles data as a stream of 16-bit data, and this register controls which 16-bit portion of each 32 bits of data transferred from the serial sound interface should be input first.</p> <p>00: The 16 bits of stream data that would otherwise be processed first is discarded.</p> <p>01: The higher-order 16 bits of each 32 bits of data received from the serial sound interface are placed first in the stream to the decoder.</p> <p>10: The lower-order 16 bits of each 32 bits of data received from the serial sound interface are placed first in the stream to the decoder.</p> <p>11: Setting prohibited</p>

Bit	Bit Name	Initial Value	R/W	Description
3, 2	BUFEND1 [1:0]	10	R/W	<p>These bits select whether to change the order of 16-bit units of data transferred from the serial sound interface or suppress the stream data. In the serial sound interface, either “padding mode” or “non-padding mode” is selectable. In non-padding mode, each 32 bits of data transferred from the serial sound interface are CD-ROM data. Since the CD-ROM decoder has two 16-bit input data registers, the order of the 16-bit data can be swapped within the 32 bits. On the other hand, in padding mode each 32 bits of data transferred from the serial sound interface includes padding. Since the padding is without meaning, it should be kept out of the input stream to the decoder. This suppression can be specified by the setting of this register.</p> <p>The CD-ROM decoder handles data as a stream of 16-bit data, and this register controls which 16-bit portion of each 32 bits of data transferred from the serial sound interface should be input second.</p> <p>00: The 16 bits of stream data that would otherwise be processed second is discarded.</p> <p>01: The higher-order 16 bits of each 32 bits of data received from the serial sound interface are placed second in the stream to the decoder.</p> <p>10: The higher-order 16 bits of each 32 bits of data received from the serial sound interface are placed second in the stream to the decoder.</p> <p>11: Setting prohibited</p>
1, 0	—	All 0	R/W	<p>Reserved</p> <p>These bits are always read as 0. The write value should always be 0.</p>

24.3.49 Interrupt Flag Register (INTHOLD)

The interrupt flag register (INTHOLD) consists of various interrupt flags.

Bit:	7	6	5	4	3	2	1	0
	ISEC	ITARG	ISY	IERR	IBUF	IREADY	-	-
Initial value:	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7	ISEC	0	R/W	ISEC Interrupt Flag Writing 0 to this bit is only possible after 1 has been read from it.
6	ITARG	0	R/W	ITARG Interrupt Flag Writing 0 to this bit is only possible after 1 has been read from it.
5	ISY	0	R/W	ISY Interrupt Flag Writing 0 to this bit is only possible after 1 has been read from it.
4	IERR	0	R/W	IERR Interrupt Flag Writing 0 to this bit is only possible after 1 has been read from it.
3	IBUF	0	R/W	IBUF Interrupt Flag Writing 0 to this bit is only possible after 1 has been read from it.
2	IREADY	0	R/W	IREADY Interrupt Flag Writing 0 to this bit is only possible after 1 has been read from it.
1, 0	—	All 0	R/W	Reserved These bits are always read as 0. The write value should always be 0.

24.3.50 Interrupt Source Mask Control Register (INHINT)

The interrupt source mask control register (INHINT) controls masking of various interrupt requests in the CD-ROM decoder.

Bit:	7	6	5	4	3	2	1	0
	INH ISEC	INH ITARG	INH ISY	INH IERR	INH IBUF	INH IREADY	PREINH REQDM	PREINH IREADY
Initial value:	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7	INHISEC	0	R/W	ISEC Interrupt Mask When set to 1, inhibits ISEC interrupt requests
6	INHITARG	0	R/W	ITARG Interrupt Mask When set to 1, inhibits ITARG interrupt requests
5	INHISY	0	R/W	ISY Interrupt Mask When set to 1, inhibits ISY interrupt requests
4	INHIERR	0	R/W	IERR Interrupt Mask When set to 1, inhibits IERR interrupt requests
3	INHIBUF	0	R/W	IBUF Interrupt Mask When set to 1, inhibits IBUF interrupt requests
2	INHIREADY	0	R/W	IREADY Interrupt Mask When set to 1, inhibits IREADY interrupt requests
1	PREINH REQDM	0	R/W	Inhibits setting of the DMA-transfer-request interrupt source flag for the output data stream. When this bit is set to 1, the DMA-transfer-request interrupt source is not retained.
0	PREINH IREADY	0	R/W	Inhibits setting of the IREADY interrupt flag. When this bit is set to 1, the IREADY interrupt source not retained.

24.3.51 CD-ROM Decoder Stream Data Input Register (STRMDIN0)

The CD-ROM decoder stream data input register (STRDMIN0) holds the higher 2 bytes (from MSB) of the 4 bytes of data that is to be input to the CD-ROM decoder.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	STRMDIN[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 0	STRMDIN [31:16]	All 0	R/W	<p>Indicate the higher 2 bytes (from MSB) of the 4-bytes of data that is to be input to the CD-ROM decoder.</p> <p>The CD-ROM decoder has a 4-byte wide data window as a data input register to handle the data input to this register as a stream data. The amount of data for one sector is 2352 bytes.</p>

24.3.52 CD-ROM Decoder Stream Data Input Register (STRMDIN2)

The CD-ROM decoder stream data input register (STRDMIN2) holds the lower 2 bytes (from LSB) of the 4 bytes of data that is to be input to the CD-ROM decoder.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	STRMDIN[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 0	STRMDIN [15:0]	All 0	R/W	<p>Indicate the lower 2 bytes (from LSB) of the 4-bytes of data that is to be input to the CD-ROM decoder.</p> <p>The CD-ROM decoder has a 4-byte wide data window as a data input register to handle the data input to this register as a stream data. The amount of data for one sector is 2352 bytes.</p>

24.3.53 CD-ROM Decoder Stream Data Output Register (STRMDOUT0)

The CD-ROM decoder stream data output register (STRMDOUT0) holds 2 bytes that is to be output from the CD-ROM decoder.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	STRMDOUT[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15 to 0	STRMDOUT [15:0]	H'0000	R	<p>Indicate 2 bytes that are to be output from the CD-ROM decoder.</p> <p>The CD-ROM decoder has a 2-byte wide data window or set of registers for the output of decoded data. Every time the relevant register is accessed, further data of access size are output sequentially in the output format that is separately defined. The amount of data for one sector is 2768 bytes. Always read 2768 bytes.</p>

24.4 Operation

24.4.1 Endian Conversion for Data in the Input Stream

Stream data must be input to the core of the CD-ROM decoder in order according to the CD-ROM data format specifications. In some systems, however, the order of the data from the serial sound interface may have to be changed or the data will have been padded before transfer. To cope with this, the stream data input control section is capable of swapping the order of the data and preventing the input of padding data to the core of the CD-ROM decoder. These functions are controlled through the serial sound interface data control register (SSI).

Figure 24.6 shows a case where the upper and lower 16 bits of the data, consisting of padding data plus the first 2 bytes of sync code, that is, H'000000FF, are swapped (H'00FF0000) and input to the CD-ROM decoder as the stream data.

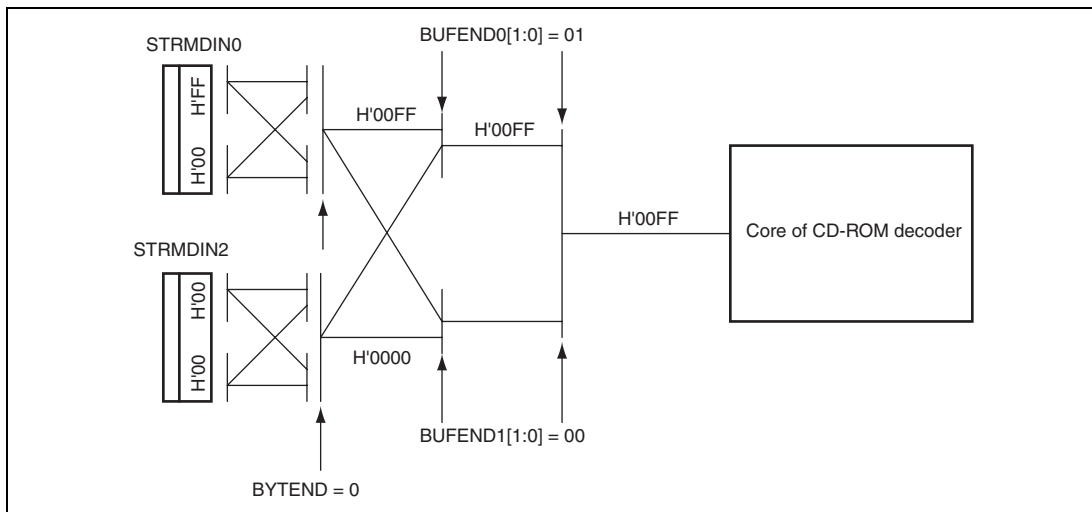

Figure 24.6 Example of Padded Stream Data Control by the SSI Register

Figure 24.7 shows a case of input stream data that has no padding (H'12345678). The upper and lower 16 bits of data are swapped (H'56781234) for input to the CD-ROM decoder.

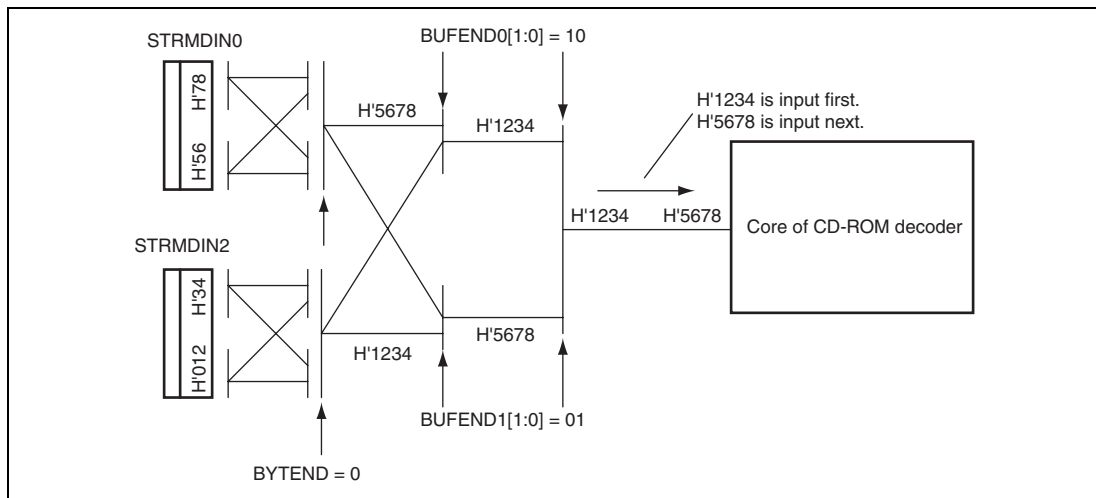

Figure 24.7 Example of Non-Padded Stream Data Control by the SSI Register

24.4.2 Sync Code Maintenance Function

Each sector of CD-ROM data consists of 2352 bytes starting with H'00FFFFFFFFFFFFFFFFF00 (sync code). However, a scratch on the disc or some other factor might lead to erroneous recognition of the sync code sequence at the wrong time. Conversely, a sync code might not be detected at a point where it should be detected. As a solution to these problems, the CD-ROM decoder of this LSI has a sync-code maintenance function, which operates to ignore sync codes detected at abnormal times and maintain the appearance of the sync code at the expected times when it is not actually detected on the disc.

The operating modes of the sync-code maintenance function are listed below. For details on the settings, refer to section 24.3.2, Sync Code-Based Synchronization Control Register (CROMSY0), and table 24.2.

- Automatic sync maintenance mode
- External sync mode
- Interpolated sync mode
- Interpolated sync plus external sync mode

(1) Automatic Sync Maintenance Mode

In automatic sync maintenance mode, the sync code is ignored if detected within the one-sector (2352-byte) period. Furthermore, if a sync code is not detected at the point where a next sector should start, sync code maintenance is applied. If synchronization timing has changed, re-synchronization is performed at the point where a sync code is detected within 2352 bytes after the change.

Therefore, this mode is effective in rejecting abnormal sync patterns and following changes in synchronization timing. Note, however, that this mode cannot achieve synchronization with the first sector after a change to the synchronization timing.

Figure 24.8 shows operation in the case of normal sync-code detection, figure 24.9 shows a case where a sync code is detected before a current one-sector period has elapsed, and figure 24.10 shows the case where the actual sync code is only detected some time after a full one-sector period has elapsed.

Figure 24.8 Operation in Automatic Sync Maintenance Mode (Normal Timing)

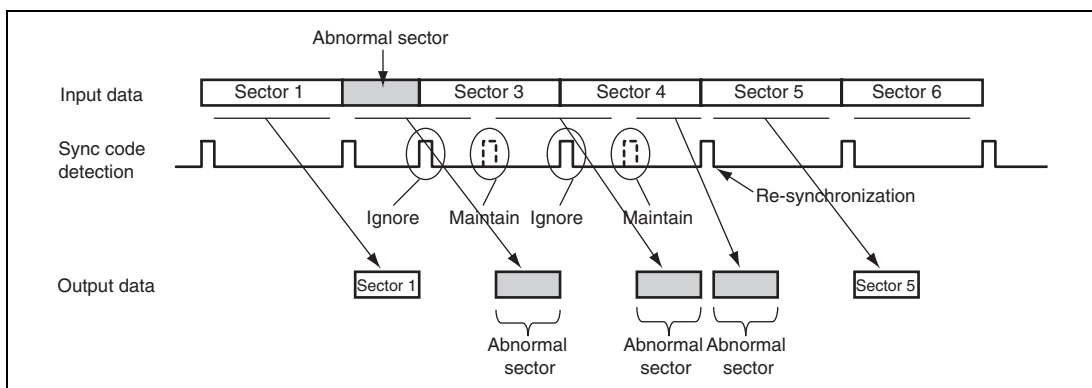

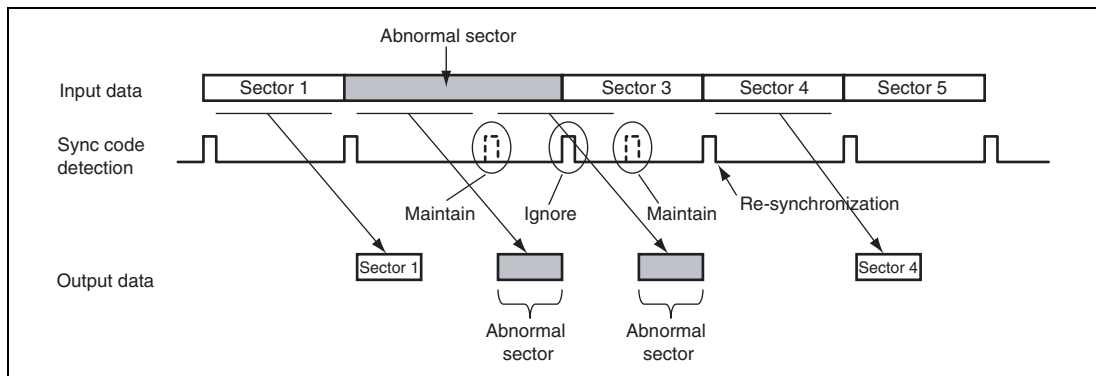

Figure 24.9 Operation in Automatic Sync Maintenance Mode (When an Abnormally Short Sector is Encountered)

**Figure 24.10 Operation in Automatic Sync Maintenance Mode
(When an Abnormally Long Sector is Encountered)**

(2) External Sync Mode

In external sync mode, synchronization is always based on the sync codes in the incoming data. Even if the next sync code is not detected at the 2352nd byte, decoding does not proceed until the next sync code is detected.

Accordingly, this mode is effective in that it strictly follows the external synchronization timing. Note, however, that decoding will not be performed normally when the sync-code pattern is input with abnormal timing.

Figure 24.11 shows the operation in external sync mode.

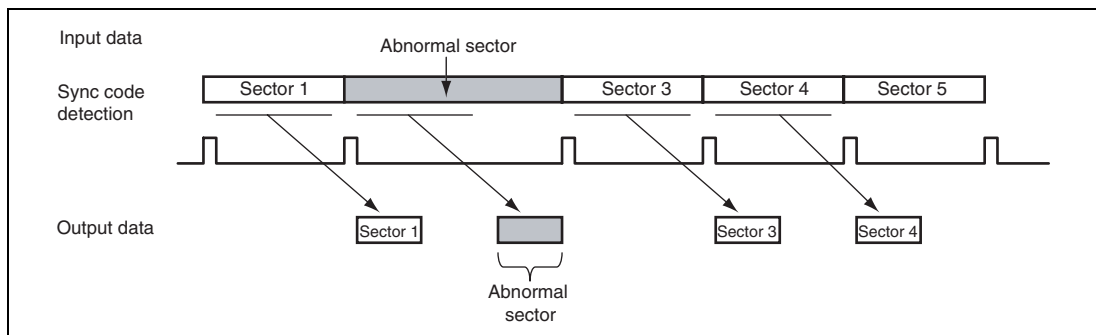

Figure 24.11 Operation in External Sync Mode

(3) Interpolated Sync Mode

In interpolated sync mode, synchronization is always driven by the internal counter after a sync code pattern has been detected at the start of decoding. Accordingly, this mode is effective when the sync patterns have been damaged.

However, decoding becomes incorrect after a change to the synchronization timing, since the change in timing is not followed.

Figure 24.12 shows the operation in interpolated sync mode.

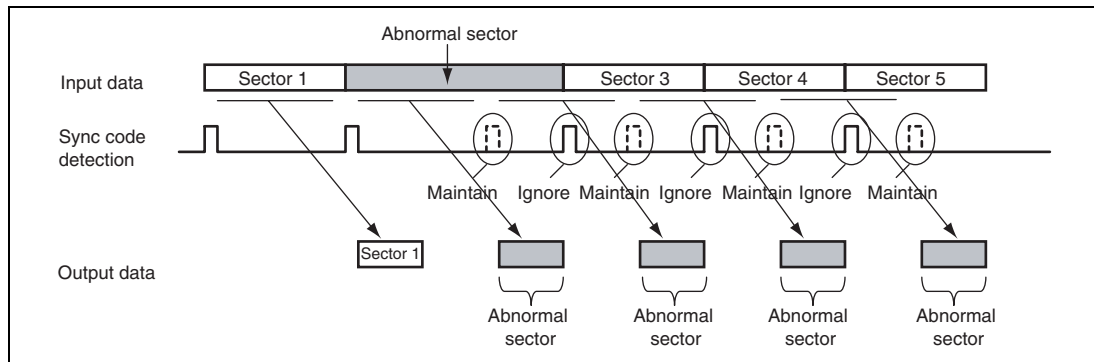

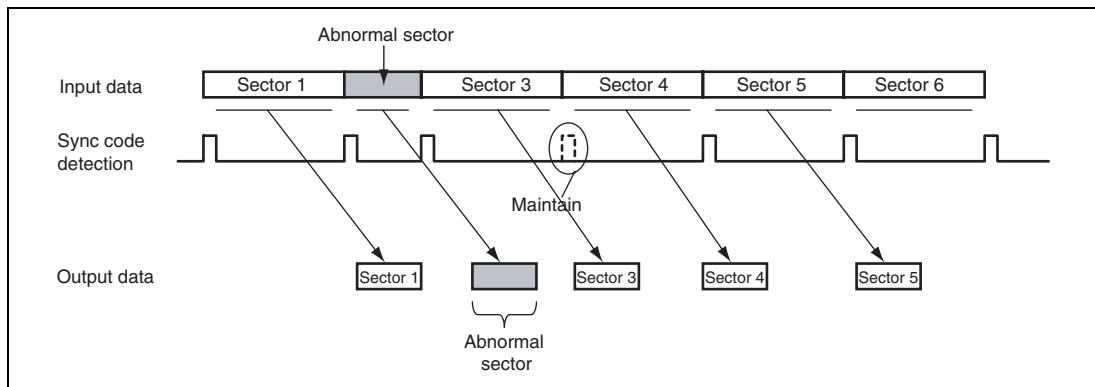

Figure 24.12 Operation in Interpolated Sync Mode

(4) Interpolated Sync Plus External Sync Mode

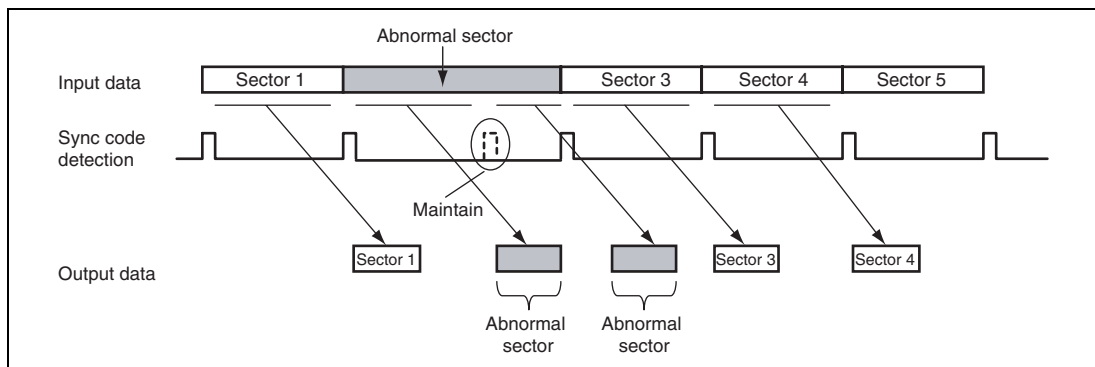

In interpolated sync plus external sync mode, synchronization is based on the detected sync code patterns as long as they are present, and if a sync pattern is not detected at the 2352nd byte, the sync code maintenance is applied. Synchronization in this mode is more quickly responsive to changes in synchronization timing than synchronization in the automatic sync maintenance mode.

However, decoding still becomes incorrect when a sync pattern is input with abnormal timing.

Figures 23.13 and 23.14 show the operation in interpolated sync plus external sync mode in the cases of abnormally short and long sectors, respectively.

**Figure 24.13 Operation in Interpolated Sync Plus External Sync Mode
(When an Abnormally Short Sector is Encountered)**

**Figure 24.14 Operation in Interpolated Sync Plus External Sync Mode
(When an Abnormally Long Sector is Encountered)**

24.4.3 Error Correction

The CD-ROM decoder handles data in the formats containing information relevant to error correction, including the EDC, P parity, and Q parity. The CD-ROM decoder includes the following functions for use in error correction.

- Syndrome calculation
- ECC correction
- EDC checking

(1) Syndrome Calculation

After the data of a sector in Mode 1 or Form 1 of Mode 2 has been input, the ECC is used in correction if any error is detected (the result of syndrome calculation is non-zero). After correction, the results of syndrome operation for the corrected data are output to bits ST_ECCP (P parity) and ST_ECCQ (Q parity) in the CROMST6 register, respectively.

(2) ECC correction and EDC Checking

For CD-ROM format data that contains EDC, P-parity, and Q-parity fields, the CD-ROM decoder performs EDC checking and ECC correction. Supported correction modes are P correction, Q correction, PQ correction (P correction followed by Q correction), and QP correction (Q correction followed by P correction). In PQ and QP correction modes, up to three iterations of correction are possible (the number of iterations is limited by the playback speed).

The EDC check is performed twice, before and after correction.

The mode of ECC correction and EDC checking is specified by bits MD_DEC[2:0] in the CROMCTL1 register. When the PQ or QP correction mode is selected, the number of iterations is specified by bits MD_PQREP[1:0] in the CROMCTL1 register.

When the automatic mode/form detection function is in use, the sector mode determines whether or not ECC correction and EDC checking can be performed. For sectors in Mode 0 and Mode 2 (non-XA), which include neither parity bits nor EDC, ECC correction and EDC checking are not performed. For sectors in Form 2 of Mode 2, ECC correction is not performed.

(a) ECC Correction

When ECC correction is in use and an error in a sector is identified as non-correctable, the CD-ROM decoder generates an IERR interrupt and sets the ST_ECCNG bit of the CROMST6 register to 1. The CD-ROM detector also sets this bit to 1 on detecting a short sector.

While the NO_ECC bit of the CROMCTL4 register is set to 1, a 'pass' result in pre-correction EDC checking makes the CD-ROM decoder skip ECC correction, regardless of the results of the syndrome operation.

(b) EDC Checking

When EDC checking is in use, checking is in line with the specified or detected sector mode and form, depending on whether or not automatic sector mode and form detection is selected.

The results of EDC checking before and after correction are reflected in the ST_EDC1 and ST_EDC2 bits of the CROMST6 register, respectively. If EDC checking after ECC correction indicates that an error remains, an IERR interrupt is generated.

24.4.4 Automatic Decoding Stop Function

Decoding can be stopped automatically in response to an error during the decoding of CD-ROM data.

The possible conditions for automatically stopping the decoding process are listed below. The applicable conditions are specified in the CROMCTL3 register.

- An error is found to be not correctable by ECC correction.
- Post-correction EDC checking indicates that an error remains.
- A change of the sector mode or form.
- A non-sequential MSF (minutes, seconds, frames (1/75 second)) value.

When automatic stopping is set up and any of the above conditions is encountered in a certain sector, the decoding is stopped after the results of decoding for that sector have been output.

After decoding has been stopped in response to a condition specified in the CROMCTL3 register, the condition can be identified by reading the CBUFST1 register.

The CD-ROM decoder has buffer space for two sectors. If input of the data stream continues and the output stream of data is not read, the CD-ROM decoder stops at the point where the data of a third sector starts to be input. At this time, the BUF_NG bit in the CBUFST2 register is set to 1, but no interrupt is generated. Once the BUF_NG bit in the CBUFST2 register has been set to 1, recovery can only be accomplished by using the LOGICRST bit in the ROMDECRST register to reset the CD-ROM decoder function. When the LOGICRST bit in the ROMDECRST register is set to 1, a reset signal is output and any registers in which settings have been made are cleared to their initial values.

24.4.5 Buffering Format

Figure 24.15 shows the format of the output data stream produced by CD-ROM decoding.

A 2-byte-wide window register STRMDOUT0 is provided for the output. When this window register is accessed after decoding of a CD-ROM sector has finished, the bytes of data are output in order from the sync code.

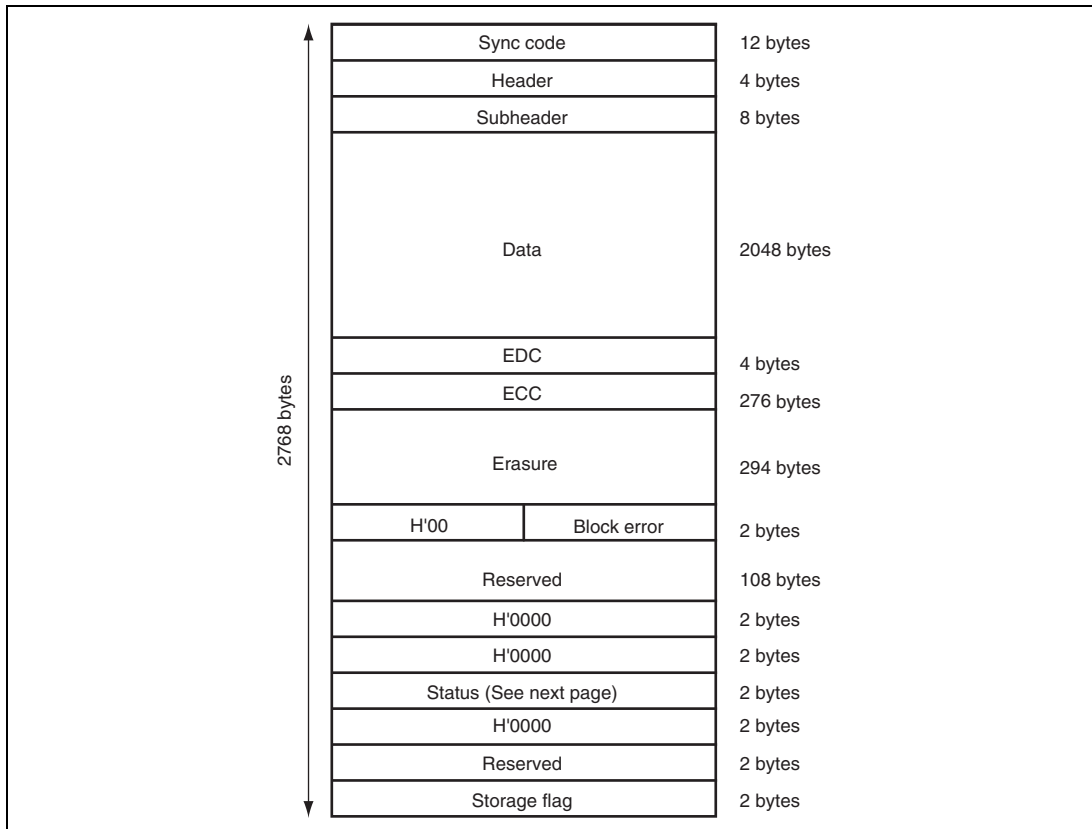

Figure 24.15 Output Data Stream Format

The meanings of bits in the two-byte status field shown in figure 24.15 are given below. The values of the non-assigned bits are undefined.

Status															
15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
PERR	QERR	EDCE	—	—	—	—	—	SD	SY		FM[2:0]		HD	—	—

[Legend]

PERR: Indicates that a P-parity error remains.

QERR: Indicates that a Q-parity error remains.

EDCE: Indicates that a remaining error was detected in post-correction EDC checking.

SD: Indicates that a short sector was encountered

SY: Indicates that a sync code was interpolated.

FM: Indicates the data format

001: Mode 0

010: Mode 1

011: Long (format with no EDC and ECC)

100: Mode 2 (non-XA)

101: Mode 2 Form 1

110: Mode 2 Form 2

HD: Header continuity (minutes, seconds, and frames (1/75) are non-sequential)

The value of the storage flag field in figure 24.15 is incremented every time the data for one sector are output. The value starts at H'0000 and wraps back around to H'0000 after incrementation reaches H'FFFF. Note that the upper byte and lower byte in the storage flag are swapped.

24.4.6 Target-Sector Buffering Function

In the CD-ROM decoder, the sector for output can be designated in two ways: automatic buffering, where the CD-ROM decoder itself detects the presence of target sectors, and manual buffering, where the target sector for output is designated by software and the software also recognizes the sectors buffered in the CD-ROM decoder.

The following describes the procedures for setting the registers in the CD-ROM decoder to set up automatic or manual buffering.

(1) Setting Up Automatic Buffering

Figure 24.16 shows an example of setting up the automatic buffering. Set the relevant CD-ROM decoder registers and start input of the data stream; the CD-ROM decoder then detects the target sector and starts the output of the stream data.

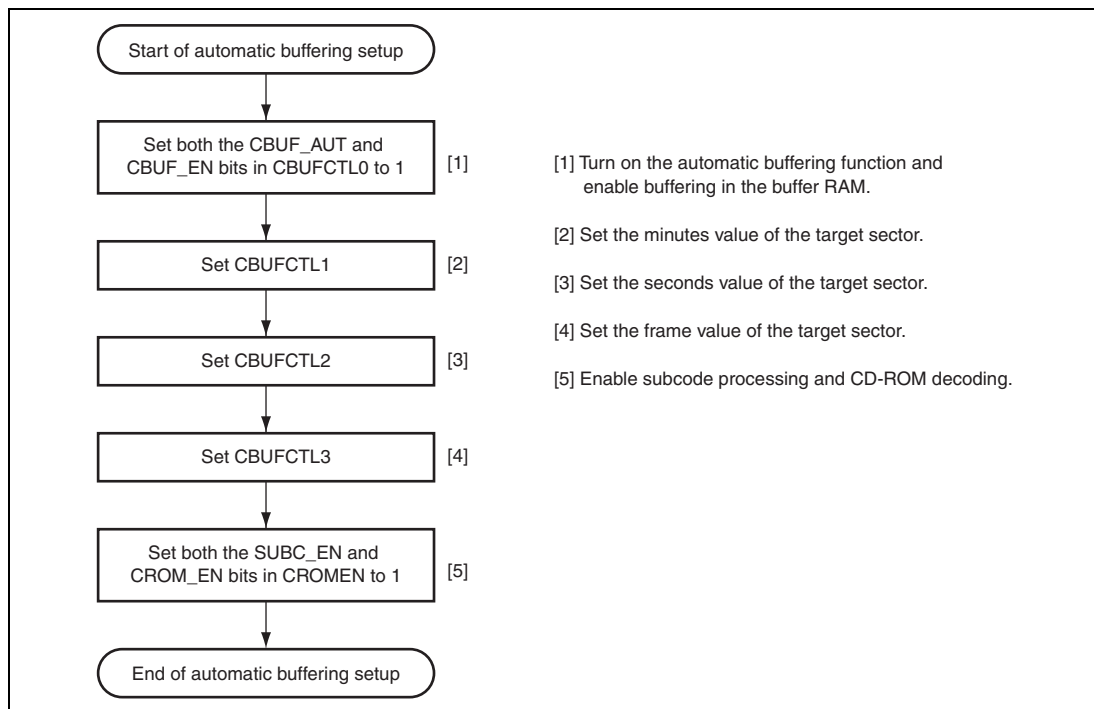

Figure 24.16 Example of Setting Up Automatic Buffering

(2) Setting Up Manual Buffering

Figure 24.17 shows an example of setting up manual buffering. Each time an ISEC interrupt is generated, the software checks whether or not the sector is the target sector and starts buffering when the target sector is found.

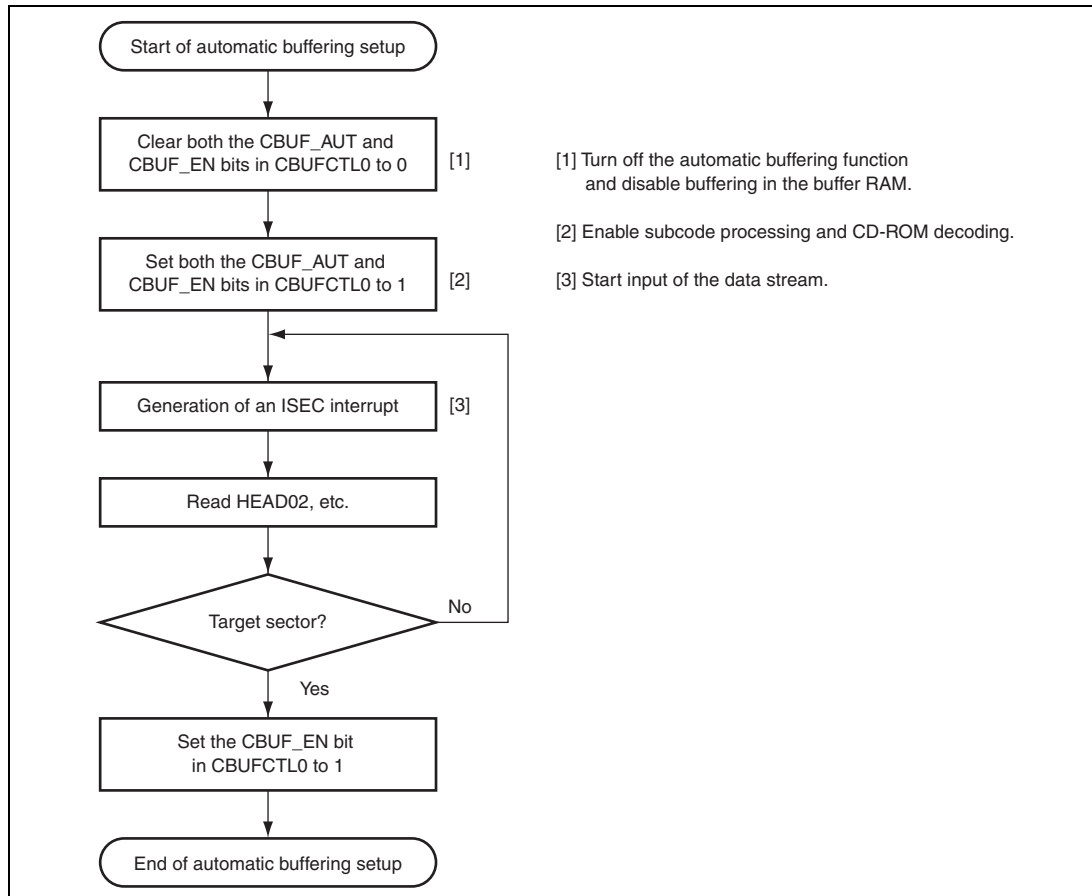

Figure 24.17 Example of Setting Up Manual Buffering

24.5 Interrupt Sources

24.5.1 Interrupt and DMA Transfer Request Signals

Table 24.3 lists the interrupt signals and DMA transfer request signal generated by the CD-ROM decoder, along with the meanings and the modules to which the signals are connected.

Table 24.3 Interrupt and DMA Transfer Request Signals

Name	Condition	Connected To
ISEC	Transitions from sector to sector	Interrupt controller
ITARG	Access to a CD-ROM sector that is not the expected target sector	Interrupt controller
ISY	A sync code from the CD-ROM with abnormal timing	Interrupt controller
IERR	An error that was not correctable by ECC correction or an error indicated by EDC checking after ECC correction	Interrupt controller
IBUF	State changes in data transfer to the buffer	Interrupt controller
IREADY	Request for data transfer to the buffer for CD-ROM	Interrupt controller
DMA transfer request	Request for data transfer to the buffer for CD-ROM	Direct memory access controller

(1) ISEC Interrupt

This interrupt is generated when the sync code indicates a transition from sector to sector.

(2) ITARG Interrupt

This interrupt is generated when the stream data transferred from the CD-DSP is not the data of the target sector. The CD-ROM decoder checks the time data in the subcode. In correct operation, data transfer is expected to start slightly before the target sector. An ITARG interrupt is generated in the following cases.

- When data of a sector preceding the target sector by quite a few sectors have been transferred
- When data of a sector that comes after the target sector have been transferred

For the generation of this interrupt, ITARG is detected from the subcode. However, this interrupt has no meaning in this LSI because CD-ROM data are transferred from the serial sound interface.

(3) ISY Interrupt

This interrupt can be generated in the following cases.

- When a sync code was detected at a position where the value in the word counter (counter for checking sync code intervals) was not correct and the sync code was ignored
- When a sync code has not been detected although the word counter has reached the final value and a sync code has been interpolated (for sync maintenance)
- When a sync code was detected at a position where the value in the word counter (counter for checking sync code intervals) was not correct and the sync code was used in resynchronization
- When a sync code has not been detected although the word counter has reached the final value, so the period taken up by the sector has been prolonged
- When the sector has been processed as a short sector with the aid of interpolated sync codes
- When the sector has been processed as a long sector with the aid of interpolated sync codes

(4) IERR Interrupt

This interrupt is generated in the following cases.

- When ECC correction was incapable of correcting an error
- When ECC correction was OK but the subsequent EDC check indicated an error

(5) IBUF Interrupt

This interrupt is generated when the following transitions occur.

- Data transfer to the buffer → Data transfer complete (searching for data for the next transfer)
- Data for transfer to the buffer are being searched for → Data transfer started

(6) IREADY Interrupt

This interrupt is generated when decoding of data for one sector is completed. This interrupt should be used to start the CPU buffering stream data for output to SDRAM.

(7) DMA Transfer Request

The source of direct memory access controller activation is the same as that of IREADY. An interrupt request is generated when output stream data for one sector becomes ready, and after the 2768 bytes of data shown in figure 24.15 have been transferred, the request signal is negated once. This is because a certain amount of time is required before the output data for the next sector is ready, so the transfer request from the direct memory access controller should be turned off between transfers.

24.5.2 Timing of Status Registers Updates

The status information registers of the CD-ROM decoder are updated on each ISEC interrupt. The sector for which information is reflected in the status registers is selected by the EROSEL bit of the CROMCTL4 register.

24.6 Usage Notes

24.6.1 Stopping and Resuming Buffering Alone during Decoding

When the data of the output stream are being not read out but operation of the CD-ROM decoder has continued until the buffers are full, the BUF_NG bit in the CBUFST2 register is set to 1; after that, the CD-ROM decoder becomes incapable of operation.

To stop buffering alone, clear the CBUF_EN bit in the CBUFCTL0 register to 0. If the automatic buffering function is in use, clear the CBUF_AUT in the CBUFCTL0 register to 0 at the same time. In this case, the sectors currently in the buffers must be read out.

To resume automatic buffering, set the CBUF_AUT and CBUF_EN bits in the CBUFCTL0 register at the same time.

24.6.2 When CROMST0 Status Register Bits are Set

1. When the ST_SECS bit in the CROMST0 register becomes set, stop decoding immediately and retry from one sector before the sector that was being decoded.
2. When the ST_SECL bit in the CROMST0 register becomes set, stop decoding immediately and retry from two sectors before the sector that was being decoded.

24.6.3 Link Blocks

The CD-ROM decoder uses the header information before ECC correction to detect link blocks. Accordingly, an input data stream that contains an error may be erroneously detected as a link block. To prevent this, the following measures should be implemented in software.

- During buffering (BUF_ACT = 1 in the CBUFST0 register), check the LINK_OUT1 bit in the CROMST5 register on each ISEC interrupt. If it is set to 1, check to see if an IERR interrupt has also occurred; if an IERR interrupt has not occurred, save the MSF values from the HEAD20 to HEAD23 registers. If an IERR interrupt has occurred, do not save the MSF values.
- Perform the following processing for seven sectors (indicated by ISEC being generated seven times) after finding that the LINK_OUT1 bit has been set to 1.

In either of cases 1 and 2 below,

1. LINK_ON = 1 (in the CROMST5 register) is confirmed at each ISEC interrupt, and LINK_ON = 1 is detected again within the subsequent two-sector period
2. LINK_ON = 1 was not detected at any ISEC interrupt

Forcibly stop decoding, set the CROMSY0 register to place the decoder in external sync mode, and retry decoding by specifying the MSF value stored above + 7 as the MSF value for the target sector. The start sector address will be the address where RUN_OUT is stored + 7 when CBUF_LINK = 0, and the address where RUN_OUT is stored when CBUF_LINK = 1.

24.6.4 Stopping and Resuming CD-DSP Operation

When stopping and resuming the stream data input to the CD-ROM decoder, note that the input data stream does not stop immediately before a sync code and that the CD-ROM decoder may recognize the data as incorrect when the input stream is resumed. This happens because the system holds a combination of the data up to the point where input was stopped and data that is input from the point of resumption. Take care on this point when stopping and resuming input.

24.6.5 Note on Clearing the IREADY Flag

To clear the IREADY flag to 0 in interrupt processing etc., be sure to read one sector of data (2768 bytes) beforehand. If the IREADY flag is cleared to 0 before reading of one sector of data is complete, decoding of the subsequent sectors will not be possible. For recovery from this situation, write 1 to the LOGICRST bit in the CD-ROM decoder reset control register (ROMDECRST), and then clear the bit to 0.

24.6.6 Note on Stream Data Transfer (1)

When reading of the stream data is slower than writing of the stream data, the buffer of the CD-ROM decoder will overflow. This causes the CD-ROM decoder to be abnormally stopped. Caution is required in writing and reading of the stream data. Sample combinations of stream data transfer settings are shown below.

Table 24.4 Sample Combinations of Stream Data Transfer Settings

Stream Input	Stream Output
LW/cycle-stealing transfer by direct memory access controller (without padding)	(1) 16-byte/cycle-stealing transfer by direct memory access controller (16 bytes*) (2) Burst transfer by direct memory access controller (16 bytes*, longword, word)
LW/cycle-stealing transfer by direct memory access controller (with padding)	(1) Cycle-stealing transfer by direct memory access controller (16 bytes*, longword) (2) Burst transfer by direct memory access controller (16 bytes*, longword, word)
LW write by CPU	(1) Cycle-stealing transfer by direct memory access controller (16 bytes*, longword, word) (2) Burst transfer by direct memory access controller (16 bytes*, longword, word)

Note: * Set bit 25 in the DMA channel control register (CHCR_n) to 1, as well as making the regular settings for 16-byte transfer.

24.6.7 Note on Stream Data Transfer (2)

When reading the stream data, be sure to use either the direct memory access controller or the CPU. If both the direct memory access controller and the CPU are used for reading, the stream data may not be recognized as being in the CD-ROM format.

Section 25 A/D Converter

This LSI includes a 10-bit successive-approximation A/D converter allowing selection of up to six analog input channels.

25.1 Features

- Resolution: 10 bits
- Input channels: six channels
- Minimum conversion time: 6.0 μ s per channel
- Absolute accuracy: ± 5 LSB
- Operating modes: Three
 - Single mode: A/D conversion on one channel
 - Multi mode: A/D conversion on one to four channels or on one to six channels
 - Scan mode: Continuous A/D conversion on one to four channels or on one to six channels
- Data registers: Six
 - Conversion results are held in a 16-bit data register for each channel
- Sample-and-hold function
- A/D conversion start methods: Three
 - Software
 - Conversion start trigger from the multi-function timer pulse unit 2
 - External trigger signal
- Interrupt source
 - An A/D conversion end interrupt (ADI) request can be generated on completion of A/D conversion.
- Module standby mode can be set

Figure 25.1 shows a block diagram of the A/D converter.

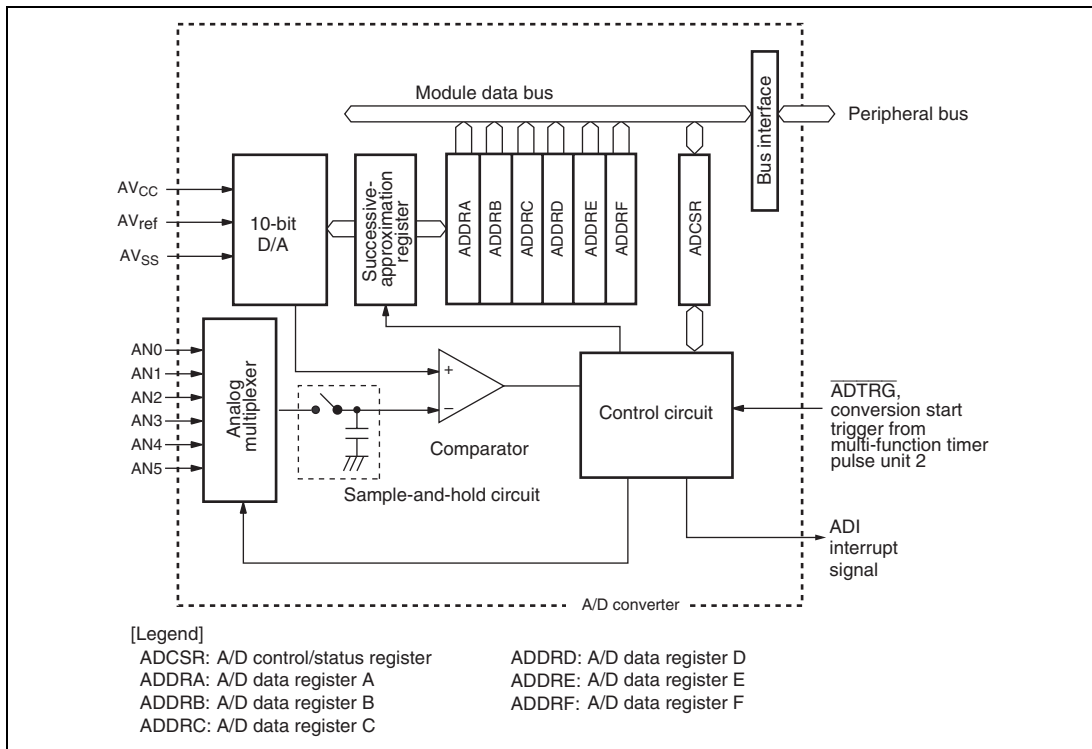

Figure 25.1 Block Diagram of A/D Converter

25.2 Input/Output Pins

Table 25.1 shows the A/D converter pins.

Table 25.1 Pin Configuration

Pin Name	Symbol	I/O	Function
Analog power supply pin	AVcc	Input	Analog power supply pin
Analog ground pin	AVss	Input	Analog ground pin and A/D conversion reference ground
Analog reference voltage pin	AVref	Input	A/D converter reference voltage pin
Analog input pin 0	AN0	Input	Analog input
Analog input pin 1	AN1	Input	
Analog input pin 2	AN2	Input	
Analog input pin 3	AN3	Input	
Analog input pin 4	AN4	Input	
Analog input pin 5	AN5	Input	
A/D external trigger input pin	$\overline{\text{ADTRG}}$	Input	External trigger input to start A/D conversion

25.3 Register Descriptions

The A/D converter has the following registers.

Table 25.2 Register Configuration

Register Name	Abbreviation	R/W	Initial Value	Address	Access Size
A/D data register A	ADDRA	R	H'0000	H'FFFF9800	16
A/D data register B	ADDRB	R	H'0000	H'FFFF9802	16
A/D data register C	ADDRC	R	H'0000	H'FFFF9804	16
A/D data register D	ADDRD	R	H'0000	H'FFFF9806	16
A/D data register E	ADDRE	R	H'0000	H'FFFF9808	16
A/D data register F	ADDRF	R	H'0000	H'FFFF980A	16
A/D control/status register	ADCSR	R/W	H'0000	H'FFFF9820	16

25.3.1 A/D Data Registers A to F (ADDRA to ADDR F)

The six A/D data registers, ADDRA to ADDR F, are 16-bit read-only registers that store the results of A/D conversion.

An A/D conversion produces 10-bit data, which is transferred for storage into the ADDR corresponding to the selected channel. The 10 bits of the result are stored in the upper bits (bits 15 to 6) of ADDR. Bits 5 to 0 of ADDR are reserved bits that are always read as 0.

Access to ADDR in 8-bit units is prohibited. ADDR must always be accessed in 16-bit units.

Table 25.3 indicates the pairings of analog input channels and ADDR.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
											-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15 to 6		All 0	R	Bit data (10 bits)
5 to 0	—	All 0	R	Reserved
				These bits are always read as 0. The write value should always be 0.

Table 25.3 Analog Input Channels and ADDR

Analog Input Channel	A/D Data Register where Conversion Result is Stored
AN0	ADDRA
AN1	ADDRB
AN2	ADDRC
AN3	ADDRD
AN4	ADDRE
AN5	ADDRF

25.3.2 A/D Control/Status Register (ADCSR)

ADCSR is a 16-bit readable/writable register that selects the mode, controls the A/D converter, and enables or disables starting of A/D conversion by external trigger input.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	ADF	ADIE	ADST	TRGS[3:0]				CKS[2:0]			MDS[2:0]			CH[2:0]		
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
	R/W:R/(W)*1	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Note: *1 Only 0 can be written to clear the flag after 1 is read.

Bit	Bit Name	Initial Value	R/W	Description
15	ADF	0	R/(W)*1	<p>A/D End Flag</p> <p>Status flag indicating the end of A/D conversion.</p> <p>[Clearing conditions]</p> <ul style="list-style-type: none"> • Cleared by reading ADF while ADF = 1, then writing 0 to ADF • Cleared when the direct memory access controller is activated by ADI interrupt and ADDR is read <p>[Setting conditions]</p> <ul style="list-style-type: none"> • A/D conversion ends in single mode • A/D conversion ends for the selected channels in multi mode • A/D conversion ends for the selected channels in scan mode
14	ADIE	0	R/W	<p>A/D Interrupt Enable</p> <p>Enables or disables the interrupt (ADI) requested at the end of A/D conversion. Set the ADIE bit while A/D conversion is not being made.</p> <p>0: A/D end interrupt request (ADI) is disabled</p> <p>1: A/D end interrupt request (ADI) is enabled</p>

[Legend]

x: Don't care

- Note:
- Only 0 can be written to clear the flag after 1 is read.
Please note that ADF flag becomes "0" in the following cases, too.
 - Reading the state of ADF = 1 with CPU.
 - Clearing ADF flag by having read ADDR with DMAC
 - Set of ADF flag according to A/D conversion end
 - Writing 0 in the ADF flag with CPU
 - Set the A/D conversion time to minimum or more values to meet the absolute accuracy of the A/D conversion characteristics.

25.4 Operation

The A/D converter uses the successive-approximation method, and the resolution is 10 bits. It has three operating modes: single mode, multi mode, and scan mode. Switching the operating mode or analog input channels must be done while the ADST bit in ADCSR is 0 to prevent incorrect operation. The ADST bit can be set at the same time as the operating mode or analog input channels are changed.

25.4.1 Single Mode

Single mode should be selected when only A/D conversion on one channel is required.

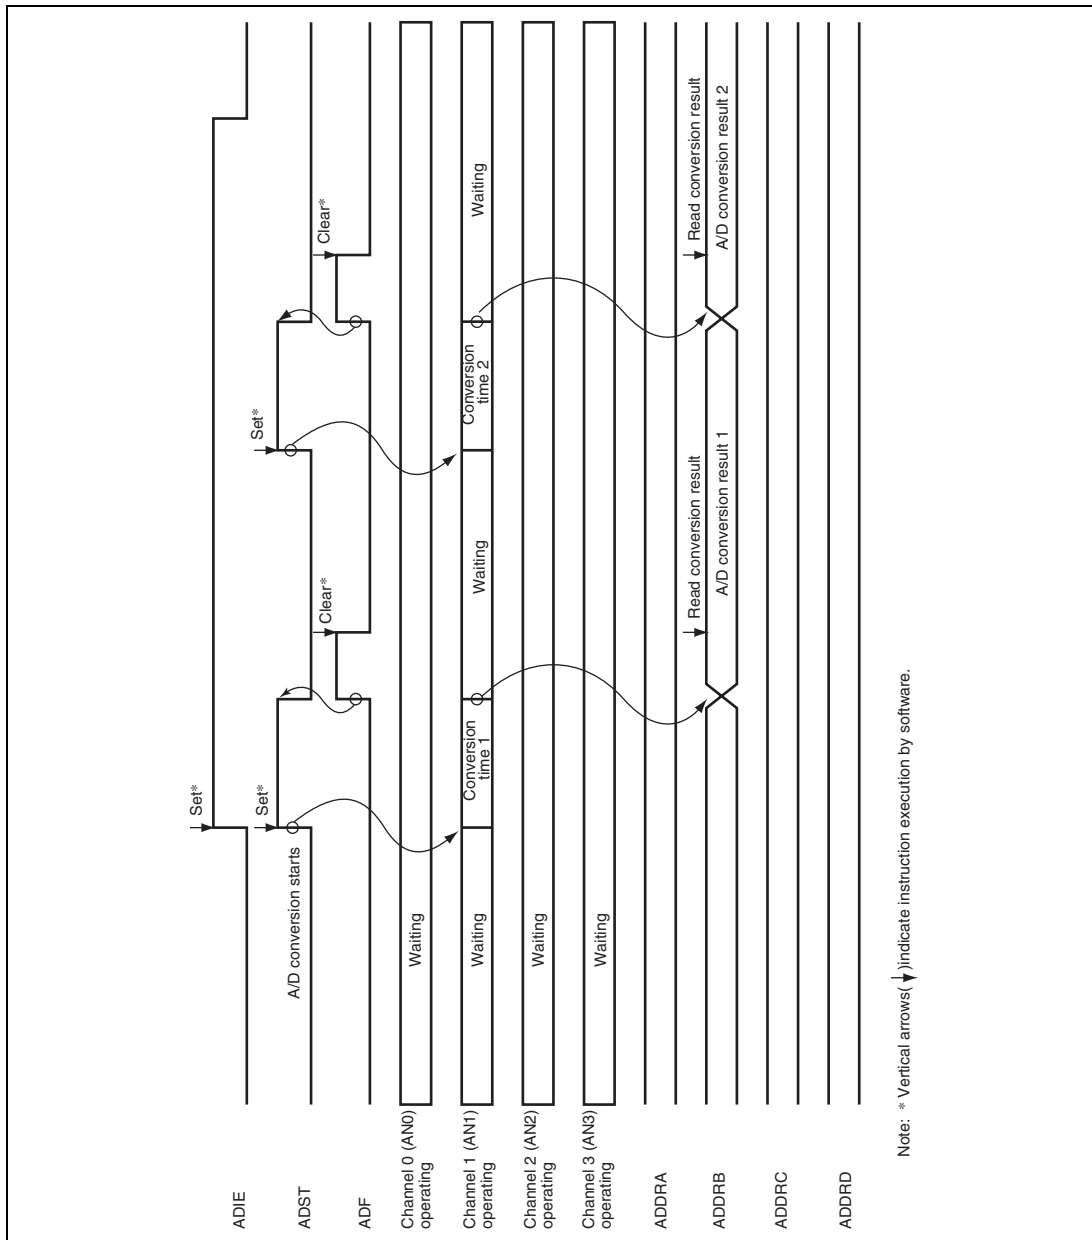

In single mode, A/D conversion is performed once for the specified one analog input channel, as follows:

1. A/D conversion for the selected channel starts when the ADST bit in ADCSR is set to 1 by software, the multi-function timer pulse unit 2, or external trigger input.
2. When A/D conversion is completed, the A/D conversion result is transferred to the A/D data register corresponding to the channel.
3. After A/D conversion has completed, the ADF bit in ADCSR is set to 1. If the ADIE bit is set to 1 at this time, an ADI interrupt request is generated.
4. The ADST bit that remains 1 during A/D conversion is automatically cleared to 0 when A/D conversion is completed, and the A/D converter becomes idle.

When the operating mode or analog input channel selection must be changed during A/D conversion, to prevent incorrect operation, first clear the ADST bit to 0 to halt A/D conversion. After making the necessary changes, set the ADST bit to 1 to start A/D conversion again. The ADST bit can be set at the same time as the mode or channel selection is switched.

Typical operations when a single channel (AN1) is selected in single mode are described next. Figure 25.2 shows a timing diagram for this example (the bits which are set in this example belong to ADCSR).

1. Single mode is selected, input channel AN1 is selected (CH[2:0] = 001), the A/D interrupt is enabled (ADIE = 1), and A/D conversion is started (ADST = 1).
2. When A/D conversion is completed, the A/D conversion result is transferred into ADDR0. At the same time the ADF flag is set to 1, the ADST bit is cleared to 0, and the A/D converter becomes idle.
3. Since ADF = 1 and ADIE = 1, an ADI interrupt is requested.
4. The A/D interrupt handling routine starts.
5. The routine reads ADF = 1, and then writes 0 to the ADF flag.
6. The routine reads and processes the A/D conversion result (ADDR0).
7. Execution of the A/D interrupts handling routine ends. Then, when the ADST bit is set to 1, A/D conversion starts and steps 2 to 7 are executed.

**Figure 25.2 Example of A/D Converter Operation
(Single Mode, One Channel (AN1) Selected)**

25.4.2 Multi Mode

Multi mode should be selected when performing A/D conversion once on one or more channels.

In multi mode, A/D conversion is performed once for a maximum of six specified analog input channels, as follows:

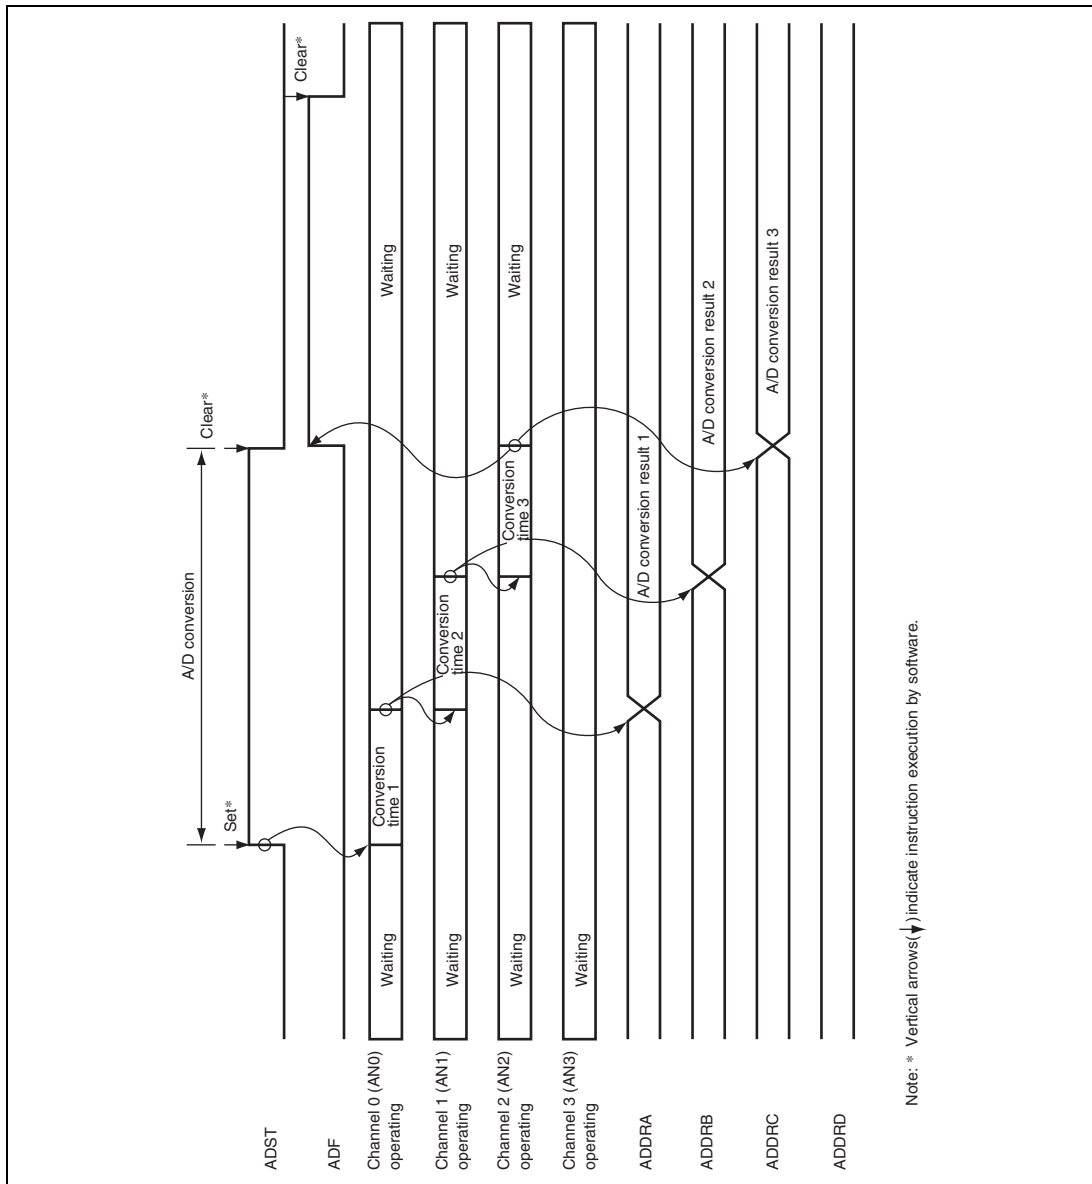

1. A/D conversion starts from the analog input channel with the lowest number (e.g. AN0, AN1, ..., AN3) when the ADST bit in ADCSR is set to 1 by software, the multi-function timer pulse unit 2, or external trigger input.
2. When A/D conversion is completed on each channel, the A/D conversion result is sequentially transferred to the A/D data register corresponding to that channel.
3. After A/D conversion on all selected channels has completed, the ADF bit in ADCSR is set to 1. If the ADIE bit is set to 1 at this time, an ADI interrupt request is generated.
4. The ADST bit that remains 1 during A/D conversion is automatically cleared to 0 when A/D conversion is completed, and the A/D converter becomes idle. If the ADST bit is cleared to 0 during A/D conversion, A/D conversion is halted and the A/D converter becomes idle. The ADF bit is cleared by reading ADF while ADF = 1, then writing 0 to the ADF bit.

A/D conversion is to be performed once on all the specified channels. The conversion results are transferred for storage into the A/D data registers corresponding to the channels.

When the operating mode or analog input channel selection must be changed during A/D conversion, to prevent incorrect operation, first clear the ADST bit to 0 to halt A/D conversion. After making the necessary changes, set the ADST bit to 1. A/D conversion will start again from the first channel in the group. The ADST bit can be set at the same time as the mode or channel selection is changed.

Typical operations when three channels (AN0 to AN2) are selected in multi mode are described next. Figure 25.3 shows a timing diagram for this example.

1. Multi mode is selected (MDS2 = 1, MDS1 = 0), analog input channels AN0 to AN2 are selected (CH[2:0] = 010), and A/D conversion is started (ADST = 1).
2. A/D conversion of the first channel (AN0) starts. When A/D conversion is completed, the A/D conversion result is transferred into ADDRA.
3. Next, the second channel (AN1) is selected automatically and A/D conversion starts.
4. Conversion proceeds in the same way through the third channel (AN2).
5. When conversion of all selected channels (AN0 to AN2) is completed, the ADF flag is set to 1 and the ADST bit cleared to 0.
6. If the ADIE bit is set to 1 at this time, an ADI interrupt is requested.

**Figure 25.3 Example of A/D Converter Operation
(Multi Mode, Three Channels (AN0 to AN2) Selected)**

25.4.3 Scan Mode

Scan mode is useful for monitoring analog inputs in a group of one or more channels at all times. In scan mode, A/D conversion is performed sequentially for a maximum of six specified analog input channels, as follows:

1. A/D conversion starts from the analog input channel with the lowest number (e.g. AN0, AN1, ..., AN3) when the ADST bit in ADCSR is set to 1 by software, the multi-function timer pulse unit 2, or external trigger input.
2. When A/D conversion is completed on each channel, the A/D conversion result is sequentially transferred to the A/D data register corresponding to that channel.
3. After A/D conversion on all selected channels has completed, the ADF bit in ADCSR is set to 1. If the ADIE bit is set to 1 at this time, an ADI interrupt request is generated. The A/D converter starts A/D conversion again from the channel with the lowest number.
4. The ADST bit is not cleared automatically, so steps 2. and 3. are repeated as long as the ADST bit remains set to 1. When the ADST bit is cleared to 0, A/D conversion halts and the A/D converter becomes idle.

The ADF bit is cleared by reading ADF while ADF = 1, then writing 0 to the ADF bit.

When the operating mode or analog input channel selection must be changed during A/D conversion, to prevent incorrect operation, first clear the ADST bit to 0 to halt A/D conversion. After making the necessary changes, set the ADST bit to 1. A/D conversion will start again from the first channel in the group. The ADST bit can be set at the same time as the mode or channel selection is changed.

Typical operations when three channels (AN0 to AN2) are selected in scan mode are described as follows. Figure 25.4 shows a timing diagram for this example.

1. Scan mode is selected (MDS2 = 1, MDS1 = 1), analog input channels AN0 to AN2 are selected (CH[2:0] = 010), and A/D conversion is started (ADST = 1).
2. A/D conversion of the first channel (AN0) starts. When A/D conversion is completed, the A/D conversion result is transferred into ADDRA.
3. Next, the second channel (AN1) is selected automatically and A/D conversion starts.
4. Conversion proceeds in the same way through the third channel (AN2).
5. When conversion of all the selected channels (AN0 to AN2) is completed, the ADF flag is set to 1 and conversion of the first channel (AN0) starts again. If the ADIE bit is set to 1 at this time, an ADI interrupt is requested.

6. The ADST bit is not cleared automatically, so steps 2. to 4. are repeated as long as the ADST bit remains set to 1. When steps 2. to 4. are repeated, the ADF flag is kept to 1. When the ADST bit is cleared to 0, A/D conversion stops. The ADF bit is cleared by reading ADF while ADF = 1, then writing 0 to the ADF bit.

If both the ADF flag and ADIE bit are set to 1 while steps 2. to 4. are repeated, an ADI interrupt is requested at all times. To generate an interrupt on completing conversion of the third channel, clear the ADF bit to 0 after an interrupt is requested.

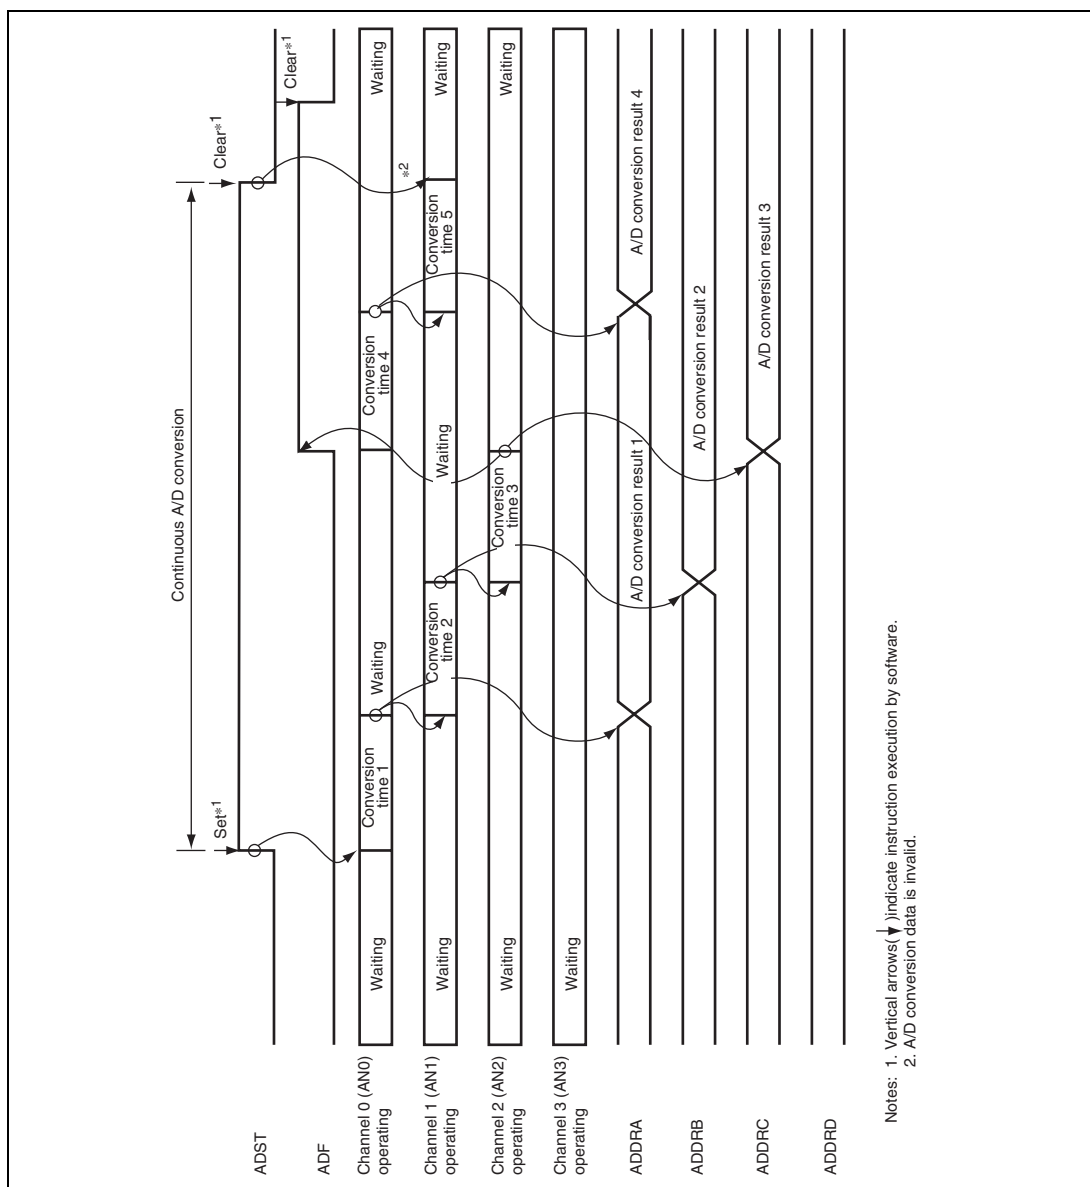

Figure 25.4 Example of A/D Converter Operation (Scan Mode, Three Channels (AN0 to AN2) Selected)

25.4.4 A/D Converter Activation by External Trigger or Multi-Function Timer Pulse Unit 2

The A/D converter can be independently activated by an external trigger or an A/D conversion request from the multi-function timer pulse unit 2. To activate the A/D converter by an external trigger or the multi-function timer pulse unit 2, set the A/D trigger enable bits (TRGS[3:0]). When an external trigger or an A/D conversion request from the multi-function timer pulse unit 2 is generated with this bit setting, the ADST bit is set to 1 to start A/D conversion. The channel combination is determined by bits CH2 to CH0 in ADCSR. The timing from setting of the ADST bit until the start of A/D conversion is the same as when 1 is written to the ADST bit by software.

25.4.5 Input Sampling and A/D Conversion Time

The A/D converter has a built-in sample-and-hold circuit. The A/D converter samples the analog input at the A/D conversion start delay time (t_d) after the ADST bit in ADCSR is set to 1, then starts conversion. Figure 25.5 shows the A/D conversion timing. Table 25.4 indicates the A/D conversion time.

As indicated in figure 25.5, the A/D conversion time (t_{CONV}) includes t_d and the input sampling time (t_{SPL}). The length of t_d varies depending on the timing of the write access to ADCSR. The total conversion time therefore varies within the ranges indicated in table 25.4.

In multi mode and scan mode, the values given in table 25.4 apply to the first conversion. In the second and subsequent conversions, time is the values given in table 25.5.

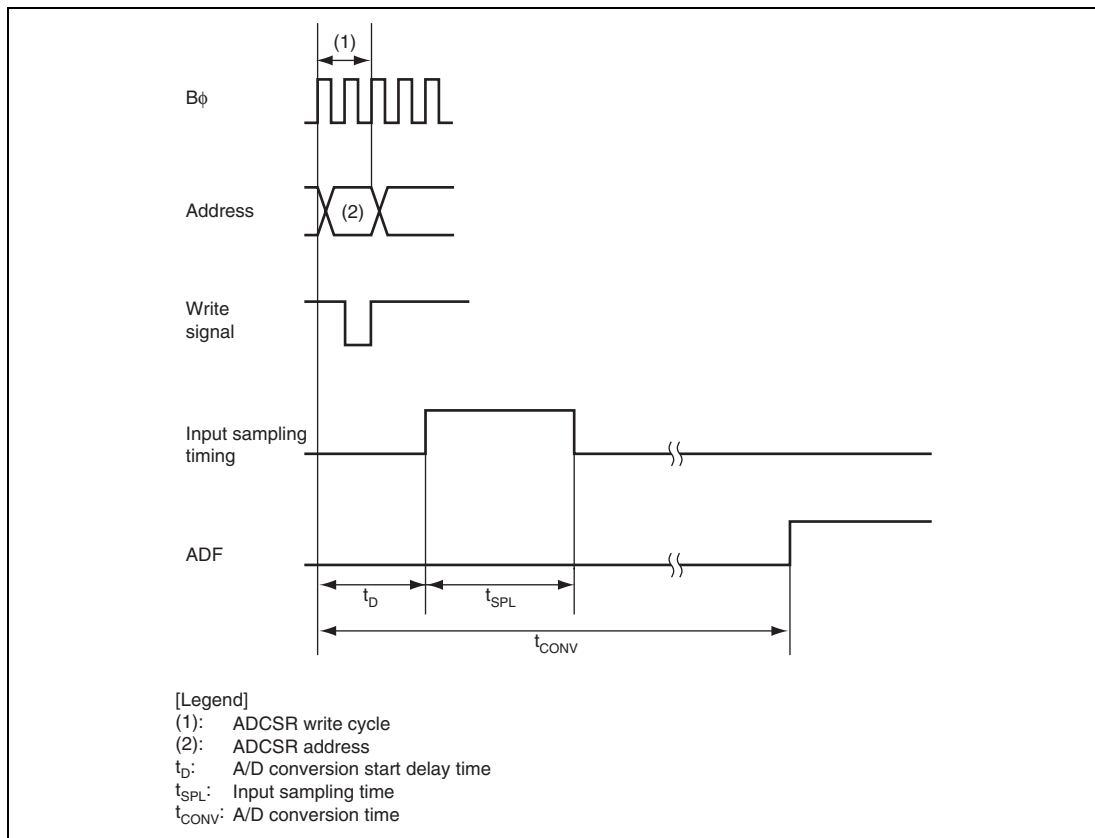

Figure 25.5 A/D Conversion Timing

Table 25.4 A/D Conversion Time (Single Mode)

		CKS2 = 0								
		CKS1 = 0						CKS1 = 1		
		CKS0 = 0			CKS0 = 1			CKS0 = 0		
Item	Symbol	Min.	Typ.	Max.	Min.	Typ.	Max.	Min.	Typ.	Max.
A/D conversion start delay time	t_d	15	—	26	17	—	30	19	—	34
Input sampling time	t_{SPL}	—	97	—	—	113	—	—	129	—
A/D conversion time	t_{CONV}	401	—	412	467	—	480	533	—	548

Note: Values in the table are represented in terms of t_{cyc} (CKIO clock output cycle time).

Table 25.5 A/D Conversion Time (Multi Mode and Scan Mode)

CKS2	CKS1	CKS0	Conversion Time (t_{cyc})
0	0	0	384 (constant)
		1	448 (constant)
	1	0	512 (constant)

Note: Values in the table are represented in terms of t_{cyc} (CKIO clock output cycle time).

25.4.6 External Trigger Input Timing

A/D conversion can also be externally triggered. When the TRGS[3:0] bits in ADCSR are set to B'1001, an external trigger is input to the ADTRG pin. The ADST bit in ADCSR is set to 1 at the falling edge of the ADTRG pin, thus starting A/D conversion. Other operations, regardless of the operating mode, are the same as when the ADST bit has been set to 1 by software. Figure 25.6 shows the timing.

Figure 25.6 External Trigger Input Timing

25.5 Interrupt Sources and DMA Transfer Request

The A/D converter generates an A/D conversion end interrupt (ADI) at the end of A/D conversion. An ADI interrupt request is generated if the ADIE bit is set to 1 when the ADF bit in ADCSR is set to 1 on completion of A/D conversion. Note that the direct memory access controller can be activated by an ADI interrupt depending on the setting of the direct memory access controller. In this case, an interrupt is not issued to the CPU. If the setting to activate the direct memory access controller has not been made, an interrupt request is sent to the CPU. Having the converted data read by the direct memory access controller in response to an ADI interrupt enables continuous conversion to be achieved without imposing a load on software.

In single mode, set the direct memory access controller so that DMA transfer initiated by an ADI interrupt is performed only once. In the case of A/D conversion on multiple channels in scan mode or multi mode, setting the DMA transfer count to one causes DMA transfer to finish after transferring only one channel of data. To make the direct memory access controller transfer all conversion data, set the ADDR where A/D conversion data is stored as the transfer source address, and the number of converted channels as the transfer count.

When the direct memory access controller is activated by ADI, the ADF bit in ADCSR is automatically cleared to 0 when data is transferred by the direct memory access controller.

Table 25.6 Relationship between Interrupt Sources and DMA Transfer Request

Name	Interrupt Source	Interrupt Flag	Direct Memory Access Controller Activation
ADI	A/D conversion end	ADF in ADCSR	Possible

25.6 Definitions of A/D Conversion Accuracy

The A/D converter compares an analog value input from an analog input channel with its analog reference value and converts it to 10-bit digital data. The absolute accuracy of this A/D conversion is the deviation between the input analog value and the output digital value. It includes the following errors:

- Offset error
- Full-scale error
- Quantization error
- Nonlinearity error

These four error quantities are explained below with reference to figure 25.7. In the figure, the 10-bit A/D converter is illustrated as the 3-bit A/D converter for explanation. Offset error is the deviation between actual and ideal A/D conversion characteristics when the digital output value changes from the minimum (zero voltage) B'000000000 (000 in the figure) to B'000000001 (001 in the figure)(figure 25.7, item (1)). Full-scale error is the deviation between actual and ideal A/D conversion characteristics when the digital output value changes from B'111111110 (110 in the figure) to the maximum B'111111111 (111 in the figure)(figure 25.7, item (2)). Quantization error is the intrinsic error of the A/D converter and is expressed as 1/2 LSB (figure 25.7, item (3)). Nonlinearity error is the deviation between actual and ideal A/D conversion characteristics between zero voltage and full-scale voltage (figure 25.7, item (4)). Note that it does not include offset, full-scale, or quantization error.

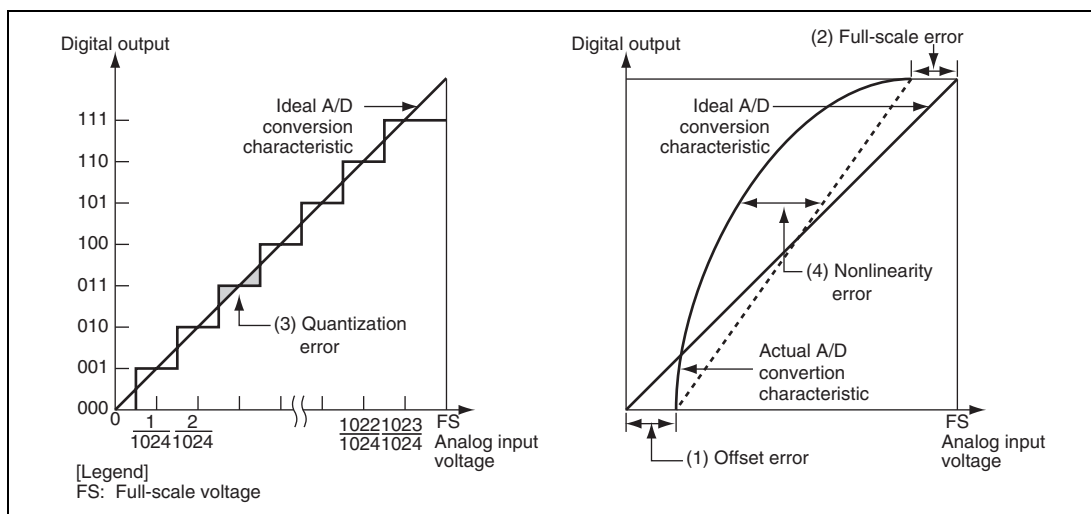

Figure 25.7 Definitions of A/D Conversion Accuracy

25.7 Usage Notes

When using the A/D converter, note the following points.

25.7.1 Module Standby Mode Setting

Operation of the A/D converter can be disabled or enabled using the standby control register. The initial setting is for operation of the A/D converter to be halted. Register access is enabled by clearing module standby mode. For details, see section 33, Power-Down Modes.

25.7.2 Setting Analog Input Voltage

Permanent damage to the LSI may result if the following voltage ranges are exceeded.

1. Analog input range

During A/D conversion, voltages on the analog input pins ANn should not go beyond the following range: $AV_{ss} \leq AN_n \leq AV_{cc}$ ($n = 0$ to 5).

2. AVcc and AVss input voltages

Input voltages AVcc and AVss should be $PV_{cc} - 0.3 \text{ V} \leq AV_{cc} \leq PV_{cc}$ and $AV_{ss} = V_{ss}$. Do not leave the AVcc and AVss pins open when the A/D converter is not in use and in software standby mode. When not in use, connect AVcc to the power supply (PVcc) and AVss to the ground (Vss).

3. Setting range of AVref input voltage

Set the reference voltage range of the AVref pin as $3.0 \text{ V} \leq AV_{ref} \leq AV_{cc}$.

25.7.3 Notes on Board Design

In board design, digital circuitry and analog circuitry should be as mutually isolated as possible, and layout in which digital circuit signal lines and analog circuit signal lines cross or are in close proximity should be avoided as far as possible. Failure to do so may result in incorrect operation of the analog circuitry due to inductance, adversely affecting A/D conversion values.

Digital circuitry must be isolated from the analog input signals (AN0 to AN5), analog reference voltage (AVref), and analog power supply (AVcc) by the analog ground (AVss). Also, the analog ground (AVss) should be connected at one point to a stable digital ground (Vss) on the board.

25.7.4 Processing of Analog Input Pins

To prevent damage from voltage surges at the analog input pins (AN0 to AN5), connect an input protection circuit like the one shown in figure 25.8. The circuit shown also includes a CR filter to suppress noise. This circuit is shown as an example; the circuit constants should be selected according to actual application conditions.

Figure 25.9 shows an equivalent circuit diagram of the analog input ports and table 25.7 lists the analog input pin specifications.

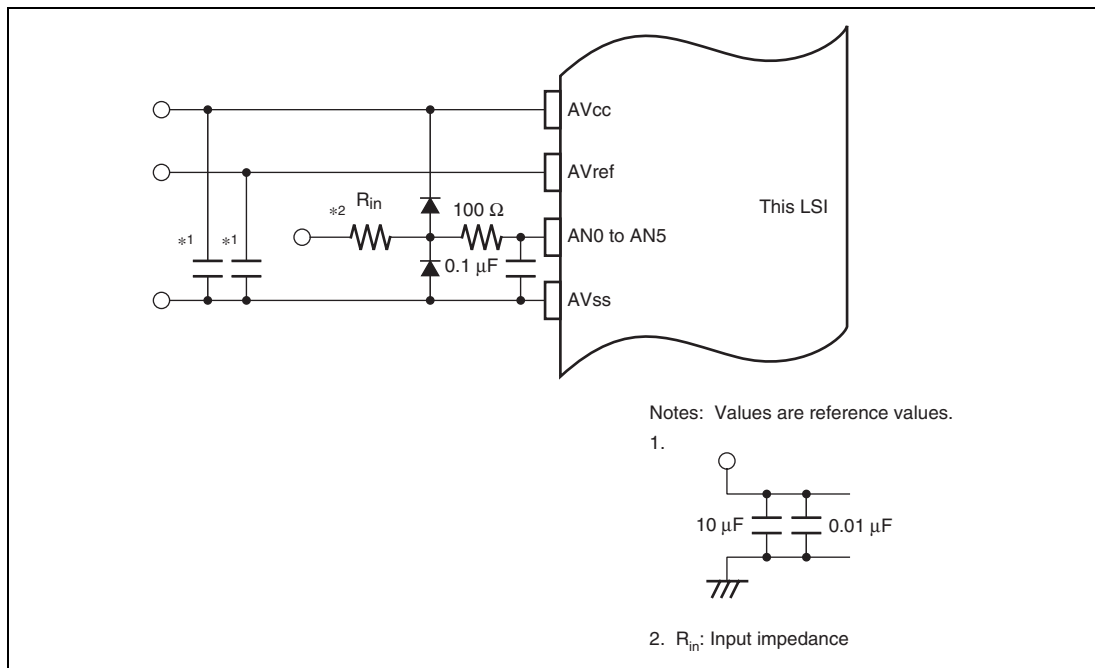

Figure 25.8 Example of Analog Input Protection Circuit

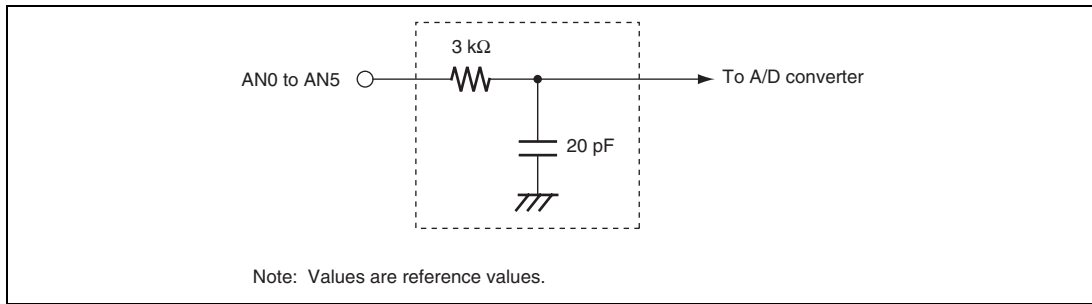

Figure 25.9 Analog Input Pin Equivalent Circuit

Table 25.7 Analog Input Pin Ratings

Item	Min.	Max.	Unit
Analog input capacitance	—	20	pF
Allowable signal-source impedance	—	5	kΩ

25.7.5 Permissible Signal Source Impedance

This LSI's analog input is designed such that conversion precision is guaranteed for an input signal for which the signal source impedance is 5 kΩ or less. This specification is provided to enable the A/D converter's sample-and-hold circuit input capacitance to be charged within the sampling time; if the sensor output impedance exceeds 5 kΩ, charging may be insufficient and it may not be possible to guarantee A/D conversion precision. However, for A/D conversion in single mode with a large capacitance provided externally for A/D conversion in single mode, the input load will essentially comprise only the internal input resistance of 3 kΩ, and the signal source impedance is ignored. However, as a low-pass filter effect is obtained in this case, it may not be possible to follow an analog signal with a large differential coefficient (e.g., 5 mV/μs or greater) (see figure 25.10). When converting a high-speed analog signal, a low-impedance buffer should be inserted.

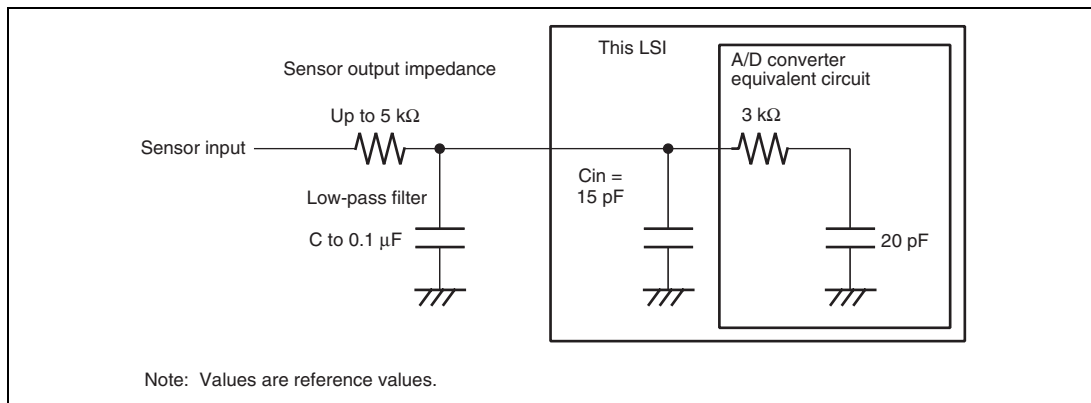

Figure 25.10 Example of Analog Input Circuit

25.7.6 Influences on Absolute Precision

Adding capacitance results in coupling with GND, and therefore noise in GND may adversely affect absolute precision. Be sure to connect AVSS, etc. to an electrically stable GND.

Care is also required to insure that filter circuits mounted on the board do not pick up interference from digital signals (i.e., by acting as antennae).

25.7.7 A/D Conversion in Deep Standby Mode

Before entering deep standby mode, disable A/D conversion by clearing the ADST bit to 0. If the LSI enters deep standby mode with A/D conversion enabled, the states on the A/D converter pins are not guaranteed.

25.7.8 Note on Usage in Scan Mode and Multi Mode

Starting conversion immediately after having stopped scan mode or multi mode operation may lead to erroneous results of conversion.

To perform continuous conversion in such cases, set ADST to 0, wait for at least the A/D conversion time for a single channel to elapse, and then start conversion (ADST = 1). (The A/D conversion time for a single channel will vary according to the settings of the ADC registers.)

25.7.9 Note on Usage in Single Mode and Multi Mode

Starting conversion in the same mode or another mode immediately after conversion is completed in single mode or multi mode may lead to erroneous conversion operations.

To perform continuous conversion in such cases, set the ADST bit to 1 after dummy-reading ADCSR twice.

Section 26 NAND Flash Memory Controller

The NAND flash memory controller provides interfaces for an external NAND-type flash memory.

26.1 Features

(1) NAND-Type Flash Memory Interface

- Interface directly connectable to NAND-type flash memory
- Read or write in sector units (512 + 16 bytes)
- Read or write in byte units
- Supports large-block (2048 + 64 bytes) flash memory*
- Supports addresses for 2 Gbits and more by extension to 5-byte addresses

Note: * This module handles 512 + 16 bytes as a sector. For products with 2048 + 64 byte-pages, this module divides a page into 512 + 16 bytes units (i.e. four sectors per page) for processing.

(2) Access Modes: This module can select one of the following two access modes.

- Command access mode: Performs an access by specifying a command to be issued from this module to flash memory, address, and data size to be input or output.
- Sector access mode: Performs a read or write in sector units by specifying a sector address. By specifying the number of sectors, the continuous physical sectors can be read or written.

(3) Sectors and Control Codes

- A sector is the basic unit of access and comprised of 512-byte data and 16-byte control code fields.
- User information can be written to any part of the control code field.

(4) Data Error

- When a program error or erase error occurs, the error is reflected on the error source flags. Interrupts for each source can be specified.

(5) Data Transfer FIFO and Data Register

- The 224-byte data FIFO register (FLDTFIFO) is incorporated for data transfer of flash memory.
- The 32-byte control code FIFO register (FLECFIFO) is incorporated for data transfer of control code.

(6) DMA Transfer

- By individually specifying the destinations of data and control code of flash memory to the direct memory access controller, data and control code can be sent to different areas.

(7) Access Time

- The operating clock (FCLK) on the pins for the NAND-type flash memory is generated by dividing the peripheral clock (P ϕ). The division ratio can be specified by the QTSEL bit in the common control register (FLCMNCR).
- Before changing the clock pulse generator configuration, this module must be placed in a module stop state.
- In NAND-type flash memory, the $\overline{\text{FRE}}$ and $\overline{\text{FWE}}$ pins operate at the frequency of FCLK. The operating frequency must be specified within the maximum operating frequency of memory to be connected.

Figure 26.1 shows a block diagram.

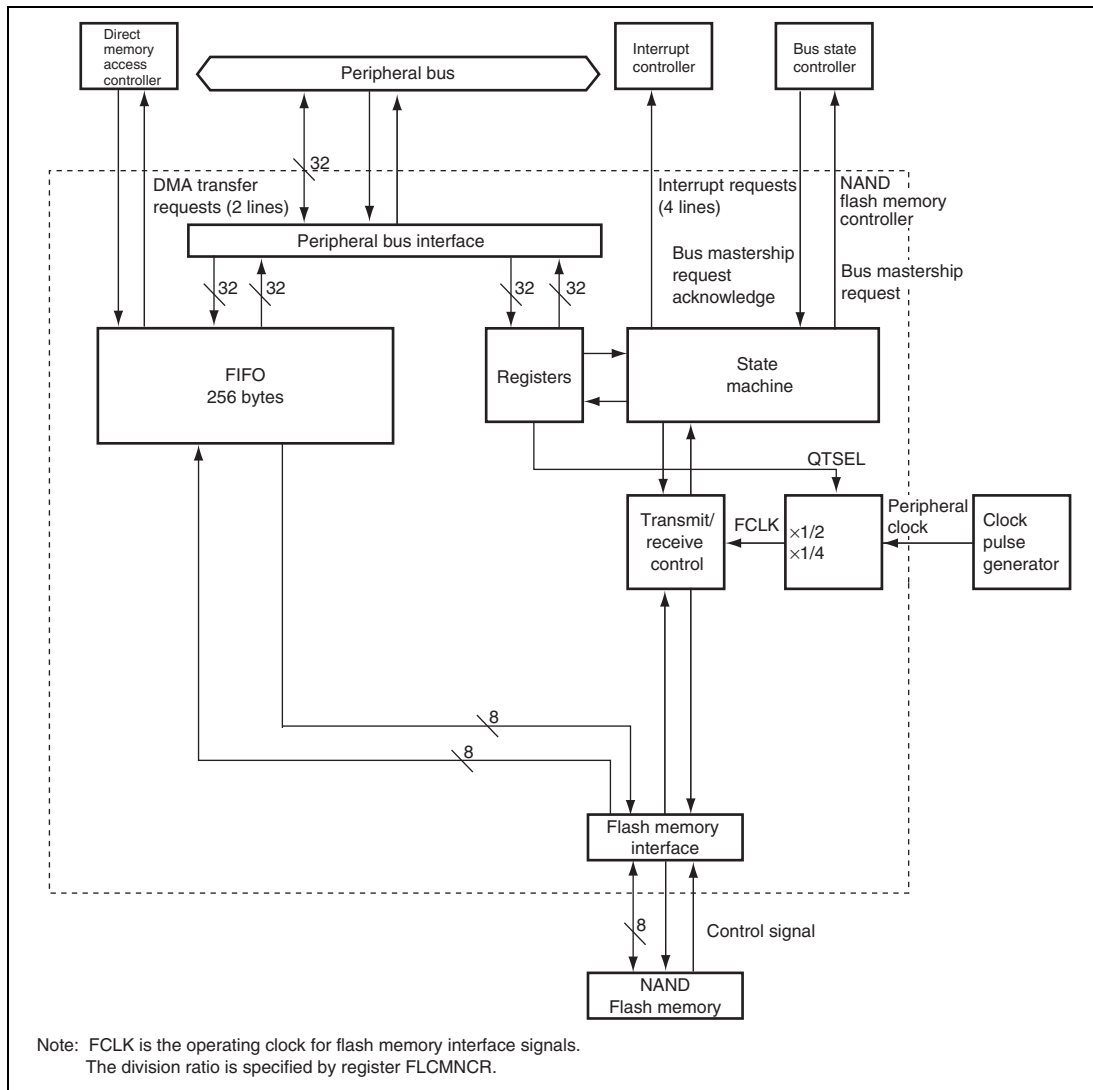

Figure 26.1 Block Diagram

26.2 Input/Output Pins

The pin configuration of is listed in table 26.1.

Table 26.1 Pin Configuration

Pin Name	I/O	Corresponding Flash Memory Pin		Function
		NAND Type		
$\overline{\text{FCE}}$	Output	$\overline{\text{CE}}$		Flash Memory Chip Enable Enables flash memory connected to this LSI.
NAF7 to NAF0	I/O	I/O7 to I/O0		Flash Memory Data I/O pins for command, address, and data.
FCLE	Output	CLE		Flash Memory Command Latch Enable Asserted when a command is output.
FALE	Output	ALE		Flash Memory Address Latch Enable Asserted when an address is output and negated when data is input or output.
$\overline{\text{FRE}}$	Output	$\overline{\text{RE}}$		Flash Memory Read Enable Reads data at the falling edge of $\overline{\text{RE}}$.
$\overline{\text{FWE}}$	Output	$\overline{\text{WE}}$		Flash Memory Write Enable Flash memory latches a command, address, and data at the rising edge of $\overline{\text{WE}}$.
FRB	Input	R/B		Flash Memory Ready/Busy Indicates ready state at high level; indicates busy state at low level.
—*	—	$\overline{\text{WP}}$		Write Protect/Reset When this pin goes low, erroneous erasure or programming at power on or off can be prevented.
—*	—	$\overline{\text{SE}}$		Spare Area Enable Used to access spare area. This pin must be fixed at low in sector access mode.

Note: * Not supported in this LSI.

26.3 Register Descriptions

Table 26.2 shows the register configuration.

Table 26.2 Register Configuration

Register Name	Abbreviation	R/W	Initial Value	Address	Access Size
Common control register	FLCMNCR	R/W	H'00100001	H'FFFF4000	32
Command control register	FLCMDCR	R/W	H'00000000	H'FFFF4004	32

2, 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	—	1	R	Reserved This bit is always read as 1. The write value should always be 1.

26.3.2 Command Control Register (FLCMDCR)

FLCMDCR is a 32-bit readable/writable register that issues a command in command access mode, specifies address issue, and specifies source or destination of data transfer. In sector access mode, FLCMDCR specifies the number of sector transfers.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

26.3.3 Command Code Register (FLCMCDR)

FLCMCDR is a 32-bit readable/writable register that specifies a command to be issued in command access or sector access.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CMD2[7:0]								CMD1[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15 to 8	CMD2[7:0]	H'00	R/W	Second Command Data Specify a command code to be issued in the second command stage.
7 to 0	CMD1[7:0]	H'00	R/W	First Command Data Specify a command code to be issued in the first command stage.

26.3.4 Address Register (FLADR)

FLADR is a 32-bit readable/writable register that specifies the value to be output as an address.

The address of the size specified by ADRCNT[1:0] in the command control register is output sequentially from ADR1 in byte units. By the sector access address specification bit (ADRMD) of the command control register, it is possible to specify whether the sector number set in the address data bits is converted into an address to be output to the flash memory.

- When ADRMD = 1

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	ADR4[7:0]								ADR3[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Bit	Bit Name	Initial Value	R/W	Description
31 to 26	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
25 to 0	ADR[25:0]	H'0000 000	R/W	<p>Sector Address Specification</p> <p>Specify a sector number to be accessed when $ADRMD = 0$. The sector number is converted into an address and is output to flash memory.</p> <p>When the $ADRCNT2$ bit in $FLCMDCR = 1$, the $ADR[25:0]$ bits are valid. When the $ADRCNT2$ bit in $FLCMDCR = 0$, the $ADR[17:0]$ bits are valid. See figure 26.11 for details.</p> <ul style="list-style-type: none"> • Large-block products (2048 + 64 bytes) $ADR[25:2]$ specifies the page address and $ADR[1:0]$ specifies the column address in sector units. $ADR[1:0] = 00$: 0th byte (sector 0) $ADR[1:0] = 01$: (512 + 16)th byte (sector 1) $ADR[1:0] = 00$: (1024 + 32)th byte (sector 2) $ADR[1:0] = 00$: (1536 + 48)th byte (sector 3) • Small-block products (512 + 16 bytes) Only the page address can be specified.

26.3.5 Address Register 2 (FLADR2)

FLADR2 is a 32-bit readable/writable register, and is valid when the ADRCNT2 bit in FLCMDCR is set to 1. FLADR2 specifies an address to be output in command access mode.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	ECFLW [7:0]	H'00	R	<p>FLECFIFO Access Count</p> <p>Specify the number of longwords in FLECFIFO to be read or written. These bit values are used when the CPU reads from or writes to FLECFIFO.</p> <p>In FLECFIFO read, these bits specify the number of longwords of the data that can be read from FLECFIFO.</p> <p>In FLECFIFO write, these bits specify the number of longwords of unoccupied area that can be written in FLECFIFO.</p>
23 to 16	DTFLW [7:0]	H'00	R	<p>FLDTFIFO Access Count</p> <p>Specify the number of longwords in FLDTFIFO to be read or written. These bit values are used when the CPU reads from or writes to FLDTFIFO.</p> <p>In FLDTFIFO read, these bits specify the number of longwords of the data that can be read from FLDTFIFO.</p> <p>In FLDTFIFO write, these bits specify the number of longwords of unoccupied area that can be written in FLDTFIFO.</p>
15 to 12	—	All 0	R	<p>Reserved</p> <p>These bits are always read as 0. The write value should always be 0.</p>
11 to 0	DTCNT [11:0]	H'000	R/W	<p>Data Count Specification</p> <p>Specify the number of bytes of data to be read or written in command access mode. (Up to 2048 + 64 bytes can be specified.)</p>

26.3.7 Data Register (FLDATAR)

FLDATAR is a 32-bit readable/writable register. It stores input/output data used when 0 is written to the CDSRC bit in FLCMDCR in command access mode. FLDATAR cannot be used for reading or writing of five or more bytes of contiguous data.

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	DT4[7:0]	H'00	R/W	Fourth Data Specify the 4th data to be input or output via the NAF7 to NAF0 pins. In write: Specify write data In read: Store read data
23 to 16	DT3[7:0]	H'00	R/W	Third Data Specify the 3rd data to be input or output via the NAF7 to NAF0 pins. In write: Specify write data In read: Store read data
15 to 8	DT2[7:0]	H'00	R/W	Second Data Specify the 2nd data to be input or output via the NAF7 to NAF0 pins. In write: Specify write data In read: Store read data
7 to 0	DT1[7:0]	H'00	R/W	First Data Specify the 1st data to be input or output via the NAF7 to NAF0 pins. In write: Specify write data In read: Store read data

26.3.8 Interrupt DMA Control Register (FLINTDMACR)

FLINTDMACR is a 32-bit readable/writable register that enables or disables DMA transfer requests or interrupts. A transfer request from this module to the direct memory access controller is issued after each access mode has been started.

Bits 9 to 5 are the flag bits that indicate various errors occurred in flash memory access and whether there is a transfer request from the FIFO. Only 0 can be written to these bits. To clear a flag, write 0 to the target flag bit and 1 to the other flag bits.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Note: * Only 0 can be written to these bits.

26.3.9 Ready Busy Timeout Setting Register (FLBSYTMR)

FLBSYTMR is a 32-bit readable/writable register that specifies the timeout time when the FRB pin is busy.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	RBTMOUT[19:16]			
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RBTMOUT[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 20	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
19 to 0	RBTMOUT [19:0]	H'00000	R/W	Ready Busy Timeout Specify timeout time (the number of P ϕ clocks) in busy state. When these bits are set to 0, timeout is not generated.

26.3.10 Ready Busy Timeout Counter (FLBSYCNT)

FLBSYCNT is a 32-bit read-only register.

The status of flash memory obtained by the status read is stored in the bits STAT[7:0].

The timeout time set in the bits RBTMOUT[19:0] in FLBSYTMR is copied to the bits RBTIMCNT[19:0] and counting down is started when the FRB pin is placed in a busy state. When values in the RBTIMCNT[19:0] become 0, 1 is set to the BTOERB bit in FLINTDMACR, thus notifying that a timeout error has occurred. In this case, an FLSTE interrupt request can be issued if an interrupt is enabled by the RBERINTE bit in FLINTDMACR.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	STAT[7:0]							-	-	-	-	RBTIMCNT[19:16]				
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	RBTIMCNT[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	STAT[7:0]	All 0	R	Indicate the flash memory status obtained by the status read.
23 to 20	—	All 0	R	Reserved These bits are always read as 0.
19 to 0	RBTIMCNT[19:0]	H'00000	R	Ready Busy Timeout Counter When the FRB pin is placed in a busy state, the values of the bits RBTMOUT[19:0] in FLBSYTMR are copied to these bits. These bits are counted down while the FRB pin is busy. A timeout error occurs when these bits are decremented to 0.

26.3.11 Data FIFO Register (FLDTFIFO)

FLDTFIFO is used to read or write the data FIFO area.

In DMA transfer, this register must be specified as the destination or source.

Note that the direction of read or write specified by the SELRW bit in FLCMDCR must match that specified in this register. When changing the read/write direction, FLDTFIFO should be cleared by setting the AC0CLR bit in FLINTDMACR before use.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	DTFO [31:0]	H'xxxxxxx	R/W	Data FIFO Area Read/Write Data In write: Data in this register is written to the data FIFO area. In read: Data read from the data FIFO area is stored in this register.

26.3.12 Control Code FIFO Register (FLECFIFO)

FLECFIFO is used to read or write the control code FIFO area.

In DMA transfer, data in this register must be specified as the destination (source).

Note that the direction of read or write specified by the SELRW bit in FLCMDCR must match that specified in this register. When changing the read/write direction, FLECFIFO should be cleared by setting the AC1CLR bit in FLINTDMACR before use.

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	ECFO [31:0]	H'xxxxxxxx	R/W	Control Code FIFO Area Read/Write Data In write: Data in this register is written to the control code FIFO area. In read: Data read from the control code FIFO area is stored in this register.

26.3.13 Transfer Control Register (FLTRCR)

Setting the TRSTRT bit to 1 initiates access to flash memory. Access completion can be checked by the TREND bit. During the transfer (from when the TRSTRT bit is set to 1 until the TREND bit is set to 1), the processing should not be forcibly ended (by setting the TRSTRT bit to 0).

When reading from flash memory, TREND is set when reading from flash memory have been finished. However, if there is any read data remaining in the FIFO, the processing should not be forcibly ended until all data has been read from the FIFO. While this module has the external bus mastership and transfer is in progress, the SLEEP instruction should not be executed until the TREND bit is set and transfer is completed.

Bit:	7	6	5	4	3	2	1	0
	-	-	-	-	-	TR STAT	TR END	TR STRT
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7 to 3	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
2	TRSTAT	0	R	Transfer State Indicates that this module has acquired the external bus mastership and that transfer is actually being performed. 0: Transfer has not been started. 1: Transfer is in progress or transfer has ended.
1	TREND	0	R/W	Processing End Flag Bit Indicates that the processing performed in the specified access mode has been completed. The write value should always be 0.
0	TRSTRT	0	R/W	Transfer Start By setting this bit from 0 to 1 when the TREND bit is 0, processing in the access mode specified by the access mode specification bits ACM[1:0] is initiated. 0: Stops transfer 1: Starts transfer

26.3.14 Bus Hold Time Setting Register (FLHOLDCR)

FLHOLDCR specifies the external bus release frequency if any other module (including the CPU) accesses a memory under the control of the bus state controller while this module is writing to or reading from the flash memory in sector access mode. With the HOLDEN bit = 0 in this register, this module holds the external bus during transfers between the flash memory and this LSI. Note that this may cause a deadlock depending on the program code and transfer data location and usage.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	HOLDEN
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	HOLDEN	0	R/W	Bus Hold Enable Specifies whether to release the external bus mastership during write to or read from the flash memory in sector access mode. 0: Holds the bus mastership during transfers. 1: Releases the bus mastership during transfers if the FIFO empty or full state is entered in sector access mode. Note: When using the FIFO in command access mode, store the control program for this module and transfer data in the on-chip RAM.

26.4 Operation

26.4.1 Access Sequence

This module performs accesses in several independent stages.

For example, NAND-type flash memory programming consists of the following five stages.

- First command issue stage (program setup command)
- Address issue stage (program address)
- Data stage (output)
- Second command issue stage (program start command)
- Status read stage

NAND-type flash memory programming access is achieved by executing these five stages sequentially. An access to flash memory is completed at the end of the final stage (status read stage).

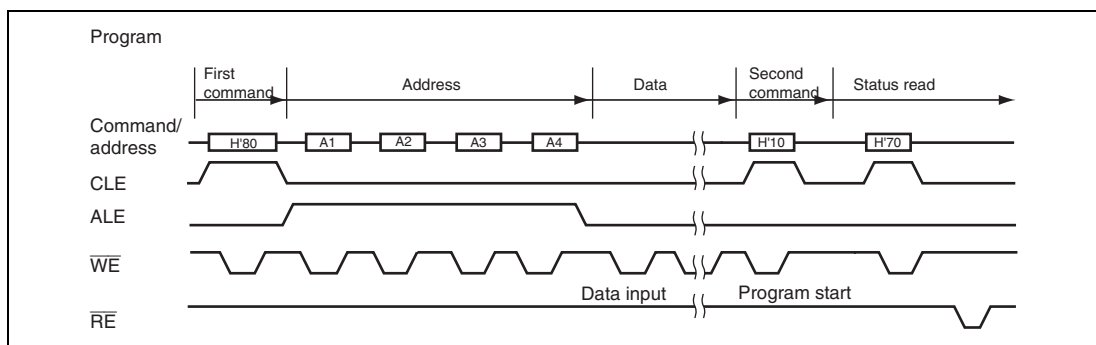

Figure 26.2 Programming Operation for NAND-Type Flash Memory and Stages

For details on NAND-type flash memory read operation, see section 26.4.4, Command Access Mode.

26.4.2 Operating Modes

Two operating modes are supported.

- Command access mode
- Sector access mode

The ECC generation and error check are performed in sector access mode.

26.4.3 Register Setting Procedure

Figure 26.3 shows the register setting flow required for accessing the flash memory.

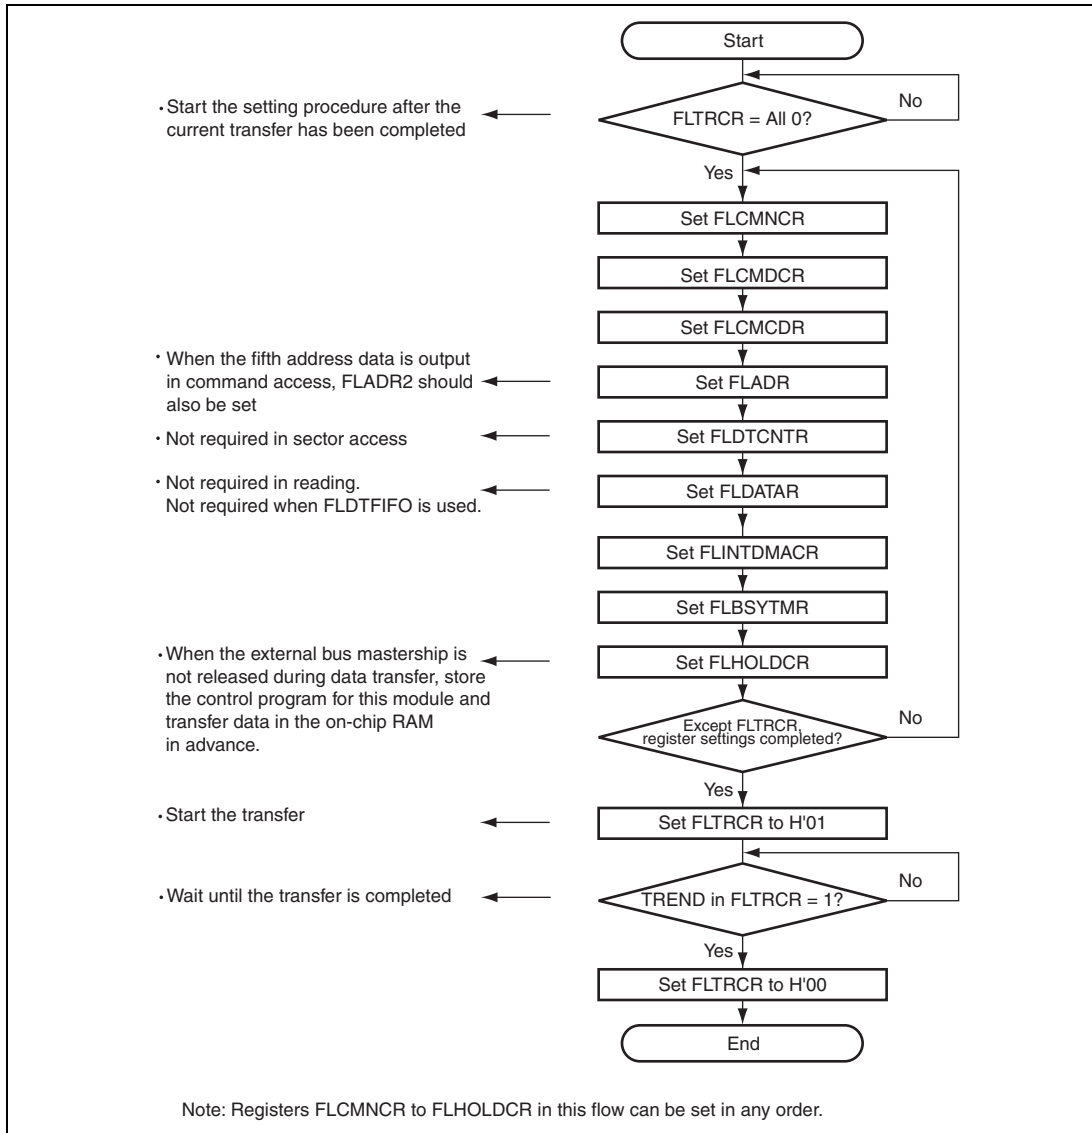

Figure 26.3 Register Setting Flow

26.4.4 Command Access Mode

Command access mode accesses flash memory by specifying a command to be issued to flash memory, address, data, read/write direction, and number of times to the registers. In this mode, I/O data can be transferred by the DMA via FLDTFIFO.

(1) NAND-Type Flash Memory Access

Figure 26.4 shows an example of read operation for NAND-type flash memory. In this example, the first command is specified as H'00, address data length is specified as 3 bytes, and the number of read bytes is specified as 8 bytes in the data counter.

Figure 26.4 Read Operation Timing for NAND-Type Flash Memory

Figures 26.5 and 26.6 show examples of programming operation for NAND-type flash memory.

Figure 26.5 Programming Operation Timing for NAND-Type Flash Memory (1)

Figure 26.6 Programming Operation Timing for NAND-Type Flash Memory (2)

(2) NAND-Type Flash Memory (2048 + 64 Bytes) Access

Figure 26.7 shows an example of read operation for NAND-type flash memory (2048 + 64 bytes). In this example, the first command is specified as H'00, the second command is specified as H'30, and address data length is specified as 4 bytes. The number of read bytes is specified as 4 bytes in the data counter.

Figure 26.7 Read Operation Timing for NAND-Type Flash Memory

Figures 26.8 and 26.9 show examples of programming operation for NAND-type flash memory (2048 + 64 bytes).

Figure 26.8 Programming Operation Timing for NAND-Type Flash Memory (1)

Figure 26.9 Programming Operation Timing for NAND-Type Flash Memory (2)

26.4.5 Sector Access Mode

In sector access mode, flash memory can be read or programmed in sector units by specifying the sector number of the sector to be accessed.

Since 512-byte data is stored in FLDTFIFO and 16-byte control code is stored in FLECFIFO, the DREQ1EN and DREQ0EN bits in FLINTDMACR can be set to transfer by the DMA.

Figure 26.10 shows the relationship of DMA transfer between sectors in flash memory (data and control code) and memory on the address space.

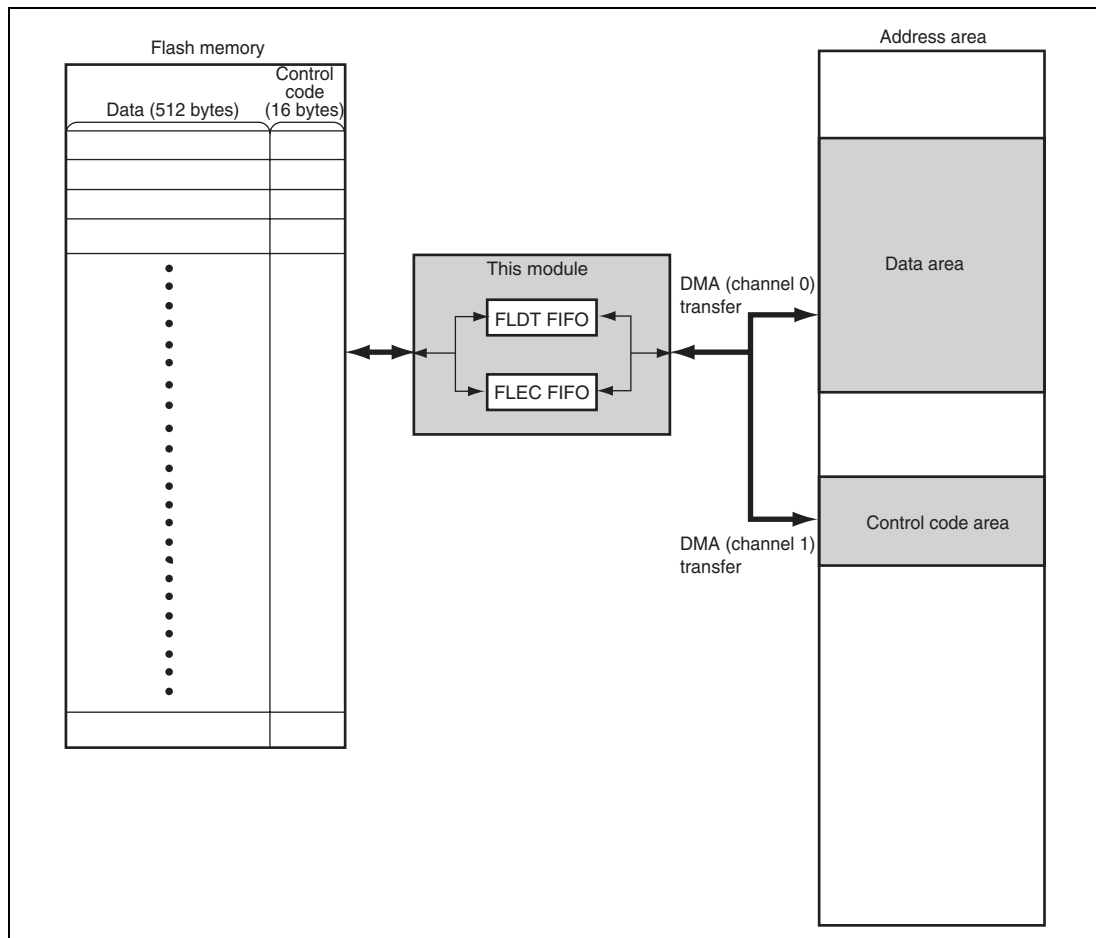

Figure 26.10 Relationship between DMA Transfer and Sector (Data and Control Code), and Memory and DMA Transfer

(1) Sector Address

Figure 26.11 shows the relationship between the physical sector address of NAND-type flash memory and the address of flash memory.

Figure 26.11 Relationship between Sector Number and Address Expansion of NAND-Type Flash Memory

(2) Continuous Sector Access

A series of sectors can be read or written by specifying the start sector address of NAND-type flash memory and the number of sectors to be transferred. Figure 26.12 shows an example of physical sector specification register and transfer count specification register settings when transferring logical sectors 0 to 40, which are not contiguous because of an unusable sector in NAND-type flash memory.

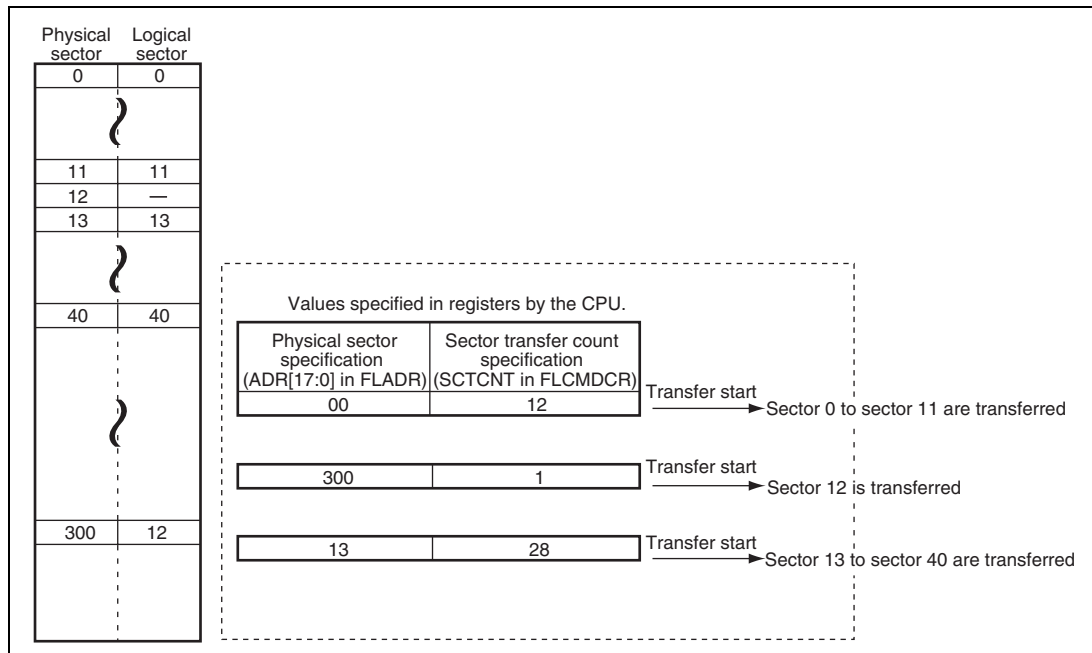

Figure 26.12 Sector Access when Unusable Sector Exists in Continuous Sectors

(3) Flash Memory Access in Sector Access Mode

Figures 26.13 and 26.14 show the timing of writing to and reading from the NAND-type flash memory in sector access mode.

Figure 26.13 shows the timing of writing to the 1-Gbit large-block flash memory. During the execution of sequential sector access spanning multiple pages, data are written to the flash memory with the timing shown in the figure for every page (2048 + 64 bytes).

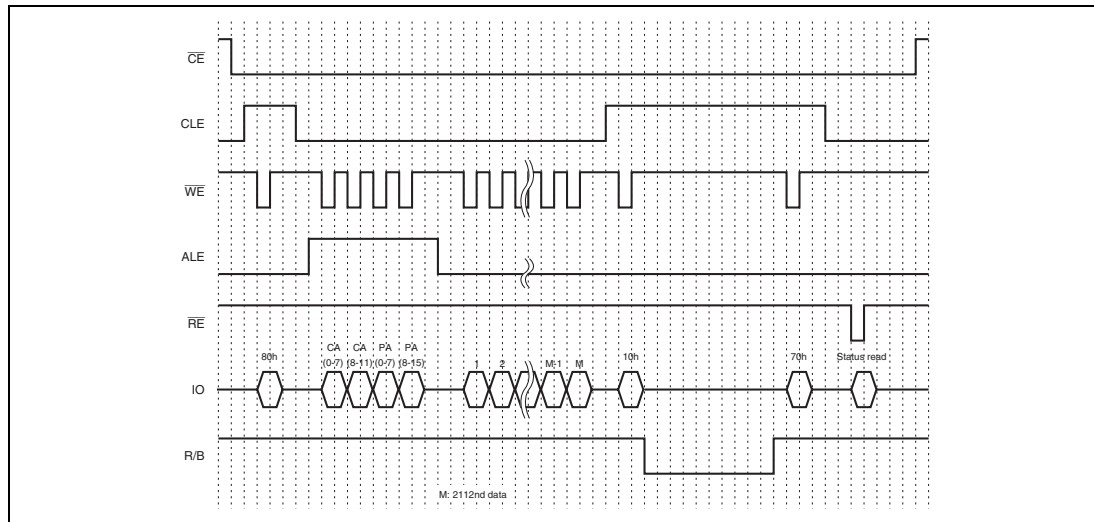

Figure 26.13 Programming Operation Timing for NAND-Type Flash Memory

Figure 26.14 shows the timing of reading from the 1-Gbit large-block flash memory. During the execution of sequential sector access spanning multiple pages, data are read from the flash memory with the timing shown in the figure for every page (2048 + 64 bytes).

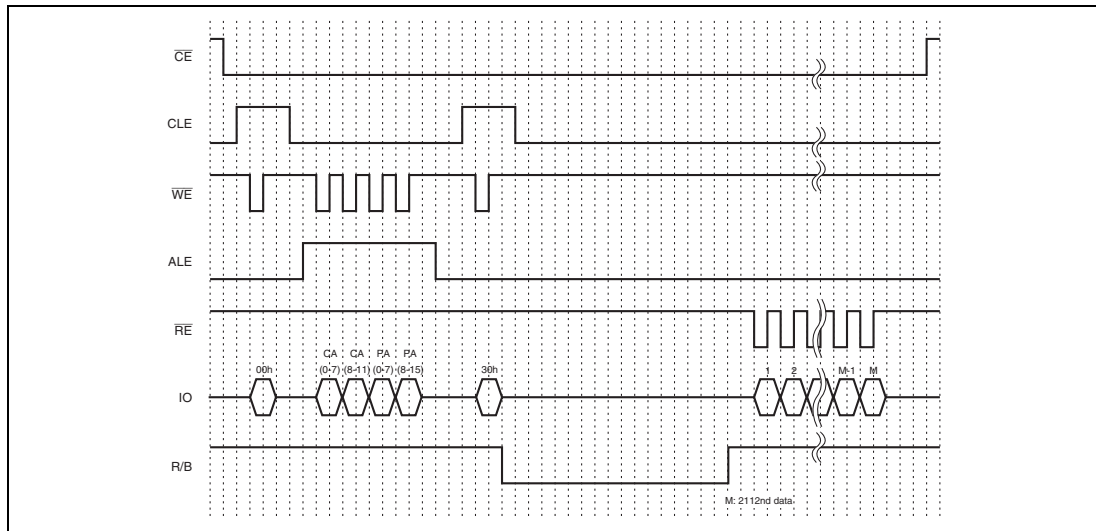

Figure 26.14 Read Timing from NAND-Type Flash Memory (Sector Access Mode)

26.4.6 Status Read

This module can read the status register of an AND/NAND-type flash memory. The data in the status register is input through the I/O7 to I/O0 pins and stored in the bits STAT[7:0] in FLBSYCNT, which can be read by the CPU. If a program error or erase error is detected when the status register value is stored in the bits STAT[7:0] in FLBSYCNT, the STERB bit in FLINTDMACR is set to 1 and generates an interrupt to the CPU if the STERINTE bit in FLINTDMACR is enabled. If a status error occurs during continuous sector access, the TREND bit in FLTRCR is set to 1 and the procedure stops.

(1) Status Read of NAND-Type Flash Memory

The status register of NAND-type flash memory can be read by inputting command H'70 to NAND-type flash memory. If programming is executed in command access mode or sector access mode while the DOSR bit in FLCMDCR is set to 1, this module automatically inputs command H'70 to NAND-type flash memory and reads the status register of NAND-type flash memory. When the status register of NAND-type flash memory is read, the I/O7 to I/O0 pins indicate the following information as described in table 26.3.

Table 26.3 Status Read of NAND-Type Flash Memory

I/O	Status (definition)	Description
I/O7	Program protection	0: Cannot be programmed 1: Can be programmed
I/O6	Ready/busy	0: Busy state 1: Ready state
I/O5 to I/O1	Reserved	—
I/O0	Program/erase	0: Pass 1: Fail

26.5 Interrupt Sources

This module has five interrupt sources: Status error, ready/busy timeout error, transfer end, FIFO0 transfer request, and FIFO1 transfer request. Each of the interrupt sources has its corresponding interrupt flag and the interrupt can be requested independently to the CPU if the interrupt is enabled by the interrupt enable bit. Note that the status error and ready/busy timeout error use the common FLSTE interrupt to the CPU.

Table 26.4 NAND Flash Memory Controller Interrupt Requests

Interrupt Source	Interrupt Flag	Enable Bit	Description	Priority
FLSTE interrupt	STERB	STERINTE	Status error	High ↑
	BTOERB	RBERINTE	Ready/busy timeout error	
FLTEND interrupt	TREND	TEINTE	Transfer end	↓ Low
FLTRQ0 interrupt	TRREQF0	TRINTE0	FIFO0 transfer request	
FLTRQ1 interrupt	TRREQF1	TRINTE1	FIFO1 transfer request	

26.6 DMA Transfer Specifications

This module can request DMA transfers separately to the data area FLDTFIFO and control code area FLECFIFO. Table 26.5 summarizes DMA transfer enable or disable states in each access mode.

Table 26.5 DMA Transfer Specifications

	Sector Access Mode	Command Access Mode
FLDTFIFO	DMA transfer enabled	DMA transfer enabled
FLECFIFO	DMA transfer enabled	DMA transfer disabled

For details on settings of the direct memory access controller, see section 10, Direct Memory Access Controller.

26.7 Usage Notes

26.7.1 External Bus Mastership Release Timing

This module negates \overline{FCE} regardless of the busy/ready state when having completed a necessary process. With bit 21 (BUSYON) set to 0 in the common control register (FLCMNCR), this module negates \overline{FCE} and releases the bus mastership even during the busy state upon completion of the process. With BUSYON = 0, setting bit 24 (DOSR) in the command control register (FLCMDCR) to 1 to read the status enables acquiring the bus mastership even during the busy state.

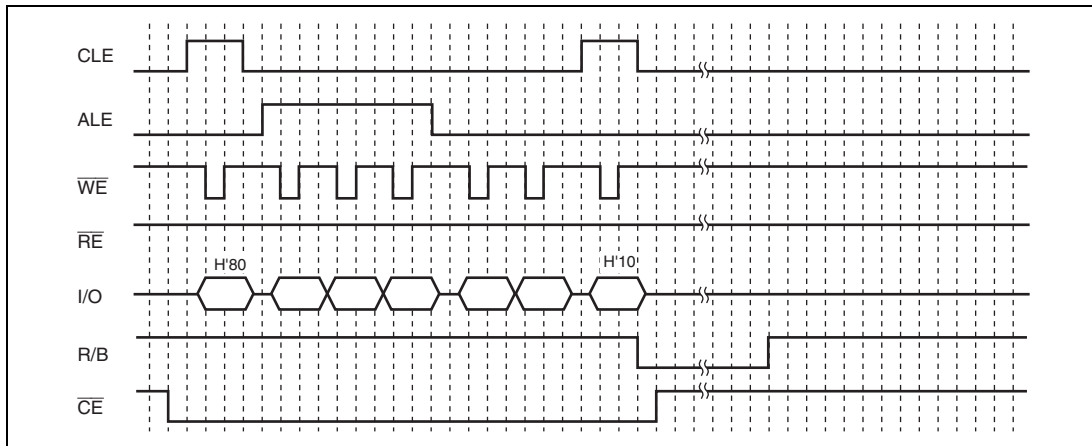

Figure 26.15 BUSYON = 0, DOSR = 0 (Writing to Flash Memory)

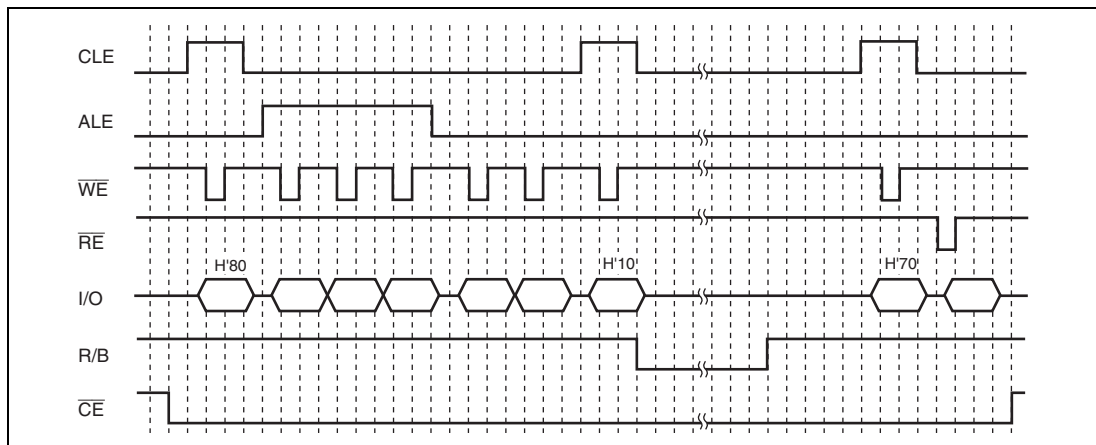

Figure 26.16 BUSYON = 0, DOSR = 1 (Writing to Flash Memory)

26.7.2 Usage Notes for the SNAND Bit

When using the SNAND bit in FLCMNCR, only the first command or the second command is corresponded in spite of the setting of the DOCMD1 or DOCMD2 bit in FLCMDCR.

When no command or only the first command is issued, 0 should be written in the SNAND bit.

Section 27 USB 2.0 Host/Function Module

The USB 2.0 host/function module is a USB controller which provides capabilities as a USB host controller and USB function controller function. This module supports high-speed transfer defined by USB (universal serial bus) Specification 2.0, full-speed transfer, and low-speed transfer when used as the host controller, and supports high-speed transfer and full-speed transfer when used as the function controller. This module has a USB transceiver* and supports all of the transfer types defined by the USB specification.

This module has an 8-Kbyte buffer memory for data transfer, providing a maximum of ten pipes. Any endpoint numbers can be assigned to PIPE1 to PIPE9, based on the peripheral devices or user system for communication.

Note: * Before using this module, set up the internal transceiver. For details, refer to section 27.5.1, Setting up the USB Transceiver.

27.1 Features

(1) Host Controller and Function Controller Supporting USB High-Speed Operation

- The USB host controller and USB function controller are incorporated.
- The USB host controller and USB function controller can be switched by register settings.
- USB transceiver is incorporated.

(2) Reduced Number of External Pins and Space-Saving Installation

- On-chip D+ pull-up resistor (during USB function operation)
- On-chip D+ and D- pull-down resistor (during USB host operation)
- On-chip D+ and D- terminal resistor (during high-speed operation)
- On-chip D+ and D- output resistor (during full-speed operation)

(3) All Types of USB Transfers Supported

- Control transfer
- Bulk transfer
- Interrupt transfer (high bandwidth transfers not supported)
- Isochronous transfer (high bandwidth transfers not supported)

(4) Internal Bus Interfaces

- Two DMA interface channels are incorporated.

(5) Pipe Configuration

- On-chip 8-Kbyte buffer memory for USB communications
- Up to ten pipes can be selected (including the default control pipe)
- Programmable pipe configuration
- Endpoint numbers can be assigned flexibly to PIPE1 to PIPE9.
- Transfer conditions that can be set for each pipe:
 - PIPE0: Control transfer (default control pipe: DCP), 64-byte fixed single buffer
 - PIPE1 and PIPE2: Bulk transfers/isochronous transfer, continuous transfer mode, programmable buffer size (up to 2-Kbytes: double buffer can be specified)
 - PIPE3 to PIPE5: Bulk transfer, continuous transfer mode, programmable buffer size (up to 2-Kbytes: double buffer can be specified)
 - PIPE6 to PIPE9: Interrupt transfer, 64-byte fixed single buffer

(6) Features of the USB Host Controller

- High-speed transfer (480 Mbps), full-speed transfer (12 Mbps), and low-speed transfer (1.5 Mbps) are supported.
- Communications with multiple peripheral devices connected via a single HUB
- Automatic response to the reset handshake
- Automatic scheduling for SOF and packet transmissions
- Programmable intervals for isochronous and interrupt transfers

(7) Features of the USB Function Controller

- Both high-speed transfer (480 Mbps) and full-speed transfer (12 Mbps) are supported.
- Automatic recognition of high-speed operation or full-speed operation based on automatic response to the reset handshake
- Control transfer stage control function
- Device state control function
- Auto response function for SET_ADDRESS request
- NAK response interrupt function (NRDY)
- SOF interpolation function

(8) Other Features

- Transfer ending function using transaction count
- BRDY interrupt event notification timing change function (BFRE)
- Function that automatically clears the buffer memory after the data for the pipe specified at the DnFIFO (n = 0 or 1) port has been read (DCLRM)
- NAK setting function for response PID generated by end of transfer (SHTNAK)

27.2 Input/Output Pins

Table 27.1 shows the pin configuration of the USB.

Table 27.1 USB Pin Configuration

Category	Name	Pin Name	I/O	Function
USB bus interface	USB D+ data	DP	I/O	D+ I/O of the USB on-chip transceiver This pin should be connected to the D+ pin of the USB bus.
	USB D- data	DM	I/O	D- I/O of the USB on-chip transceiver This pin should be connected to the D- pin of the USB bus.
VBUS monitor input	VBUS input	VBUS	Input	USB cable connection monitor pin This pin should be connected directly to the VBUS of the USB bus. Whether the VBUS is connected or disconnected can be detected. If this pin is not connected with the VBUS of the USB bus, it should be supplied with 5 V. It should be supplied with 5 V also when the host controller function is selected. Note: The VBUS cannot be supplied to connected peripheral devices.
Reference resistor	Reference input	REFRIN	Input	Reference resistor connection pin This pin should be connected to USBAPVss through a 5.6 kΩ ±1% resistor.
Clock	Crystal resonator for USB/external clock	USB_X1	Input	This pin should be connected to crystal resonator for the USB. This pin can also be used for external clock input.
		USB_X2	Output	

Category	Name	Pin Name	I/O	Function
Power supply	Transceiver block analog pin power supply	USBAPVcc	Input	Power supply for pins
	Transceiver block analog pin ground	USBAPVss	Input	Ground for pins
	Transceiver block digital pin power supply	USBDPVcc	Input	Power supply for pins
	Transceiver block digital pin ground	USBDPVss	Input	Ground for pins
	Transceiver block analog core power supply	USBAVcc	Input	Power supply for the core
	Transceiver block analog core ground	USBAVss	Input	Ground for the core
	Transceiver block digital core power supply	USBDVcc	Input	Power supply for the core
	Transceiver block digital core ground	USBDVss	Input	Ground for the core
	USB 480 MHz power supply	USBUVcc	Input	Power supply for 480-MHz operation block
	USB 480 MHz ground	USBUVss	Input	Ground for 480-MHz operation block

27.3 Register Description

Table 27.2 shows the register configuration.

27.3.1 System Configuration Control Register (SYSCFG)

SYSCFG is a register that enables high-speed operation, selects the host controller function or function controller function, controls the DP and DM pins, selects input clock, and enables operation of this module.

This register is initialized by a power-on reset.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	SCKE	—	—	HSE	DCFM	DRPD	DPRPU	—	UCKSEL	UPLLE	USBE
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R	R	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10	SCKE	0	R/W	USB Module Clock Enable Stops or enables supplying clock signal to this module. 0: Stops supplying the clock signal to the USB module. 1: Enables supplying the clock signal to the USB module. When this bit is 0, only this register and the BUSWAIT register allow both writing and reading; the other registers in the USB module allows reading only. When modifying this bit while EXTAL is selected as the input clock, take care on following points. <ul style="list-style-type: none"> • Before setting this bit to 1, wait 1 ms after setting UPLLE to 1. • When transition to software standby mode or USB module standby function is made, set this bit to 0.
9, 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
7	HSE	0	R/W	<p>High-Speed Operation Enable</p> <p>0: High-speed operation is disabled</p> <p>When the function controller function is selected: Only full-speed operation is enabled.</p> <p>When the host controller function is selected: Full-speed or low-speed operation is enabled.</p> <p>1: High-speed operation is enabled (detected by this module)</p> <p>(1) When the host controller function is selected</p> <p>When HSE = 0, the USB port performs low-speed or full-speed operation.</p> <p>Set HSE to 0 when connection of a low-speed peripheral device to the USB port has been detected.</p> <p>When HSE = 1, this module executes the reset handshake protocol, and automatically allows the USB port to perform high-speed or full-speed operation according to the protocol execution result.</p> <p>This bit should be modified after detecting device connection (after detecting the ATTCH interrupt) and before executing a USB bus reset (before setting USBRESET to 1).</p> <p>(2) When the function controller function is selected</p> <p>When HSE = 0, this module performs full-speed operation.</p> <p>When HSE = 1, this module executes the reset handshake protocol, and automatically performs high-speed or full-speed operation according to the protocol execution result.</p> <p>This bit should be modified while DPRPU is 0.</p>
6	DCFM	0	R/W	<p>Controller Function Select</p> <p>Selects the host controller function or function controller function.</p> <p>0: Function controller function is selected.</p> <p>1: Host controller function is selected.</p> <p>This bit should be modified while DPRPU and DPRD are 0.</p>

Bit	Bit Name	Initial Value	R/W	Description
5	DRPD	0	R/W	<p>D+/D- Line Resistor Control</p> <p>Enables or disables pulling down D+ and D- lines when the host controller function is selected.</p> <p>0: Pulling down the lines is disabled.</p> <p>1: Pulling down the lines is enabled.</p> <p>This bit should be set to 1 if the host controller function is selected, and should be set to 0 if the function controller function is selected.</p>
4	DPRPU	0	R/W	<p>D+ Line Resistor Control</p> <p>Enables or disables pulling up D+ line when the function controller function is selected.</p> <p>0: Pulling up the line is disabled.</p> <p>1: Pulling up the line is enabled.</p> <p>Setting this bit to 1 when the function controller function is selected allows this module to pull up the D+ line to 3.3 V, thus notifying the USB host of connection. Modifying this bit from 1 to 0 allows this module to cancel pulling up the D+ line, thus notifying the USB host of disconnection.</p> <p>This bit should be set to 1 if the function controller function is selected, and should be set to 0 if the host controller function is selected.</p> <p>Note: Set this bit to 0 when the USB is disconnected. Include the following processing when this bit is changed from 1 to 0.</p> <ol style="list-style-type: none"> (1) Set the DPRPU bit to 0. (2) Wait for at least 1 μs. (3) Set the DCFM bit to 1. (4) Wait for at least 200 ns. (5) Set the DCFM bit to 0.

Table 27.3 Register Bits Initialized by Writing USBE = 0 (when Function Controller Function is Selected)

Register Name	Bit Name	Remarks
SYSSTS	LNST	The value is retained when the host controller function is selected.
DVSTCTR	RHST	
INTSTS0	DVSQ	The value is retained when the host controller function is selected.
USBADDR	USBADDR	The value is retained when the host controller function is selected.
USEREQ	BRequest, bmRequestType	The values are retained when the host controller function is selected.
USBVAL	wValue	The value is retained when the host controller function is selected.
USBINDX	wIndex	The value is retained when the host controller function is selected.
USBLENG	wLength	The value is retained when the host controller function is selected.

Table 27.4 Register Bits Initialized by Writing USBE = 0 (when Host Controller Function is Selected)

Register Name	Bit Name	Remarks
DVSTCTR	RHST	
FRMNUM	FRNM	The value is retained when the function controller function is selected.
UFRMNUM	UFRNM	The value is retained when the function controller function is selected.

27.3.2 CPU Bus Wait Setting Register (BUSWAIT)

BUSWAIT is a register that specifies the number of wait cycles to be inserted during an access from the CPU to this module.

This register can be modified even when the SCKE bit in SYSCFG is 0.

This register is initialized by a power-on reset.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	BWAIT[3:0]			
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	1	1	1	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
3 to 0	BWAIT[3:0]	1111	R/W	CPU Bus Access Wait Specifies the number of wait cycles to be inserted during an access to a register (the same number applies to an access to a FIFO port). For details, see section 27.4.1 (5), Register Access Wait Control. 0000: 0 wait cycles (2 access cycles) : 0010: 2 wait cycles (4 access cycles) : 0100: 4 wait cycles (6 access cycles) : 1111: 15 wait cycles (17 access cycles)

27.3.3 System Configuration Status Register (SYSSTS)

SYSSTS is a register that monitors the line status (D + and D – lines) of the USB data bus.

This register is initialized by a power-on reset or a USB bus reset.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	—	LNST[1:0]	
Initial value:	0	0	0	0	0	Undefined	0	0	0	0	0	0	0	0	Undefined*	Undefined*
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
9 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1, 0	LNST[1:0]	Undefined*	R	USB Data Line Status Monitor Indicates the status of the USB data bus lines (D+ and D-) as shown in table 27.5. These bits should be read after setting DPRPU to 1 to notify connection when the function controller function is selected; whereas after setting DRPD to 1 to enable pulling down the lines when the host controller function is selected.

Note: * Depends on the DP and DM pin status.

Table 27.5 USB Data Bus Line Status

LNST[1]	LNST[0]	During Low-Speed Operation (only when Host Controller Function is Selected)	During Full-Speed Operation	During High-Speed Operation	During Chirp Operation
0	0	SE0	SE0	Squelch	Squelch
0	1	K state	J state	Unsquench	Chirp J
1	0	J state	K state	Invalid	Chirp K
1	1	SE1	SE1	Invalid	Invalid

[Legend]

Chirp: The reset handshake protocol (RHSP) is being executed in high-speed operation enabled state (the HSE bit in SYSCFG is set to 1).

Squelch: SE0 or idle state

Unsquench: High-speed J state or high-speed K state

Chirp J: Chirp J state

Chirp K: Chirp K state

27.3.4 Device State Control Register (DVSTCTR)

DVSTCTR is a register that controls and confirms the state of the USB data bus.

This register is initialized by a power-on reset. After a USB bus reset, only the WKUP bit is initialized.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	WKUP	RWUPE	USBRST	RESUME	UACT	—	RHST[2:0]

R/W:	R	R	R	R	R	R	R	R/W*	R/W	R/W	R/W	R/W	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
8	WKUP	0	R/W*	<p>Wakeup Output</p> <p>Enables or disables outputting the remote wakeup signal (resume signal) to the USB bus when the function controller function is selected.</p> <p>0: Remote wakeup signal is not output. 1: Remote wakeup signal is output.</p> <p>The module controls the output time of a remote wakeup signal. When this bit is set to 1, this module clears this bit to 0 after outputting the 10-ms K state.</p> <p>According to the USB specification, the USB bus idle state must be kept for 5 ms or longer before a remote wakeup signal is output. If this module writes 1 to this bit right after detection of suspended state, the K state will be output after 2 ms.</p> <p>Note: Do not write 1 to this bit, unless the device state is in the suspended state (the DVSQ bit in the INTSTS0 register is set to 1xx) and the USB host enables the remote wakeup signal. When this bit is set to 1, the internal clock must not be stopped even in the suspended state (write 1 to this bit while SCKE is 1).</p> <p>This bit should be set to 0 if the host controller function is selected.</p>

Bit	Bit Name	Initial Value	R/W	Description
7	RWUPE	0	R/W	<p>Remote Wakeup Detection Enable</p> <p>Enables or disables the downstream port peripheral device to use the remote wakeup function (resume signal output) when the host controller function is selected.</p> <p>0: Downstream port remote wakeup is disabled. 1: Downstream port remote wakeup is enabled.</p> <p>With this bit set to 1, on detecting the remote wakeup signal, this module detects the resume signal (K-state for 2.5 μs) from the downstream port device and performs the resume process (drives the port to the K-state).</p> <p>With this bit set to 0, this module ignores the detected remote wakeup signal (K-state) from the peripheral device connected to the downstream port.</p> <p>While this bit is 1, the internal clock should not be stopped even in the suspended state (SCKE should be set to 1). Also note that the USB bus should not be reset from the suspended state (USBRST should not be set to 1); it is prohibited by USB Specification 2.0.</p> <p>This bit should be set to 0 if the function controller function is selected.</p>

Bit	Bit Name	Initial Value	R/W	Description
6	USBRST	0	R/W	<p>Bus Reset Output</p> <p>Controls the USB bus reset signal output when the host controller function is selected.</p> <p>0: USB bus reset signal is not output. 1: USB bus reset signal is output.</p> <p>When the host controller function is selected, setting this bit to 1 allows this module to drive the USB port to SE0 to reset the USB bus. Here, this module performs the reset handshake protocol if the HSE bit is 1.</p> <p>This module continues outputting SE0 while USBRST is 1 (until 0 is written to USBRST). USBRST should be 1 (= USB bus reset period) for the time defined by USB Specification 2.0.</p> <p>Writing 1 to this bit during communication (UACT = 1) or during the resume process (RESUME = 1) prevents this module from starting the USB bus reset process until both UACT and RESUME become 0.</p> <p>Write 1 to the UACT bit simultaneously with the end of the USB bus reset process (writing 0 to USBRST).</p> <p>This bit should be set to 0 if the function controller function is selected.</p>
5	RESUME	0	R/W	<p>Resume Output</p> <p>Controls the resume signal output when the host controller function is selected.</p> <p>0: Resume signal is not output. 1: Resume signal is output.</p> <p>Setting this bit to 1 allows this module to drive the port to the K-state and output the resume signal.</p> <p>This module continues outputting K-state while RESUME is 1 (until 0 is written to RESUME). RESUME should be 1 (= resume period) for the time defined by USB Specification 2.0.</p> <p>This bit should be set to 1 in the suspended state.</p> <p>Write 1 to the UACT bit simultaneously with the end of the resume process (writing 0 to RESUME).</p> <p>This bit should be set to 0 if the function controller function is selected.</p>

Bit	Bit Name	Initial Value	R/W	Description
4	UACT	0	R/W	<p>USB Bus Enable</p> <p>Enables operation of the USB bus (controls the SOF or μSOF packet transmission to the USB bus) when the host controller function is selected.</p> <p>0: Downstream port is disabled (SOF/μSOF transmission is disabled).</p> <p>1: Downstream port is enabled (SOF/μSOF transmission is enabled).</p> <p>With this bit set to 1, this module puts the USB port to the USB-bus enabled state and performs SOF output and data transmission and reception.</p> <p>This module starts outputting SOF/μSOF within 1 (μ) frame after 1 has been written to UACT.</p> <p>With this bit set to 0, this module enters the idle state after outputting SOF/μSOF.</p> <p>This module sets this bit to 0 on any of the following conditions.</p> <ul style="list-style-type: none"> • A DTCH interrupt is detected during communication (while UACT = 1). • An EOFERR interrupt is detected during communication (while UACT = 1). <p>Writing 1 to this bit should be done at the end of the USB reset process (writing 0 to USBRST) or at the end of the resume process from the suspended state (writing 0 to RESUME).</p> <p>This bit should be set to 0 if the function controller function is selected.</p>
3	—	0	R	<p>Reserved</p> <p>This bit is always read as 0. The write value should always be 0.</p>

Bit	Bit Name	Initial Value	R/W	Description
2 to 0	RHST[2:0]	000	R	<p>Reset Handshake</p> <p>Indicates the status of the reset handshake.</p> <p>(1) When the host controller function is selected</p> <p>000: Communication speed not determined (powered state or no connection)</p> <p>1xx: Reset handshake in progress</p> <p>001: Low-speed connection</p> <p>010: Full-speed connection</p> <p>011: High-speed connection</p> <p>These bits indicate 100 after 1 has been written to USBRST.</p> <p>If HSE has been set to 1, these bits indicate 111 as soon as this module detects Chirp-K from the peripheral device.</p> <p>This module fixes the value of the RHST bits when 0 is written to USBRST and this module completes SE0 driving.</p> <p>When the UTST bits are set to 1xxx (when a host test mode is specified), the RHST bits indicate 011.</p> <p>(2) When the function controller function is selected</p> <p>000: Communication speed not determined</p> <p>100: Reset handshake in progress</p> <p>010: Full-speed connection</p> <p>011: High-speed connection</p> <p>If HSE has been set to 1, these bits indicate 100 as soon as this module detects the USB bus reset. Then, these bits indicate 011 as soon as this module outputs Chirp-K and detects Chirp-JK from the USB host three times. If the connection speed is not fixed to high speed within 2.5 ms after Chirp-K output, these bits indicate 010.</p> <p>If HSE has been set to 0, these bits indicate 010 as soon as this module detects the USB bus reset.</p> <p>A DVST interrupt is generated as soon as this module detects the USB bus reset and then the value of the RHST bits is fixed to 010 or 011.</p>

Note: * Only 1 can be written.

27.3.5 Test Mode Register (TESTMODE)

TESTMODE is a register that controls the USB test signal output during high-speed operation.

This register is initialized by a power-on reset.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	UTST[3:0]			
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
3 to 0	UTST[3:0]	0000	R/W	Test Mode This module outputs the USB test signals during the high-speed operation, when these bits are written appropriate value. Table 27.6 shows test mode operation of this module.

Bit	Bit Name	Initial Value	R/W	Description
3 to 0	UTST[3:0]	0000	R/W	<p>(1) When the host controller function is selected</p> <p>These bits can be set after writing 1 to DRPD. This module outputs waveforms when both DRPD and UACT are set to 1. This module also performs high-speed termination after the UTST bits are written to.</p> <ul style="list-style-type: none"> • Procedure for setting the UTST bits <ol style="list-style-type: none"> 1. Power-on reset. 2. Start the clock supply (Set SCKE to 1 after the crystal oscillation and the PLL for USB are settled). 3. Set DCFM and DRPD to 1 (setting HSE to 1 is not required). 4. Set USBE to 1. 5. Set the UTST bits to the appropriate value according to the test specifications. 6. Set the UACT bit to 1. • Procedure for modifying the UTST bits <ol style="list-style-type: none"> 1. (In the state after executing step 6 above) Set UACT and USBE to 0. 2. Set USBE to 1. 3. Set the UTST bits to the appropriate value according to the test specifications. 4. Set the UACT bit to 1. <p>When these bits are set to Test_SE0_NAK (1011), this module does not output the SOF packet even when 1 is set to UACT.</p> <p>When these bits are set to Test_Force_Enable (1101), this module outputs the SOF packet when 1 is set to UACT. In this test mode, this module does not perform hardware control consequent to detection of high-speed disconnection (detection of the DTCH interrupt).</p> <p>When setting the UTST bits, the PID bits for all the pipes should be set to NAK.</p> <p>To return to normal USB communication after a test mode has been set and executed, a power-on reset should be applied.</p>

Bit	Bit Name	Initial Value	R/W	Description
3 to 0	UTST[3:0]	0000	R/W	(2) When the function controller function is selected The appropriate value should be set to these bits according to the SetFeature request from the USB host during high-speed communication. This module does not make a transition to the suspended state while these bits are 0001 to 0100.

Table 27.6 Test Mode Operation

Test Mode	UTST Bit Setting	
	When Function Controller Function is Selected	When Host Controller Function is Selected
Normal operation	0000	0000
Test_J	0001	1001
Test_K	0010	1010
Test_SE0_NAK	0011	1011
Test_Packet	0100	1100
Test_Force_Enable	—	1101
Reserved	0101 to 0111	1110 to 1111

27.3.6 DMA-FIFO Bus Configuration Registers (D0FBCFG, D1FBCFG)

D0FBCFG is a register that controls DMA0-FIFO bus accesses. D1FBCFG is a register that controls DMA1-FIFO bus accesses.

These registers are initialized by a power-on reset.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	TENDE	—	—	—	—

Bit	Bit Name	Initial Value	R/W	Description
15 to 12	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
11 to 5	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.
4	TENDE	0	R/W	DMA Transfer End Sampling Enable Controls acceptance of DMA transfer end signal output from the direct memory access controller on completion of a DMA transfer. For details, see section 27.4.4 (3), DMA Transfers (D0FIFO/D1FIFO Port). 0: DMA transfer end signal is not sampled. 1: DMA transfer end signal is sampled.
3 to 0	—	Undefined	R	Reserved The read value is undefined. The write value should always be 0.

27.3.7 FIFO Port Registers (CFIFO, D0FIFO, D1FIFO)

CFIFO, D0FIFO and D1FIFO are port registers that are used to read data from the FIFO buffer memory and writing data to the FIFO buffer memory.

There are three FIFO ports: the CFIFO, D0FIFO and D1FIFO ports. Each FIFO port is configured of a port register (CFIFO, D0FIFO, D1FIFO) that handles reading of data from the FIFO buffer memory and writing of data to the FIFO buffer memory, a select register (CFIFOSEL, D0FIFOSEL, D1FIFOSEL) that is used to select the pipe assigned to the FIFO port, and a control register (CFIFOCTR, D0FIFOCTR, D1FIFOCTR).

Each FIFO port has the following features.

- The DCP FIFO buffer should be accessed through the CFIFO port.
- Accessing the FIFO buffer using DMA transfer should be performed through the D0FIFO or D1FIFO port.
- The D1FIFO and D0FIFO ports can be accessed also by the CPU.
- When using functions specific to the FIFO port, the pipe number (selected pipe) specified by the CURPIPE bits cannot be changed (when the DMA transfer function is used, etc.).
- Registers configuring a FIFO port do not affect other FIFO ports.
- The same pipe should not be assigned to two or more FIFO ports.
- There are two FIFO buffer states: the access right is on the CPU side and it is on the SIE side. When the FIFO buffer access right is on the SIE side, the FIFO buffer cannot be accessed from the CPU.

These registers are initialized by a power-on reset.

0	Writing: invalid, reading: prohibited*		N + 1 address	N + 0 address
1	N + 0 address	N + 1 address	Writing: invalid, reading: prohibited*	

Note: * Reading data from the invalid bits in a word or byte unit is prohibited.

Table 27.9 Endian Operation in 8-Bit Access (when MBW = 00)

BIGEND Bit	Bits 31 to 24	Bits 23 to 16	Bits 15 to 8	Bits 7 to 0
0	Writing: invalid, reading: prohibited*			N + 0 address
1	N + 0 address	Writing: invalid, reading: prohibited*		

Note: * Reading data from the invalid bits in a word or byte unit is prohibited.

27.3.8 FIFO Port Select Registers (CFIFOSEL, D0FIFOSEL, D1FIFOSEL)

CFIFOSEL, D0FIFOSEL and D1FIFOSEL are registers that assign the pipe to the FIFO port, and control access to the corresponding port.

The same pipe should not be specified by the CURPIPE bits in CFIFOSEL, D0FIFOSEL and D1FIFOSEL. When the CURPIPE bits in D0FIFOSEL and D1FIFOSEL are cleared to B'000, no pipe is selected.

The pipe number should not be changed while the DMA transfer is enabled.

These registers are initialized by a power-on reset.

(1) CFIFOSEL

Note: * Only 0 can be read and 1 can be written.

27.3.9 FIFO Port Control Registers (CFIFOCTR, D0FIFOCTR, D1FIFOCTR)

CFIFOCTR, D0FIFOCTR and D1FIFOCTR are registers that determine whether or not writing to the buffer memory has been finished, the buffer accessed from the CPU has been cleared, and the FIFO port is accessible. CFIFOCTR, D0FIFOCTR, and D1FIFOCTR are used for the corresponding FIFO ports.

These registers are initialized by a power-on reset.

Bit	Bit Name	Initial Value	R/W	Description
15	BVAL	0	R/W*2	<p>Buffer Memory Valid Flag</p> <p>This bit should be set to 1 when data has been completely written to the FIFO buffer on the CPU side for the pipe selected using the CURPIPE bits (selected pipe).</p> <p>0: Invalid 1: Writing ended</p> <p>When the selected pipe is in the transmitting direction, set this bit to 1 in the following cases. Then, this module switches the FIFO buffer from the CPU side to the SIE side, enabling transmission.</p> <ul style="list-style-type: none"> To transmit a short packet, set this bit to 1 after data has been written. To transmit a zero-length packet, set this bit to 1 before data is written to the FIFO buffer. Set this bit to 1 after the number of data bytes has been written for the pipe in continuous transfer mode, where the number is a natural integer multiple of the maximum packet size and less than the buffer size. <p>When the data of the maximum packet size has been written for the pipe in non-continuous transfer mode, this module sets this bit to 1 and switches the FIFO buffer from the CPU side to the SIE side, enabling transmission.</p> <p>Writing 1 to this bit should be done while FRDY indicates 1 (set by this module).</p> <p>When the selected pipe is in the receiving direction, do not set this bit to 1.</p>

Bit	Bit Name	Initial Value	R/W	Description
14	BCLR	0	R/W* ¹	<p>CPU Buffer Clear</p> <p>This bit should be set to 1 to clear the FIFO buffer on the CPU side for the selected pipe.</p> <p>0: Invalid</p> <p>1: Clears the buffer memory on the CPU side.</p> <p>When double buffer mode is set for the FIFO buffer assigned to the selected pipe, this module clears only one plane of the FIFO buffer even when both planes are read-enabled.</p> <p>When the selected pipe is the DCP, setting BCLR to 1 allows this module to clear the FIFO buffer regardless of whether the FIFO buffer is on the CPU side or SIE side. To clear the buffer on the SIE side, set the PID bits for the DCP to NAK before setting BCLR to 1.</p> <p>When the selected pipe is in the transmitting direction, if 1 is written to BVAL and BCLR bits simultaneously, this module clears the data that has been written before it, enabling transmission of a zero-length packet.</p> <p>When the selected pipe is not the DCP, writing 1 to this bit should be done while FRDY indicates 1 (set by this module).</p>
13	FRDY	0	R	<p>FIFO Port Ready</p> <p>Indicates whether the FIFO port can be accessed.</p> <p>0: FIFO port access is disabled.</p> <p>1: FIFO port access is enabled.</p> <p>In the following cases, this module sets FRDY to 1 but data cannot be read via the FIFO port because there is no data to be read. In these cases, set BCLR to 1 to clear the FIFO buffer, and enable transmission and reception of the next data.</p> <ul style="list-style-type: none"> • A zero-length packet is received when the FIFO buffer assigned to the selected pipe is empty. • A short packet is received and the data is completely read while BFRE is 1.

Bit	Bit Name	Initial Value	R/W	Description
12	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
11 to 0	DTLN[11:0]	H'000	R	Receive Data Length Indicates the length of the receive data. While the FIFO buffer is being read, these bits indicate the different values depending on the RCNT bit value as described below. <ul style="list-style-type: none"> • RCNT = 0: This module sets these bits to indicate the length of the receive data until all the received data has been read from a single FIFO buffer plane. While BFRE is 1, these bits retain the length of the receive data until BCLR is set to 1 even after all the data has been read. • RCNT = 1: This module decrements the value indicated by these bits each time data is read from the FIFO buffer. (The value is decremented by one when MBW is 00, by two when MBW is 01, and by four when MBW is 10.) This module sets these bits to 0 when all the data has been read from one FIFO buffer plane. However, in double buffer mode, if data has been received in one FIFO buffer plane before all the data has been read from the other plane, this module sets these bits to indicate the length of the receive data in the former plane when all the data has been read from the latter plane. Note: When RCNT is 1, it takes 10 bus cycles for these bits to be updated after the FIFO port has been read.

Notes: 1. Only 0 can be read and 1 can be written.
2. Only 1 can be written.

27.3.10 Interrupt Enable Register 0 (INTENB0)

INTENB0 is a register that enables or disables the various interrupts. On detecting the interrupt corresponding to the bit that has been set to 1, this module generates the USB interrupt.

This module sets 1 to each status bit in INTSTS0 when a detection condition of the corresponding interrupt source has been satisfied regardless of the set value in INTENB0 (regardless of whether the interrupt output is enabled or disabled).

While the status bit in INTSTS0 corresponding to the interrupt source indicates 1, this module generates the USB interrupt when the corresponding interrupt enable bit in INTENB0 is modified from 0 to 1.

This register is initialized by a power-on reset.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

9	NRDYE	0	R/W	Buffer Not Ready Response Interrupt Enable Enables or disables the USB interrupt request when the NRDY interrupt is detected. 0: Interrupt request disabled 1: Interrupt request enabled
8	BRDYE	0	R/W	Buffer Ready Interrupt Enable Enables or disables the USB interrupt request when the BRDY interrupt is detected. 0: Interrupt request disabled 1: Interrupt request enabled
7 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Note: * The RSME, DVSE, and CTRE bits can be set to 1 only when the function controller function is selected; do not set these bits to 1 to enable the corresponding interrupt output when the host controller function is selected.

27.3.11 Interrupt Enable Register 1 (INTENB1)

INTENB1 is a register that enables or disables the various interrupts when the host controller function is selected. On detecting the interrupt corresponding to the bit in this register that has been set to 1, this module generates the USB interrupt.

This module sets 1 to each status bit in INTSTS1 when a detection condition of the corresponding interrupt source has been satisfied regardless of the set value in INTENB1 (regardless of whether the interrupt output is enabled or disabled).

While the status bit in INTSTS1 corresponding to the interrupt source indicates 1, this module generates the USB interrupt when the corresponding interrupt enable bit in INTENB1 is modified from 0 to 1.

When the function controller function is selected, the interrupts should not be enabled. This register is initialized by a power-on reset.

3 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Note: The INTENB1 register bits can be set to 1 only when the host controller function is selected; do not set these bits to 1 to enable the corresponding interrupt output when the function controller function is selected.

27.3.12 BRDY Interrupt Enable Register (BRDYENB)

BRDYENB is a register that enables or disables the BRDY bit in INTSTS0 to be set to 1 when the BRDY interrupt is detected for each pipe.

On detecting the BRDY interrupt for the pipe corresponding to the bit in this register that has been set to 1, this module sets 1 to the corresponding PIPEBRDY bit in BRDYSTS and the BRDY bit in INTSTS0, and generates the BRDY interrupt.

While at least one PIPEBRDY bit in BRDYSTS indicates 1, this module generates the BRDY interrupt when the corresponding interrupt enable bit in BRDYENB is modified from 0 to 1.

This register is initialized by a power-on reset.

27.3.13 NRDY Interrupt Enable Register (NRDYENB)

NRDYENB is a register that enables or disables the NRDY bit in INTSTS0 to be set to 1 when the NRDY interrupt is detected for each pipe.

On detecting the NRDY interrupt for the pipe corresponding to the bit in this register that has been set to 1, this module sets 1 to the corresponding PIPENRDY bit in NRDYSTS and the NRDY bit in INTSTS0, and generates the NRDY interrupt.

While at least one PIPENRDY bit in NRDYSTS indicates 1, this module generates the NRDY interrupt when the corresponding interrupt enable bit in NRDYENB is modified from 0 to 1.

This register is initialized by a power-on reset.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

27.3.14 BEMP Interrupt Enable Register (BEMPENB)

BEMPENB is a register that enables or disables the BEMP bit in INTSTS0 to be set to 1 when the BEMP interrupt is detected for each pipe.

On detecting the BEMP interrupt for the pipe corresponding to the bit in this register that has been set to 1, this module sets 1 to the corresponding PIPEBEMP bit in BEMPSTS and the BEMP bit in INTSTS0, and generates the BEMP interrupt.

While at least one PIPEBEMP bit in BEMPSTS indicates 1, this module generates the BEMP interrupt when the corresponding interrupt enable bit in BEMPENB is modified from 0 to 1.

This register is initialized by a power-on reset.

27.3.15 SOF Control Register (SOFCFG)

SOFCFG is a register that specifies the transaction-enabled time and BRDY interrupt status clear timing.

This register is initialized by a power-on reset.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	TRNEN SEL	—	BRDYM	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R/W	R	R/W	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	TRNENSEL	0	R/W	Transaction-Enabled Time Select Selects the transaction-enabled time either for full- or low-speed communication, during which this module issues tokens in a frame. 0: For non-low-speed communication 1: For low-speed communication This bit is valid only when the host controller function is selected. Even when the host controller function is selected, the setting of this bit has no effect on the transaction-enabled time during high-speed communication. This bit should be set to 0 when the function controller function is selected.
7	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
6	BRDYM	0	R/W	BRDY Interrupt Status Clear Timing for each Pipe Specifies the timing for clearing the BRDY interrupt status for each pipe. 0: Writing 0 clears the status. 1: This module automatically clears the status when data has been read from the FIFO buffer or data has been written to the FIFO buffer.
5 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

27.3.16 Interrupt Status Register 0 (INTSTS0)

INTSTS0 is a register that indicates the status of the various interrupts detected.

This register is initialized by a power-on reset. By a USB bus reset, the DVST and DVSQ[2:0] bits are initialized.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	VBINT	RESM	SOFR	DVST	CTRT	BEMP	NRDY	BRDY	VBSTS	DVSQ[2:0]		VALID	CTSQ[2:0]			
Initial value:	0	0	0	0/1*1	0	0	0	0	0/1*3	0*2	0*2	0/1*2	0	0	0	0
R/W:	R/W*7	R/W*7	R/W*7	R/W*7	R/W*7	R	R	R	R	R	R	R	R/W*7	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15	VBINT	0	R/W*7	<p>VBUS Interrupt Status*4*5</p> <p>0: VBUS interrupts not generated 1: VBUS interrupts generated</p> <p>This module sets this bit to 1 on detecting a level change (high to low or low to high) in the VBUS pin input value. This module sets the VBSTS bit to indicate the VBUS pin input value. When the VBUS interrupt is generated, repeat reading the VBSTS bit until the same value is read several times to eliminate chattering.</p>
14	RESM	0	R/W*7	<p>Resume Interrupt Status*4*5*6</p> <p>0: Resume interrupts not generated 1: Resume interrupts generated</p> <p>When the function controller function is selected, this module sets this bit to 1 on detecting the falling edge of the signal on the DP pin in the suspended state (DVSQ = 1XX).</p> <p>When the host controller function is selected, the read value is invalid.</p>

Bit	Bit Name	Initial Value	R/W	Description
13	SOFR	0	R/W* ⁷	<p>Frame Number Refresh Interrupt Status*⁴</p> <p>0: SOF interrupts not generated 1: SOF interrupts generated</p> <p>(1) When the host controller function is selected This module sets this bit to 1 on updating the frame number when the UACT bit has been set to 1. (This interrupt is detected every 1 ms.)</p> <p>(2) When the function controller function is selected This module sets this bit to 1 on updating the frame number. (This interrupt is detected every 1 ms.)</p> <p>This module can detect an SOFR interrupt through the internal interpolation function even when a damaged SOF packet is received from the USB host.</p>
12	DVST	0/1* ¹	R/W* ⁷	<p>Device State Transition Interrupt Status*^{4*6}</p> <p>0: Device state transition interrupts not generated 1: Device state transition interrupts generated</p> <p>When the function controller function is selected, this module updates the DVSQ value and sets this bit to 1 on detecting a change in the device state.</p> <p>When this interrupt is generated, clear the status before this module detects the next device state transition.</p> <p>When the host controller function is selected, the read value is invalid.</p>

Bit	Bit Name	Initial Value	R/W	Description
11	CTRT	0	R/W* ⁷	<p>Control Transfer Stage Transition Interrupt Status*⁴*⁶</p> <p>0: Control transfer stage transition interrupts not generated</p> <p>1: Control transfer stage transition interrupts generated</p> <p>When the function controller function is selected, this module updates the CTSQ value and sets this bit to 1 on detecting a change in the control transfer stage.</p> <p>When this interrupt is generated, clear the status before this module detects the next control transfer stage transition.</p> <p>When the host controller function is selected, the read value is invalid.</p>
10	BEMP	0	R	<p>Buffer Empty Interrupt Status</p> <p>0: BEMP interrupts not generated</p> <p>1: BEMP interrupts generated</p> <p>This module sets this bit to 1 when at least one PIPEBEMP bit in BEMPSTS is set to 1 among the PIPEBEMP bits corresponding to the PIPEBEMPE bits in BEMPENB to which 1 has been set (when this module detects the BEMP interrupt status in at least one pipe among the pipes for which the BEMP interrupt output is enabled).</p> <p>For the conditions for PIPEBEMP status assertion, refer to section 27.4.2 (3), BEMP Interrupt.</p> <p>This module clears this bit to 0 when 0 is written to all the PIPEBEMP bits corresponding to the PIPEBEMPE bits to which 1 has been set.</p> <p>This bit cannot be cleared to 0 even if 0 is written to this bit.</p>

Bit	Bit Name	Initial Value	R/W	Description
9	NRDY	0	R	<p>Buffer Not Ready Interrupt Status</p> <p>0: NRDY interrupts not generated 1: NRDY interrupts generated</p> <p>This module sets this bit to 1 when at least one PIPENRDY bit in NRDYSTS is set to 1 among the PIPENRDY bits corresponding to the PIPENRDYE bits in NRDYENB to which 1 has been set (when this module detects the NRDY interrupt status in at least one pipe among the pipes for which the NRDY interrupt output is enabled).</p> <p>For the conditions for PIPENRDY status assertion, refer to section 27.4.2 (2), NRDY Interrupt.</p> <p>This module clears this bit to 0 when 0 is written to all the PIPENRDY bits corresponding to the PIPENRDYE bits to which 1 has been set.</p> <p>This bit cannot be cleared to 0 even if 0 is written to this bit.</p>
8	BRDY	0	R	<p>Buffer Ready Interrupt Status</p> <p>Indicates the BRDY interrupt status.</p> <p>0: BRDY interrupts not generated 1: BRDY interrupts generated</p> <p>This module sets this bit to 1 when at least one PIPEBRDY bit in BRDYSTS is set to 1 among the PIPEBRDY bits corresponding to the PIPEBRDYE bits in BRDYENB to which 1 has been set (when this module detects the BRDY interrupt status in at least one pipe among the pipes for which the BRDY interrupt output is enabled).</p> <p>For the conditions for PIPEBRDY status assertion, refer to section 27.4.2 (1), BRDY Interrupt.</p> <p>This module clears this bit to 0 when 0 is written to all the PIPEBRDY bits corresponding to the PIPEBRDYE bits to which 1 has been set.</p> <p>This bit cannot be cleared to 0 even if 0 is written to this bit.</p>

Bit	Bit Name	Initial Value	R/W	Description
7	VBSTS	0/1* ³	R	VBUS Input Status 0: The VBUS pin is low level. 1: The VBUS pin is high level.
6 to 4	DVSQL[2:0]	000/001* ²	R	Device State 000: Powered state 001: Default state 010: Address state 011: Configured state 1xx: Suspended state When the host controller function is selected, the read value is invalid.
3	VALID	0	R/W* ⁷	USB Request Reception 0: Not detected 1: Setup packet reception When the host controller function is selected, the read value is invalid.
2 to 0	CTSQC[2:0]	000	R	Control Transfer Stage 000: Idle or setup stage 001: Control read data stage 010: Control read status stage 011: Control write data stage 100: Control write status stage 101: Control write (no data) status stage 110: Control transfer sequence error 111: Setting prohibited When the host controller function is selected, the read value is invalid.

- Notes:
1. This bit is initialized to B'0 by a power-on reset and B'1 by a USB bus reset.
 2. These bits are initialized to B'000 by a power-on reset and B'001 by a USB bus reset.
 3. This bit is initialized to 0 when the level of the VBUS pin input is high and 1 when low.
 4. To clear the VBINT, RESM, SOFR, DVST, or CTRT bit, write 0 only to the bits to be cleared; write 1 to the other bits. Do not write 0 to the status bits indicating 0.
 5. This module can detect a change in the status indicated by the VBINT and RESM bits even while the clock supply is stopped (while SCKE is 0), and outputs interrupts when the corresponding interrupt enable bits are enabled. Clearing the status should be done after enabling the clock supply.
 6. A change in the status of the RESM, DVST, and CTRT bits occur only when the function controller function is selected; disable the corresponding interrupt enable bits (set to 0) when the host controller function is selected.
 7. Only 0 can be written.

27.3.17 Interrupt Status Register 1 (INTSTS1)

INTSTS1 is a register that is used to confirm interrupt status.

The various interrupts indicated by the bits in this register should be enabled only when the host controller function is selected.

This register is initialized by a power-on reset.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Here, if the corresponding interrupt enable bit has been set to 1, this module generates the interrupt.</p> <p>Specifically, this module detects the ATTCH interrupt on any of the following conditions.</p> <ul style="list-style-type: none"> • K-stateSE0, or SE1 changes to J-state, and J-state continues 2.5 μs. • J-state, SE0, or SE1 changes to K-state, and K-state continues 2.5 μs. <p>When the function controller function is selected, the read value is invalid.</p>
10 to 7	—	All 0	R	<p>Reserved</p> <p>These bits are always read as 0. The write value should always be 0.</p>

Bit	Bit Name	Initial Value	R/W	Description
6	EOFERR	0	R/W* ¹	<p>EOF Error Detection Interrupt Status</p> <p>Indicates the status of the EOFERR interrupt when the host controller function is selected.</p> <p>0: EOFERR interrupt not generated 1: EOFERR interrupt generated</p> <p>This module detects the EOFERR interrupt on detecting that communication is not completed at the EOF2 timing prescribed by USB Specification 2.0, and sets this bit to 1. Here, if the corresponding interrupt enable bit has been set to 1, this module generates the EOFERR interrupt.</p> <p>After detecting the EOFERR interrupt, this module controls hardware as described below (irrespective of the set value of the corresponding interrupt enable bit). Terminate all the pipes in which communications are currently carried for the USB port and perform re-enumeration of the USB port.</p> <p>(1) Modifies the UACT bit to 0. (2) Causes a transition to the idle state.</p> <p>When the function controller function is selected, the read value is invalid.</p>

Bit	Bit Name	Initial Value	R/W	Description
5	SIGN	0	R/W* ¹	<p>Setup Transaction Error Interrupt Status</p> <p>Indicates the status of the setup transaction error interrupt when the host controller function is selected.</p> <p>0: SIGN interrupts not generated 1: SIGN interrupts generated</p> <p>This module detects the SIGN interrupt when ACK response is not returned from the peripheral device three consecutive times during the setup transactions issued by this module, and sets this bit to 1. Here, if the corresponding interrupt enable bit has been set to 1, this module generates the SIGN interrupt.</p> <p>Specifically, this module detects the SIGN interrupt when any of the following response conditions occur for three consecutive setup transactions.</p> <ul style="list-style-type: none"> • Timeout is detected when the peripheral device has returned no response. • A damaged ACK packet is received. • A handshake other than ACK (NAK, NYET, or STALL) is received. <p>When the function controller function is selected, the read value is invalid.</p>

Bit	Bit Name	Initial Value	R/W	Description
4	SACK	0	R/W*1	<p>Setup Transaction Normal Response Interrupt Status</p> <p>Indicates the status of the setup transaction normal response interrupt when the host controller function is selected.</p> <p>0: SACK interrupts not generated 1: SACK interrupts generated</p> <p>This module detects the SACK interrupt when ACK response is returned from the peripheral device during the setup transactions issued by this module, and sets this bit to 1. Here, if the corresponding interrupt enable bit has been set to 1, this module generates the SACK interrupt.</p>
3 to 0	—	All 0	R	<p>Reserved</p> <p>These bits are always read as 0. The write value should always be 0.</p>

- Notes:
- Only 0 can be written.
 - This module can detect a change in the status indicated by the BCHG bit even while the clock supply is stopped (while SCKE is 0), and outputs an interrupt when the corresponding interrupt enable bit is enabled. Clearing the status should be done after enabling the clock supply.
No interrupts other than BCHG can be detected while the clock supply is stopped (while SCKE is 0).

27.3.18 BRDY Interrupt Status Register (BRDYSTS)

BRDYSTS is a register that indicates the BRDY interrupt status for each pipe.

This register is initialized by a power-on reset.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	PIPE9 BRDY	PIPE8 BRDY	PIPE7 BRDY	PIPE6 BRDY	PIPE5 BRDY	PIPE4 BRDY	PIPE3 BRDY	PIPE2 BRDY	PIPE1 BRDY	PIPE0 BRDY

3	PIPE3NRDY	0	R/W*	NRDY Interrupt Status for PIPE3 0: Interrupts not generated 1: Interrupts generated
2	PIPE2NRDY	0	R/W*	NRDY Interrupt Status for PIPE2 0: Interrupts not generated 1: Interrupts generated
1	PIPE1NRDY	0	R/W*	NRDY Interrupt Status for PIPE1 0: Interrupts not generated 1: Interrupts generated
0	PIPE0NRDY	0	R/W*	NRDY Interrupt Status for PIPE0 0: Interrupts not generated 1: Interrupts generated

Note: * Only 0 can be written.

27.3.20 BEMP Interrupt Status Register (BEMPSTS)

BEMPSTS is a register that indicates the BEMP interrupt status for each pipe.

This register is initialized by a power-on reset.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	PIPE9 BEMP	PIPE8 BEMP	PIPE7 BEMP	PIPE6 BEMP	PIPE5 BEMP	PIPE4 BEMP	PIPE3 BEMP	PIPE2 BEMP	PIPE1 BEMP	PIPE0 BEMP
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*	R/W*

Bit	Bit Name	Initial Value	R/W	Description
15 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9	PIPE9BEMP	0	R/W*	BEMP Interrupts for PIPE9 0: Interrupts not generated 1: Interrupts generated
8	PIPE8BEMP	0	R/W*	BEMP Interrupts for PIPE8 0: Interrupts not generated 1: Interrupts generated
7	PIPE7BEMP	0	R/W*	BEMP Interrupts for PIPE7 0: Interrupts not generated 1: Interrupts generated
6	PIPE6BEMP	0	R/W*	BEMP Interrupts for PIPE6 0: Interrupts not generated 1: Interrupts generated
5	PIPE5BEMP	0	R/W*	BEMP Interrupts for PIPE5 0: Interrupts not generated 1: Interrupts generated
4	PIPE4BEMP	0	R/W*	BEMP Interrupts for PIPE4 0: Interrupts not generated 1: Interrupts generated

Bit	Bit Name	Initial Value	R/W	Description
3	PIPE3BEMP	0	R/W*	BEMP Interrupts for PIPE3 0: Interrupts not generated 1: Interrupts generated
2	PIPE2BEMP	0	R/W*	BEMP Interrupts for PIPE2 0: Interrupts not generated 1: Interrupts generated
1	PIPE1BEMP	0	R/W*	BEMP Interrupts for PIPE1 0: Interrupts not generated 1: Interrupts generated
0	PIPE0BEMP	0	R/W*	BEMP Interrupts for PIPE0 0: Interrupts not generated 1: Interrupts generated

Note: * Only 0 can be written.

27.3.21 Frame Number Register (FRMNUM)

FRMNUM is a register that determines the source of isochronous error notification and indicates the frame number.

This register is initialized by a power-on reset.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	OVRN	CRCE	—	—	—	FRNM[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W*	R/W*	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15	OVRN	0	R/W*	<p>Overrun/Underrun Detection Status</p> <p>Indicates whether an overrun/underrun error has been detected in the pipe during isochronous transfer.</p> <p>0: No error 1: An error occurred</p> <p>This bit can be cleared to 0 by writing 0 to the bit. Here, 1 should be written to the other bits in this register.</p> <p>(1) When the host controller function is selected This module sets this bit to 1 on any of the following conditions.</p> <ul style="list-style-type: none"> For the isochronous transfer pipe in the transmitting direction, the time to issue an OUT token comes before all the transmit data has been written to the FIFO buffer. For the isochronous transfer pipe in the receiving direction, the time to issue an IN token comes when no FIFO buffer planes are empty. <p>(2) When the function controller function is selected This module sets this bit to 1 on any of the following conditions.</p> <ul style="list-style-type: none"> For the isochronous transfer pipe in the transmitting direction, the IN token is received before all the transmit data has been written to the FIFO buffer. For the isochronous transfer pipe in the receiving direction, the OUT token is received when no FIFO buffer planes are empty. <p>Note: This bit is provided for debugging. The system should be designed so that no overrun/underrun should occur.</p>

Bit	Bit Name	Initial Value	R/W	Description
14	CRCE	0	R/W*	<p>Receive Data Error</p> <p>Indicates whether a CRC error or bit stuffing error has been detected in the pipe during isochronous transfer. Simultaneously with error detection, the internal NRDY interrupt request is generated. For details, see section 27.4.2, Interrupt Functions.</p> <p>0: No error 1: An error occurred</p>
13 to 11	—	All 0	R	<p>Reserved</p> <p>These bits are always read as 0. The write value should always be 0.</p>
10 to 0	FRNM[10:0]	H'000	R	<p>Frame Number</p> <p>This module sets these bits to indicate the latest frame number, which is updated every time an SOF packet is issued or received (every 1 ms)</p> <p>Read these bits twice to check that the same value is read.</p>

Note: * Only 0 can be written

27.3.22 μ Frame Number Register (UFRMNUM)

UFRMNUM is a register that indicates the μ frame number.

This register is initialized by a power-on reset.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	—	—	UFRNM[2:0]		
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15 to 3	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
2 to 0	UFRNM[2:0]	000	R	μ Frame The μ frame number can be confirmed. This module sets these bits to indicate the μ frame number during high-speed operation. During operation other than high-speed operation, this module sets these bits to B'000. Read these bits twice to check that the same value is read.

27.3.23 USB Address Register (USBADDR)

USBADDR is a register that indicates the USB address. This register is valid only when the function controller function is selected. When the host controller function is selected, peripheral device addresses should be set using the DEVSEL bits in PIPEMAXP.

This register is initialized by a power-on reset or a USB bus reset.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	USBADDR[6:0]						
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15 to 7	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
6 to 0	USBADDR [6:0]	H'00	R	USB Address When the function controller function is selected, these bits indicate the USB address assigned by the host when the SET_ADDRESS request is successfully processed.

27.3.24 USB Request Type Register (USBREQ)

USBREQ is a register that stores setup requests for control transfers. When the function controller function is selected, the values of bRequest and bmRequestType that have been received are stored. When the host controller function is selected, the values of bRequest and bmRequestType to be transmitted are set.

This register is initialized by a power-on reset or a USB bus reset.

Bit	Bit Name	Initial Value	R/W	Description
15 to 8	BREQUEST [7:0]	H'00	R/W*	Request These bits store the USB request bRequest value. (1) When the host controller function is selected The USB request data value for the setup transaction to be transmitted should be set in these bits. After setting SUREQ to 1, do not modify these bits until 0 is read from SUREQ. (2) When the function controller function is selected Indicates the USB request data value received during the setup transaction. Writing to these bits is invalid.
7 to 0	BMREQUEST- TYPE[7:0]	H'00	R/W*	Request Type These bits store the USB request bmRequestType value. (1) When the host controller function is selected The USB request type value for the setup transaction to be transmitted should be set in these bits. After setting SUREQ to 1, do not modify these bits until 0 is read from SUREQ. (2) When the function controller function is selected Indicates the USB request type value received during the setup transaction. Writing to these bits is invalid.

Note: * When the function controller function is selected, these bits can only be read, and writing to these bits is invalid. When the host controller function is selected, these bits can be read and written to.

27.3.25 USB Request Value Register (USBVAL)

USBVAL is a register that stores setup requests for control transfers. When the function controller function is selected, the value of wValue that has been received is stored. When the host controller function is selected, the value of wValue to be transmitted is set.

This register is initialized by a power-on reset or a USB bus reset.

Bit	Bit Name	Initial Value	R/W	Description
15 to 0	WVALUE[15:0]	H'0000	R/W*	Value These bits store the USB request wValue value. (1) When the host controller function is selected The USB request wValue value for the setup transaction to be transmitted should be set in these bits. After setting SUREQ to 1, do not modify these bits until 0 is read from SUREQ. (2) When the function controller function is selected Indicates the USB request wValue value received during the setup transaction. Writing to these bits is invalid.

Note: * When the function controller function is selected, these bits can only be read, and writing to these bits is invalid. When the host controller function is selected, these bits can be read and written to.

27.3.26 USB Request Index Register (USBINDEX)

USBINDEX is a register that stores setup requests for control transfers. When the function controller function is selected, the value of wIndex that has been received is stored. When the host controller function is selected, the value of wIndex to be transmitted is set.

This register is initialized by a power-on reset or a USB bus reset.

Bit	Bit Name	Initial Value	R/W	Description
15 to 0	WINDEX[15:0]	H'0000	R/W*	Index These bits store the USB request wIndex value. (1) When the host controller function is selected The USB request wIndex value for the setup transaction to be transmitted should be set in these bits. After setting SUREQ to 1, do not modify these bits until 0 is read from SUREQ. (2) When the function controller function is selected Indicates the USB request wIndex value received during the setup transaction. Writing to these bits is invalid.

Note: * When the function controller function is selected, these bits can only be read, and writing to these bits is invalid. When the host controller function is selected, these bits can be read and written to.

27.3.27 USB Request Length Register (USBLENG)

USBLENG is a register that stores setup requests for control transfers. When the function controller function is selected, the value of wLength that has been received is stored. When the host controller function is selected, the value of wLength to be transmitted is set.

This register is initialized by a power-on reset or a USB bus reset.

Bit	Bit Name	Initial Value	R/W	Description
15 to 0	WLENGTH [15:0]	H'0000	R/W*	Length These bits store the USB request wLength value. (1) When the host controller function is selected The USB request wLength value for the setup transaction to be transmitted should be set in these bits. After setting SUREQ to 1, do not modify these bits until 0 is read from SUREQ. (2) When the function controller function is selected Indicates the USB request wLength value received during the setup transaction. Writing to these bits is invalid.

Note: * When the function controller function is selected, these bits can only be read, and writing to these bits is invalid. When the host controller function is selected, these bits can be read and written to.

27.3.28 DCP Configuration Register (DCPCFG)

DCPCFG is a register that specifies the data transfer direction for the default control pipe (DCP).

This register is initialized by a power-on reset.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	—	—	—	DIR	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	DIR	0	R/W	Transfer Direction When the host controller function is selected, this bit sets the transfer direction of data stage. 0: Data receiving direction 1: Data transmitting direction When the function controller function is selected, this bit should be cleared to 0.
3 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

27.3.29 DCP Maximum Packet Size Register (DCPMAXP)

DCPMAXP is a register that specifies the maximum packet size for the DCP.

This register is initialized by a power-on reset.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	DEVSEL[3:0]				—	—	—	—	—	MXPS[6:0]						
Initial value:	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R	R	R	R	R	R/W	R/W	R/W	R/W	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15 to 12	DEVSEL[3:0]	0000	R/W	<p>Device Select</p> <p>When the host controller function is selected, these bits specify the communication target peripheral device address.</p> <p>0000: Address 0000 0001: Address 0001 : : 1001: Address 1001 1010: Address 1010</p> <p>Other than above: Setting prohibited</p> <p>These bits should be set after setting the DEVADDn register corresponding to the value to be set in these bits.</p> <p>For example, before setting DEVSEL to 0010 the DEVADD2 register should be set.</p> <p>These bits should be set while CSSTS is 0, PID is NAK, and SUREQ is 0.</p> <p>Before modifying these bits after modifying the PID bits for the DCP from BUF to NAK, check that CSSTS and PBUSY are 0. However, if the PID bits have been modified to NAK by this module, checking PBUSY is not necessary.</p> <p>When the function controller function is selected, these bits should be set to B'0000.</p>

Bit	Bit Name	Initial Value	R/W	Description
11 to 7	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
6 to 0	MXPS[6:0]	H'40	R/W	Maximum Packet Size Specifies the maximum data payload (maximum packet size) for the DCP. These bits are initialized to H'40 (64 bytes). These bits should be set to the value based on the USB Specification. These bits should be set while CSSTS is 0 and PID is NAK. Before modifying these bits after modifying the PID bits for the DCP from BUF to NAK, check that CSSTS and PBUSY are 0. However, if the PID bits have been modified to NAK by this module, checking PBUSY is not necessary. While MXPS is 0, do not write to the FIFO buffer or do not set PID to BUF.

27.3.30 DCP Control Register (DCPCTR)

DCPCTR is a register that is used to confirm the buffer memory status, change and confirm the data PID sequence bit, and set the response PID for the DCP.

This register is initialized by a power-on reset. The CCPL and PID[1:0] bits are initialized by a USB bus reset.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	BSTS	SUREQ	CSCLR	CSSTS	SUREQ CLR	—	—	SQCLR	SQSET	SQMON	PBUSY	PINGE	—	CCPL	PID[1:0]

Bit	Bit Name	Initial Value	R/W	Description
6	SQMON	1	R	<p>Sequence Toggle Bit Monitor</p> <p>Indicates the expected value of the sequence toggle bit for the next transaction during the DCP transfer.</p> <p>0: DATA0 1: DATA1</p> <p>This module allows this bit to toggle upon normal completion of the transaction. However, this bit is not allowed to toggle when a DATA-PID disagreement occurs during the transfer in the receiving direction.</p> <p>When the function controller function is selected, this module sets this bit to 1 (specifies DATA1 as the expected value) upon normal reception of the setup packet.</p> <p>When the function controller function is selected, this module does not reference to this bit during the IN/OUT transaction of the status stage, and does not allow this bit to toggle upon normal completion.</p>
5	PBUSY	0	R	<p>Pipe Busy</p> <p>This bit indicates whether communication using the DCP has actually entered the NAK state.</p> <p>0: Transition to NAK has not yet been made. 1: Transition to NAK has been made.</p> <p>This module modifies this bit from 0 to 1 upon start of the USB transaction for the DCP, and modifies the bit from 1 to 0 upon completion of one transaction.</p> <p>Reading this bit after setting PID to NAK allows checking that modification of the pipe settings is possible.</p> <p>For details, refer to section 27.4.3 (1), Pipe Control Register Switching Procedures.</p>

Bit	Bit Name	Initial Value	R/W	Description
4	PINGE	0	R/W	<p>PING Token Issue Enable</p> <p>When the host controller function is selected, setting this bit to 1 allows this module to issue the PING token during transfers in the transmitting direction and start a transfer in the transmitting direction with the PING transaction.</p> <p>0: Disables issuing PING token. 1: Enables normal PING operation.</p> <p>When having detected the ACK handshake during PING transactions, this module performs the OUT transaction as the next transaction.</p> <p>When having detected the NAK handshake during OUT transactions, this module performs the PING transaction as the next transaction.</p> <p>When the host controller function is selected, setting this bit to 0 prevents this module from issuing the PING token during transfers in the transmitting direction and only allows this module to perform OUT transactions for the transfers in the transmitting direction.</p> <p>These bits should be modified while CSSTS is 0 and PID is NAK.</p> <p>Before setting this bit to 1 after modifying the PID bits for the DCP from BUF to NAK, check that CSSTS and PBUSY are 0. However, if the PID bits have been modified to NAK by this module, checking PBUSY is not necessary.</p> <p>When the function controller function is selected, be sure to write 0 to this bit.</p>
3	—	0	R	<p>Reserved</p> <p>This bit is always read as 0. The write value should always be 0.</p>

Bit	Bit Name	Initial Value	R/W	Description
2	CCPL	0	R/W* ¹	<p>Control Transfer End Enable</p> <p>When the function controller function is selected, setting this bit to 1 enables the status stage of the control transfer to be completed.</p> <p>0: Invalid</p> <p>1: Completion of control transfer is enabled.</p> <p>When this bit is set to 1 while the corresponding PID bits are set to BUF, this module completes the control transfer stage.</p> <p>Specifically, during control read transfer, this module transmits the ACK handshake in response to the OUT transaction from the USB host, and outputs the zero-length packet in response to the IN transaction from the USB host during control write or no-data control transfer. However, on detecting the SET_ADDRESS request, this module operates in auto response mode from the setup stage up to the status stage completion irrespective of the setting of this bit.</p> <p>This module modifies this bit from 1 to 0 on receiving the new setup packet.</p> <p>A 1 cannot be written to this bit while VALID is 1.</p> <p>When the host controller function is selected, be sure to write 0 to this bit.</p>

Bit	Bit Name	Initial Value	R/W	Description
1, 0	PID[1:0]	00	R/W	<p>Response PID</p> <p>Controls the response type of this module during control transfer.</p> <p>00: NAK response</p> <p>01: BUF response (depending on the buffer state)</p> <p>10: STALL response</p> <p>11: STALL response</p> <p>(1) When the host controller function is selected</p> <p>Modify the setting of these bits from NAK to BUF using the following procedure.</p> <ul style="list-style-type: none"> • When the transmitting direction is set <p>Write all the transmit data to the FIFO buffer while UACT is 1 and PID is NAK, and then set PID to BUF. After PID has been set to BUF, this module executes the OUT transaction (or PING transaction).</p> <ul style="list-style-type: none"> • When the receiving direction is set <p>Check that the FIFO buffer is empty (or empty the buffer) while UACT is 1 and PID is NAK, and then set PID to BUF. After PID has been set to BUF, this module executes the IN transaction.</p> <p>This module modifies the setting of these bits as follows.</p> <ul style="list-style-type: none"> • This module sets PID to STALL (11) on receiving the data of the size exceeding the maximum packet size when PID has been set to BUF. • This module sets PID to NAK on detecting a receive error such as a CRC error three consecutive times. • This module also sets PID to STALL (11) on receiving the STALL handshake.

Bit	Bit Name	Initial Value	R/W	Description
1, 0	PID[1:0]	00	R/W	<p>Even if the PID bits have been modified to NAK after this module has issued S-SPLIT of the split transaction for the selected pipe (while CSSTS indicates 1), this module continues the transaction until C-SPLIT completes. On completion of C-SPLIT, this module sets PID to NAK.</p> <p>(2) When the function controller function is selected This module modifies the setting of these bits as follows.</p> <ul style="list-style-type: none"> • This module modifies PID to NAK on receiving the setup packet. Here, this module sets VALID to 1. PID cannot be modified until VALID is set to 0. • This module sets PID to STALL (11) on receiving the data of the size exceeding the maximum packet size when PID has been set to BUF. • This module sets PID to STALL (1x) on detecting the control transfer sequence error. • This module sets PID to NAK on detecting the USB bus reset. <p>This module does not reference to the setting of the PID bits while the SET_ADDRESS request is processed (auto processing).</p>

Notes: 1. This bit is always read as 0. Only 1 can be written.
2. Only 1 can be written.

27.3.31 Pipe Window Select Register (PIPESEL)

PIPE1 to PIPE 9 should be set using PIPESEL, PIPECFG, PIPEBUF, PIPEMAXP, PIPEPERI, PIPEnCTR, PIPEnTRE, and PIPEnTRN. After selecting the pipe using PIPESEL, functions of the pipe should be set using PIPECFG, PIPEBUF, PIPEMAXP, and PIPEPERI. PIPEnCTR, PIPEnTRE, and PIPEnTRN can be set regardless of the pipe selection in PIPESEL.

This register is initialized by a power-on reset.

Here, writing to these registers are invalid.

27.3.32 Pipe Configuration Register (PIPECFG)

PIPECFG is a register that specifies the transfer type, buffer memory access direction, and endpoint numbers for PIPE1 to PIPE9. It also selects continuous or non-continuous transfer mode, single or double buffer mode, and whether to continue or disable pipe operation at the end of transfer.

This register is initialized by a power-on reset.

Bit	Bit Name	Initial Value	R/W	Description
15 to 12	DEVSEL[3:0]	0000	R/W	<p>Device Select</p> <p>When the host controller function is selected, these bits specify the USB address of the communication target peripheral device.</p> <p>0000: Address 0000 0001: Address 0001 0010: Address 0010 : : 1010: Address 1010</p> <p>Other than above: Setting prohibited</p> <p>These bits should be set after setting the address to the DEVADDn register corresponding to the value to be set in these bits.</p> <p>For example, before setting DEVSEL to 0010, the address should be set to the DEVADD2 register.</p> <p>Before modifying these bits after modifying the PID bits for the selected pipe from BUF to NAK, check that CSSTS and PBUSY are 0. However, if the PID bits have been modified to NAK by this module, checking PBUSY is not necessary.</p> <p>When the function controller function is selected, these bits should be set to B'0000.</p>
11	—	0	R	<p>Reserved</p> <p>This bit is always read as 0. The write value should always be 0.</p>

Bit	Bit Name	Initial Value	R/W	Description
10 to 0	MXPS[10:0]	*	R/W	<p>Maximum Packet Size</p> <p>Specifies the maximum data payload (maximum packet size) for the selected pipe. The valid value for these bits depends on the pipe as follows.</p> <p>PIPE1, PIPE2: 1 byte (H'001) to 1,024 bytes (H'400)</p> <p>PIPE3 to PIPE5: 8 bytes (H'008), 16 bytes (H'010), 32 bytes (H'020), 64 bytes (H'040), and 512 bytes (H'200) (Bits 2 to 0 are not provided.)</p> <p>PIPE6 to PIPE9: 1 byte (H'001) to 64 bytes (H'040)</p> <p>These bits should be set to the appropriate value for each transfer type based on the USB Specification.</p> <p>For split transactions using the isochronous pipe, these bits should be set to 188 bytes or less.</p> <p>Before modifying these bits after modifying the PID bits for the selected pipe from BUF to NAK, check that CSSTS and PBUSY are 0. However, if the PID bits have been modified to NAK by this module, checking PBUSY is not necessary.</p> <p>While MXPS is 0, do not write to the FIFO buffer or set PID to BUF.</p>

Note: * The initial value of MXPS is H'000 when no pipe is selected with the PIPESEL bits in PIPESEL and H'040 when a pipe is selected with the PIPESEL bit in PIPESEL.

27.3.35 Pipe Timing Control Register (PIPEPERI)

PIPEPERI is a register that selects whether the buffer is flushed or not when an interval error occurred during isochronous IN transfer, and sets the interval error detection interval for PIPE1 to PIPE9.

This register is initialized by a power-on reset.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	IFIS	—	—	—	—	—	—	—	—	—	IITV[2:0]		
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
12	IFIS	0	R/W	<p>Isochronous IN Buffer Flush</p> <p>Specifies whether to flush the buffer when the pipe selected by the PIPESEL bits (selected pipe) is used for isochronous IN transfers.</p> <p>0: The buffer is not flushed. 1: The buffer is flushed.</p> <p>When the function controller function is selected and the selected pipe is for isochronous IN transfers, this module automatically clears the FIFO buffer when this module fails to receive the IN token from the USB host within the interval set by the IITV bits in terms of (μ) frames.</p> <p>In double buffer mode (DBLB = 1), this module only clears the data in the plane used earlier.</p> <p>This module clears the FIFO buffer on receiving the SOF packet immediately after the (μ) frame in which this module has expected to receive the IN token. Even if the SOF packet is corrupted, this module also clears the FIFO buffer at the right timing to receive the SOF packet by using the internal interpolation.</p> <p>When the host controller function is selected, set this bit to 0.</p> <p>When the selected pipe is not for the isochronous transfer, set this bit to 0.</p>

Bit	Bit Name	Initial Value	R/W	Description
11 to 3	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
2 to 0	IITV[2:0]	000	R/W	Interval Error Detection Interval Specifies the interval error detection timing for the selected pipe in terms of frames, which is expressed as n-th power of 2 (n is the value to be set). As described later, the detailed functions are different in host controller mode and in function controller mode. Modify these bits while CSSTS is 0 and PID is NAK and before the pipe is selected by the CURPIPE bits. Before modifying these bits after modifying the PID bits for the selected pipe from BUF to NAK, check that CSSTS and PBUSY are 0. However, if the PID bits have been modified to NAK by this module, checking PBUSY is not necessary. Before modifying these bits after USB communication has been completed with these bits set to a certain value, set PID to NAK and then set ACLRM to 1 to initialize the interval timer. The IITV bits are invalid for PIPE3 to PIPE5; set these bits to 000 for these pipes.

27.3.36 PIPE_n Control Registers (PIPE_nCTR) (n = 1 to 9)

PIPE_nCTR is a register that is used to confirm the buffer memory status for the corresponding pipe, change and confirm the data PID sequence bit, determine whether auto response mode is set, determine whether auto buffer clear mode is set, and set a response PID for PIPE1 to PIPE9. This register can be set regardless of the pipe selection in PIPESEL.

This register is initialized by a power-on reset. PID[1:0] are initialized by a USB bus reset.

(1) PIPE_nCTR (n = 1 to 5)

2. Only 1 can be written.

Table 27.10 Meaning of BSTS Bit

DIR Bit	BFRE Bit	DCLRM Bit	Meaning of BSTS Bit
0	0	0	1: The received data can be read from the FIFO buffer. 0: The received data has been completely read from the FIFO buffer.
		1	Setting prohibited
	1	0	1: The received data can be read from the FIFO buffer. 0: BCLR has been set to 1 after the received data has been completely read from the FIFO buffer.
		1	1: The received data can be read from the FIFO buffer. 0: The received data has been completely read from the FIFO buffer.
1	0	0	1: The transmit data can be written to the FIFO buffer. 0: The transmit data has been completely written to the FIFO buffer.
		1	Setting prohibited
	1	0	Setting prohibited
		1	Setting prohibited

Table 27.11 Information Cleared by this Module by Setting ACLRM = 1

No.	Information Cleared by ACLRM Bit Manipulation	Cases in which Clearing the Information is Necessary
1	All the information in the FIFO buffer assigned to the pertinent pipe (all the information in two FIFO buffer planes in double buffer mode)	
2	The interval count value when the pertinent pipe is for isochronous transfer	When the interval count value is to be reset
3	Values of the internal flags related to the BFRE bit	When the BFRE setting is modified
4	FIFO buffer toggle control	When the DBLB setting is modified
5	Values of the internal flags related to the transaction count	When the transaction count function is forcibly terminated

Table 27.12 Operation of This Module depending on PID Setting (when Host Controller Function is Selected)

PID	Transfer Type	Transfer Direction (DIR Bit)	Operation of This Module
00 (NAK)	Operation does not depend on the setting.	Operation does not depend on the setting.	Does not issue tokens.
01 (BUF)	Bulk or interrupt	Operation does not depend on the setting.	Issues tokens while UACT is 1 and the FIFO buffer corresponding to the pertinent pipe is ready for transmission and reception. Does not issue tokens while UACT is 0 or the FIFO buffer corresponding to the pertinent pipe is not ready for transmission or reception.
	Isochronous	Operation does not depend on the setting.	Issues tokens irrespective of the status of the FIFO buffer corresponding to the pertinent pipe.
10 (STALL) or 11 (STALL)	Operation does not depend on the setting.	Operation does not depend on the setting.	Does not issue tokens.

Table 27.13 Operation of This Module depending on PID Setting (when Function Controller Function is Selected)

PID	Transfer Type	Transfer Direction (DIR Bit)	Operation of This Module
00 (NAK)	Bulk or interrupt	Operation does not depend on the setting.	Returns NAK in response to the token from the USB host. For the operation when ATREPM is 1, refer to the description of the ATREPM bit.
	Isochronous	Operation does not depend on the setting.	Returns nothing in response to the token from the USB host.
01 (BUF)	Bulk	Receiving direction (DIR = 0)	Receives data and returns ACK in response to the OUT token from the USB host if the FIFO buffer corresponding to the pertinent pipe is ready for reception. Returns NAK if not ready. Returns ACK in response to the PING token from the USB host if the FIFO buffer corresponding to the pertinent pipe is ready for reception. Returns NYET if not ready.
		Interrupt	Receiving direction (DIR = 0)
	Bulk or interrupt	Transmitting direction (DIR = 1)	Transmits data in response to the token from the USB host if the corresponding FIFO buffer is ready for transmission. Returns NAK if not ready.
	Isochronous	Receiving direction (DIR = 0)	Receives data in response to the OUT token from the USB host if the FIFO buffer corresponding to the pertinent pipe is ready for reception. Discards data if not ready.

PID	Transfer Type	Transfer Direction (DIR Bit)	Operation of This Module
01 (BUF)	Isochronous	Transmitting direction (DIR = 1)	Transmits data in response to the token from the USB host if the corresponding FIFO buffer is ready for transmission. Transmits the zero-length packet if not ready.
10 (STALL) or 11 (STALL)	Bulk or interrupt	Operation does not depend on the setting.	Returns STALL in response to the token from the USB host.
	Isochronous	Operation does not depend on the setting.	Returns nothing in response to the token from the USB host.

Notes: 1. Only 0 can be read and 1 can be written.
2. Only 1 can be written.

Table 27.14 Information Cleared by this Module by Setting ACLRM = 1

No.	Information Cleared by ACLRM Bit Manipulation	Cases in which Clearing the Information is Necessary
1	All the information in the FIFO buffer assigned to the pertinent pipe	
2	When the host controller function is selected, the interval count value when the pertinent pipe is for isochronous transfer	When the interval count value is to be reset
3	Values of the internal flags related to the BFRE bit	When the BFRE setting is modified
4	Values of the internal flags related to the transaction count	When the transaction count function is forcibly terminated

27.3.37 PIPE_n Transaction Counter Enable Registers (PIPE_nTRE) (n = 1 to 5)

PIPE_nTRE is a register that enables or disables the transaction counter corresponding to PIPE1 to PIPE5, and clears the transaction counter.

This register is initialized by a power-on reset.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	TRENB	TRCLR	—	—	—	—	—	—	—	—

Bit	Bit Name	Initial Value	R/W	Description
9	TRENB	0	R/W	<p>Transaction Counter Enable</p> <p>Enables or disables the transaction counter.</p> <p>0: The transaction counter is disabled.</p> <p>1: The transaction counter is enabled.</p> <p>For the pipe in the receiving direction, setting this bit to 1 after setting the total number of the packets to be received in the TRNCNT bits allows this module to control hardware as described below on having received the number of packets equal to the set value in the TRNCNT bits.</p> <ul style="list-style-type: none"> • In continuous transmission/reception mode (CNTMD = 1), this module switches the FIFO buffer to the CPU side even if the FIFO buffer is not full on completion of reception. • While SHTNAK is 1, this module modifies the PID bits to NAK for the corresponding pipe on having received the number of packets equal to the set value in the TRNCNT bits. • While BFRE is 1, this module asserts the BRDY interrupt on having received the number of packets equal to the set value in the TRNCNT bits and then reading out the last received data. <p>For the pipe in the transmitting direction, set this bit to 0.</p> <p>When the transaction counter is not used, set this bit to 0.</p> <p>When the transaction counter is used, set the TRNCNT bits before setting this bit to 1. Set this bit to 1 before receiving the first packet to be counted by the transaction counter.</p>
8	TRCLR	0	R/W* ¹	<p>Transaction Counter Clear</p> <p>Clears the current value of the transaction counter corresponding to the pertinent pipe and then sets this bit to 0.</p> <p>0: Invalid</p> <p>1: The current counter value is cleared.</p>

Bit	Bit Name	Initial Value	R/W	Description
7 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

- Notes:
1. Only 0 can be read and 1 can be written.
 2. Modify each bit in this register while CSSTS is 0 and PID is NAK. Before modifying each bit after modifying the PID bits for the corresponding pipe from BUF to NAK, check that CSSTS and PBUSY are 0. However, if the PID bits have been modified to NAK by this module, checking PBUSY is not necessary.

27.3.38 PIPE_n Transaction Counter Registers (PIPE_nTRN) (n = 1 to 5)

PIPE_nTRN is a transaction counter corresponding to PIPE1 to PIPE5.

This register is initialized by a power-on reset, but retains the set value by a USB bus reset.

Bit	Bit Name	Initial Value	R/W	Description
15 to 0	TRNCNT[15:0]	All 0	R/W	Transaction Counter When written to: Specifies the number of transactions to be transferred through DMA. When read from: Indicates the specified number of transactions if TREN _B is 0. Indicates the number of currently counted transaction if TREN _B is 1.

Bit	Bit Name	Initial Value	R/W	Description
15 to 0	TRNCNT[15:0]	All 0	R/W	<p>This module increments the value of these bits by one when all of the following conditions are satisfied on receiving the packet.</p> <ul style="list-style-type: none"> TRENB is 1. (TRNCNT set value \neq current counter value + 1) on receiving the packet. The payload of the received packet agrees with the set value in the MXPS bits. <p>This module clears the value of these bits to 0 when any of the following conditions are satisfied.</p> <ul style="list-style-type: none"> All the following conditions are satisfied. <ul style="list-style-type: none"> TRENB is 1. (TRNCNT set value = current counter value + 1) on receiving the packet. The payload of the received packet agrees with the set value in the MXPS bits. All the following conditions are satisfied. <ul style="list-style-type: none"> TRENB is 1. This module has received a short packet. All the following conditions are satisfied. <ul style="list-style-type: none"> TRENB is 1. The TRCLR bit has been set to 1. <p>For the pipe in the transmitting direction, set these bits to 0.</p> <p>When the transaction counter is not used, set these bits to 0.</p> <p>Modify these bits while CSSTS is 0, PID is NAK, and TRENB is 0.</p> <p>Before modifying these bits after modifying the PID bits for the corresponding pipe from BUF to NAK, check that CSSTS and PBUSY are 0. However, if the PID bits have been modified to NAK by this module, checking PBUSY is not necessary.</p> <p>To modify the value of these bits, set TRNCNT to 1 before setting TRENB to 1.</p>

27.3.39 Device Address n Configuration Registers (DEVADDn) (n = 0 to A)

DEVADDn is a register that specifies the address and port number of the hub to which the communication target peripheral device is connected and that also specifies the transfer speed of the peripheral device for PIPE0 to PIPEA.

When the host controller function is selected, this register should be set before starting communication using each pipe.

The bits in this register should be modified while no valid pipes are using the settings of this register. Valid pipes refer to the ones satisfying both of condition 1 and 2 below.

1. This register is selected by the DEVSEL bits as the communication target.
2. The PID bits are set to BUF for the selected pipe or the selected pipe is the DCP with SUREQ being 1.

This register is initialized by a power-on reset.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	UPPHUB[3:0]				HUBPORT[2:0]			USBSPD[1:0]		—	—	—	—	—	—

Bit	Bit Name	Initial Value	R/W	Description
7, 6	USBSPD[1:0]	00	R/W	<p>Transfer Speed of the Communication Target Device</p> <p>Specifies the USB transfer speed of the communication target peripheral device.</p> <p>00: DEVADDn is not used.</p> <p>01: Low speed</p> <p>10: Full speed</p> <p>11: High speed</p> <p>When the host controller function is selected, this module refers to the setting of these bits to generate packets.</p> <p>When the function controller function is selected, set these bits to 00.</p>
5 to 0	—	All 0	R	<p>Reserved</p> <p>These bits are always read as 0. The write value should always be 0.</p>

27.3.40 USB AC Characteristics Switching Register 1 (USBACSWR1)

USBACSWR1 is a register used to set up the internal USB transceiver of this module. This register is initialized by a power-on reset.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	—	—	UAC23	—	—	—	—	—	—	—
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15 to 8	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
7	UAC23	0	R/W	USB AC Characteristics Switch 23 Adjusts the eye pattern for high-speed operation.*
6 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Note: If you intend to use this module for high-speed transfer, be sure to set this bit to 1. For details, see section 27.5.1, Setting up the USB Transceiver.

27.4 Operation

27.4.1 System Control and Oscillation Control

This section describes the register operations that are necessary to the initial settings of this module, and the registers necessary for power consumption control.

(1) Resets

Table 27.15 lists the types of controller resets. For the initialized states of the registers following the reset operations, see section 27.3, Register Description.

Table 27.15 Types of Reset

Name	Operation
Power-on reset	Low level input from the $\overline{\text{RES}}$ pin
USB bus reset	Automatically detected by this module from the D+ and D- lines when the function controller function is selected

(2) Controller Function Selection

This module can select the host controller function or function controller function using the DCFM bit in SYSCFG. Changing the DCFM bit should be done in the initial settings immediately after a power-on reset or in the D+ pull-up disabled (DPRPU = 0) and D+ /D- pull-down disabled (DRPD = 0) state.

(3) Enabling High-Speed Operation

This module can select a USB communication speed (communication bit rate). When the host controller function is selected, the high-speed operation or full-speed/low-speed operation can be set. When the function controller function is selected, either the high-speed operation or full-speed operation can be selected. In order to enable the high-speed operation for this module, the HSE bit in SYSCFG should be set to 1. If high-speed mode has been enabled, this module executes the reset handshake protocol, and the USB communication speed is set automatically. The results of the reset handshake can be confirmed using the RHST bit in DVSTCTR.

If high-speed operation has been disabled, this module operates at full-speed or low-speed. If the function controller function is also selected, this module operates at full-speed.

Changing the HSE bit should be done between the ATTCH interrupt detection and bus reset execution when the host controller function is selected, or with the D+ line pull-up disabled (DPRPU = 0) when the host controller function is selected.

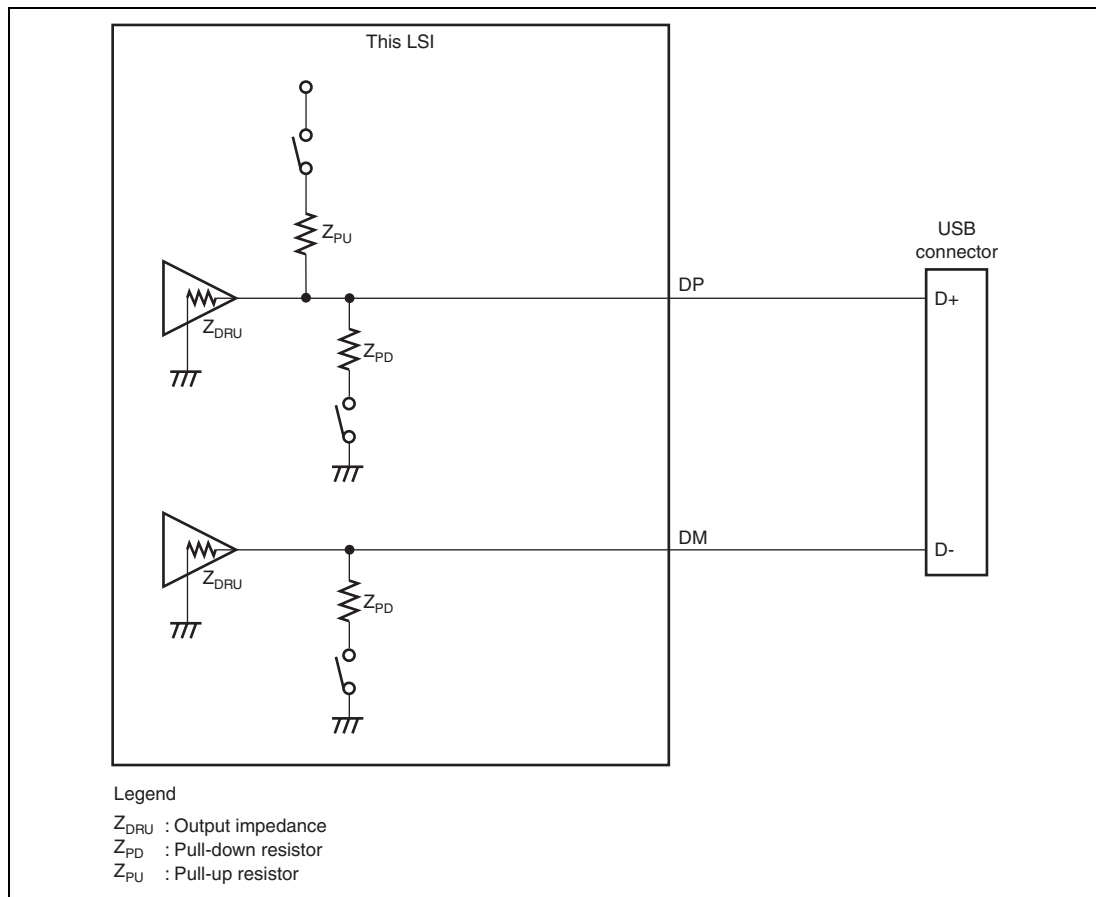

(4) USB Data Bus Resistor Control

Figure 27.1 shows a diagram of the connections between this module and the USB connectors.

This module incorporates a pull-up resistor for the D+ signal and a pull-down resistor for the D+ and D- signals. These signals can be pulled up or down using the DPRPU and DRPD bits in SYSCFG.

This module controls the terminal resistor for the D+ and D- signals during high-speed operation and the output resistor for the signals during full-speed operation. This module automatically switches the resistor after connection with the host controller or peripheral device by means of reset handshake, suspended state and resume detection.

When the function controller function is selected and the DPRPU bit in SYSCFG is cleared to 0 during communication with the host controller, the pull-up resistor (or the terminal resistor) of the USB data line is disabled, making it possible to notify the USB host of the device disconnection.

**Figure 27.1 UBS Connector Connection**

(5) Register Access Wait Control

There is a restriction on the cycle time for accessing the registers of this module except for SYSSTS as given below.

Wait-related restriction: The cycle time for successive accessing the registers of this module must 80 ns or more. To fulfill the above restriction, a register access wait control is necessary using the BWAIT[3:0] bits in BUSWAIT. The initial value is the maximum value (access cycles = 17 clock cycles). The optimum value should be found and set.

Setting example 1: When successively accessing the registers of this module

Bus clock frequency: 72 MHz

Calculation: (2 cycles (access cycles for the registers of this module) + 1 cycle (interval between successive accesses) + BWAIT) \times 1/72 MHz \geq 80 ns

BWAIT = 3

Setting example 2: When sending data from the on-chip high-speed RAM to the FIFO port register through DMA transfer

Bus clock frequency: 72 MHz

Calculation: (2 cycles (access cycles for the registers of this module) + 2 cycles (access cycles for the on-chip high-speed RAM) + BWAIT) \times 1/72 MHz \geq 80 ns

BWAIT = 2

(6) Input Clock Selection

The UCKSEL bit in SYSCFG can be used to select the input clock signal from USB_X1 or EXTAL for this module. Stop supply of the clock signal to the USB module (SCKE = 0) when the UCKSEL bit is to be modified.

(7) Settings for Clock Supply to the USB Module

The method of setting to select the clock signal for supply to the USB module depends on the input clock.

(a) Selecting the 48-MHz signal from USB_X1

Select the input signal from USB_X1 as the clock signal by setting the UCKSEL bit in SYSCFG to 0, then set the SCKE bit to enable supply of the clock signal.

(b) Selecting the 12-MHz signal from EXTAL

Select the input signal from EXTAL as the clock signal by setting the UCKSEL bit in SYSCFG to 1, then make settings for supply of the clock signal according to the following procedure.

Setting example 1: When supply of the clock signal is enabled in the initial settings immediately after a power-on reset.

1. Set the UPLLE bit to 1.
2. Wait for 1 ms.
3. Set the SCKE bit to 1.

Setting example 2: When supply of the clock signal is stopped in the suspended state.

1. Set the SCKE bit to 0.
2. Set the UPLLE bit to 0.

Setting example 3: When supplying the clock signal is enabled through recovery from the suspended state

1. Set the UPLLE bit to 1.
2. Wait for 1 ms.
3. Set the SCKE bit to 1.

Note: If a USB reset is used for recovery from the suspended state when operation as a function controller and high-speed transfer is selected, set the SCKE bit to 1 in no more than 2.5 ms.

27.4.2 Interrupt Functions

Table 27.16 lists the interrupt generation conditions for this module.

When an interrupt generation condition is satisfied and the interrupt output is enabled using the corresponding interrupt enable register, this module issues a USB interrupt request to the interrupt controller.

Table 27.16 Interrupt Generation Conditions

Bit	Interrupt Name	Cause of Interrupt	Function That Generates the Interrupt	Related Status
VBINT	VBUS interrupt	When a change in the state of the VBUS input pin has been detected (low to high or high to low)	Host, function	VBSTS
RESM	Resume interrupt	When a change in the state of the USB bus has been detected in the suspended state (J-state to K-state or J-state to SE0)	Function	—
SOFR	Frame number update interrupt	When the host controller function is selected: <ul style="list-style-type: none"> When an SOF packet with a different frame number has been transmitted When the function controller function is selected: <ul style="list-style-type: none"> When an SOF packet with a different frame number is received 	Host, function	—

EOFERR	EOF error detection	When EOF error of a peripheral device is detected	Host	—
SACK	Normal setup operation	When the normal response (ACK) for the setup transaction is received	Host	—
SIGN	Setup error	When a setup transaction error (no response or ACK packet corruption) is detected three consecutive times.	Host	—

Figure 27.2 shows a diagram relating to interrupts of this module.

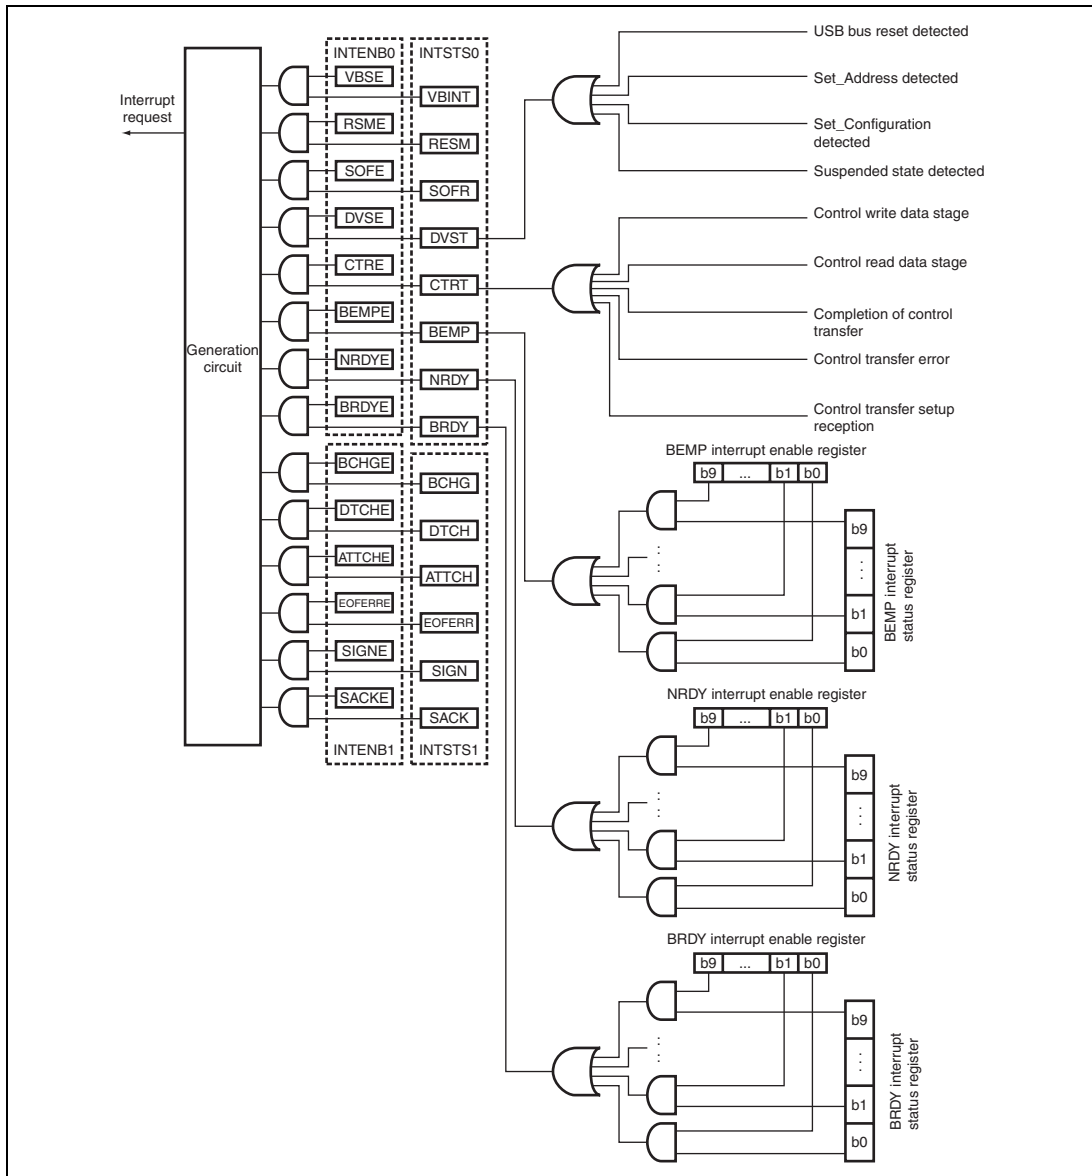

Figure 27.2 Items Relating to Interrupts

(1) BRDY Interrupt

The BRDY interrupt is generated when either of the host controller function or function controller function is selected. The following shows the conditions under which this module sets 1 to a corresponding bit in BRDYSTS. Under this condition, this module generates BRDY interrupt, if the PIPEBRDYE bit in BRDYENB that corresponds to the pipe to 1 and the BRDYE bit in INTENB0 have been set to 1.

The conditions for generating and clearing the BRDY interrupt depend on the settings of the BRDYM bit and BFRE bit for the pertinent pipe as described below.

(a) When the BRDYM bit is 0 and BFRE bit is 0

With these settings, the BRDY interrupt indicates that the FIFO port is accessible.

On any of the following conditions, this module generates the internal BRDY interrupt request trigger and sets 1 to the PIPEBRDY bit corresponding to the pertinent pipe.

- (i) For the pipe in the transmitting direction:
 - When the DIR bit is changed from 0 to 1.
 - When packet transmission is completed using the pertinent pipe when write-access from the CPU to the FIFO buffer for the pertinent pipe is disabled (when the BSTS bit is read as 0).

In continuous transmission/reception mode, the request trigger is generated on completion of transmitting data of one plane of the FIFO buffer.
 - When one FIFO buffer is empty on completion of writing data to the other FIFO buffer in double buffer mode.

The request trigger is not generated until completion of writing data to the currently-written FIFO buffer plane even if transmission to the other FIFO buffer is completed.
 - When the hardware flushes the buffer of the pipe for isochronous transfers.
 - When 1 is written to the ACLRM bit, which causes the FIFO buffer to make transition from the write-disabled to write-enabled state.

The request trigger is not generated for the DCP (that is, during data transmission for control transfers).

(ii) For the pipe in the receiving direction:

- When packet reception is completed successfully thus enabling the FIFO buffer to be read when read-access from the CPU to the FIFO buffer for the pertinent pipe is disabled (when the BSTS bit is read as 0).

The request trigger is not generated for the transaction in which DATA-PID disagreement occurs.

In continuous transmission/reception mode, the request trigger is not generated when the data is of the specified maximum packet size and the buffer has available space.

When a short packet is received, the request trigger is generated even if the FIFO buffer has available space.

When the transaction counter is used, the request trigger is generated on receiving the specified number of packets. In this case, the request trigger is generated even if the FIFO buffer has available space.

- When one FIFO buffer is read-enabled on completion of reading data from the other FIFO buffer in double buffer mode.

The request trigger is not generated until completion of reading data from the currently-read FIFO buffer plane even if reception by the other FIFO buffer is completed.

When the function controller function is selected, the BRDY interrupt is not generated in the status stage of control transfers.

The PIPEBRDY interrupt status of the pertinent pipe can be cleared to 0 by writing 0 to the corresponding PIPEBRDY interrupt status bit in the BRDYSTS register. In this case, 1s should be written to the PIPEBRDY interrupt status bits for the other pipes.

Be sure to clear the BRDY status before accessing the FIFO buffer.

(b) When the BRDYM bit is 0 and the BFRE bit is 1

With these settings, this module generates the BRDY interrupt on completion of reading all the data for a single transfer using the pipe in the receiving direction, and sets 1 to the PIPEBRDY bit corresponding to the pertinent pipe.

On any of the following conditions, this module determines that the last data for a single transfer has been received.

- When a short packet including a zero-length packet is received.
- When the transaction counter register (TRNCNT bits) is used and the number of packets specified by the TRNCNT bits are completely received.

When the pertinent data is completely read out after any of the above determination conditions has been satisfied, this module determines that all the data for a single transfer has been completely read out.

When a zero-length packet is received when the FIFO buffer is empty, this module determines that all the data for a single transfer has been completely read out upon passing the zero-length packet data to the CPU. In this case, to start the next transfer, write 1 to the BCLR bit in the corresponding FIFOCTR register.

With these settings, this module does not detect the BRDY interrupt for the pipe in the transmitting direction.

The PIPEBRDY interrupt status of the pertinent pipe can be cleared to 0 by writing 0 to the corresponding PIPEBRDY interrupt status bit. In this case, 1s should be written to the PIPEBRDY interrupt status bits for the other pipes.

In this mode, the BFRE bit setting should not be modified until all the data for a single transfer has been processed. When it is necessary to modify the BFRE bit before completion of processing, all the FIFO buffers for the pertinent pipe should be cleared using the ACLRM bit.

(c) When the BRDYM bit is 1 and the BFRE bit is 0

With these settings, the PIPEBRDY values are linked to the BSTS bit settings for each pipe. In other words, the BRDY interrupt status bits (PIPEBRDY) are set to 1 or 0 by this module depending on the FIFO buffer status.

(i) For the pipe in the transmitting direction:

The BRDY interrupt status bits are set to 1 when the FIFO buffer is write-enabled and are set to 0 when write-disabled.

However, the BRDY interrupt is not generated if the DCP in the transmitting direction is write-enabled.

(ii) For the pipe in the receiving direction:

The BRDY interrupt status bits are set to 1 when the FIFO buffer is read-enabled and are set to 0 when all the data have been read (read-disabled).

When a zero-length packet is received when the FIFO buffer is empty, the pertinent bit is set to 1 and the BRDY interrupt is continuously generated until BCLR = 1 is written. With this setting, the PIPEBRDY bit cannot be cleared to 0. When BRDYM is set to 1, all of the BFRE bits (for all pipes) should be cleared to 0.

Figure 27.3 shows the timing at which the BRDY interrupt is generated.

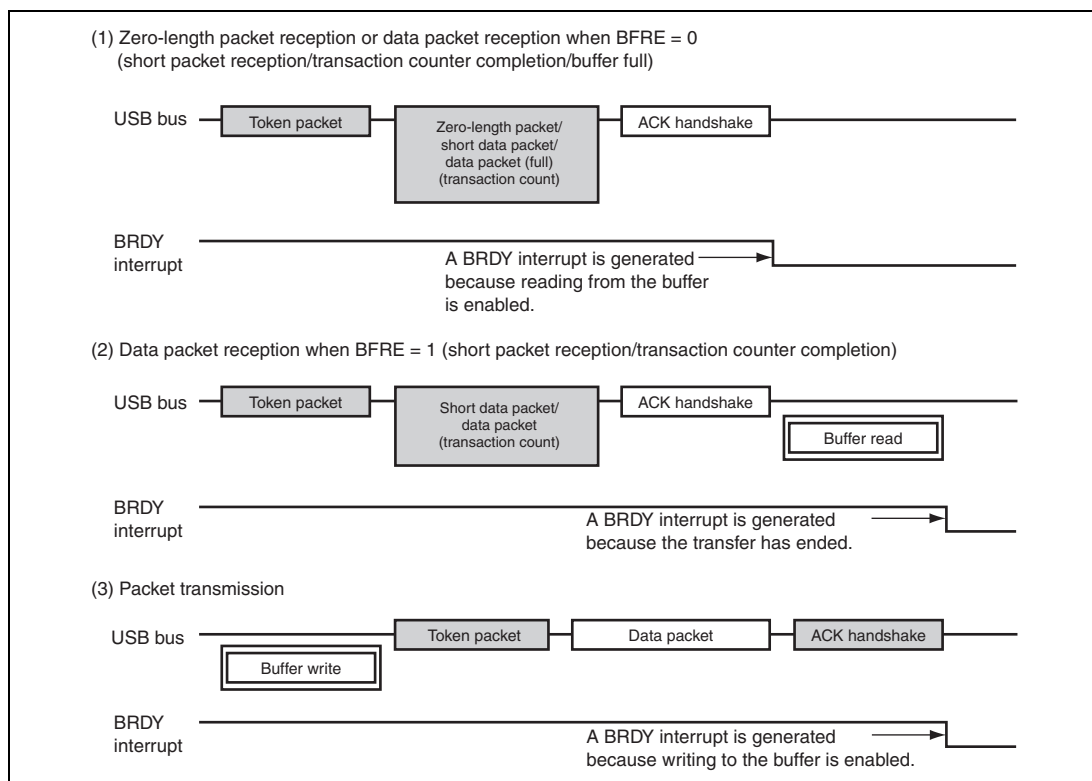

Figure 27.3 Timing at which a BRDY Interrupt is Generated

(2) NRDY Interrupt

On generating the internal NRDY interrupt request for the pipe whose PID bits are set to BUF, this module sets the corresponding PIPENRDY bit in NRDYSTS to 1. If the corresponding bit in NRDYENB is set to 1, this module sets the NRDY bit in INTSTS0 to 1, allowing the USB interrupt to be generated.

The following describes the conditions on which this module generates the internal NRDY interrupt request for a given pipe.

However, the internal NRDY interrupt request is not generated during setup transaction execution when the host controller function is selected. During setup transactions when the host controller function is selected, the SACK or SIGN interrupt is detected.

The internal NRDY interrupt request is not generated during status stage execution of the control transfer when the function controller function is selected.

(a) When the host controller function is selected and when the connection is used in which no split transactions occur

- (i) For the pipe in the transmitting direction:

On any of the following conditions, this module detects the NRDY interrupt.

- For the pipe for isochronous transfers, when the time to issue an OUT token comes in a state in which there is no data to be transmitted in the FIFO buffer.
In this case, this module transmits a zero-length packet following the OUT token, setting the corresponding PIPENRDY bit and the OVRN bit to 1.
- During communications other than setup transactions using the pipe for the transfers other than isochronous transfers, when any combination of the following two cases occur three consecutive times: 1) no response is returned from the peripheral device (when timeout is detected before detection of the handshake packet from the peripheral device) and 2) an error is detected in the packet from the peripheral device.
In this case, this module sets the corresponding PIPENRDY bit to 1 and modifies the setting of the PID bits of the corresponding pipe to NAK.
- During communications other than setup transactions, when the STALL handshake is received from the peripheral device (including the STALL handshake in response to PING in addition to the STALL handshake in response to OUT).
In this case, this module sets the corresponding PIPENRDY bit to 1 and modifies the setting of the PID bits of the corresponding pipe to STALL (11).

- (ii) For the pipe in the receiving direction
- For the pipe for isochronous transfers, when the time to issue an IN token comes in a state in which there is no space available in the FIFO buffer.
In this case, this module discards the received data for the IN token, setting the PIPENRDY bit of the corresponding pipe and the OVRN bit to 1.
When a packet error is detected in the received data for the IN token, this module also sets the CRCE bit to 1.
 - For the pipe for the transfers other than isochronous transfers, when any combination of the following two cases occur three consecutive times: 1) no response is returned from the peripheral device for the IN token issued by this module (when timeout is detected before detection of the DATA packet from the peripheral device) and 2) an error is detected in the packet from the peripheral device.
In this case, this module sets the corresponding PIPENRDY bit to 1 and modifies the setting of the PID bits of the corresponding pipe to NAK.
 - For the pipe for isochronous transfers, when no response is returned from the peripheral device for the IN token (when timeout is detected before detection of the DATA packet from the peripheral device) or an error is detected in the packet from the peripheral device.
In this case, this module sets the corresponding PIPENRDY bit to 1. (The setting of the PID bits of the corresponding pipe to NAK is not modified.)
 - For the pipe for isochronous transfers, when a CRC error or a bit stuffing error is detected in the received data packet.
In this case, this module sets the corresponding PIPENRDY bit and CRCE bit to 1.
 - When the STALL handshake is received.
In this case, this module sets the corresponding PIPENRDY bit to 1 and modifies the setting of the PID bits of the corresponding pipe to STALL.

(b) When the host controller function is selected and when the connection is used in which split transactions occur

(i) For the pipe in the transmitting direction:

- For the pipe for isochronous transfers, when the time to issue an OUT token comes in a state in which there is no data to be transmitted in the FIFO buffer.
In this case, this module transmits a zero-length packet following the OUT token, setting the corresponding PIPENRDY bit and the OVRN bit to 1 at the issuance of the start-split transaction (S-SPLIT).
- For the pipe for the transfers other than isochronous transfers, when any combination of the following two cases occur three consecutive times: 1) no response is returned from the HUB for the S-SPLIT or complete-split transaction (C-SPLIT) (when timeout is detected before detection of the handshake packet from the HUB) and 2) an error is detected in the packet from the HUB.
In this case, this module sets the PIPENRDY bit of the corresponding pipe to 1 and modifies the setting of the PID bits of the corresponding pipe to NAK.
If the NRDY interrupt is detected when the C-SPLIT is issued, this module clears the CSSTS bit to 0.
- When the STALL handshake is received in response to the C-SPLIT.
In this case, this module sets the corresponding PIPENRDY bit to 1, modifies the setting of the PID bits of the corresponding pipe to STALL (11) and clears the CSSTS bit to 0.
This interrupt is not detected for SETUP transactions.
- When the NYET is received in response to the C-SPLIT and the microframe number = 4.
In this case, this module sets the corresponding PIPENRDY bit to 1 and clears the CSSTS bit to 0 (does not modify the setting of the PID bits).

(ii) For the pipe in the receiving direction:

- For the pipe for isochronous transfers, when the time to issue an IN token comes in a state in which there is no space available in the FIFO buffer.
In this case, this module discards the received data for the IN token, setting the corresponding PIPENRDY bit and the OVRN bit to 1 at the issuance of the S-SPLIT.
- During bulk-pipe transfers or the transfers other than SETUP transactions with the DCP, when any combination of the following two cases occur three consecutive times: 1) no response is returned from the HUB for the IN token issued by this module at the issuance of S-SPLIT or C-SPLIT (when timeout is detected before detection of the DATA packet from the HUB) and 2) an error is detected in the packet from the HUB.

In this case, this module sets the corresponding PIPENRDY bit to 1 and modifies the setting of the PID bits of the corresponding pipe to NAK. When the condition is generated during the C-SPLIT transaction, this module clears the CSSTS bit to 0.

- During the C-SPLIT transaction for the pipe for isochronous transfers or interrupt transfers, when any combination of the following two cases occur three consecutive times: 1) no response is returned from the HUB for the IN token issued by this module (when timeout is detected before detection of the DATA packet from the HUB) and 2) an error is detected in the packet from the HUB.

On generating this condition for the pipe for interrupt transfers, this module sets the corresponding PIPENRDY bit to 1, modifies the setting of the PID bits of the corresponding pipe to NAK and clears the CSSTS bit to 0.

On generating this condition for the pipe for isochronous transfers, this module sets the corresponding PIPENRDY bit to 1 and CRCE bit to 1, and clears the CSSTS bit to 0 (does not modify the setting of the PID bits).

- During the C-SPLIT transaction, when the STALL handshake is received for the pipe for the transfers other than isochronous transfers.

In this case, this module sets the corresponding PIPENRDY bit to 1, modifies the setting of the PID bits of the corresponding pipe to STALL (11) and clears the CSSTS bit to 0.

- During the C-SPLIT transaction, when the NYET handshake is received for the pipe for the isochronous transfers or interrupt transfers and the microframe number = 4.

In this case, this module sets the corresponding PIPENRDY bit to 1 and CRCE bit to 1, and clears the CSSTS bit to 0 (does not modify the setting of the PID bits).

(c) When the function controller function is selected

- (i) For the pipe in the transmitting direction:

- On receiving an IN token when there is no data to be transmitted in the FIFO buffer.

In this case, this module generates a NRDY interrupt request at the reception of the IN token, setting the PIPENRDY bit to 1. For the pipe for the isochronous transfers in which an interrupt is generated, this module transmits a zero-length packet, setting the OVRN bit to 1.

- (ii) For the pipe in the receiving direction:

- On receiving an OUT token when there is no space available in the FIFO buffer.

For the pipe for the isochronous transfers in which an interrupt is generated, this module generates a NRDY interrupt request, setting the PIPENRDY bit to 1 and OVRN bit to 1.

For the pipe for the transfers other than isochronous transfers in which an interrupt is generated, this module generates a NRDY interrupt request when a NAK handshake is

transferred after the data following the OUT token was received, setting the PIPENRDY bit to 1.

However, during re-transmission (due to DATA-PID disagreement), the NRDY interrupt request is not generated. In addition, if an error occurs in the DATA packet, the NRDY interrupt request is not generated.

- On receiving a PING token when there is no space available in the FIFO buffer.

In this case, this module generates a NRDY interrupt request at the reception of the PING token, setting the PIPENRDY bit to 1.

- For the pipe for isochronous transfers, when a token is not received normally within an interval frame.

In this case, this module generates a NRDY interrupt request, setting the PIPENRDY bit to 1.

Figure 27.4 shows the timing at which an NRDY interrupt is generated when the function controller function is selected.

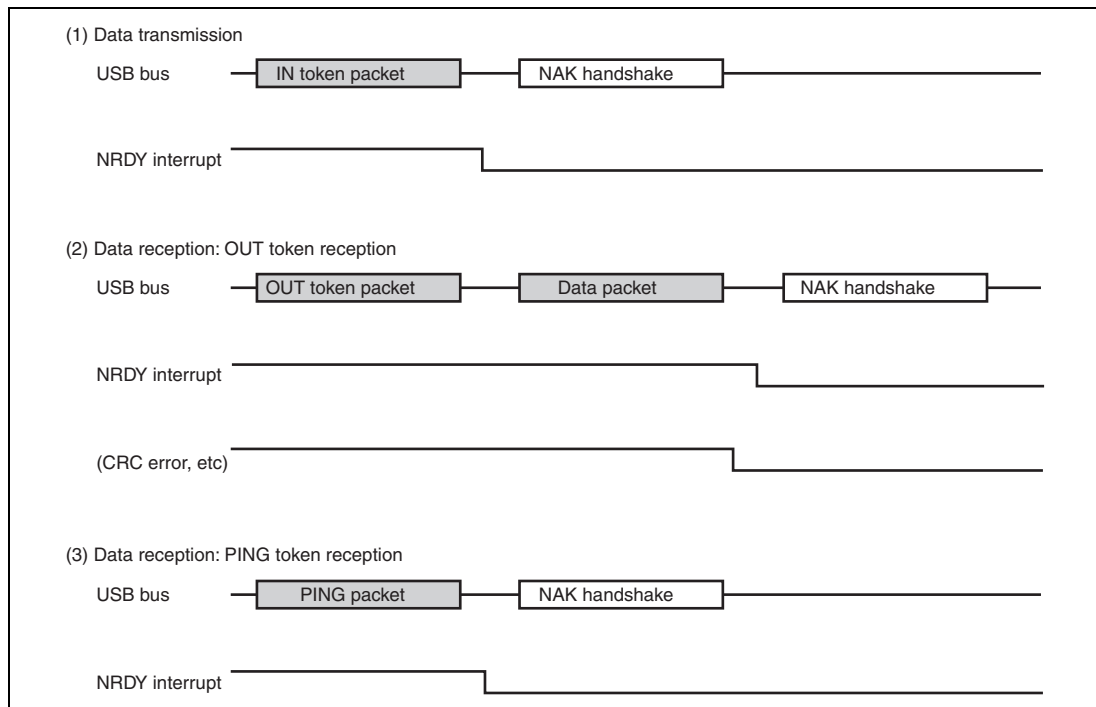

Figure 27.4 Timing at which NRDY Interrupt is Generated when Function Controller Function is Selected

(3) BEMP Interrupt

On generating the BEMP interrupt for the pipe whose PID bits are set to BUF, this module sets the corresponding PIPEBEMP bit in BEMPSTS to 1. If the corresponding bit in BEMPENB is set to 1, this module sets the BEMP bit in INTSTS0 to 1, allowing the USB interrupt to be generated.

The following describes the conditions on which this module generates the internal BEMP interrupt request.

- (a) For the pipe in the transmitting direction, when the FIFO buffer of the corresponding pipe is empty on completion of transmission (including zero-length packet transmission). In single buffer mode, the internal BEMP interrupt request is generated simultaneously with the BRDY interrupt for the pipe other than DCP. However, the internal BEMP interrupt request is not generated on any of the following conditions.
 - When writing data to the FIFO buffer of the CPU has already been started on completion of transmitting data of one plane in double buffer mode.
 - When the buffer is cleared (emptied) by setting the ACLRM or BCLR bit to 1.
 - When IN transfer (zero-length packet transmission) is performed during the control transfer status stage in function controller mode.
- (b) For the pipe in the receiving direction:

When the successfully-received data packet size exceeds the specified maximum packet size. In this case, this module generates the BEMP interrupt request, setting the corresponding PIPEBEMP bit to 1, and discards the received data and modifies the setting of the PID bits of the corresponding pipe to STALL (11). Here, this module returns no response when used as the host controller, and returns STALL response when used as the function controller. However, the internal BEMP interrupt request is not generated on any of the following conditions.

 - When a CRC error or bit stuffing error is detected in the received data.
 - When a setup transaction is being performed. Writing 0 to the PIPEBEMP bit clears the status; writing 1 to the PIPEBEMP bit has no effect.

Figure 27.5 shows the timing at which a BEMP interrupt is generated when the function controller function has been selected.

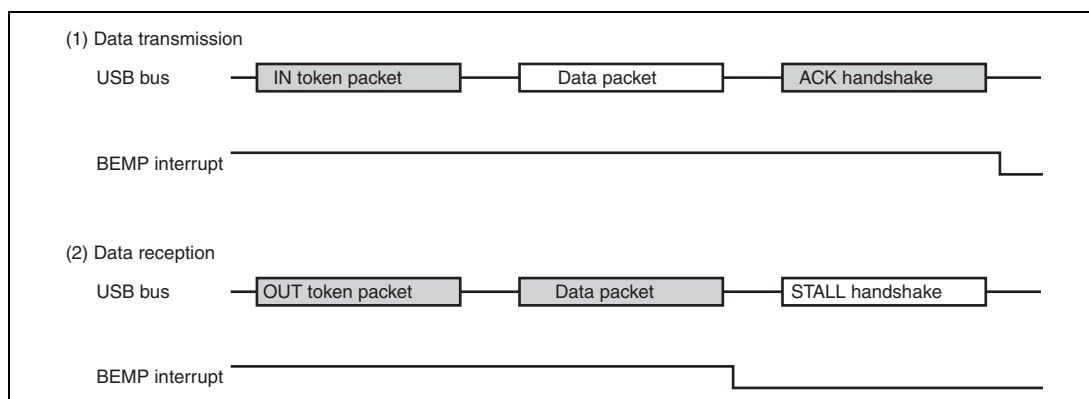

Figure 27.5 Timing at which BEMP Interrupt is Generated when Function Controller Function is Selected

(4) Device State Transition Interrupt

Figure 27.6 shows a diagram of this module device state transitions. This module controls device states and generates device state transition interrupts. However, recovery from the suspended state (resume signal detection) is detected by means of the resume interrupt. The device state transition interrupts can be enabled or disabled individually using INTENB0. The device state that made a transition can be confirmed using the DVSQ bit in INTSTS0.

To make a transition to the default state, the device state transition interrupt is generated after the reset handshake protocol has been completed.

Device state can be controlled only when the function controller function is selected. Also, the device state transition interrupts can be generated only when the function controller function is selected.

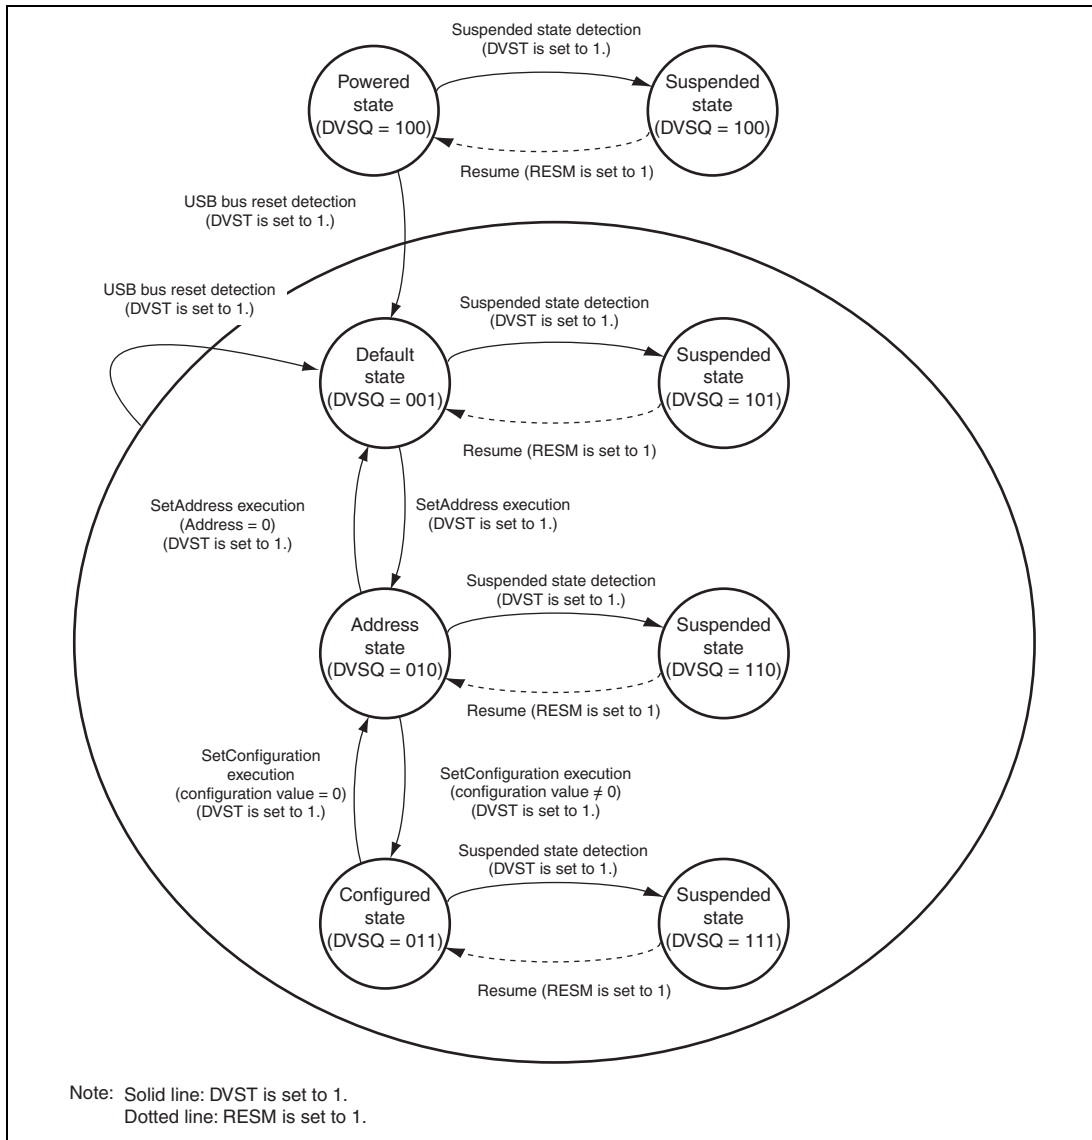

Figure 27.6 Device State Transitions

(5) Control Transfer Stage Transition Interrupt (Function Controller Function)

Figure 27.7 shows a diagram of how this module handles the control transfer stage transition. This module controls the control transfer sequence and generates control transfer stage transition interrupts. Control transfer stage transition interrupts can be enabled or disabled individually using INTENB0. The transfer stage that made a transition can be confirmed using the CTSQ bit in INTSTS0.

The control transfer stage transition interrupts are generated only when the function controller function is selected.

The control transfer sequence errors are described below. If an error occurs, the PID bit in DCPCTR is set to B'1x (STALL).

(a) During control read transfers

- At the IN token of the data stage, an OUT or PING token is received when there have been no data transfers at all.
- An IN token is received at the status stage
- A packet is received at the status stage for which the data packet is DATAPID = DATA0

(b) During control write transfers

- At the OUT token of the data stage, an IN token is received when there have been no ACK response at all
- A packet is received at the data stage for which the first data packet is DATAPID = DATA0
- At the status stage, an OUT or PING token is received

(c) During no-data control transfers

- At the status stage, an OUT or PING token is received

At the control write transfer stage, if the number of receive data exceeds the wLength value of the USB request, it cannot be recognized as a control transfer sequence error. At the control read transfer status stage, packets other than zero-length packets are received by an ACK response and the transfer ends normally.

When a CTRT interrupt occurs in response to a sequence error (SERR = 1), the CTSQ = 110 value is retained until CTRT = 0 is written from the system (the interrupt status is cleared). Therefore, while CTSQ = 110 is being held, the CTRT interrupt that ends the setup stage will not be

generated even if a new USB request is received. (This module retains the setup stage end, and after the interrupt status has been cleared, a setup stage end interrupt is generated.)

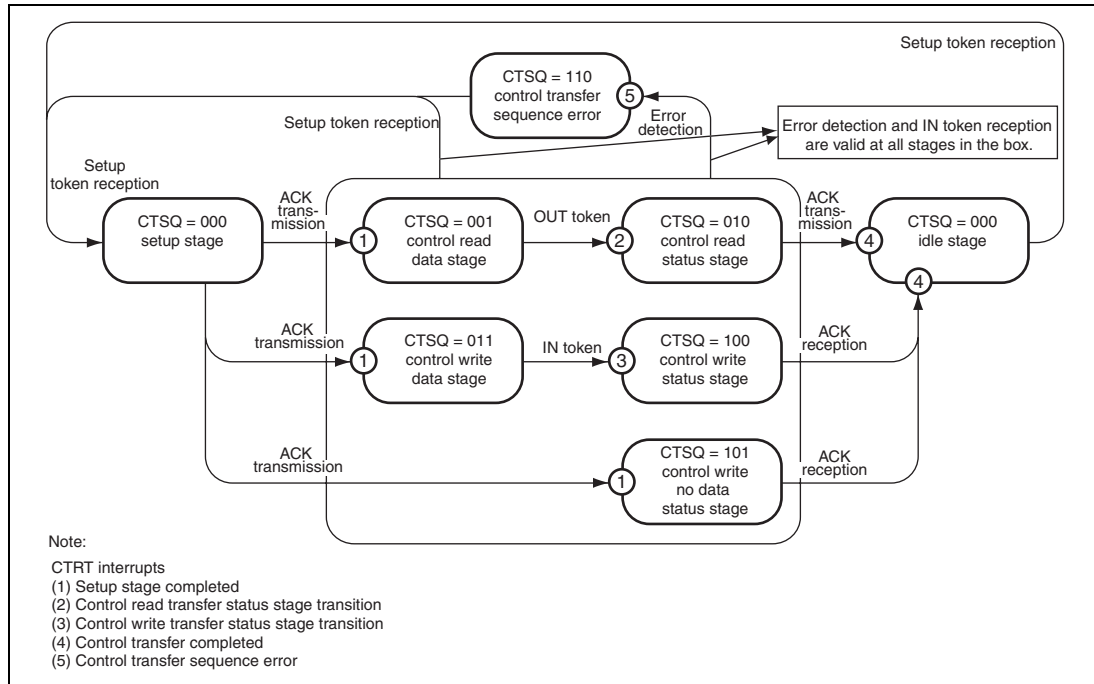

Figure 27.7 Control Transfer Stage Transitions

(6) Frame Update Interrupt

Figure 27.8 shows an example of the SOFR interrupt output timing of this module. With the host controller function selected, an interrupt is generated at the timing at which the frame number is updated. With the function controller function selected, the SOFR interrupt is generated when the frame number is updated.

When the function controller function is selected, this module updates the frame number and generates an SOFR interrupt if it detects a new SOF packet during full-speed operation. During high-speed operation, however, this module does not update the frame number, or generates no SOFR interrupt until the module enters the μ SOF locked state. Also, the SOF interpolation function is not activated. The μ SOF lock state is the state in which μ SOF packets with different frame numbers are received twice continuously without error occurrence.

The conditions under which the μ SOF lock monitoring begins and stops are as follows.

1. Conditions under which μ SOF lock monitoring begins
USBE = 1
2. Conditions under which μ SOF lock monitoring stops
USBE = 0, a USB bus reset is received, or suspended state is detected.

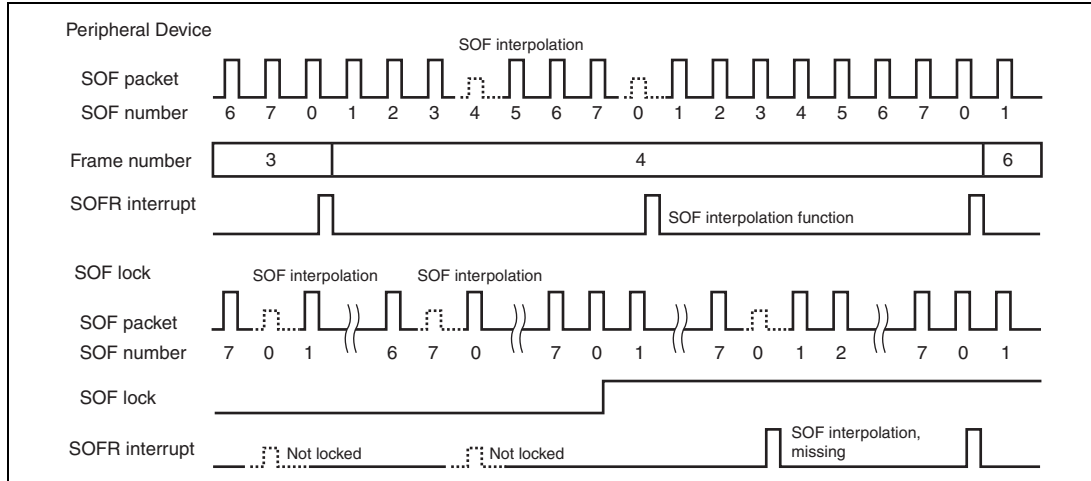

Figure 27.8 Example of SOFR Interrupt Output Timing

(7) VBUS Interrupt

If there has been a change in the VBUS pin, the VBUS interrupt is generated. The level of the VBUS pin can be checked with the VBSTS bit in INTSTS0. Whether the host controller is connected or disconnected can be confirmed using the VBUS interrupt. However, if the system is activated with the host controller connected, the first VBUS interrupt is not generated because there is no change in the VBUS pin.

(8) Resume Interrupt

With the function controller function selected, the resume interrupt is generated when the USB bus state changes (from J-state to K-state, or from J-state to SE0) while the device state is the suspended state.. Recovery from the suspended state is detected by means of the resume interrupt.

With the host controller function selected, the resume interrupt is not generated; use the BCHG interrupt to detect the change of the USB bus state.

(9) BCHG Interrupt

The BCHG interrupt is generated when the USB bus state has changed. The BCHG interrupt can be used to detect whether or not the peripheral device is connected when the host controller function has been selected and can also be used to detect a remote wakeup. The BCHG interrupt is generated regardless of whether the host controller function or function controller function has been selected.

(10) DTCH Interrupt

The DTCH interrupt is generated if disconnection of the USB bus is detected when the host controller function has been selected. This module detects bus disconnection based on USB Specification 2.0.

After detecting the DTCH interrupt, this module controls hardware as described below (irrespective of the set value of the corresponding interrupt enable bit). Terminate all the pipes in which communications are currently carried out for the USB port and make a transition to the wait state for bus connection to the USB port (wait state for ATTCH interrupt generation).

- (a) Modifies the UACT bit to 0.
- (b) Puts the port into the idle state.

(11) SACK Interrupt

The SACK interrupt is generated when an ACK response for the transmitted setup packet has been received from the peripheral device with the host controller function selected. The SACK interrupt can be used to confirm that the setup transaction has been completed successfully.

(12) SIGN Interrupt

The SIGN interrupt is generated when an ACK response for the transmitted setup packet has not been correctly received from the peripheral device three consecutive times with the host controller function selected. The SIGN interrupt can be used to detect no ACK response transmitted from the peripheral device or corruption of an ACK packet.

(13) ATTCH Interrupt

The ATTCH interrupt is generated when J-state or K-state of the full-speed or low-speed level signal is detected on the USB port for 2.5 μ s in host controller mode. To be more specific, the ATTCH interrupt is detected on any of the following conditions.

- (a) When K-state, SE0, or SE1 changes to J-state, and J-state continues 2.5 μ s.
- (b) When J-state, SE0, or SE1 changes to K-state, and K-state continues 2.5 μ s.

(14) EOFERR Interrupt

The EOFERR interrupt is generated when it is detected that communication is not completed at the EOF2 timing prescribed by USB Specification 2.0.

After detecting the EOFERR interrupt, this module controls hardware as described below (irrespective of the set value of the corresponding interrupt enable bit). Terminate all the pipes in which communications are currently carried out for the pertinent port and perform re-enumeration of the pertinent port.

- (a) Modifies the UACT bit for the port in which an EOFERR interrupt has been detected to 0.
- (b) Puts the port in which an EOFERR interrupt has been generated into the idle state.

27.4.3 Pipe Control

Table 27.17 lists the pipe setting items of this module. With USB data transfer, data transmission has to be carried out using the logic pipe called the endpoint. This module has ten pipes that are used for data transfer.

Settings should be entered for each of the pipes in conjunction with the specifications of the system.

Table 27.17 Pipe Setting Items

Register Name	Bit Name	Setting Contents	Remarks	
DCPCFG PIPECFG	TYPE	Specifies the transfer type	PIPE1 to PIPE9: Can be set	
	BFRE	Selects the BRDY interrupt mode	PIPE1 to PIPE5: Can be set	
	DBLB	Selects a double buffer	PIPE1 to PIPE5: Can be set	
	CNTMD		Selects continuous transfer or non-continuous transfer	PIPE1 and PIPE2: Can be set (only when bulk transfer has been selected).
				PIPE3 to PIPE5: Can be set
	DIR	Selects transfer direction	IN or OUT can be set	
	EPNUM	Endpoint number	PIPE1 to PIPE9: Can be set A value other than 0000 should be set when the pipe is used.	
SHTNAK		Selects disabled state for pipe when transfer ends	PIPE1 and PIPE2: Can be set (only when bulk transfer has been selected)	
			PIPE3 to PIPE5: Can be set	
PIPEBUF	BUFSIZE	Buffer memory size	DCP: Cannot be set (fixed at 256 bytes) PIPE1 to PIPE5: Can be set (a maximum of 2 Kbytes can be specified in 64-byte units) PIPE6 to PIPE9: Cannot be set (fixed at 64 bytes)	
	BUFNMB	Buffer memory number	DCP: Cannot be set (areas fixed at H'0 to H'3) PIPE1 to PIPE5: Can be set (can be specified in areas H'8 to H'7F) PIPE6 to PIPE9: Cannot be set (areas fixed at H'4 to H'7)	

Register Name	Bit Name	Setting Contents	Remarks
DCPMAXP	DEVSEL	Selects a device	Referenced only when the host controller function is selected.
PIPEMAXP	MXPS	Maximum packet size	Compliant with the USB standard.
PIPEPERI	IFIS	Buffer flush	PIPE1 and PIPE2: Can be set (only when isochronous transfer has been selected) PIPE3 to PIPE5: Cannot be set PIPE6 to PIPE9: Can be set (only when the host controller function has been selected)
	IITV	Interval counter	PIPE1 and PIPE2: Can be set (only when isochronous transfer has been selected) PIPE3 to PIPE5: Cannot be set PIPE6 to PIPE9: Can be set (only when the host controller function has been selected)
DCPCTR	BSTS	Buffer status	For the DCP, receive buffer status and transmit buffer status are switched with the ISEL bit.
PIPE _n CTR	INBUFM	IN buffer monitor	Mounted for PIPE3 to PIPE5.
	SUREQ	SETUP request	Can be set only for the DCP. Can be controlled only when the host controller function has been selected.
	SUREQCLR	SUREQ clear	Can be set only for the DCP. Can be controlled only when the host controller function has been selected.
	CSCLR	CSSTS clear	Can be controlled only when the host controller function has been selected.
	CSSTS	SPLIT status indication	Can be referenced only when the host controller function has been selected.
	ATREPM	Auto response mode	PIPE1 to PIPE5: Can be set Can be controlled only when the function controller function has been selected.

Register Name	Bit Name	Setting Contents	Remarks
DCPCTR	ACLRM	Auto buffer clear	PIPE1 to PIPE9: Can be set
PIPEnCTR	SQCLR	Sequence clear	Clears the data toggle bit
	SQSET	Sequence set	Sets the data toggle bit
	SQMON	Sequence monitor	Monitors the data toggle bit
	PBUSY	Pipe busy status	
	PID	Response PID	See section 27.4.3 (6), Response PID
PIPEnTRE	TRENB	Transaction counter enable	PIPE1 to PIPE5: Can be set
	TRCLR	Current transaction counter clear	PIPE1 to PIPE5: Can be set
PIPEnTRN	TRNCNT	Transaction counter	PIPE1 to PIPE5: Can be set

(1) Pipe Control Register Switching Procedures

The following bits in the pipe control registers can be modified only when USB communication is disabled (PID = NAK):

Registers that Should Not be Set in the USB Communication Enabled (PID = BUF) State

- Bits in DCPMAXP
- The SQCLR, SQSET, and PINGE bits in DCPCTR
- Bits in PIPECFG, PIPEBUF, PIPEMAXP and PIPEPERI
- The ATREPM, ACLRM, SQCLR and SQSET bits in PIPExCTR
- Bits in PIPExTRE and PIPExTRN

In order to modify the above bits from the USB communication enabled (PID = BUF) state, follow the procedure shown below:

1. Generate a bit modification request with the pipe control register.
2. Modify the PID corresponding to the pipe to NAK.
3. Wait until the corresponding CSSTS bit is cleared to 0 (only when the host controller function has been selected).
4. Wait until the corresponding PBUSY bit is cleared to 0.
5. Modify the bits in the pipe control register.

The following bits in the pipe control registers can be modified only when the pertinent information has not been set by the CURPIPE bits in CFIFOSEL, D0FIFOSEL and D1FIFOSEL.

Registers that Should Not be Set When CURPIPE in FIFO-PORT is set.

- Bits in PIPECFG, PIPEBUF, PIPEMAXP and PIPEPERI

In order to modify pipe information, the CURPIPE bits should be set to the pipes other than the pipe to be modified. For the DCP, the buffer should be cleared using BCLR after the pipe information is modified.

(2) Transfer Types

The TYPE bit in PIPECFG is used to specify the transfer type for each pipe. The transfer types that can be set for the pipes are as follows.

1. DCP: No setting is necessary (fixed at control transfer).
2. PIPE1 and PIPE2: These should be set to bulk transfer or isochronous transfer.
3. PIPE3 to PIPE5: These should be set to bulk transfer.
4. PIPE6 to PIPE9: These should be set to interrupt transfer.

(3) Endpoint Number

The EPNUM bit in PIPECFG is used to set the endpoint number for each pipe. The DCP is fixed at endpoint 0. The other pipes can be set from endpoint 1 to endpoint 15.

1. DCP: No setting is necessary (fixed at end point 0).
2. PIPE1 to PIPE9: The endpoint numbers from 1 to 15 should be selected and set.
These should be set so that the combination of the DIR bit and EPNUM bit is unique.

(4) Maximum Packet Size Setting

The MXPS bit in DCPMAXP and PIPEMAXP is used to specify the maximum packet size for each pipe. DCP and PIPE1 to PIPE5 can be set to any of the maximum pipe sizes defined by the USB specification. For PIPE6 to PIPE9, 64 bytes are the upper limit of the maximum packet size. The maximum packet size should be set before beginning the transfer (PID = BUF).

1. DCP: 64 should be set when using high-speed operation.
2. DCP: Select and set 8, 16, 32, or 64 when using full-speed operation.
3. PIPE1 to PIPE5: 512 should be set when using high-speed bulk transfer.
4. PIPE1 to PIPE5: Select and set 8, 16, 32, or 64 when using full-speed bulk transfer.
5. PIPE1 and PIPE2: Set a value between 1 and 1024 when using high-speed isochronous transfer.
6. PIPE1 and PIPE2: Set a value between 1 and 1023 when using full-speed isochronous transfer.
7. PIPE6 to PIPE9: Set a value between 1 and 64.

The high bandwidth transfers used with interrupt transfers and isochronous transfers are not supported.

(5) Transaction Counter (For PIPE1 to PIPE5 in Reading Direction)

When the specified number of transactions have been completed in the data packet receiving direction, this module recognizes that the transfer has ended. The transaction counter function is available when the pipes assigned to the D0FIFO/D1FIFO port have been set in the direction of reading data from the buffer memory. Two transaction counters are provided: one is the TRNCNT register that specifies the number of transactions to be executed and the other is the current counter that internally counts the number of executed transactions. When the current counter value matches the number of the transactions specified in TRNCNT, reading the buffer memory is enabled. The current counter of the transaction counter function is initialized by the TRCLR bit, so that the transactions can be counted again starting from the beginning. The information read from TRNCNT differs depending on the setting of the TRENb bit.

- TRENb = 0: The specified transaction counter value can be read.
- TRENb = 1: The current counter value indicating the internally counted number of executed transactions can be read.

When operating the TRCLR bit, the following should be noted.

- If the transactions are being counted and PID = BUF, the current counter cannot be cleared.
- If there is any data left in the buffer, the current counter cannot be cleared.

(6) Response PID

The PID bits in DCPCTR and PIPEnCTR are used to set the response PID for each pipe.

The following shows this module operation with various response PID settings:

(a) Response PID settings when the host controller function is selected

The response PID is used to specify the execution of transactions.

- NAK setting: Using pipes is disabled. No transaction is executed.
- BUF setting: Transactions are executed based on the status of the buffer memory. For OUT direction: If there are transmit data in the buffer memory, an OUT token is issued. For IN direction: If there is an area to receive data in the buffer memory, an IN token is issued.
- STALL setting: Using pipes is disabled. No transaction is executed.

Setup transactions for the DCP are set with the SUREQ bit.

(b) Response PID settings when the function controller function is selected

The response PID is used to specify the response to transactions from the host.

- NAK setting: The NAK response is always returned in response to the generated transaction.
- BUF setting: Responses are made to transactions based on the status of the buffer memory.
- STALL setting: The STALL response is always returned in response to the generated transaction.

For setup transactions, an ACK response is always returned, regardless of the PID setting, and the USB request is stored in the register.

This module may carry out writing to the PID bits, depending on the results of the transaction.

(c) When the host controller function has been selected and the response PID is set by hardware

- NAK setting: In the following cases, PID = NAK is set and issuing of tokens is automatically stopped:
 - When a transfer other than isochronous transfer has been performed and the NRDY interrupt is generated. (For details, see descriptions of the NRDY interrupt.)
 - If a short packet is received when the SHTNAK bit in PIPECFG has been set to 1 for bulk transfer.
 - If the transaction counter ended when the SHTNAK bit has been set to 1 for bulk transfer.

- BUF setting: There is no BUF writing by this module.
 - STALL setting: In the following cases, PID = STALL is set and issuing of tokens is automatically stopped:
 - When STALL is received in response to the transmitted token.
 - When the size of the receive data packet exceeds the maximum packet size.
- (d) When the function controller function has been selected and the response PID is set by hardware**
- NAK setting: In the following cases, PID = NAK is set and NAK is always returned in response to transactions:
 - When the SETUP token is received normally (DCP only).
 - If the transaction counter ended or a short packet is received when the SHTNAK bit in PIPECFG has been set to 1 for bulk transfer.
 - BUF setting: There is no BUF writing by this module.
 - STALL setting: In the following cases, PID = STALL is set and STALL is always returned in response to transactions:
 - When the size of the receive data packet exceeds the maximum packet size.
 - When a control transfer sequence error has been detected (DCP only).

(7) Data PID Sequence Bit

This module automatically toggles the sequence bit in the data PID when data is transferred normally in the control transfer data stage, bulk transfer and interrupt transfer. The sequence bit of the data PID that was transmitted can be confirmed with the SQMON bit in DCPCTR and PIPEnCTR. When data is transmitted, the sequence bit switches at the timing at which the ACK handshake is received. When data is received, the sequence bit switches at the timing at which the ACK handshake is transmitted. The SQCLR bit in DCPCTR and the SQSET bit in PIPEnCTR can be used to change the data PID sequence bit.

When the function controller function has been selected and control transfer is used, this module automatically sets the sequence bit when a stage transition is made. DATA0 is returned when the setup stage is ended and DATA1 is returned in a status stage. Therefore, settings are not required. However, when the host controller function has been selected and control transfer is used, the sequence bit should be set at the stage transition.

For the Clearfeature request transmission or reception, the data PID sequence bit should be set, regardless of whether the host controller function or function controller function is selected.

With pipes for which isochronous transfer has been set, sequence bit operation cannot be carried out using the SQSET bit.

(8) Response PID = NAK Function

This module has a function that disables pipe operation (PID response = NAK) at the timing at which the final data packet of a transaction is received (this module automatically distinguishes this based on reception of a short packet or the transaction counter) by setting the SHTNAK bit in PIPECFG to 1.

When a double buffer is being used for the buffer memory, using this function enables reception of data packets in transfer units. If pipe operation has disabled, the pipe has to be set to the enabled state again (PID response = BUF).

This function can be used only when bulk transfers are used.

(9) Auto Transfer MODE

With the pipes for bulk transfer (PIPE1 to PIPE5), when the ATREPM bit in PIPEnCTR is set to 1, a transition is made to auto response mode. During an OUT transfer (DIR = 0), OUT-NAK mode is entered, and during an IN transfer (DIR = 1), null auto response mode is entered.

(a) OUT-NAK Mode

With the pipes for bulk OUT transfer, NAK is returned in response to an OUT or PING token and an NRDY interrupt is output when the ATREPM bit is set to 1. To make a transition from normal mode to OUT-NAK mode, OUT-NAK mode should be specified in the pipe operation disabled state (response PID = NAK) before enabling pipe operation (response PID = BUF). After pipe operation has been enabled, OUT-NAK mode becomes valid. However, if an OUT token is received immediately before pipe operation is disabled, the token data is normally received, and an ACK is returned to the host.

To make a transition from OUT-NAK mode to normal mode, OUT-NAK mode should be canceled in the pipe operation disabled state (response PID = NAK) before enabling pipe operation (response PID = BUF). In normal mode, reception of OUT data is enabled and an ACK is returned in response to a PING token if the buffer is ready to receive data.

(b) Null Auto Response Mode

With the pipes for bulk IN transfer, zero-length packets are continuously transmitted when the ATREPM bit is set to 1.

To make a transition from normal mode to null auto response mode, null auto response mode should be set in the pipe operation disabled state (response PID = NAK) before enabling pipe operation (response PID = BUF). After pipe operation has been enabled, null auto response mode becomes valid. Before setting null auto response mode, INBUFM = 0 should be confirmed because the mode can be set only when the buffer is empty. If the INBUFM bit is 1, the buffer should be emptied with the ACLRM bit. While a transition to null auto response mode is being made, data should not be written from the FIFO port.

To make a transition from null auto response mode to normal mode, pipe operation disabled state (response PID = NAK) should be retained for the period of zero-length packet transmission (full-speed: 10 μ s, high-speed: 3 μ s) before canceling null auto response mode. In normal mode, data can be written from the FIFO port; therefore, packet transmission to the host is enabled by enabling pipe operation (response PID = BUF).

27.4.4 FIFO Buffer Memory

(1) FIFO Buffer Memory Allocation

Figure 27.9 shows an example of a FIFO buffer memory map for this module. The FIFO buffer memory is an area shared by the CPU and this module. In the FIFO buffer memory status, there are times when the access right to the buffer memory is allocated to the user system (CPU side), and times when it is allocated to this module (SIE side).

The buffer memory sets independent areas for each pipe. In the memory areas, 64 bytes comprise one block, and the memory areas are set using the first block number of the number of blocks (specified using the BUFNMB and BUFSIZE bits in PIPEBUF).

Independent buffer memory areas should be set for each pipe. Each memory area can be set using the first block number and the number of blocks (specified using the BUFNMB and BUFSIZE bits in PIPEBUF), where one block comprises 64 bytes.

When continuous transfer mode has been selected using the CNTMD bit in PIPECFG, the BUFSIZE bits should be set so that the buffer memory size should be an integral multiple of the maximum packet size. When double buffer mode has been selected using the DBLB bit in PIPECFG, two planes of the memory area specified using the BUFSIZE bits in PIPEBUF can be assigned to a single pipe.

Moreover, three FIFO ports are used for access to the buffer memory (reading and writing data). A pipe is assigned to the FIFO port by specifying the pipe number using the CURPIPE bit in C/DnFIFOSEL.

The buffer statuses of the various pipes can be confirmed using the BSTS bit in DCPCTR and the INBUFM bit in PIPECTR. Also, the access right of the FIFO port can be confirmed using the FRDY bit in CFIFOCTR or DnFIFOCTR.

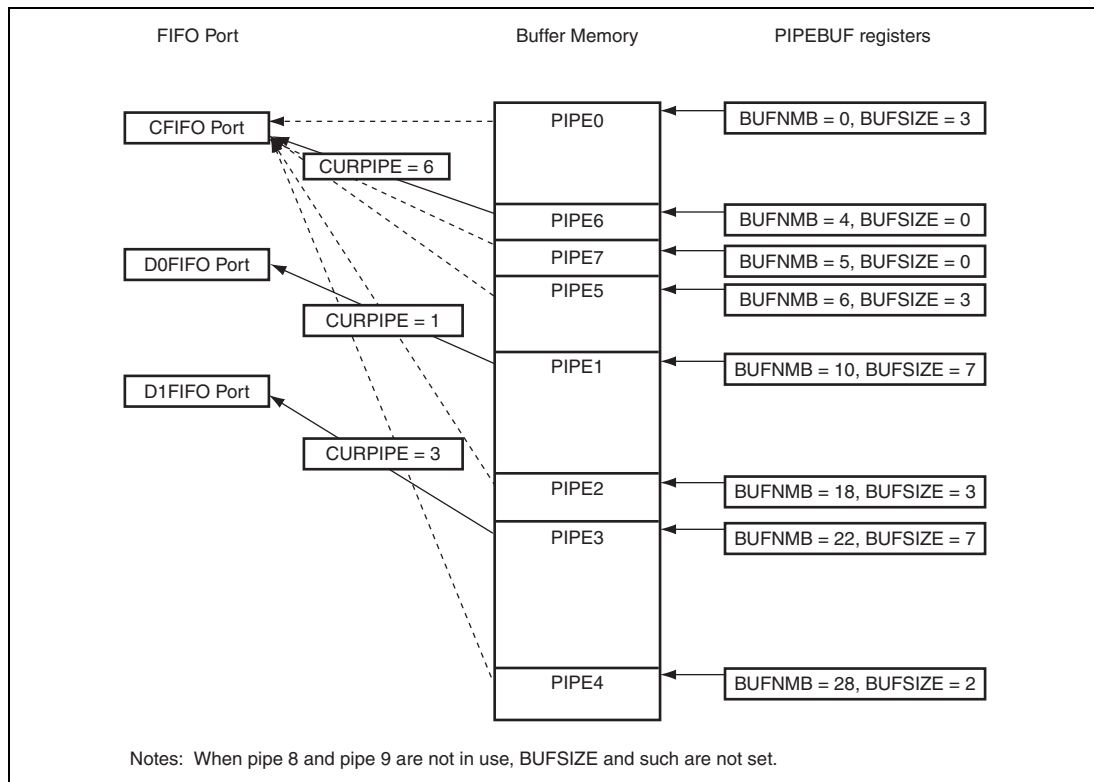

Figure 27.9 Example of a Buffer Memory Map

(a) Buffer Status

Tables 27.18 and 27.19 show the buffer status. The buffer memory status can be confirmed using the BSTS bit in DCPCTR and the INBUFM bit in PIPE_nCTR. The access direction for the buffer memory can be specified using either the DIR bit in PIPE_nCFG or the ISEL bit in CFIFOSEL (when DCP is selected).

The INBUFM bit is valid for PIPE0 to PIPE5 in the sending direction.

For an IN pipe uses double buffer, the BSTS bit can be used to monitor the buffer memory status of CPU side and the INBUFM bit to monitor the buffer memory status of SIE side. In the case like the BEMP interrupt may not shows the buffer empty status because the CPU (direct memory access controller) writes data slowly, the INBUFM bit can be used to confirm the end of sending.

Table 27.18 Buffer Status Indicated by the BSTS Bit

ISEL or DIR	BSTS	Buffer Memory State
0 (receiving direction)	0	There is no received data, or data is being received. Reading from the FIFO port is inhibited.
0 (receiving direction)	1	There is received data, or a zero-length packet has been received. Reading from the FIFO port is allowed. However, because reading is not possible when a zero-length packet is received, the buffer must be cleared.
1 (transmitting direction)	0	The transmission has not been finished. Writing to the FIFO port is inhibited.
1 (transmitting direction)	1	The transmission has been finished. CPU write is allowed.

Table 27.19 Buffer Status Indicated by the INBUFM Bit

IDIR	INBUFM	Buffer Memory State
0 (receiving direction)	Invalid	Invalid
1 (transmitting direction)	0	The transmission has been finished. There is no waiting data to be transmitted.
1 (transmitting direction)	1	The FIFO port has written data to the buffer. There is data to be transmitted

(b) FIFO Buffer Clearing

Table 27.20 shows the clearing of the FIFO buffer memory by this module. The buffer memory can be cleared using the three bits indicated below.

Table 27.20 List of Buffer Clearing Methods

Bit Name	BCLR	DCLRM	ACLRM
Register	CFIFOCTR DnFIFOCTR	DnFIFOSEL	PIPEnCTR
Function	Clears the buffer memory on the CPU side	In this mode, after the data of the specified pipe has been read, the buffer memory is cleared automatically.	This is the auto buffer clear mode, in which all of the received packets are discarded.
Clearing method	Cleared by writing 1	1: Mode valid 0: Mode invalid	1: Mode valid 0: Mode invalid

(c) Buffer Areas

Table 27.21 shows the FIFO buffer memory map of this controller. The buffer memory has special fixed areas to which pipes are assigned in advance, and user areas that can be set by the user.

The buffer for the DCP is a special fixed area that is used both for control read transfers and control write transfers.

The PIPE6 to PIPE9 area is assigned in advance, but the area for pipes that are not being used can be assigned to PIPE1 to PIPE5 as a user area.

The settings should ensure that the various pipes do not overlap. Note that each area is twice as large as the setting value in the double buffer.

Also, the buffer size should not be specified using a value that is less than the maximum packet size.

Table 27.21 Buffer Memory Map

Buffer Memory Number	Buffer Size	Pipe Setting	Note
H'0 to H'3	256 bytes	Fixed area only for the DCP	Single buffer, continuous transfers enabled
H'4	64 bytes	Fixed area for PIPE6	Single buffer
H'5	64 bytes	Fixed area for PIPE7	Single buffer
H'6	64 bytes	Fixed area for PIPE8	Single buffer
H'7	64 bytes	Fixed area for PIPE9	Single buffer
H'8 to H'7F	Up to 7616 bytes	PIPE1 to PIPE5 user area	Double buffer can be set, continuous transfers enabled

(d) Auto Buffer Clear Mode Function

With this module, all of the received data packets are discarded if the ACLRM bit in PIPEnCTR is set to 1. If a normal data packet has been received, the ACK response is returned to the host controller. This function can be set only in the buffer memory reading direction.

Also, if the ACLRM bit is set to 1 and then to 0, the buffer memory of the selected pipe can be cleared regardless of the access direction.

(e) Buffer Memory Specifications (Single/Double Setting)

Either a single or double buffer can be selected for PIPE1 to PIPE5, using the DBLB bit in PIPEnCFG. The double buffer is a function that assigns two memory areas specified with the BUFSIZE bit in PIPEBUF to the same pipe. Figure 27.10 shows an example of buffer memory settings for this module.

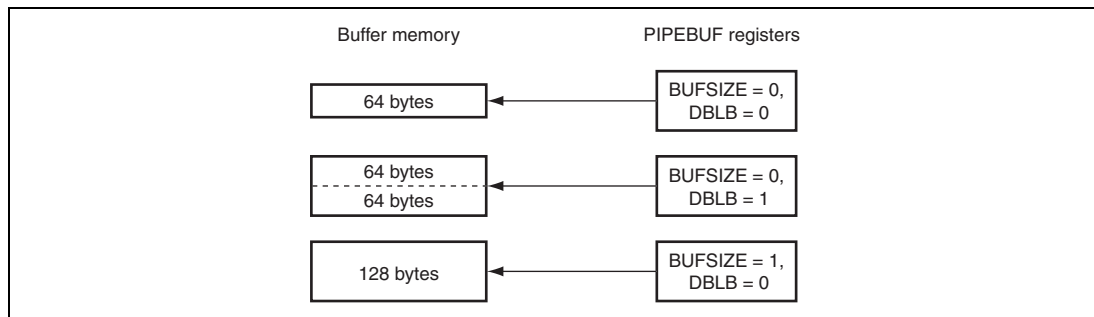

Figure 27.10 Example of Buffer Memory Settings

(f) Buffer Memory Operation (Continuous Transfer Setting)

Either the continuous transfer mode or the non-continuous transfer mode can be selected, using the CNTMD bit in PIPECFG. This selection is valid for PIPE1 to PIPE5.

The continuous transfer mode function is a function that sends and receives multiple transactions in succession. When the continuous transfer mode is set, data can be transferred without interrupts being issued to the CPU, up to the buffer sizes assigned for each of the pipes.

In the continuous sending mode, the data being written is divided into packets of the maximum packet size and sent. If the data being sent is less than the buffer size (short packet, or the integer multiple of the maximum packet size is less than the buffer size), BVAL = 1 must be set after the data being sent has been written.

In the continuous reception mode, interrupts are not issued during reception of packets up to the buffer size, until the transaction counter has ended, or a short packet is received.

Table 27.22 describes the relationship between the transfer mode settings by CNTMD bit and the timings at which reading data or transmitting data from the FIFO buffer is enabled.

Table 27.22 Relationship between Transfer Mode Settings by CNTMD Bit and Timings at which Reading Data or Transmitting Data from FIFO Buffer is Enabled

Continuous or Non-Continuous Transfer Mode	When Reading Data or Transmitting Data is Enabled
Non-continuous transfer (CNTMD = 0)	<p>In the receiving direction (DIR = 0), reading data from the FIFO buffer is enabled when:</p> <ul style="list-style-type: none"> • This module receives one packet. <hr/> <p>In the transmitting direction (DIR = 1), transmitting data from the FIFO buffer is Data of the maximum packet size is written to the FIFO buffer.</p> <p>or</p> <ul style="list-style-type: none"> • Data of the short packet size (including 0-byte data) is written to the FIFO buffer and then writes 1 to BVAL.
Continuous transfer (CNTMD = 1)	<p>In the receiving direction (DIR = 0), reading data from the FIFO buffer is enabled when:</p> <ul style="list-style-type: none"> • The number of the data bytes received in the FIFO buffer assigned to the selected pipe becomes the same as the number of assigned data bytes $((\text{BUFSIZE} + 1) \times 64)$. • This module receives a short packet other than a zero-length packet. • This module receives a zero-length packet when data is already stored in the FIFO buffer assigned to the selected pipe. <p>or</p> <ul style="list-style-type: none"> • This module receives the number of packets equal to the transaction counter value specified for the selected pipe. <hr/> <p>In the transmitting direction (DIR = 1), transmitting data from the FIFO buffer is enabled when:</p> <ul style="list-style-type: none"> • The number of the data bytes written to the FIFO buffer becomes the same as the number of data bytes in a single FIFO buffer plane assigned to the selected pipe. <p>or</p> <ul style="list-style-type: none"> • The number of data bytes less than the size of a single FIFO buffer plane (including 0-byte data) assigned to the selected pipe is written to the FIFO buffer and then 1 is written to BVAL.

Figure 27.11 shows an example of buffer memory operation for this module.

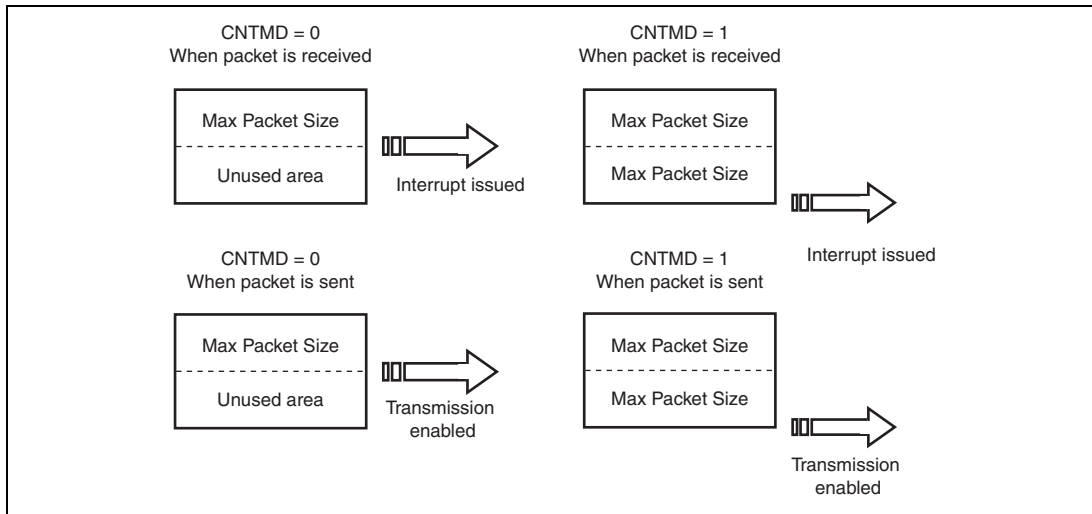

Figure 27.11 Example of Buffer Memory Operation

(2) FIFO Port Functions

Table 27.23 shows the settings for the FIFO port functions of this module. In write access, writing data until the buffer is full (or the maximum packet size for non-continuous transfers) automatically enables sending of the data. To enable sending of data before the buffer is full (or before the maximum packet size for non-continuous transfers), the BVAL bit in C/DnFIFOCTR must be set to end the writing. Also, to send a zero-length packet, the BCLR bit in the same register must be used to clear the buffer and then the BVAL bit set in order to end the writing.

In read access, reception of new packets is automatically enabled if all of the data has been read. Data cannot be read when a zero-length packet is being received (DTLN = 0), so the BCLR bit in the register must be used to release the buffer. The length of the data being received can be confirmed using the DTLN bit in C/DnFIFOCTR.

Table 27.23 FIFO Port Function Settings

Register Name	Bit Name	Function	Note
C/DnFIFOSEL	RCNT	Selects DTLN read mode	
	REW	Buffer memory rewind (re-read, rewrite)	
	DCLRM	Automatically clears data received for a specified pipe after the data has been read	For DnFIFO only
	DREQE	Enables DMA transfers	For DnFIFO only
	MBW	FIFO port access bit width	
	BIGEND	Selects FIFO port endian	
	ISEL	FIFO port access direction	
	CURPIPE	Selects the current pipe	For DCP only
C/DnFIFOCTR	BVAL	Ends writing to the buffer memory	
	BCLR	Clears the buffer memory on the CPU side	
	DTLN	Checks the length of received data	

(a) FIFO Port Selection

Table 27.24 shows the pipes that can be selected with the various FIFO ports. The pipe to be accessed is selected using the CURPIPE bit in C/DnFIFOSEL. After the pipe is selected, whether the CURPIPE value for the pipe, which was written last, can be correctly read should be checked. (If the previous pipe number is read, it indicates that the pipe modification is being executed by this module.) Then, the FIFO port can be accessed after FRDY = 1 is checked.

Also, the bus width to be accessed should be selected using the MBW bit. The buffer memory access direction conforms to the DIR bit in PIPEnCFG. The ISEL bit determines this only for the DCP.

Table 27.24 FIFO Port Access Categorized by Pipe

Pipe	Access Method	Port that can be Used
DCP	CPU access	CFIFO port register
PIPE1 to PIPE9	CPU access	CFIFO port register D0FIFO/D1FIFO port register
	DMA access	D0FIFO/D1FIFO port register

(b) REW Bit

It is possible to temporarily stop access to the pipe currently being accessed, access a different pipe, and then continue processing using the current pipe once again. The REW bit in C/DnFIFOSEL is used for this.

If a pipe is selected when the REW bit is set to 1 and at the same time the CURPIPE bit in C/DnFIFOSEL is set, the pointer used for reading from and writing to the buffer memory is reset, and reading or writing can be carried out from the first byte. Also, if a pipe is selected with 0 set for the REW bit, data can be read and written in continuation of the previous selection, without the pointer used for reading from and writing to the buffer memory being reset.

To access the FIFO port, FRDY = 1 must be ensured after selecting a pipe.

(c) Accessing FIFO Port for Odd Data

For reading data from the FIFO port, when the number of data bits to be read is smaller than the access width specified by the MBW bits in the FIFO port select registers, read the data with the specified width and discard the unnecessary bits through software.

For writing data to the FIFO port, when the number of data bits to be written is smaller than the access width specified by the MBW bits in the FIFO port select registers, access the registers as shown in the following examples. In the examples, the FIFO port access width is 32 bits (MBW = 10) and 24-bit data is written to the FIFO port.

Example 1 for writing odd data: Writing data with 16-bit width once and then with 8-bit width once

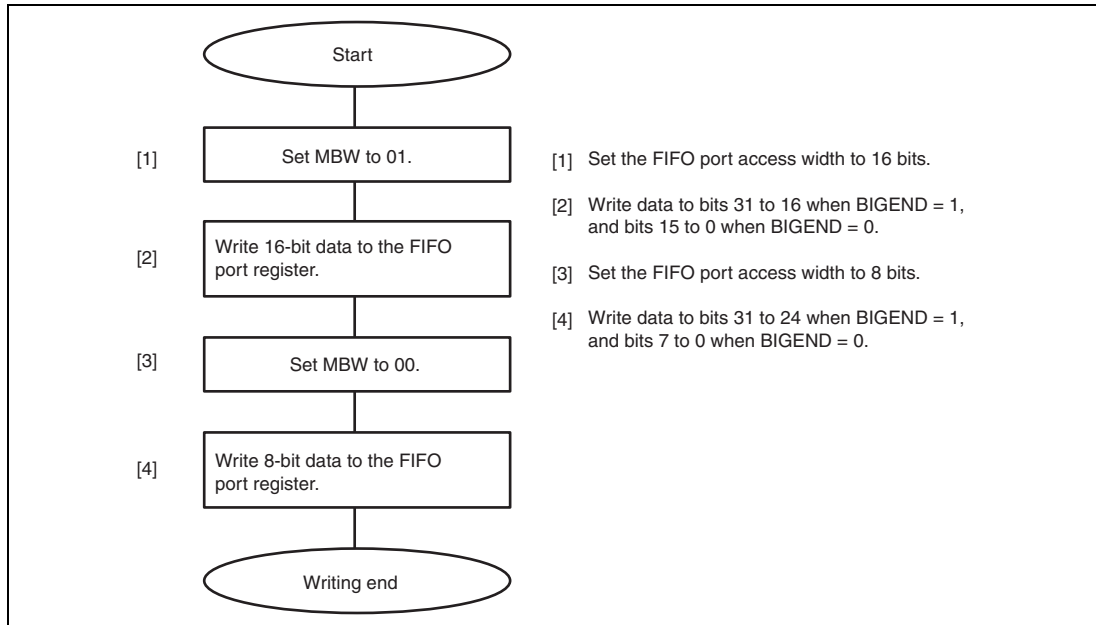

Figure 27.12 Example 1 for Writing Odd Data to FIFO Port

Example 1 for writing odd data 2: Writing data with 8-bit width three times

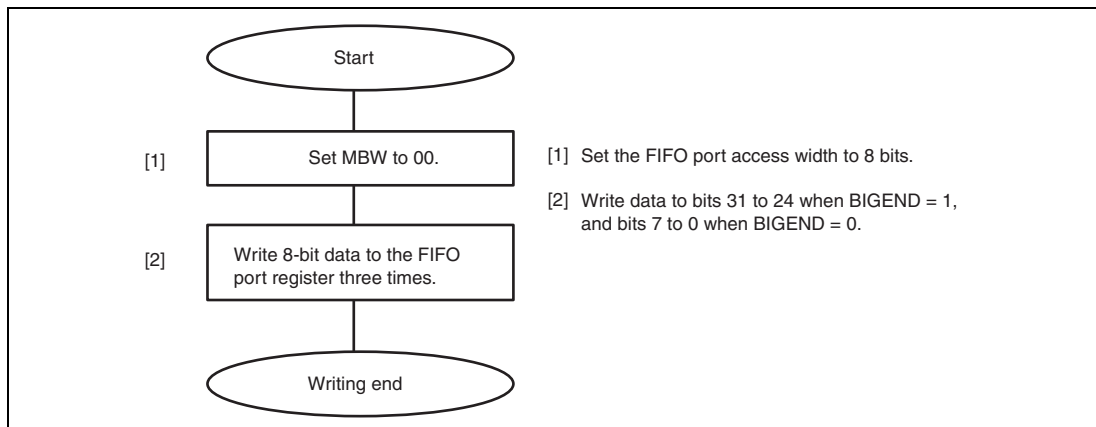

Figure 27.13 Example 2 for Writing Odd Data to FIFO Port

(d) Modifying MBW Bits when the Pipe is in the Receiving Direction

When the specified pipe is in the receiving direction, modify the MBW bits in the FIFO port select registers (CFIFOSEL, D0FIFOSEL, D1FIFOSEL) simultaneously with the CURPIPE bits. When the DCP is currently set (CURPIPE = 000) in the CFIFO port select register, modify the MBW bits simultaneously with the CURPIPE bits or ISEL bit.

To modify only the MBW bits for the currently set pipe, follow the procedure below. Once the buffer memory starts to be read out, however, do not modify the MBW bits until the entire data has been read out.

When the selected CURPIPE is in the writing direction to buffer memory, the port access width can be changed simply by setting the MBW bits.

Once the buffer memory starts to be written to, however, do not modify the port access width from 8 bits to 16 or 32 bits, or from 16 bits to 32 bits.

When CURPIPE setting is not DCP (000) for D0FIFO, D1FIFO, or CFIFO

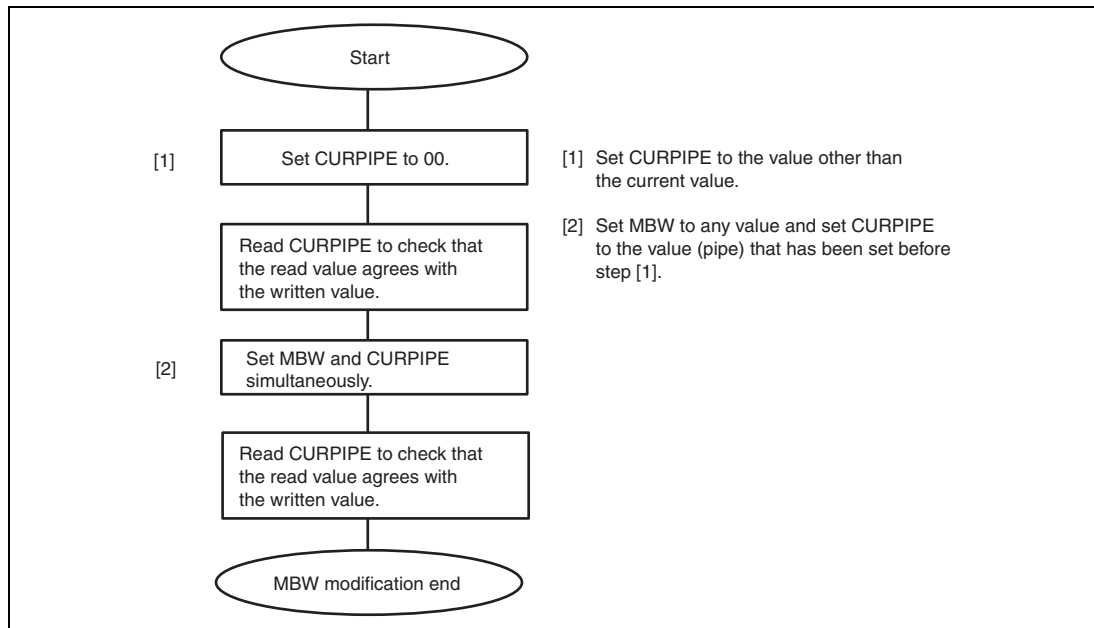

Figure 27.14 MBW Modification Procedure Example when CURPIPE Setting is not DCP (000) for D0FIFO, D1FIFO, or CFIFO

When CURPIPE setting is DCP (000) for CFIFO

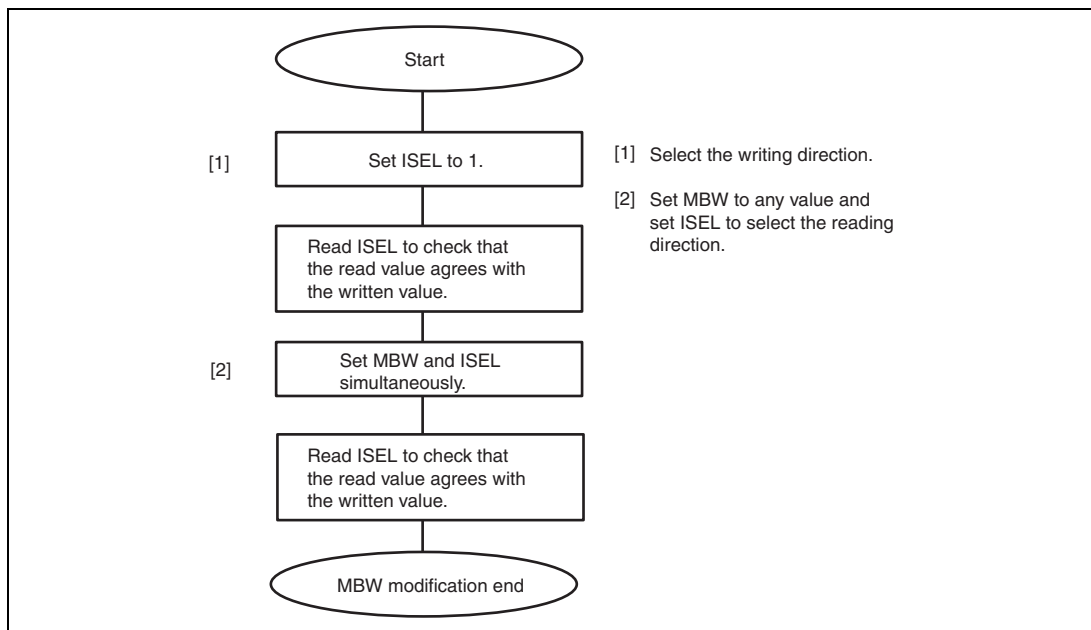

Figure 27.15 MBW Modification Procedure Example When CURPIPE Setting is DCP (000)

(3) DMA Transfers (D0FIFO/D1FIFO Port)

(a) Overview of DMA Transfers

For pipes 1 to 9, the FIFO port can be accessed using the direct memory access controller. When accessing the buffer for the pipe targeted for DMA transfer is enabled, a DMA transfer request is issued.

The unit of transfer to the FIFO port should be selected using the MBW bit in DnFIFOSEL and the pipe targeted for the DMA transfer should be selected using the CURPIPE bit. The selected pipe should not be changed during the DMA transfer.

(b) Auto Recognition of DMA Transfer Completion

With this module, it is possible to complete FIFO data writing through DMA transfer by controlling DMA transfer end signal input. The DMA transfer end signal is output from the direct memory access controller when the controller transfers data through DMA for the times specified by the DMA transfer count register (DMATCR) of the direct memory access controller. When a transfer end signal is sampled, the module enables buffer memory transmission (the same

condition as when $BVAL = 1$). Whether to sample the DMA transfer end signal can be specified through the $TENDE$ bit in $DnFBCFG$.

(c) DnFIFO Auto Clear Mode (D0FIFO/D1FIFO Port Reading Direction)

If 1 is set for the $DCLRM$ bit in $DnFIFOSEL$, the module automatically clears the buffer memory of the selected pipe when reading of the data from the buffer memory has been completed.

Table 27.25 shows the packet reception and buffer memory clearing processing for each of the various settings. As shown, the buffer clear conditions depend on the value set to the $BFRE$ bit. Using the $DCLRM$ bit eliminates the need for the buffer to be cleared even if a situation occurs that necessitates clearing of the buffer. This makes it possible to carry out DMA transfers without involving software.

This function can be set only in the buffer memory reading direction.

Table 27.25 Packet Reception and Buffer Memory Clearing Processing

Buffer Status When Packet is Received	Register Setting			
	DCLRM = 0		DCLRM = 1	
	BFRE = 0	BFRE = 1	BFRE = 0	BFRE = 1
Buffer full	Doesn't need to be cleared	Doesn't need to be cleared	Doesn't need to be cleared	Doesn't need to be cleared
Zero-length packet reception	Needs to be cleared	Needs to be cleared	Doesn't need to be cleared	Doesn't need to be cleared
Normal short packet reception	Doesn't need to be cleared	Needs to be cleared	Doesn't need to be cleared	Doesn't need to be cleared
Transaction count ended	Doesn't need to be cleared	Needs to be cleared	Doesn't need to be cleared	Doesn't need to be cleared

27.4.5 Control Transfers (DCP)

Data transfers of the data stage of control transfers are done using the default control pipe (DCP).

The DCP buffer memory is a 256-byte single buffer, and is a fixed area that is shared for both control reading and control writing. The buffer memory can be accessed through the CFIFO port.

(1) Control Transfers when the Host Controller Function is Selected

(a) Setup Stage

USQREQ, USBVAL, USBINDX, and USBLENG are the registers that are used to transmit a USB request for setup transactions. Writing setup packet data to the registers and writing 1 to the SUREQ bit in DCPCTR transmits the specified data for setup transactions. Upon completion of transactions, the SUREQ bit is cleared to 0. The above USB request registers should not be modified while SUREQ = 1. The device address for setup transactions is specified using the DEVSEL bits in DCPMAXP.

When the data for setup transactions has been sent, a SIGN or SACK interrupt request is generated according to the response received from the peripheral device (SIGN1 or SACK bits in INTSTS1), by means of which the result of the setup transactions can be confirmed.

A data packet of DATA0 (USB request) is transmitted as the data packet for the setup transactions regardless of the setting of the SQMON bit in DCPCTR.

(b) Data Stage

Data transfers are done using the DCP buffer memory.

The access direction of the DCP buffer memory should be specified using the ISEL bit in CFIFOSEL.

For the first data packet of the data stage, the data PID must be transferred as DATA1. Transaction is done by setting the data PID = DATA1 and the PID bit = BUF using the SQSET bit in DCPCTR. Completion of data transfer is detected using the BRDY and BEMP interrupts.

Setting continuous transfer mode allows data transfers over multiple packets. Note that when continuous transfer mode is set for the receiving direction, the BRDY interrupt is not generated until the buffer becomes full or a short packet is received (the integer multiple of the maximum packet size, and less than 256 bytes).

For control write transfers, when the number of data bytes to be sent is the integer multiple of the maximum packet size, a zero-length packet must be controlled to be sent at the end.

(c) Status Stage

Zero-length packet data transfers are done in the direction opposite to that in the data stage. As with the data stage, data transfers are done using the DCP buffer memory. Transactions are done in the same manner as the data stage.

For the data packets of the status stage, the data PID must be transferred as DATA1. The data PID should be set to DATA1 using the SQSET bit in DCPCTR.

For reception of a zero-length packet, the received data length must be confirmed using the DTLN bits in CFIFOCTR after the BRDY interrupt is generated, and the buffer memory must then be cleared using the BCLR bit.

(2) Control Transfers when the Function Controller Function is Selected**(a) Setup Stage**

This module always sends an ACK response in response to a setup packet that is normal with respect to this module. The operation of this module operates in the setup stage is noted below.

- (i) When a new USB request is received, this module sets the following registers:
 - Set the VALID bit in INTSTS0 to 1.
 - Set the PID bit in DCPCTR to NAK.
 - Set the CCPL bit in DCPCTR to 0.
- (ii) When a data packet is received right after the SETUP packet, the USB request parameters are stored in USBREQ, USBVAL, USBINDX, and USBLENG.

Response processing with respect to the control transfer should always be carried out after first setting VALID = 0. In the VALID = 1 state, PID = BUF cannot be set, and the data stage cannot be terminated.

Using the function of the VALID bit, this module is able to interrupt the processing of a request currently being processed if a new USB request is received during a control transfer, and can send a response in response to the newest request.

Also, this module automatically judges the direction bit (bit 8 of the bmRequestType) and the request data length (wLength) of the USB request that was received, and then distinguishes between control read transfers, control write transfers, and no-data control transfers, and controls the stage transition. For a wrong sequence, the sequence error of the control transfer stage transition interrupt is generated, and the software is notified. For information on the stage control of this module, see figure 27.7.

(b) Data Stage

Data transfers corresponding to USB requests that have been received should be done using the DCP. Before accessing the DCP buffer memory, the access direction should be specified using the ISEL bit in CFIFOSEL.

If the data being transferred is larger than the size of the DCP buffer memory, the data transfer should be carried out using the BRDY interrupt for control write transfers and the BEMP interrupt for control read transfers.

With control write transfers during high-speed operation, the NYET handshake response is carried out based on the state of the buffer memory.

(c) Status Stage

Control transfers are terminated by setting the CCPL bit to 1 with the PID bit in DCPCTR set to PID = BUF.

After the above settings have been entered, this module automatically executes the status stage in accordance with the data transfer direction determined at the setup stage. The specific procedure is as follows.

- (i) For control read transfers:

This module receives a zero-length packet from the USB host and sends an ACK response.

- (ii) For control write transfers and no-data control transfers:

This module sends the zero-length packet from the USB host and receives an ACK response.

(d) Control Transfer Auto Response Function

This module automatically responds to a normal SET_ADDRESS request. If any of the following errors occur in the SET_ADDRESS request, a response is necessary.

- (i) Any transfer other than a control read transfer: bmRequestType \neq H'00
- (ii) If a request error occurs: wIndex \neq H'00
- (ii) For any transfer other than a no-data control transfer: wLength \neq H'00
- (iv) If a request error occurs: wValue $>$ H'7F
- (v) Control transfer of a device state error: DVSQ = 011 (Configured)

For all requests other than the SET_ADDRESS request, the corresponding response is required.

27.4.6 Bulk Transfers (PIPE1 to PIPE5)

The buffer memory specifications for bulk transfers (single/double buffer setting, or continuous/non-continuous transfer mode setting) can be selected. The maximum size that can be set for the buffer memory is 2 Kbytes. The buffer memory state is controlled by this module, with a response sent automatically for a PING packet/NYET handshake.

(1) PING Packet Control when the Host Controller Function is Selected

This module automatically sends a PING packet in the OUT direction.

On receiving an ACK handshake in the initial state in which PING packet sending mode is set, this module sends an OUT packet as noted below. Reception of an NAK or NYET handshake returns this module to PING packet sending mode. This control also applies to the control transfers in the data stage and status stage.

1. Sets OUT data sending mode.
2. Sends a PING packet.
3. Receives an ACK handshake.
4. Sends an OUT data packet.
5. Receives an ACK handshake.
(Repeats steps 4 and 5.)
6. Sends an OUT data packet.
7. Receives an NAK/NYET handshake.
8. Sends a PING packet.

This module is returned to PING packet sending mode by a power-on reset, receiving a NYET/NAK handshake, setting or clearing the sequence toggle bits (SQSET and SQCLR), and setting the buffer clear bit (ACLRM) in PIPE_nCTR.

(2) NYET Handshake Control when the Function Controller Function is Selected

Table 27.26 shows the NYET handshake responses of this module. The NYET response of this module is made in conformance with the conditions noted below. When a short packet is received, however, the response will be an ACK response instead of a NYET packet response. The same applies to the data stages of control write transfers.

Table 27.26 NYET Handshake Responses

Value Set for PID Bit in DPCCTR	Buffer Memory State	Token	Response	Note
NAK/STALL	—	SETUP	ACK	—
	—	IN/OUT/PING	NAK/STALL	—
BUF	—	SETUP	ACK	—
	RCV-BRDY1	OUT/PING	ACK	If an OUT token is received, a data packet is received.
	RCV-BRDY2	OUT	NYET	Notifies whether a data packet can be received
	RCV-BRDY2	OUT (Short)	ACK	Notifies whether a data packet can be received
	RCV-BRDY2	PING	ACK	Notifies that a data packet can be received
	RCV-NRDY	OUT/PING	NAK	Notifies that a data packet cannot be received
	TRN-BRDY	IN	DATA0/DATA1	A data packet is transmitted
TRN-NRDY	IN	NAK	Notifies that a data packet cannot be transmitted	

[Legend]

- RCV-BRDY1: When an OUT/PING token is received, there is space in the buffer memory for two or more packets.
- RCV-BRDY2: When an OUT token is received, there is only enough space in the buffer memory for one packet.
- RCV-NRDY: When a PING token is received, there is no space in the buffer memory.
- TRN-BRDY: When an IN token is received, there is data to be sent in the buffer memory.
- TRN-NRDY: When an IN token is received, there is no data to be sent in the buffer memory.

27.4.7 Interrupt Transfers (PIPE6 to PIPE9)

When the function controller function is selected, this module carries out interrupt transfers in accordance with the timing controlled by the host controller. For interrupt transfers, PING packets are ignored (no responses are sent), and the ACK, NAK, and STALL responses are carried out without an NYET handshake response being made.

When the host controller function is selected, this module can set the timing of issuing a token using the interval timer. At this time, this module issues an OUT token even in the OUT direction, without issuing a PING token.

This module does not support high bandwidth transfers of interrupt transfers.

(1) Interval Counter during Interrupt Transfers when the Host Controller Function is Selected

For interrupt transfers, intervals between transactions are set in the IITV bits in PIPEPERI. This controller issues an interrupt transfer token based on the specified intervals.

(a) Counter Initialization

This controller initializes the interval counter under the following conditions.

- Power-on reset
The IITV bits are initialized.
- Buffer memory initialization using the ACLRM bit
The IITV bits are not initialized but the count value is. Setting the ACLRM bit to 0 starts counting from the value set in the IITV bits.

Note that the interval counter is not initialized in the following case.

- USB bus reset, USB suspended
The IITV bits are not initialized. Setting 1 to the UACT bit starts counting from the value before entering the USB bus reset state or USB suspended state.

(b) Operation when Transmission/Reception is Impossible at Token Issuance Timing

This module cannot issue tokens even at token issuance timing in the following cases. In such a case, this module attempts transactions at the subsequent interval.

- When the PID is set to NAK or STALL.
- When the buffer memory is full at the token sending timing in the receiving (IN) direction.
- When there is no data to be sent in the buffer memory at the token sending timing in the sending (OUT) direction.

27.4.8 Isochronous Transfers (PIPE1 and PIPE2)

This module has the following functions pertaining to isochronous transfers.

1. Notification of isochronous transfer error information
2. Interval counter (specified by the IITV bit)
3. Isochronous IN transfer data setup control (IDLY function)
4. Isochronous IN transfer buffer flush function (specified by the IFIS bit)

This module does not support the High Bandwidth transfers of isochronous transfers.

When using more than one pipe simultaneously for isochronous transfers, follow the packet constraints provided in section, 5.6.3, Isochronous Transfer Packet Size Constraints, in Universal Serial Bus Revision 2.0 Specification.

(1) Error Detection with Isochronous Transfers

This module has a function for detecting the error information noted below, so that when errors occur in isochronous transfers, software can control them. Tables 27.27 and 27.28 show the priority in which errors are confirmed and the interrupts that are generated.

(a) PID errors

- If the PID of the packet being received is illegal

(b) CRC errors and bit stuffing errors

- If an error occurs in the CRC of the packet being received, or the bit stuffing is illegal

(c) Maximum packet size exceeded

- The maximum packet size exceeded the set value.

(d) Overrun and underrun errors

- When host controller function is selected:
 - When using isochronous IN transfers (reception), the IN token was received but the buffer memory is not empty.
 - When using isochronous OUT transfers (transmission), the OUT token was transmitted, but the data was not in the buffer memory.
- When function controller function is selected:
 - When using isochronous IN transfers (transmission), the IN token was received but the data was not in the buffer memory.
 - When using isochronous OUT transfers (reception), the OUT token was received, but the buffer memory was not empty.

(e) Interval errors

When function controller function is selected, the following cases are considered as interval errors:

- During an isochronous IN transfer, the token could not be received during the interval frame.
- During an isochronous OUT transfer, the OUT token was received during frames other than the interval frame.

Table 27.27 Error Detection when a Token is Received

Detection Priority	Error	Generated Interrupt and Status
1	PID errors	No interrupts are generated in both cases when the host controller function is selected and the function controller function is selected (ignored as a corrupted packet).
2	CRC error and bit stuffing errors	No interrupts generated in both cases when the host controller function is selected and the function controller function is selected (ignored as a corrupted packet).
3	Overrun and underrun errors	An NRDY interrupt is generated to set the OVRN bit in both cases when host controller function is selected and function controller function is selected. When the host controller function is selected, no tokens are transmitted. When the function controller function is selected, a zero-length packet is transmitted in response to IN token. However, no data packets are received in response to OUT token.
4	Interval errors	An NRDY interrupt is generated when the function controller function is selected. It is not generated when the host controller function is selected.

Table 27.28 Error Detection when a Data Packet is Received

Detection Priority Order	Error	Generated Interrupt and Status
1	PID errors	No interrupts are generated (ignored as a corrupted packet)
2	CRC error and bit stuffing errors	An NRDY interrupt is generated to set the CRCE bit in both cases when the host controller function is selected and the function controller function is selected.
3	Maximum packet size exceeded error	A BEMP interrupt is generated to set the PID bits to STALL in both cases when the host controller function is selected and the function controller function is selected.

(2) DATA-PID

This module does not support High Bandwidth transfers. When the function controller function is selected, this module operates as follows in response to the received PID.

(a) IN direction

- DATA0: Sent as data packet PID
- DATA1: Not sent
- DATA2: Not sent
- mData: Not sent

(b) OUT direction (when using full-speed operation)

- DATA0: Received normally as data packet PID
- DATA1: Received normally as data packet PID
- DATA2: Packets are ignored
- mData: Packets are ignored

(c) OUT direction (when using high-speed operation)

- DATA0: Received normally as data packet PID
- DATA1: Received normally as data packet PID
- DATA2: Received normally as data packet PID
- mData: Received normally as data packet PID

(3) Interval Counter

The isochronous interval can be set using the IITV bits in PIPEPERI. The interval counter enables the functions shown in table 27.29 when the function controller function is selected. When the host controller function is selected, this module generates the token issuance timing. When the host controller function is selected, the interval counter operation is the same as the interrupt transfer operation.

Table 27.29 Functions of the Interval Counter when the Function Controller Function is Selected

Transfer Direction	Function	Conditions for Detection
IN	IN buffer flush function	When an IN token cannot be normally received in the interval frame during an isochronous IN transfer
OUT	Notifies that a token not being received	When an OUT token cannot be normally received in the interval frame during an isochronous OUT transfer

The interval count is carried out when an SOF is received or for interpolated SOFs, so the isochronisms can be maintained even if an SOF is damaged. The frame interval that can be set is the 2^{IITV} frame or 2^{IITV} μ frames.

(a) Interval Counter Initialization when the Function Controller Function is Selected

This module initializes the interval counter under the following conditions.

- Power-on reset
The IITV bit is initialized.
- Buffer memory initialization using the ACLRM bit
The IITV bits are not initialized but the count value is. Setting the ACLRM bit to 0 starts counting from the value set in the IITV bits.

After the interval counter has been initialized, the counter is started under the following conditions 1 or 2 when a packet has been transferred normally.

1. An SOF is received following transmission of data in response to an IN token, in the PID = BUF state.
2. An SOF is received after data following an OUT token is received in the PID = BUF state.

The interval counter is not initialized under the conditions noted below.

1. When the PID bit is set to NAK or STALL

The interval timer does not stop. This module attempts the transactions at the subsequent interval.

2. The USB bus reset or the USB is suspended

The IITV bit is not initialized. When the SOF has been received, the counter is restarted from the value prior to the reception of the SOF.

(b) Interval Counting and Transfer Control when the Host Controller Function is Selected

This module controls the interval between token issuance operations based on the IITV bit settings. Specifically, this module issues a token for a selected pipe once every 2^{IITV} (μ) frames.

This module counts the interval every 1-ms frame for the pipes used for communications with the full-speed or low-speed peripheral devices connected to a high-speed HUB.

This module starts counting the token issuance interval at the (μ) frame following the (μ) frame in which the PID bits have been set to BUF.

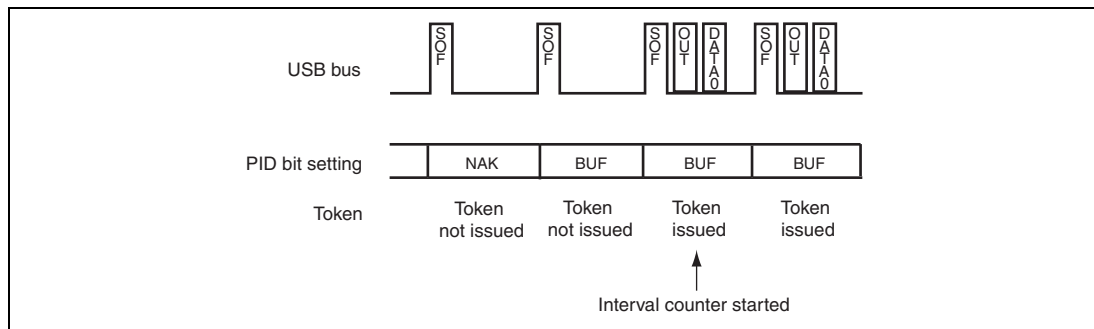

Figure 27.16 Token Issuance when IITV = 0

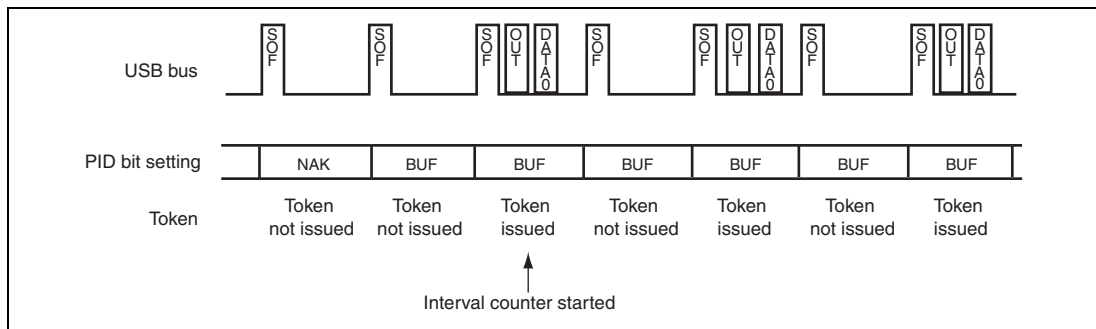

Figure 27.17 Token Issuance when IITV = 1

When the selected pipe is for isochronous transfers, this module carries out the operation below in addition to controlling token issuance interval. This module issues a token even when the NRDY interrupt generation condition is satisfied.

- When the selected pipe is for isochronous IN transfers
 This module generates the NRDY interrupt when this module issues the IN token but does not receive a packet successfully from a peripheral device (no response or packet error).
 This module sets the OVRN bit to 1 generating the NRDY interrupt when the time to issue an IN token comes in a state in which this module cannot receive data because the FIFO buffer is full (because data is read from the FIFO buffer too late).
- When the selected pipe is for isochronous OUT transfers
 This module sets the OVRN bit to 1 generating the NRDY interrupt and transmitting a zero-length packet when the time to issue an OUT token comes in a state in which there is no data to be transmitted in the FIFO buffer (because data is written to the FIFO buffer too late).
 The token issuance interval is reset when a power-on reset is applied or the ACLRM bit is set to 1.

(c) Interval Counting and Transfer Control when the Function Controller Function is Selected

- When the selected pipe is for isochronous OUT transfers

This module generates the NRDY interrupt when this module fails to receive a data packet within the interval set by the IITV bits in terms of (μ) frames.

This module generates the NRDY interrupt when this module fails to receive a data packet because of a CRC error or other errors contained in the packet, or because of the FIFO buffer being full.

This module generates the NRDY interrupt on receiving an SOF packet. Even if the SOF packet is corrupted, the internal interpolation is used and allows the interrupt to be generated at the timing to receive the SOF packet.

However, when the IITV bits are set to the value other than 0, this module generates the NRDY interrupt on receiving an SOF packet for every interval after starting interval counting operation. When the PID bits are set to NAK after starting the interval timer, this module does not generate the NRDY interrupt on receiving an SOF packet.

The interval counting starts at the different timing depending on the IITV bit setting as follows.

- When IITV = 0: The interval counting starts at the (μ) frame following the (μ) frame in which the PID bits for the selected pipe has been set to BUF.

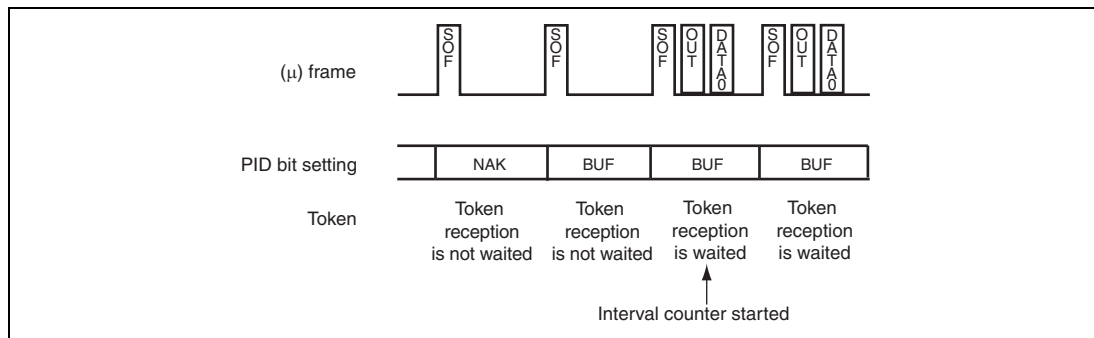

Figure 27.18 Relationship between (μ) Frames and Expected Token Reception when IITV = 0

- When IITV \neq 0: The interval counting starts on completion of successful reception of the first data packet after the PID bits for the selected pipe have been modified to BUF.

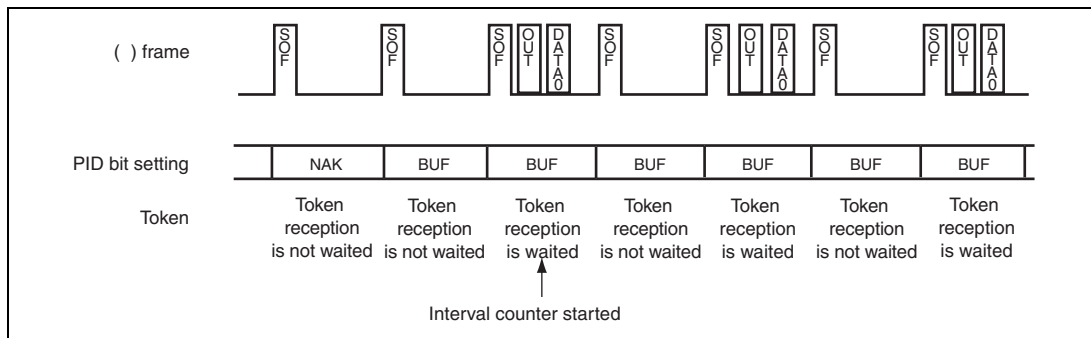

Figure 27.19 Relationship between (μ) Frames and Expected Token Reception when IITV = 1

- When the selected pipe is for isochronous IN transfers

The IFIS bit should be 1 for this use. When IFIS = 0, this module transmits a data packet in response to the received IN token irrespective of the IITV bit setting.

When IFIS = 1, this module clears the FIFO buffer when this module fails to receive an IN token within the interval set by the IITV bits in terms of (μ) frames in a state in which there is data to be transmitted in the FIFO buffer.

This module also clears the FIFO buffer when this module fails to receive an IN token successfully because of a bus error such as a CRC error contained in the token.

This module clears the FIFO buffer on receiving an SOF packet. Even if the SOF packet is corrupted, the internal interpolation is used and allows the FIFO buffer to be cleared at the timing to receive the SOF packet.

The interval counting starts at the different timing depending on the IITV bit setting (similar to the timing during OUT transfers).

The interval is counted on any of the following conditions in function controller mode.

- When a power-on reset is applied.
- When the ACLRM bit is set to 1.
- When this module detects a USB reset.

(4) Setup of Data to be Transmitted using Isochronous Transfer when the Function Controller Function is Selected

With isochronous data transmission using this module in function controller function, after data has been written to the buffer memory, a data packet can be sent with the next frame in which an SOF packet is detected. This function is called the isochronous transfer transmission data setup function, and it makes it possible to designate the frame from which transmission began.

If a double buffer is used for the buffer memory, transmission will be enabled for only one of the two buffers even after the writing of data to both buffers has been completed, that buffer memory being the one to which the data writing was completed first. For this reason, even if multiple IN tokens are received, the only buffer memory that can be sent is one packet's worth of data.

When an IN token is received, if the buffer memory is in the transmission enabled state, this module transmits the data. If the buffer memory is not in the transmission enabled state, however, a zero-length packet is sent and an underrun error occurs.

Figure 27.20 shows an example of transmission using the isochronous transfer transmission data setup function with this module, when IITV = 0 (every frame) has been set. Sending of a zero-length packet is displayed in the figure as Null, in a shaded box.

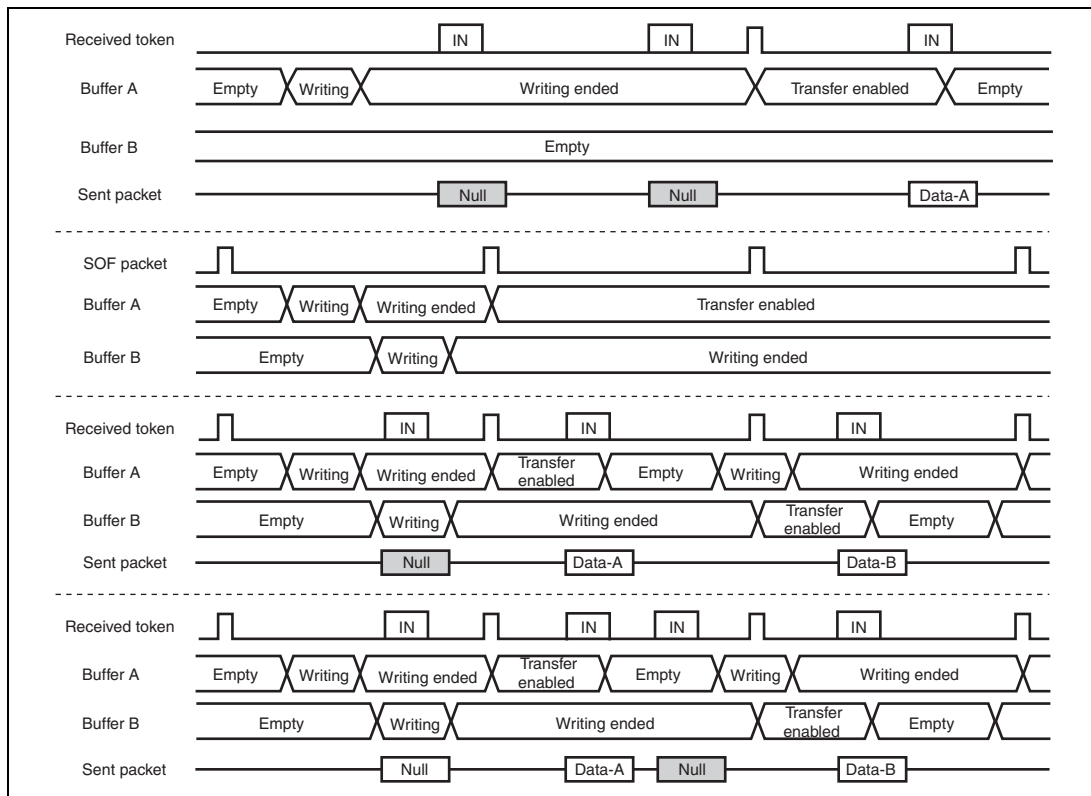

Figure 27.20 Example of Data Setup Function Operation

(5) Isochronous Transfer Transmission Buffer Flush when the Function Controller Function is Selected

If an SOF packet or a μ SOF packet is received without receiving an IN token in the interval frame during isochronous data transmission, this module operates as if an IN token had been corrupted, and clears the buffer for which transmission is enabled, putting that buffer in the writing ended state.

If a double buffer is being used and writing to both buffers has been completed, the buffer memory that was cleared is seen as the data having been sent at the same interval frame, and transmission is enabled for the buffer memory that is not discarded with SOF or μ SOF packets reception.

The timing at which the operation of the buffer flush function varies depending on the value set for the IITV bit.

- If IITV = 0
The buffer flush operation starts from the next frame after the pipe becomes valid.
- In any cases other than IITV = 0
The buffer flush operation is carried out subsequent to the first normal transaction.

Figure 27.21 shows an example of the buffer flush function of this module. When an unanticipated token is received prior to the interval frame, this module sends the written data or a zero-length packet according to the buffer state.

Figure 27.21 Example of Buffer Flush Function Operation

Figure 27.22 shows an example of this module generating an interval error. There are five types of interval errors, as shown below. The interval error is generated at the timing indicated by (1) in the figure, and the IN buffer flush function is activated.

If an interval error occurs during an IN transfers, the buffer flush function is activated; and if it occurs during an OUT transfer, an NRDY interrupt is generated.

The OVRN bit should be used to distinguish between NRDY interrupts such as received packet errors and overrun errors.

In response to tokens that are shaded in the figure, responses occur based on the buffer memory status.

1. IN direction:
 - If the buffer is in the transmission enabled state, the data is transferred as a normal response.
 - If the buffer is in the transmission disabled state, a zero-length packet is sent and an underrun error occurs.
2. OUT direction:
 - If the buffer is in the reception enabled state, the data is received as a normal response.
 - If the buffer is in the reception disabled state, the data is discarded and an overrun error occurs.

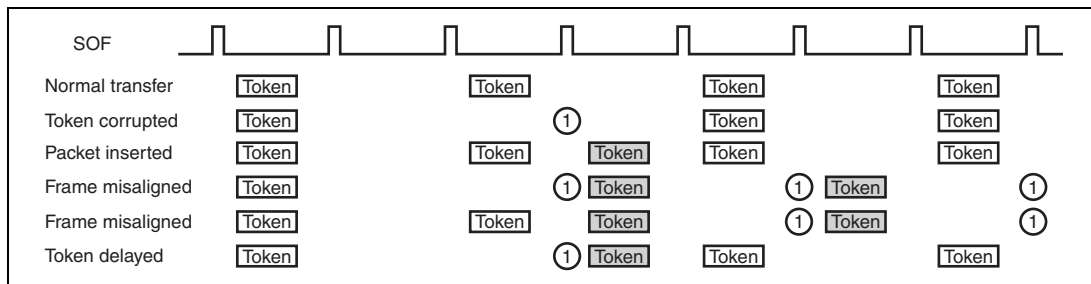

Figure 27.22 Example of an Interval Error Being Generated when IITV = 1

27.4.9 SOF Interpolation Function

When the function controller function is selected and if data could not be received at intervals of 1 ms (when using full-speed operation) or 125 μ s (when using high-speed operation) because an SOF packet was corrupted or missing, this module interpolates the SOF. The SOF interpolation operation begins when the USBE and SCKE bits in SYSCFG have been set to 1 and an SOF packet is received. The interpolation function is initialized under the following conditions.

- Power-on reset
- USB bus reset
- Suspended state detected

Also, the SOF interpolation operates under the following specifications.

- 125 μ s/1 ms conforms to the results of the reset handshake protocol.
- The interpolation function is not activated until an SOF packet is received.
- After the first SOF packet is received, either 125 μ s or 1 ms is counted with an internal clock of 48 MHz, and interpolation is carried out.
- After the second and subsequent SOF packets are received, interpolation is carried out at the previous reception interval.
- Interpolation is not carried out in the suspended state or while a USB bus reset is being received. (With suspended transitions in high-speed operation, interpolation continues for 3 ms after the last packet is received.)

This module supports the following functions based on the SOF detection. These functions also operate normally with SOF interpolation, if the SOF packet was corrupted.

- Refreshing of the frame number and the micro-frame number
- SOFR interrupt timing and μ SOF lock
- Isochronous transfer interval count

If an SOF packet is missing when full-speed operation is being used, the FRNM bit in FRMNUM is not refreshed. If a μ SOF packet is missing during high-speed operation, the UFRNM bit in UFRMNUM is refreshed. However, if a μ SOF packet for which the UFRNM = 000 is missing, the FRNM bit is not refreshed. In this case, the FRNM bit is not refreshed even if successive μ SOF packets other than UFRNM = 000 are received normally.

27.4.10 Pipe Schedule

(1) Conditions for Generating a Transaction

When the host controller function is selected and UACT has been set to 1, this module generates a transaction under the conditions noted in table 27.30.

Table 27.30 Conditions for Generating a Transaction

Transaction	Conditions for Generation				
	DIR	PID	IITV0	Buffer State	SUREQ
Setup	—* ¹	—* ¹	—* ¹	—* ¹	1 setting
Control transfer data stage, status stage, bulk transfer	IN	BUF	Invalid	Receive area exists	—* ¹
	OUT	BUF	Invalid	Send data exists	—* ¹
Interrupt transfer	IN	BUF	Valid	Receive area exists	—* ¹
	OUT	BUF	Valid	Send data exists	—* ¹
Isochronous transfer	IN	BUF	Valid	* ²	—* ¹
	OUT	BUF	Valid	* ³	—* ¹

- Notes: 1. Symbols (—) in the table indicate that the condition is one that is unrelated to the generating of tokens. "Valid" indicates that, for interrupt transfers and isochronous transfers, the condition is generated only in transfer frames that are based on the interval counter. "Invalid" indicates that the condition is generated regardless of the interval counter.
2. This indicates that a transaction is generated regardless of whether or not there is a receive area. If there was no receive area, however, the received data is destroyed.
3. This indicates that a transaction is generated regardless of whether or not there is any data to be sent. If there was no data to be sent, however, a zero-length packet is sent.

(2) Transfer Schedule

This section describes the transfer scheduling within a frame of this module. After the module sends an SOF, the transfer is carried out in the sequence described below.

1. Execution of periodic transfers

A pipe is searched in the order of Pipe 1 → Pipe 2 → Pipe 6 → Pipe 7 → Pipe 8 → Pipe 9, and then, if the pipe is one for which an isochronous or interrupt transfer transaction can be generated, the transaction is generated.

2. Setup transactions for control transfers

The DCP is checked, and if a setup transaction is possible, it is sent.

3. Execution of bulk and control transfer data stages and status stages

A pipe is searched in the order of DCP → Pipe 1 → Pipe 2 → Pipe 3 → Pipe 4 → Pipe 5, and then, if the pipe is one for which a bulk or control transfer data stage or a control transfer status stage transaction can be generated, the transaction is generated.

If a transfer is generated, processing moves to the next pipe transaction regardless of whether the response from the peripheral device is ACK or NAK. Also, if there is time for the transfer to be done within the frame, step 3 is repeated.

(3) USB Communication Enabled

Setting the UACT bit of the DVSTCTR register to 1 initiates sending of an SOF or μ SOF, and makes it possible to generate a transaction.

Setting the UACT bit to 0 stops the sending of the SOF or μ SOF and initiates a suspend state. If the setting of the UACT bit is changed from 1 to 0, processing stops after the next SOF or μ SOF is sent.

27.5 Usage Notes

27.5.1 Setting up the USB Transceiver

Set up the USB transceiver accordingly before using this module for high-speed transfer. The required setting is indicated below. Figure 27.23 shows an example of a program for making the setting.

(1) Write 1 to the UAC23 bit in the USB AC characteristics switching register 1 (USBACSWR1).

```

; Initialization routine
; (1) Set UACS23 = 1
      MOVI20 #H'FFFFFFC0C2,R0
      MOV.W #H'0080,R1
      MOV.W R1,@R0
      :
      :

```

Figure 27.23 Procedure for Setting the USB Transceiver

27.5.2 Power Supply for USB Transceiver

- Set the voltage level of power supply USB V_{CC} , USB DV_{CC} , and USB UV_{CC} to the same as V_{CC} .
- Set the voltage level of power supply USB APV_{CC} and USB DPV_{CC} to the same as PV_{CC} .
- Set the voltage level of ground USB V_{SS} , USB DV_{SS} , USB UV_{SS} , USB APV_{SS} , and USB DPV_{SS} to the same as V_{SS} .
- Separate analog power supplies USB V_{CC} , USB V_{SS} , USB APV_{CC} , and USB APV_{SS} from the digital power supplies.

Section 28 Video Display Controller 3

28.1 Overview

The video display controller 3 provides the following four functions. Note that the video display function and video recording function cannot be used together.

1. Video display function: Reduces the size of the input video, buffers the resultant video data in the memory, and then displays the video on the panel.
2. Video recording function: Stores a specified number of input video fields in on-chip large-capacity RAM or SDRAM.
3. Function for overlaying graphics images (two planes) on the input video.
4. Function for outputting the control signals for the TFT-LCD panel.

28.2 Features

Table 28.1 Features

Item	Function
Operating frequency	Video input clock: 27 MHz Panel clock: 4 MHz to 36 MHz (depends on the panel specifications)
Input video standard	8-bit input conforming to the ITU-R BT.656 standard (27 MHz) 8-bit serial input conforming to the ITU-R BT.601 standard (27 MHz)
Video recording function	Stores video data in the RGB565 format at a rate of 1/2 field (NTSC: 30 fps; PAL: 25 fps).
Video quality adjustment function	Contrast adjustment and brightness adjustment
Video scaling processing	Vertical: $\times 1/2$, $\times 1/3$, or $\times 1/4$ Horizontal: $\times 2/3$, $\times 1/2$, $\times 1/3$, or $\times 1/4$ For the support of PAL, each scaled value can be further multiplied by 6/7.
Graphics images	Two planes (layers 1 and 2) RGB565 progressive format (R = 5 bits, G = 6 bits, and B = 5 bits; 16 bits in total) α RGB4444 progressive format (α = 4 bits, R = 4 bits, G = 4 bits, and B = 4 bits; 16 bits in total)

Item	Function
Graphics functions	<p>α blending window function: Mixes the input video and layers 1 and 2 according to transparency rate α in the specified region (fade-in and fade-out functions are available).</p> <p>Chroma-keying function: Mixes images with applying the specified RGB color according to transparency rate α.</p> <p>Dot α function: Mixes images according to transparency rate α when the target is a graphics image in the αRGB4444 format.</p> <p>For each dot, the priority among the α values of the above functions is as follows: α blending window > chroma-keying > dot α.</p>
Output video size	<p>640 pixels \times 480 lines (VGA size)</p> <p>480 pixels \times 240 lines (WQVGA size)</p> <p>320 pixels \times 240 lines (QVGA size) in landscape</p> <p>240 pixels \times 320 lines (QVGA size) in portrait</p> <p>Note: The maximum input video size that can be displayed is 480 pixels \times 240 lines for NTSC and 480 pixels \times 288 lines for PAL.</p>
Output video format	RGB565 progressive video output (16-bit parallel output)
Sync signal output	Outputs the control signals for the TFT-LCD panel.
Interrupt output	<p>Line interrupt output (can be output on a desired line)</p> <p>VSYNC cycle fluctuation detection signal for BT.601 and BT.656 video input</p> <p>Field write completion signal</p> <p>Overflow/underflow detection signal for the internal buffer</p>

28.3 Input/Output Pins

Table 28.2 Pin Configuration

Symbol	I/O	Pin Name	Function
DV_CLK	Input	Video input clock	BT.601 or BT.656 clock input pin.
DV_VSYNC	Input	VSYNC input	BT.601 VSYNC signal input pin.
DV_HSYNC	Input	HSYNC input	BT.601 HSYNC signal input pin.
DV_DATA7 to DV_DATA0	Input	BT.601 or BT.656 input	BT.601 or BT.656 data signal input pins.
LCD_CLK	Output	Panel clock	Panel clock output pin.
LCD_EXTCLK	Input	Panel clock source	Panel clock source input pin.
LCD_VSYNC	Output	Panel VSYNC output	Vertical sync signal output pin for the panel.
LCD_HSYNC	Output	Panel HSYNC output	Horizontal sync signal output pin for the panel.
LCD_DE	Output	Panel data enable output	Data enable signal or data start position pulse signal output pin for the panel.
LCD_DATA15 to LCD_DATA0	Output	Panel data output	Data output pins for the panel. MSB LSB MSB LSB [15:11]: Red [4:0] [10:5]: Green [5:0] [4:0]: Blue [4:0]
LCD_M_DISP	Output	Panel control signal	Alternating signal for the panel.

28.4 Configuration

This module consists of seven functional blocks listed in table 28.3. Figure 28.1 shows the entire block diagram of this module.

Table 28.3 Functional Blocks

Block Name	Overview of Functions
Input timing control block	Selects the timing of the sync signal input with respect to the clock rising or falling edge and selects the sync signal polarity. It also selects the timing of the BT.601 and BT.656 video input signals with respect to the clock rising or falling edge.
Video receiving block	<ol style="list-style-type: none"> (1) Captures the input video and applies the scaling, contrast, and brightness processing. (2) Converts the YC format into the RGB565 format and stores the data through the IV1-BUS. (3) Applies field skipping processing, and stores the resultant data in the RGB565 format through the IV1-BUS.
Video supplying block	Reads video data through the IV2-BUS.
Graphics block 1	Reads a graphics image (layer 1) from the memory through the IV3-BUS, overlays it on the video sent from the video supplying block, and outputs the result to graphics block 2.
Graphics block 2	Reads a graphics image (layer 2) from the memory through the IV4-BUS, overlays it on the output from graphics block 1, and outputs the result to the panel control block.
Panel control block	Generates the sync signals for output to the panel.
Output timing control block	Controls the timing of the sync signal output with respect to the clock rising or falling edge and controls the sync signal polarity. It also controls the timing of the RGB666 video output signals with respect to the clock rising or falling edge.

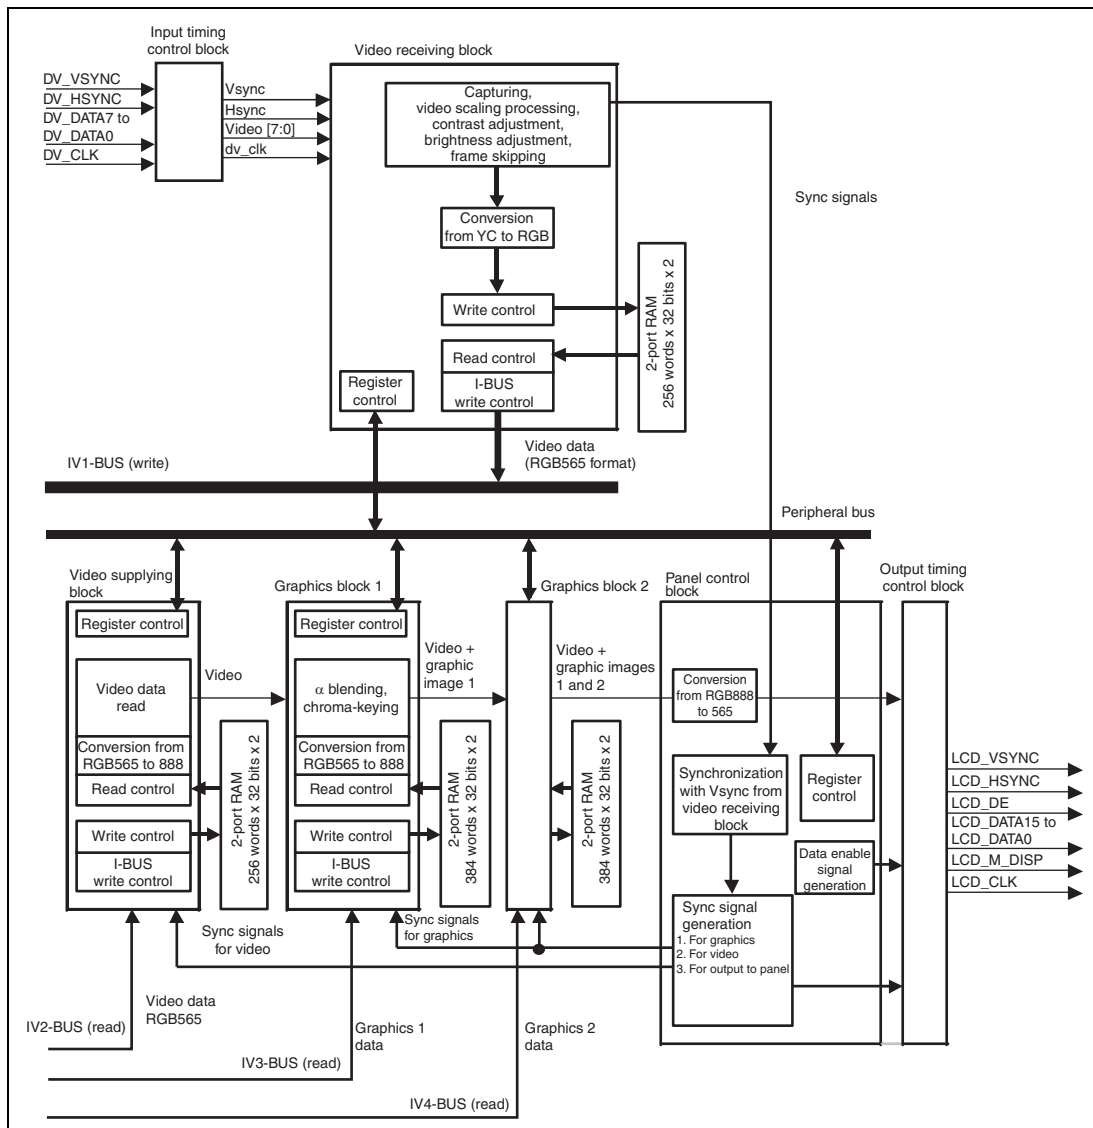

Figure 28.1 Block Diagram

28.5 Input Video Interface

28.5.1 BT.601 Video Input

The DV_VSYNC and DV_HSYNC signals conforming to BT.601 should be input with the timing shown in figure 28.2. The timing for sampling these signal inputs can be selected as either the rising or falling edge of the DV_CLK. Negative polarity is also supported. The field type is determined according to the DV_VSYNC and DV_HSYNC timing.

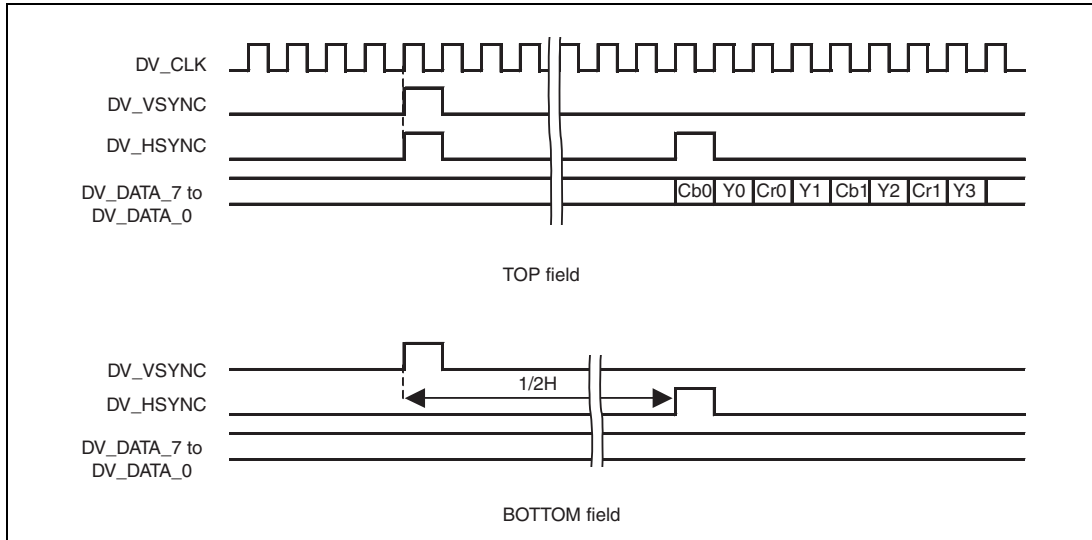

Figure 28.2 BT.601 Input Interface Signals

28.5.2 BT.656 Video Input

This module supports 8-bit video input conforming to the BT.656 standard. From the reference code (EAV or SAV), the Vsync, Hsync, and field information are obtained. Tables 28.4 to 28.6 and figures 28.3 and 28.4 give an overview of the standard.

Table 28.4 Reference Code (EAV/SAV)

Bit Number	7	6	5	4	3	2	1	0
Function	Fixed	F	V	H	P3	P2	P1	P0
0	1	0	0	0	0	0	0	0
1	1	0	0	1	1	1	0	1

Figure 28.4 BT.656 Timing (625 Lines)

28.6 Functional Descriptions

28.6.1 Video Display Function

This module provides a function for overlaying the input video and graphics images (two planes) and displaying them on the panel (video display function).

(1) Capturing

The BT.601 or BT.656 input video data is captured from a desired position with a desired size. The position should be specified with respect to the left end of the first line of the TOP field.

Figure 28.5 Concept of Capturing Function

(2) Video and Graphics Image Processing Flow

The captured video is reduced in size, the contrast and brightness are adjusted, and then the resultant data is stored in the RGB565 format in the memory. The video data stored in the memory and graphics images (two planes) are overlaid and the result is displayed in the panel.

Figure 28.6 Overview of Video and Graphics Image Processing

(3) Conversion from YC to RGB

After contrast and brightness adjustment, the YC422 format is converted to the RGB888 format in accordance with the ITU-R BT601 standard.

$$Y_1 = Y$$

$$Cb_1 = Cb - 128$$

$$Cr_1 = Cr - 128$$

$$\begin{bmatrix} R \\ G \\ B \end{bmatrix} = \begin{bmatrix} 1.164 & 0.000 & 1.596 \\ 1.164 & -0.391 & -0.813 \\ 1.164 & 2.018 & 0.000 \end{bmatrix} \begin{bmatrix} Y_1 \\ Cb_1 \\ Cr_1 \end{bmatrix}$$

(4) Conversion from RGB888 to RGB565

$$R' = R \times \frac{31}{255}$$

$$G' = G \times \frac{63}{255}$$

$$B' = B \times \frac{31}{255}$$

(5) Relationship between Input Video Vsync and Reference Vsync

The reference Vsync is a signal that is used as the reference when specifying the timing of the Vsync signals for video, graphics images, and output to the panel (see figure 28.7). The timing of the reference Vsync signal can be specified through register settings with respect to the reference point; that is, the left end of the first line of the TOP field.

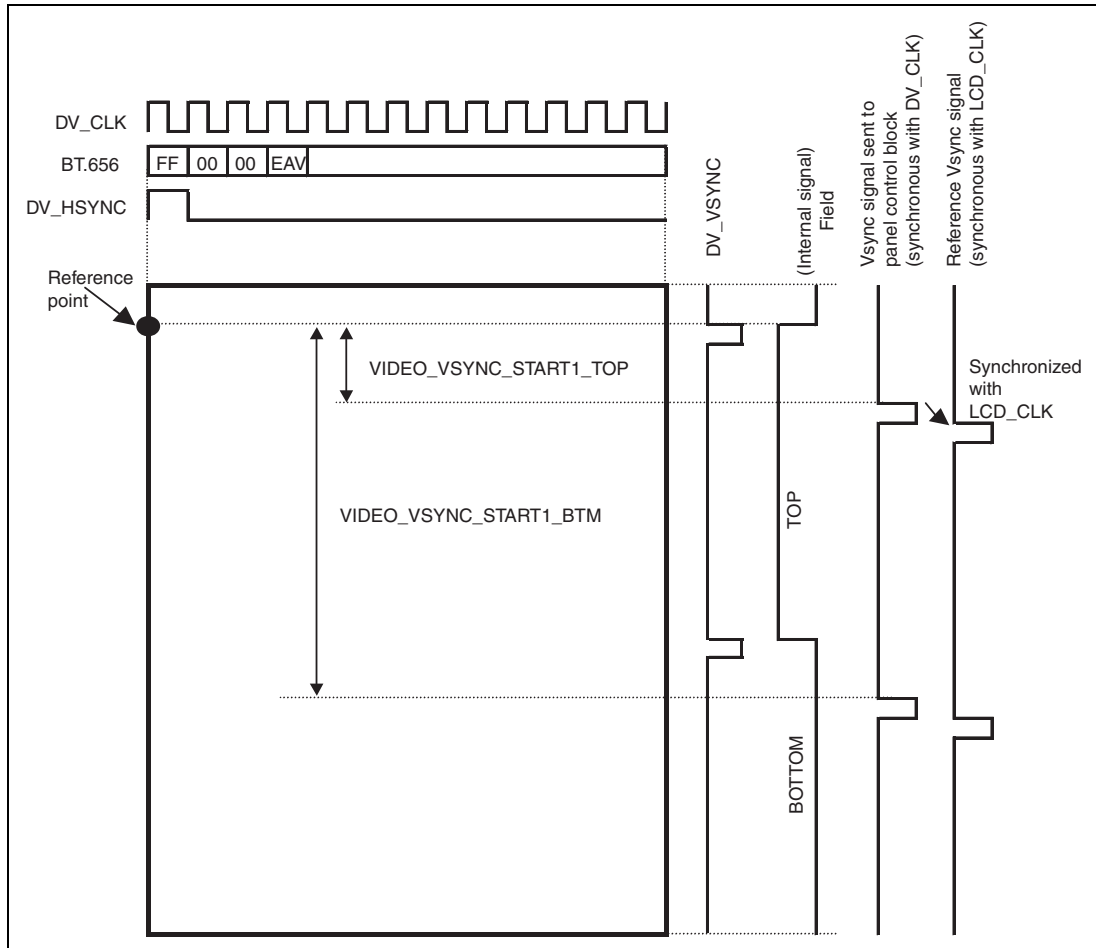

Figure 28.7 Timing of Reference Vsync Generation

(6) Controlling Video and Graphics Image Display Positions

This module provides functions for generating the Vsync and Hsync signals for video, graphics images, and output to the panel with desired timings with respect to the reference Vsync signal. The positions of the video and graphics image displayed on the panel are shown in figure 28.8.

The timing of the Vsync signal for video has a restriction because the period for buffering the input video in the large-capacity on-chip RAM should be taken into account. For details, refer to section 28.8, Usage Notes.

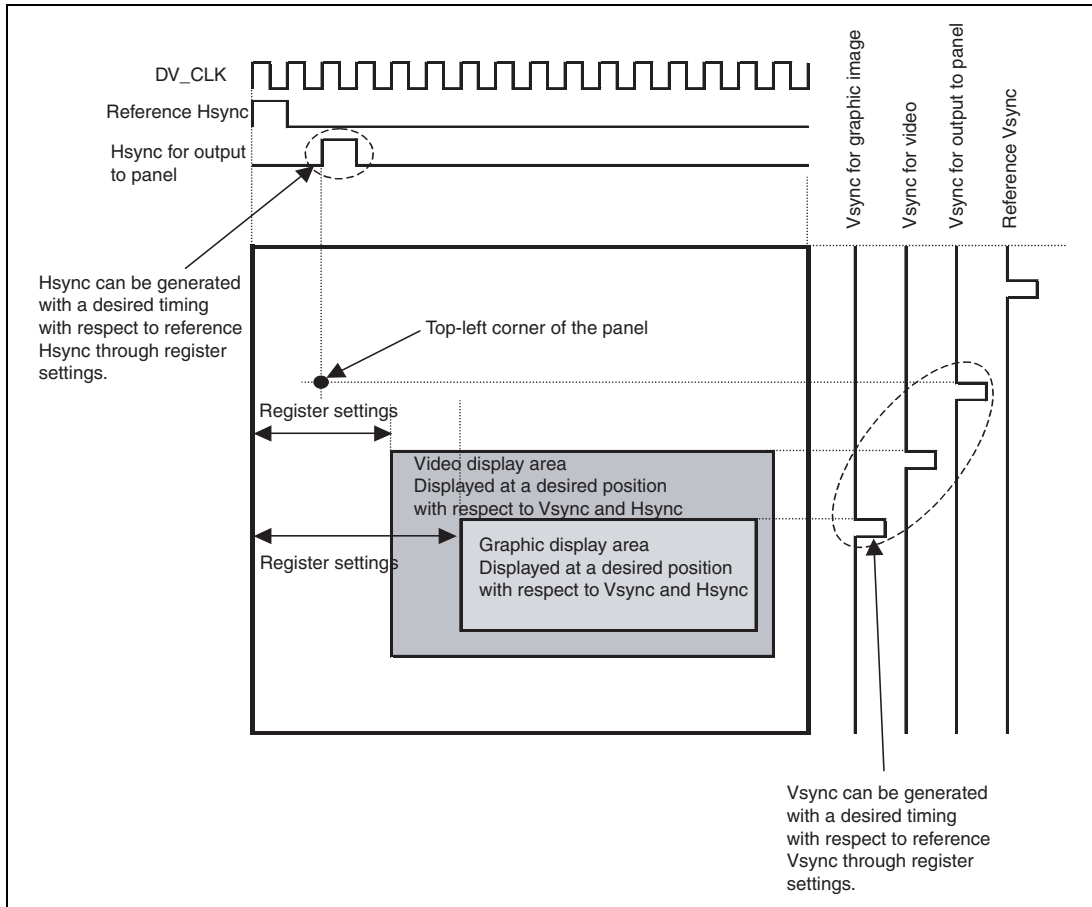

Figure 28.8 Video and Graphics Image Display Positions on Panel

28.6.2 Video Recording Function

This module stores the captured video in the RGB565 format at a 1/2-field rate (NTSC: 30 fps; PAL: 25 fps) (video recording function) after contrast and brightness adjustment. For the capturing function, refer to section 28.6.1 (1), Capturing.

The destination address of recording is calculated according to the register settings of the base address, line offset, field offset, and number of fields to be stored. After data has been written for the specified number of fields, the memory is overwritten by new video from the first address. The current field number being written can be monitored through the status register. After one field of video data is written, an interrupt is sent to the CPU to indicate the completion of writing.

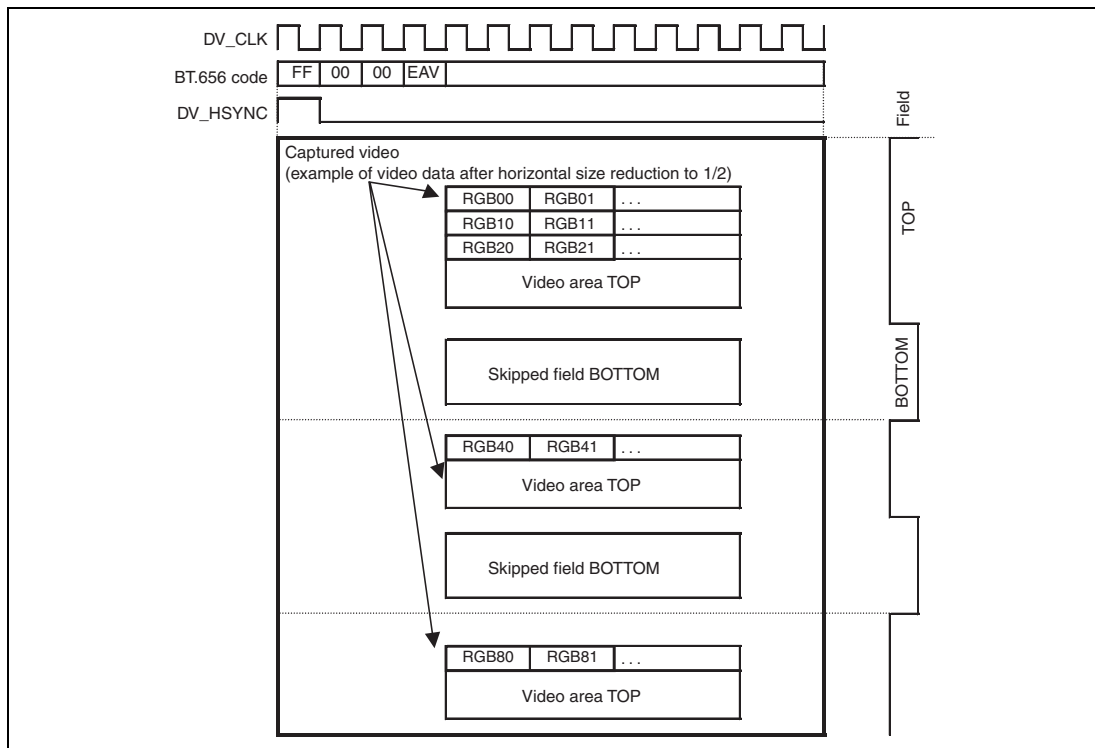

Figure 28.9 Correspondence between Video Data and Addresses

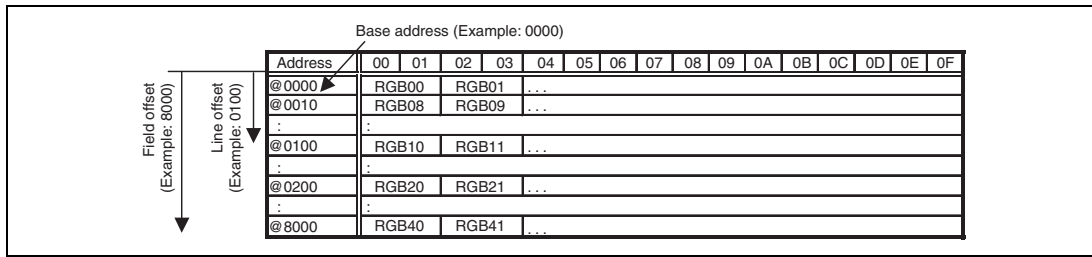

Figure 28.10 Schematic Diagram of Video Data Allocation on On-Chip Large-Capacity RAM or SDRAM

28.6.3 Panel Control Signal Output Function

(1) Sync Signal Generation

Figure 28.11 shows an example of sync signal format that can be generated. The vertical sync signal can be output with a desired pulse width specified in 1-H units and the horizontal sync signal in 1-clock-cycle units.

Figure 28.11 Example of Sync Signal Output

(2) Data Enable Signal Generation

The data enable signal (LCD_DE) for output to the panel can be generated as a rectangular area with a desired size. In addition, a signal with one pulse width can be generated one cycle before valid data to indicate the start position of valid data.

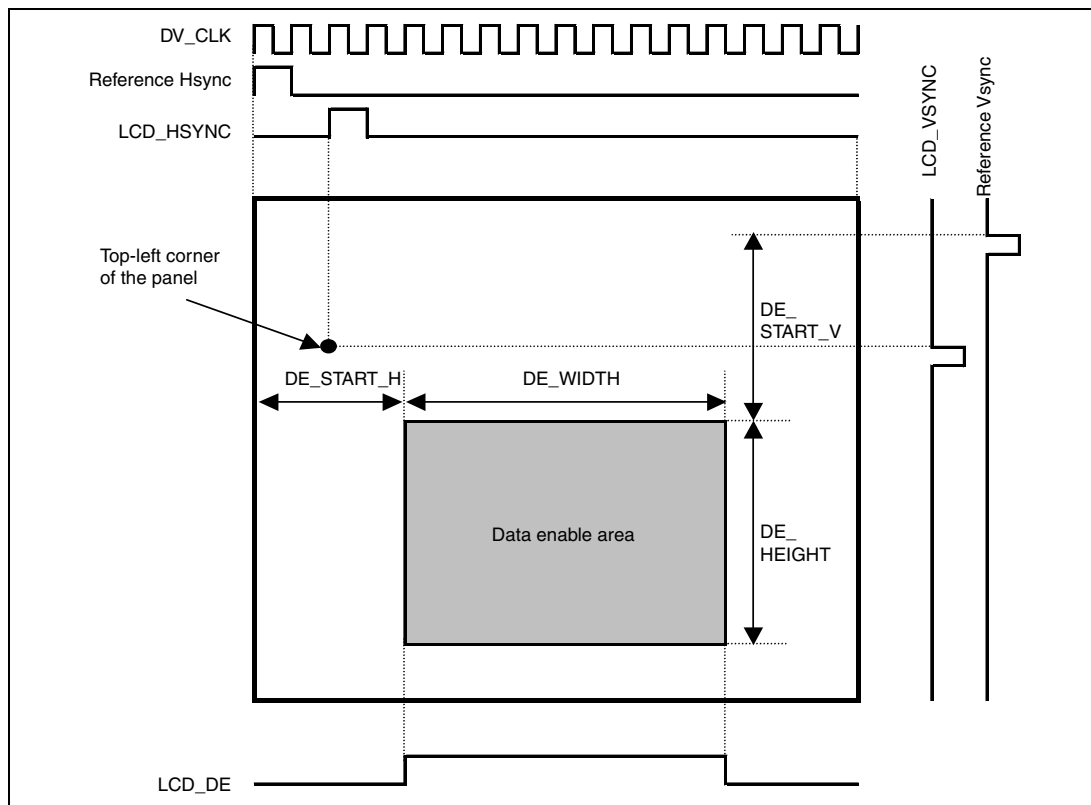

Figure 28.12 Timing of Data Enable Signal

(3) AC Modulation Signal (Alternating Signal)

This output signal is toggled between high and low (H -> L-> H -> ...) every specified number of lines.

The interval is calculated as (set value) + 1 lines.

Figure 28.13 LCD_M_DISP Signal Description

28.7 Register Descriptions

Tables 28.7 to 28.10 show the register configuration.

Table 28.7 Register Configuration in Video Receiving and Supplying Blocks

Register Name	Abbreviation	R/W	Initial Value	Address	Access Size
Video operating mode register	VIDEO_MODE	R/W	H'0000 0000	H'FFFF 2000	32, 16, 8

Bit	Bit Name	Initial Value	R/W	Description
31, 30	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
29	RGB565	0	R/W	Specifies the method of conversion from RGB888 to RGB565. 0: Converted by the operation described in section 28.6.1 (4), Conversion from RGB888 to RGB565. 1: Lower bits are truncated.
28	INV_CbCr	0	R/W	Specifies Cb and Cr inversion. 0: Normal operation 1: Inversion
27 to 22	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
21	BURST_MODE_DISP	0	R/W	Selects the mode of transfer through the IV2-BUS in the video supplying block. Reading out from the areas except the large-capacity on-chip RAM requires this bit to be set to 0. 0: 16-byte burst transfer 1: 128-byte burst transfer

Bit	Bit Name	Initial Value	R/W	Description
20	BURST_MODE _MAIN	0	R/W	Selects the mode of transfer through the IV1-BUS in the video receiving block. Writing out to the areas except the large-capacity on-chip RAM requires this bit to be set to 0. 0: 16-byte burst transfer 1: 128-byte burst transfer
19, 18	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
17	ENDIAN_DISP	0	R/W	Specifies the endian for the IV2-BUS in the video supplying block. 0: Big endian 1: Little endian
16	ENDIAN_MAIN	0	R/W	Specifies the endian for the IV1-BUS in the video supplying block. 0: Big endian 1: Little endian
15	—	All 0	R	Reserved This bit is always read as 0. The write value should always be 0.
14	SEL_EXSYNC	0	R/W	Enables the external input sync signal. 0: Disabled 1: Enabled
13	SEL_656601	0	R/W	Specifies the format of the input video. 0: BT.656 input (be sure to set SEL_EXSYNC = 0) 1: BT.601 input (be sure to set SEL_EXSYNC = 1)
12	SEL_525625	0	R/W	Specifies the number of lines for the input video. 0: 525 lines (NTSC) 1: 625 lines (PAL)
11 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
4	VIDEO_MODE	0	R/W	Specifies the operating mode for the video receiving block. 0: Video recording mode (Be sure to set the EX_SYNC_MODE bit in the SGMODE register to 0) 1: Video display mode (Be sure to set the EX_SYNC_MODE bit in the SGMODE register to 1)
3, 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1	VIDEO_DISP_EXE	0	R/W	Enables the video supplying block operation. Setting to 1 starts video supply to the graphics blocks. The register setting is updated with the VSYNC timing. 0: Disabled 1: Enabled
0	VIDEO_MAIN_EXE	0	R/W	Enables the video receiving block operation. Setting to 1 starts video storing in the large-capacity on-chip RAM or SDRAM. 0: Disabled* ² 1: Enabled

- Notes:
1. Operation of the video receiving and supplying blocks proceeds after bit VIDEO_DISP_EXE or VIDEO_MAIN_EXE, respectively, is set to 1, and detection of VSYNC. Operation stops when the protocol for the internal bus is ended after the corresponding bit has been cleared to 0.
 2. To disable the video receiving block operation, please follow the procedure shown in section 28.10.1, The Procedure of Disabling the Video Receiving Block Operation.

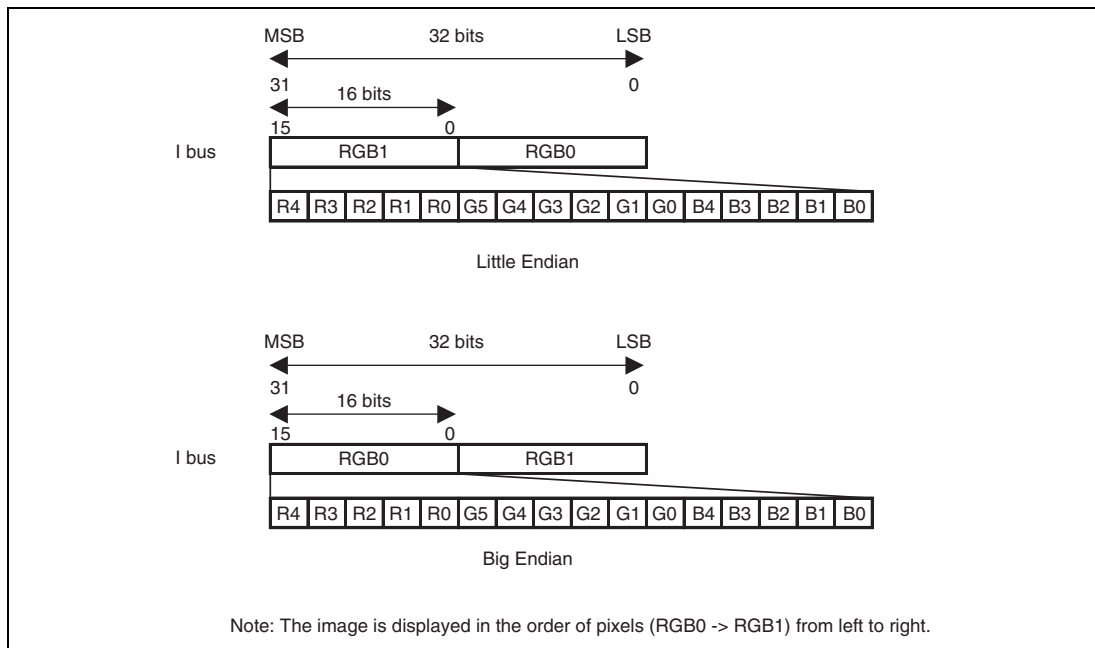

Figure 28.14 Description of Endian

28.7.2 Video Interrupt Control Register (VIDEO_INT_CNT)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	INT_V_EN	-	-	-	INT_F_EN	-	-	-	INT_UF_EN	-	-	-	INT_OF_EN
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R	R	R	R/W	R	R	R	R/W	R	R	R	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	V_PERIOD	-	-	-	F_END	-	-	-	UNDER_FLOW	-	-	-	OVER_FLOW
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W*3	R	R	R	R/W*3	R	R	R	R/W*3	R	R	R	R/W*3

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
28	INT_V_EN	0	R/W	Enables output of interrupts for indicating VSYNC cycle fluctuation detected in the input video. 0: Disabled 1: Enabled
27 to 25	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
24	INT_F_EN	0	R/W	Enables output of write completion interrupts. Set to 0 in video display mode. 0: Disabled 1: Enabled
23 to 21	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
20	INT_UF_EN	0	R/W	Enables output of underflow interrupts 0: Disabled 1: Enabled
19 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
16	INT_OF_EN	0	R/W	Enables output of overflow interrupts. 0: Disabled 1: Enabled
15 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
12	V_PERIOD	0	R/W* ³	Indicates the VSYNC cycle fluctuation status in the input video. 0: The VSYNC cycles in the input video are constant. 1: The VSYNC cycles in the input video are not constant.
11 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	F_END	0	R/W* ³	Indicates the status of writing one field of video data to the memory.* ¹ 0: Writing is in progress. 1: Writing has been completed.
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	UNDER_FLOW	0	R/W* ³	Indicates the underflow status of the buffer used to read video data from the memory.* ¹ 0: No underflow has occurred. 1: An underflow has occurred.
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
0	OVER_FLOW	0	R/W* ³	Indicates the overflow status of the buffer used to write video data to the memory.* ¹ * ² 0: No overflow has occurred. 1: An overflow has occurred

- Notes:
- The status bits (bits 12, 8, 4, and 0) always operate, regardless of the settings of operation-enabling bits. After it has been set to 1, a status bit retains this value until it is cleared to 0.
 - The overflow flag is set to 1 in the cases shown below.
 - (The number of operations of writing to the buffer in the video display controller 3) – (the number of operations of reading from the buffer) > amount of data for two lines
 - (The number of operations of writing to the buffer in the video display controller 3) < (the number of operations of reading from the buffer)
 Case (a) arises when there is a shortage of IV1-BUS bandwidth.
On the other hand, case (b) arises when less than the normal amount of data is written for one line, due to a malfunction of external input.
 - Only 0 can be written.

28.7.3 Video Input Timing Control Register (VIDEO_TIM_CNT)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	FIELD_SKEW[9:0]								
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	VSYNC_TYP	HSYNC_TYP	-	VSYNC_TIM	HSYNC_TIM	VIDEO_TIM
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 26	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
25 to 16	FIELD_SKEW [9:0]	All 0	R/W	These bits specify the timing of the VSYNC input signal for the BT.601 input. When the VSYNC signal is input within the DV_CLK cycles specified in these bits before or after the HSYNC signal, it is determined as the VSYNC signal for the TOP field.
15 to 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
5	VSYNC_TYP	0	R/W	Controls inversion of the DV_VSYNC input signal. 0: Not inverted 1: Input is inverted
4	HSYNC_TYP	0	R/W	Controls inversion of the DV_HSYNC input signal. 0: Not inverted 1: Input is inverted
3	—	All 0	R	Reserved This bit is always read as 0. The write value should always be 0.
2	VSYNC_TIM	0	R/W	Specifies the timing of the DV_VSYNC input signal. 0: Latched at the rising edge of the DV_CLK. 1: Latched at the falling edge of the DV_CLK.

Bit	Bit Name	Initial Value	R/W	Description
1	HSYNC_TIM	0	R/W	Specifies the timing of the DV_HSYNC input signal. 0: Latched at the rising edge of the DV_CLK. 1: Latched at the falling edge of the DV_CLK.
0	VIDEO_TIM	0	R/W	Specifies the timing of the DV_DATA input signal. 0: Latched at the rising edge of the DV_CLK. 1: Latched at the falling edge of the DV_CLK.

28.7.4 Valid Video Size Register (VIDEO_SIZE)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	VIDEO_HEIGHT[8:0]								
Initial value:	0	0	0	0	0	0	0	0	1	1	1	1	0	0	0	0
R/W:	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	VIDEO_WIDTH[9:0]									
Initial value:	0	0	0	0	0	0	1	0	1	1	0	1	0	0	0	0
R/W:	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 25	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
24 to 16	VIDEO_HEIGHT[8:0]	H'0F0	R/W	These bits specify the vertical size of the valid video in number of lines.
15 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9 to 0	VIDEO_WIDTH[9:0]	H'2D0	R/W	These bits specify the horizontal size of the valid video in number of pixels. A value from 8 to 800 (pixels) can be specified. The lowest bit should always be set to 0.

28.7.5 Vertical Valid Video Start Position Register (VIDEO_VSTART)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16			
	-	-	-	-	-	-	-	VIDEO_VSTART_TOP[8:0]											
Initial value:	0	0	0	0	0	0	0	0	0	0	0	1	0	0	0	0			
R/W:	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W			
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0			
	-	-	-	-	-	-	-	VIDEO_VSTART_BTM[8:0]											
Initial value:	0	0	0	0	0	0	0	1	0	0	0	1	0	1	1	1			
R/W:	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W			

Bit	Bit Name	Initial Value	R/W	Description
31 to 25	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
24 to 16	VIDEO_VSTART_TOP[8:0]	H'010	R/W	These bits specify in number of lines the vertical start position of the valid video in the TOP field. Setting to H'000 is prohibited.
15 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8 to 0	VIDEO_VSTART_BTM[8:0]	H'117	R/W	These bits specify in number of lines the vertical start position of the valid video in the BOTTOM field.

28.7.6 Horizontal Valid Video Start Position Register (VIDEO_HSTART)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	VIDEO_HSTART[8:0]								
Initial value:	0	0	0	0	0	0	0	1	0	0	0	1	0	1	0	0
R/W:	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8 to 0	VIDEO_HSTART[8:0]	H'114	R/W	These bits specify in number of DV_CLK cycles the horizontal start position of the valid video in the field.

Note: Capture does not occur when the right edge of video has been cut.

Figure 28.15 Concept of Capturing Function

28.7.7 Timing Control Register 1 for Vertical Sync Signal for Video (VIDEO_VSYNC_TIM1)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16		
	-	-	-	-	-	-	VIDEO_VSYNC_START1_TOP[9:0]											
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0		
R/W:	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W		
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0		
	-	-	-	-	-	-	VIDEO_VSYNC_START1_BTM[9:0]											
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0		
R/W:	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W		

Bit	Bit Name	Initial Value	R/W	Description
31 to 26	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
25 to 16	VIDEO_VSYNC_START1_TOP [9:0]	H'000	R/W	These bits specify the reference Vsync position in the TOP field in number of lines.
15 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9 to 0	VIDEO_VSYNC_START1_BTM[9:0]	H'000	R/W	These bits specify the reference Vsync position in the BOTTOM field in number of lines.

28.7.8 Video Storing Field Count Register (VIDEO_SAVE_NUM)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16			
	-	-	-	-	-	-	FIELD_NUM[9:0]									-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0			
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R			
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0			
	-	-	-	-	-	-	FIELD_SAVE_NUM[9:0]									-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0			
R/W:	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W			

Bit	Bit Name	Initial Value	R/W	Description
31 to 26	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
25 to 16	FIELD_NUM [9:0]	H'000	R	These bits indicate the field number of which recording processing has been completed in the video recording mode. These bits are cleared to H'000 when the VIDEO_MAIN_EXE bit in the VIDEO_MODE register is cleared to 0.
15 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9 to 0	FIELD_SAVE_NUM [9:0]	H'000	R/W	These bits specify the number of fields to be stored. Set these bits to H'000 in the video display mode (when the VIDEO_MODE bit in the VIDEO_MODE register is set to 1). H'000: One field is stored. H'001: Two fields are stored. H'03B: 60 fields are stored. H'3FF: 1024 fields are stored.

Note: After data has been written for the specified number of fields, the memory is overwritten by new video data from the first address.

Video data is stored at a 1/2-field rate (NTSC: 30 fps; PAL: 25 fps).

When the VIDEO_MAIN_EXE bit in the VIDEO_MODE register is cleared to 0, the address calculation result is initialized and data is written to the initial field storing area.

28.7.9 Video Scaling and Correction Register (VIDEO_IMAGE_CNT)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	Contrast[7:0]								Bright[7:0]							
Initial value:	1	0	0	0	0	0	0	0	1	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	CLIP_Y	CLIP_C	-	SUB_SCALE_V	SCALE_V[1:0]	-	SUB_SCALE_H	SCALE_H[1:0]	-	-
Initial value:	0	0	0	0	0	0	1	1	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R/W	R/W	R	R/W	R/W	R/W	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	Contrast[7:0]	H'80	R/W	These bits specify the contrast of luminance. Contrast = this value / 128 Y0 = Luminance of captured video input Y1 = Contrast × (Y0 – 16)
23 to 16	Bright[7:0]	H'80	R/W	These bits specify the brightness of luminance. BRIGHT = this value – 128 Y2 = Y1 + BRIGHT
15 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9	CLIP_Y	1	R/W	Enables luminance clipping. 0: Disabled 1: Enabled (235 or a greater value is clipped to 235, and 16 or a smaller value is clipped to 16.)
8	CLIP_C	1	R/W	Enables chrominance clipping. 0: Disabled 1: Enabled (240 or a greater value is clipped to 240, and 16 or a smaller value is clipped to 16.)
7	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
6	SUB_SCALE_V	0	R/W	Specifies further scaling of video by multiplying the SCALE_V scaling rate by 6/7. 0: $\times 1$ 1: $\times 6/7$
5, 4	SCALE_V[1:0]	00	R/W	These bits specify the vertical scaling rate. Be sure to set to 00 in the video recording mode. 00: $\times 1/2$ 01: $\times 1/3$ 10: $\times 1/4$ 11: Setting prohibited
3	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
2	SUB_SCALE_H	0	R/W	Specifies further scaling of video by multiplying the SCALE_H scaling rate by 6/7. 0: $\times 1$ 1: $\times 6/7$
1, 0	SCALE_H[1:0]	00	R/W	These bits specify the horizontal scaling rate. 00: $\times 1/2$ 01: $\times 1/3$ 10: $\times 2/3$ 11: $\times 1/4$

Note: The width of a valid image after horizontal scaling is always an even value.

28.7.10 Video Base Address Register (VIDEO_BASEADR)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	VIDEO_BASEADR[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	VIDEO_BASEADR[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	VIDEO_BASEADR [31:0]	H'00000000	R/W	<p>These bits specify the base address of the destination where video data is to be written to. According to the BURST_MODE_MAIN bit setting in the VIDEO_MODE register, the lower bits should be set as follows.</p> <p>In 16-byte burst transfer: The lower four bits should always be 0000.</p> <p>In 128-byte burst transfer: The lower seven bits should always be 000_0000.</p>

28.7.11 Video Line Offset Register (VIDEO_LINE_OFFSET)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	VIDEO_LINE_OFFSET[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	VIDEO_LINE_OFFSET[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	VIDEO_LINE_OFFSET[31:0]	H'00000000	R/W	<p>These bits specify the line offset. According to the BURST_MODE_MAIN bit setting in the VIDEO_MODE register, the lower bits should be set as follows.</p> <p>In 16-byte burst transfer: The lower four bits should always be 0000.</p> <p>In 128-byte burst transfer: The lower seven bits should always be 000_0000.</p>

28.7.12 Video Field Offset Register (VIDEO_FIELD_OFFSET)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	VIDEO_FIELD_OFFSET[31:16]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	VIDEO_FIELD_OFFSET[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 0	VIDEO_FIELD_OFFSET [31:0]	H'00000000	R/W	These bits specify the field offset. This setting is valid in the video recording mode. The lower four bits should always be 0000.

28.7.13 Video Line Buffer Count Register (VIDEO_LINEBUFF_NUM)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	VIDEO_LINEBUFF_NUM[8:0]								
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8 to 0	VIDEO_LINEBUFF_NUM[8:0]	H'000	R/W	These bits specify how many lines of buffer area are used in the video display mode. 0: One line of buffer area is used. 1: Two lines of buffer area are used. : 1FF: 512 lines of buffer area are used.

28.7.14 Video Display and Recording Size Register (VIDEO_DISP_SIZE)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	VIDEO_DISP_HEIGHT [8:0]								
Initial value:	0	0	0	0	0	0	0	0	1	1	1	1	0	0	0	0
R/W:	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	VIDEO_DISP_WIDTH [9:0]									
Initial value:	0	0	0	0	0	0	0	1	0	1	1	0	1	0	0	0
R/W:	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 25	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
24 to 16	VIDEO_DISP_ H'0F0 HEIGHT [8:0]		R/W	These bits specify in number of lines the vertical size of the video data to be read in the video display mode. In the video recording mode, set to 240 lines for NTSC or 288 lines for PAL.
15 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9 to 0	VIDEO_DISP_ H'168 WIDTH [9:0]		R/W	These bits specify in number of pixels the horizontal size of the video data to be read in the video display mode.* The lowest bit should always be 0.

Note: * Set the setting values of the VIDEO_DISP_WIDTH field to number of vertical pixels in captured video or less. The underflow flag is set to 1 when the setting values are more than number of vertical pixels.

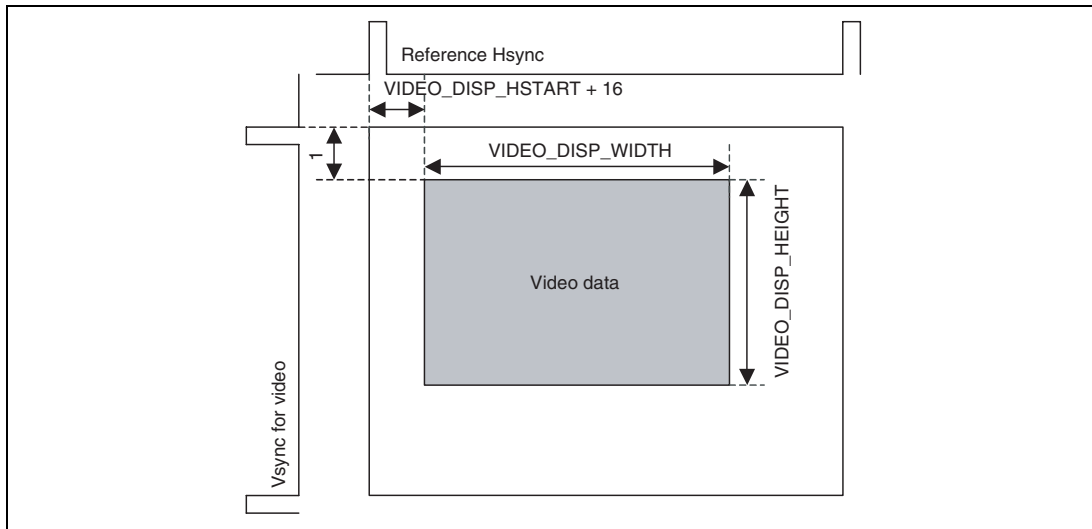

Figure 28.16 Settings for Video Data Reading (from Memory)

28.7.15 Horizontal Video Display Position Register (VIDEO_DISP_HSTART)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Initial value:	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Initial value:	-	-	-	-	-	-	VIDEO_DISP_HSTART[9:0]									
R/W:	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9 to 0	VIDEO_DISP_ H'000 HSTART [9:0]		R/W	These bits specify in number of pixels the horizontal start position of the video data to be read in the video display mode.

28.7.16 Graphics Block Control Registers (GRCMEN1 and GRCMEN2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	WE	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	DEN	VEN
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31	WE	0	R/W	Enables register value transfer. Writing 1 to this bit transfers the values of registers GRCMEN to GROPEDPHV (except GRCINTCNT) and GROPBASERGB in synchronization with Vsync. After register transfer is completed, this bit is cleared to 0.
30 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1	DEN	0	R/W	Enables display of the current layer (graphics image 1 for GRCMEN1 or graphics image 2 for GRCMEN2). 0: Disabled 1: Enabled
0	VEN	0	R/W	Enables display of the lower layer (video input for GRCMEN1 or overlaid graphics image 1 and video input for GRCMEN2). 0: Disabled 1: Enabled

Table 28.11 Functions of Display Enable Bits

DEN	VEN	Operation	Output	Control
0	0	Does not read image data from memory or process lower-layer display.	Outputs the color specified in GROPBASERGB over the entire screen (negates the enable signal output).	
0	1	Does not read image data from memory but processes lower-layer display.	Outputs only the lower layer (outputs the lower layer enable signal).	Displays only the lower layer.
1	0	Reads image data from memory but does not process lower-layer display.	Outputs only the current layer (outputs the current layer enable signal).	Displays only the current layer.
1	1	Reads image data from memory and processes lower-layer display.	Performs the specified processing for the current layer and lower layer and displays them (logically ORs the current layer and lower layer enable signals and outputs the result).	Displays the current and lower layers.

Note: When the α control area (specified by GROPEWH and GROPEDPHV) is larger than the graphics image area (specified by GROPSWH and GRODPHV), only the lower layer is displayed.

These bits should be set for each layer. When VEN = 0 in the upper layer, the graphics in the lower layer are not output.

28.7.17 Bus Control Registers (GRCBUSCNT1 and GRCBUSCNT2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	BURST_	-	-	-	BUS_	-	-	-	ENDIAN
								MODE				FORMAT				
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R/W	R	R	R	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	BURST_ MODE	0	R/W	Selects the mode of transfer through the I bus (GRCBUSCNT1: IV3-BUS; GRCBUSCNT2: IV4-BUS). Reading out from the areas except the large-capacity on-chip RAM requires this bit to be set to 0. 0: 16-byte burst transfer 1: 128-byte burst transfer
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	BUS_ FORMAT	0	R/W	Specifies the data format for the I bus (GRCBUSCNT1: IV3-BUS; GRCBUSCNT2: IV4-BUS). 0: RGB 565 format 1: αRGB 4444 format
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	ENDIAN	0	R/W	Specifies the endian for the I bus (GRCBUSCNT1: IV3-BUS; GRCBUSCNT2: IV4-BUS). 0: Big endian 1: Little endian

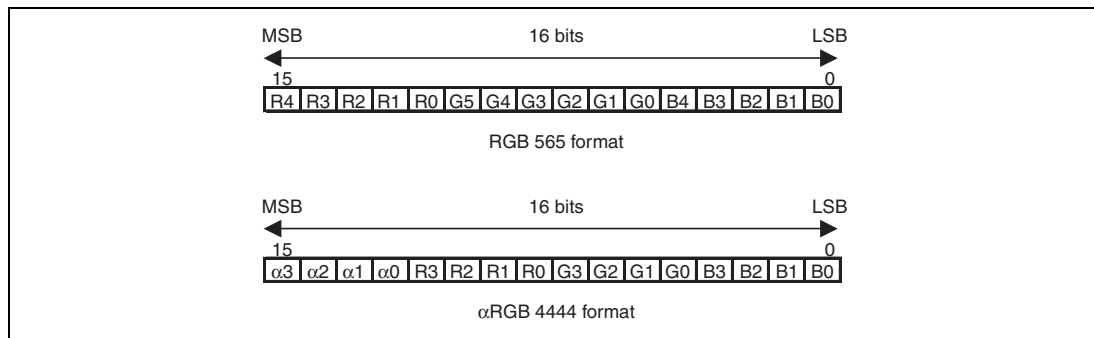

Figure 28.17 Bus Format

Table 28.12 α Value and Blending Ratio

α Value (Decimal)	Current Layer	Lower Layer
15	15/15	0/15
14	14/15	1/15
13	13/15	2/15
:	:	:
2	2/15	13/15
1	1/15	14/15
0	0/15	16/15

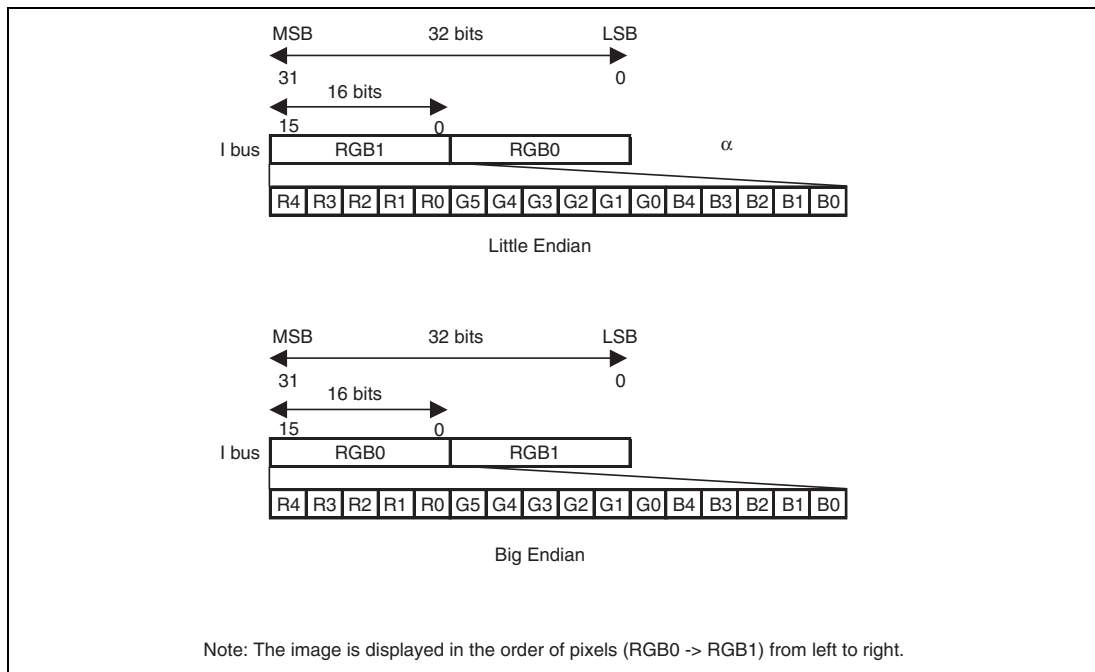

Figure 28.18 Descriptions of Endian

28.7.18 Graphics Block Interrupt Control Registers (GRCINTCNT1 and GRCINTCNT2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	INT_UF_EN
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	UNDER_FLOW
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W*2

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	INT_UF_EN	0	R/W	Enables output of underflow interrupts. 0: Disabled 1: Enabled
15 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	UNDER_FLOW	0	R/W*2	Indicates the underflow status of the buffer used to read graphics images from the memory.*1 0: No underflow has occurred. 1: An underflow has occurred.

Notes: 1. The status bit (bit 0) always operates regardless of the operation enabling bit settings. After being set to 1, the status bit remains at 1 until cleared 0.
2. Only 0 can be written.

28.7.19 Graphics Image Base Address Registers (GROPSADR1 and GROPSADR2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	GROPSADR[28:16]												
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GROPSADR[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
28 to 0	GROPSADR [28:0]	H'00000000	R/W	These bits specify the base address from which a graphics image is to be read. The lowest bit should always be 0.

Note: This module processes 16-bit RGB data; it cannot handle data located beyond a 2-byte alignment boundary.

28.7.20 Graphics Image Size Registers (GROPSWH1 and GROPSWH2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	GROPSH[9:0]									
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	GROPSW[9:0]									
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 26	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
25 to 16	GROPSH [9:0]	H'000	R/W	These bits specify the height of the graphics image area in number of lines.

Bit	Bit Name	Initial Value	R/W	Description
15 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9 to 0	GROPSW [9:0]	H'000	R/W	These bits specify the width of the graphics image area in number of pixels (Max. 640).

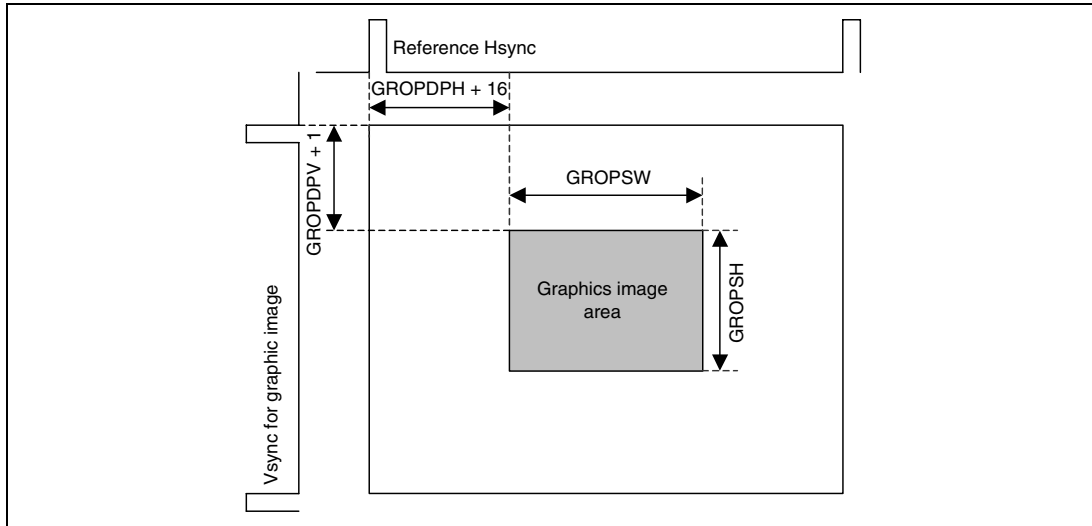

Figure 28.19 Graphics Image Area Settings (Reading from Memory)

A graphics image area should be specified within the following range; otherwise, correct operation is not guaranteed.

(Pixels for 1H) > GROPSW (width) + GRODPH (horizontal display start position) + (16 pixels)

(Lines for 1 frame) > GROPSH (height) + GRODPV (vertical display start position) + (1 line)

28.7.21 Graphics Image Line Offset Registers (GROPSOFST1 and GROPSOFST2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	GROPSOFST[28:16]												
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	GROPSOFST[15:0]															
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 29	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
28 to 0	GROPSOFST [28:0]	H'00000000	R/W	These bits specify the line offset for the graphics image. In 16-byte burst transfer: The lower four bits should always be 0000. In 128-byte burst transfer: The lower seven bits should always be 000_0000.

Figure 28.20 Graphics Image Memory Area Settings

The start (left side) address of line n is obtained by adding the base address register value (GROPSADR1 or GROPSADR2) and the line offset (GROPSOFST1 or GROPSOFST2) $\times n$.

28.7.22 Graphics Image Start Position Registers (GROPDPHV1 and GROPDPHV2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16		
	-	-	-	-	-	-	GROPDPV[9:0]											
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0		
R/W:	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W		
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0		
	-	-	-	-	-	-	GROPDPH[9:0]											
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0		
R/W:	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W		

Bit	Bit Name	Initial Value	R/W	Description
31 to 26	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
25 to 16	GROPDPV [9:0]	H'000	R/W	These bits specify the vertical display start position of the graphics image area in number of lines.
15 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9 to 0	GROPDPH [9:0]	H'000	R/W	These bits specify the horizontal display start position of the graphics image area in number of pixels.

Note: The display start address is offset as follows (see figure 28.19).

Vertical offset: (GROPDPV value) + 1 line

Horizontal offset: (GROPDPH value) + 16 pixels

28.7.23 α Control Area Size Registers (GROPEWH1 and GROPEWH2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	GROPEH[9:0]									
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	GROPEW[9:0]									
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 26	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
25 to 16	GROPEH [9:0]	H'000	R/W	These bits specify the height of the α control area in number of lines.
15 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9 to 0	GROPEW [9:0]	H'000	R/W	These bits specify the width of the α control area in number of pixels.

Note: This register specifies the size of the α control area (rectangle). See figure 28.21.

28.7.24 α Control Area Start Position Registers (GROPEDPHV1 and GROPEDPHV2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16			
	-	-	-	-	-	-	GROPDPV[9:0]												
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0			
R/W:	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W			
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0			
	-	-	-	-	-	-	GROPDPH[9:0]												
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0			
R/W:	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W			

Bit	Bit Name	Initial Value	R/W	Description
31 to 26	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
25 to 16	GROPEDPV [9:0]	H'000	R/W	These bits specify the vertical start position of the α control area in number of lines.
15 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9 to 0	GROPEDPH [9:0]	H'000	R/W	These bits specify the horizontal start position of the α control area in number of pixels.

Figure 28.21 α Control Area Settings

28.7.25 α Control Registers (GROPEDPA1 and GROPEDPA2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	DEFA[7:0]								ACOE[7:0]

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	DEFA[7:0]	H'FF	R/W	These bits specify the initial α value.
23 to 16	ACOE[7:0]	H'00	R/W	These bits specify a coefficient for α value calculation. This value is added to or subtracted from the DEFA value.

Bit	Bit Name	Initial Value	R/W	Description
15 to 8	ARATE[7:0]	H'00	R/W	These bits specify the frame rate of α control. (The reference Vsync is used as the unit of counting.) 0: addition and subtraction every frame 1: addition and subtraction every two frames : FF: addition and subtraction every 256 frames
7	WE	0	R/W	Enables transfer of the α control register values. Writing 1 to this bit transfers the register values (GROPEDPA register to GROPCRKY1 register) in synchronization with Vsync. After register transfer is completed, this bit is cleared to 0. 0: Disabled 1: Enabled
6, 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	AST	0	R	α Blending Status Flag 0: Addition or subtraction has been completed. 1: Addition or subtraction is in progress
3	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
2, 1	AMOD[1:0]	00	R/W	These bits specify the α processing mode. 00: Initial α value (the value does not change) 01: α value addition 10: α value subtraction 11: Setting prohibited
0	AEN	0	R/W	Enables or disables α control. 0: α control is disabled.* 1: α control is enabled. Note: * When 0 is specified, either the replaced α value after chroma-keying or the dot α function is valid. If neither α function is used, the α control processing becomes the same as when $\alpha = 255$.

When AEN = 1 and WE = 1, the α value is loaded in the internal circuits in synchronization with Vsync.

If AMOD[1:0] = [0 0], the α value specified in DEFA is applied to the α control area.

If AMOD[1:0] = [0 1], the ACOEF value is added to the DEFA value according to the frame rate (ARATE) and the result is applied to the α control area as the α value. When the α value becomes 255 or larger, processing stops (fade-in).

If AMOD[1:0] = [1 0], the ACOEF value is subtracted from the DEFA value according to the frame rate (ARATE) and the result is applied to the α control area as the α value. When the α value becomes 0 or smaller, processing stops (fade-out).

Table 28.13 α Value and Blending Ratio

α Value (Decimal)	Current Layer	Lower Layer
255	255/255	0/255
254	254/255	1/255
253	253/255	2/255
252	252/255	3/255
:	:	:
2	2/255	253/255
1	1/255	254/255
0	0/255	255/255

28.7.26 Chroma-Key Control Registers (GROPCRKY0_1 and GROPCRKY0_2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	CKEN
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	CROMAKR[4:0]				CROMAKG[5:0]					CROMAKB[4:0]						
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	CKEN	0	R/W	Enables or disables chroma-key processing. 0: Chroma-key processing is disabled. 1: Chroma-key processing is enabled
15 to 11	CROMAKR [4:0]	00000	R/W	These bits specify chroma-key target color R.
10 to 5	CROMAKG [5:0]	000000	R/W	These bits specify chroma-key target color G.
4 to 0	CROMAKB [4:0]	00000	R/W	These bits specify chroma-key target color B.

Note: When the bus format is α RGB444, only the CROMAKR[3:0], CROMAKG[3:0], and CROMAKB[3:0] bits are valid.

When WE =1 in GROPEDPA, the register setting is loaded in the internal circuits in synchronization with Vsync.

While the chroma-key processing is enabled, if the graphics data values (RGB16 format) of a pixel all match the CROMAKR[4:0], CROMAKG[5:0], and CROMAKB[4:0] settings, the pixel color is replaced with the color (RGB16 format) specified in the chroma-key color register (GROPCRKY1) and α processing specified through the ALPHA[7:0] bits is applied.

Chroma-keying thus enables characters or a cursor to be displayed on the lower layer.

28.7.27 Chroma-Key Color Registers (GROPCRKY1_1 and GROPCRKY1_2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	ALPHA[7:0]							
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	R[4:0]				G[5:0]					B[4:0]						
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 24	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
23 to 16	ALPHA[7:0]	H'00	R/W	These bits specify the α value after replacement.
15 to 11	R[4:0]	00000	R/W	These bits specify the R value after replacement.
10 to 5	G[5:0]	000000	R/W	These bits specify the G value after replacement.
4 to 0	B[4:0]	00000	R/W	These bits specify the B value after replacement.

Note: When the bus format is α RGB444, only the R[3:0], G[3:0], and B[3:0] bits are valid.

Each register specifies a set of color information to replace the color that matches the chroma-key target RGB values.

α calculation is done as follows.

$$\text{Output R} = \text{R (current layer)} \times \alpha + \text{R (lower layer)} \times (1 - \alpha)$$

$$\text{Output G} = \text{G (current layer)} \times \alpha + \text{G (lower layer)} \times (1 - \alpha)$$

$$\text{Output B} = \text{B (current layer)} \times \alpha + \text{B (lower layer)} \times (1 - \alpha)$$

28.7.28 Color Registers for Outside of Graphics Image Area (GROPBASERGB1 and GROPBASERGB2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	BASE_R[4:0]					BASE_G[5:0]					BASE_B[4:0]					
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 16	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
15 to 11	BASE_R [4:0]	00000	R/W	These bits specify the R value for outside of the graphics image area.
10 to 5	BASE_G [5:0]	000000	R/W	These bits specify the G value for outside of the graphics image area.
4 to 0	BASE_B [4:0]	00000	R/W	These bits specify the B value for outside of the graphics image area.

Note: This setting is valid only when VEN = 0 in GRCMEN.

28.7.29 SG Mode Register (SGMODE)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	EX_SYNC_MODE
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	RGB565
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	EX_SYNC_MODE	0	R/W	Selects the sync signal mode. 0: Free-running mode 1: Synchronized with the Vsync of the video input
15 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	RGB565	0	R/W	Specifies the method for conversion from RGB888 to RGB565. 0: Calculated as described in section 28.6.1 (4), Conversion from RGB888 to RGB565. 1: Lower bits are truncated.

28.7.30 Interrupt Output Control Register (SGINTCNT)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	INT_LINE_NUM[9:0]										-	-	-	INT_LINE_EN
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	LINE_STATUS
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W*2

Bit	Bit Name	Initial Value	R/W	Description
31, 30	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
29 to 20	INT_LINE_NUM[9:0]	All 0	R/W	These bits specify the line number for which a line interrupt is to be output.
19 to 17	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
16	INT_LINE_EN	0	R/W	Enables output of line interrupts. 0: Disabled 1: Enabled
15 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	LINE_STATUS	0	R/W*2	Indicates the line interrupt status.*1 0: No interrupt has occurred. 1: An interrupt has occurred.

- Note:
1. The status bit (bit 0) always operates regardless of the operation enabling bit setting. After being set to 1, the status bit remains at 1 until cleared 0.
 2. Only 0 can be written.

28.7.31 Sync Signal Control Register (SYNCNT)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	RGB_TIM	-	-	-	-	VSYNC_TIM	HSYNC_TIM	DE_TIM	M_DISP_TIM
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R/W	R	R	R	R	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	VSYNC_TYPE	HSYNC_TYPE	DE_TYPE	M_DISP_TYPE
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 25	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
24	RGB_TIM	0	R/W	Specifies the LCD_DATA output timing. 0: Output at the rising edge of the panel clock 1: Output at the falling edge of the panel clock
23 to 20	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
19	VSYNC_TIM	0	R/W	Specifies the LCD_VSYNC output timing. 0: Output at the rising edge of the panel clock 1: Output at the falling edge of the panel clock
18	HSYNC_TIM	0	R/W	Specifies the LCD_HSYNC output timing. 0: Output at the rising edge of the panel clock 1: Output at the falling edge of the panel clock
17	DE_TIM	0	R/W	Specifies the LCD_DE output timing. 0: Output at the rising edge of the panel clock 1: Output at the falling edge of the panel clock
16	M_DISP_TIM	0	R/W	Specifies the LCD_M_DISP output timing. 0: Output at the rising edge of the panel clock 1: Output at the falling edge of the panel clock

Bit	Bit Name	Initial Value	R/W	Description
15 to 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
3	VSYNC_ TYPE	0	R/W	Controls whether to invert LCD_VSYNC. 0: Not inverted. 1: Output is inverted.
2	HSYNC_ TYPE	0	R/W	Controls whether to invert LCD_HSYNC. 0: Not inverted. 1: Output is inverted.
1	DE_TYPE	0	R/W	Controls whether to invert LCD_DE. 0: Not inverted. 1: Output is inverted.
0	M_DISP_ TYPE	0	R/W	Controls whether to invert LCD_M_DISP. 0: Not inverted. 1: Output is inverted.

28.7.32 Panel Clock Select Register (PANEL_CLKSEL)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	ICKSEL	ICKEN	-	-	-	-	-	-	DCDR[5:0]					
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1
R/W:	R	R	R/W	R/W	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 14	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
13	ICKSEL	0	R/W	Selects the source of the panel clock. 0: External clock is selected (LCD_EXTCLK). 1: Bus clock is selected (B ϕ).
12	ICKEN	0	R/W	Enables or disables the operation of the blocks using the panel clock in this module and output of the panel clock. 0: Operation of the blocks using the panel clock is disabled. 1: Operation of the blocks using the panel clock is enabled. Note: Be sure to clear this bit to 0 before modifying the ICKSEL or DCDR bit.
11 to 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
5 to 0	DCDR[5:0]	000001	R/W	Specifies the division ratio of the input clock frequency. For details, see table 28.14. Note: The settings not shown in table 28.14 are prohibited.

This module can select the bus clock or external clock as the source of the panel clock. It also has a frequency divider providing a division ratio from 1/1 to 1/32.

Table 28.14 Input/Output Clock Frequency and Division Ratio

DCDR[5:0]	Clock Frequency Division Ratio	Input/Output Clock Frequency (MHz)		
		36.000	48.000* ²	72.000* ²
000001* ¹	1/1	36.000	48.000	72.000
000010	1/2	18.000	24.000	36.000
000011	1/3	12.000	16.000	24.000
000100	1/4	9.000	12.000	18.000
000110	1/6	6.000	8.000	12.000
001000	1/8	4.500	6.000	9.000
001100	1/12	3.000	4.000	6.000
010000	1/16	2.250	3.000	4.500
011000	1/24	1.500	2.000	3.000
100000	1/32	1.125	1.500	2.250

Notes: 1. Setting prohibited when the bus clock (B ϕ) is selected for the source of the panel clock.
 2. When the bus clock (B ϕ) is selected for the source of the panel clock.

28.7.33 Sync Signal Size Register (SYN_SIZE)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	SYN_HEIGHT[9:0]									
Initial value:	0	0	0	0	0	0	1	0	0	0	0	0	1	1	0	1
R/W:	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	SYN_WIDTH[10:0]										
Initial value:	0	0	0	0	0	0	1	1	0	1	0	1	1	0	1	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 26	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
25 to 16	SYN_HEIGHT [9:0]	H'20D	R/W	These bits specify the height including the vertical blanking interval in number of lines. Initial value: H'20D = 525 lines
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	SYN_WIDTH [10:0]	H'35A	R/W	These bits specify the width including the horizontal blanking interval in number of panel clock cycles. Initial value: H'35A = 858 pixels

28.7.34 Vertical Sync Signal Timing Control Register (PANEL_VSYNC_TIM)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16		
	-	-	-	-	-	-	VSYNC_START[9:0]											
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0		
R/W:	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W		
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0		
	-	-	-	-	-	-	VSYNC_END[9:0]											
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1		
R/W:	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W		

Bit	Bit Name	Initial Value	R/W	Description
31 to 26	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
25 to 16	VSYNC_START [9:0]	H'000	R/W	These bits specify in number of lines the interval between the reference vertical sync signal and the point where the vertical sync signal (VSYNC) for panel is set to 1.
15 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9 to 0	VSYNC_END [9:0]	H'001	R/W	These bits specify in number of lines the interval between the reference vertical sync signal and the point where the vertical sync signal (VSYNC) for panel is cleared to 0.

Note: Be sure to satisfy $VSYNC_START \neq VSYNC_END$; otherwise, correct operation is not guaranteed.

28.7.35 Horizontal Sync Signal Timing Control Register (PANEL_HSYNC_TIM)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	HSYNC_START[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	HSYNC_END[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	1	0	1	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 27	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
26 to 16	HSYNC_START [10:0]	H'000	R/W	These bits should always be set to H'000. These bits specify in number of panel clock cycles the interval between the reference horizontal sync signal and the point where the horizontal sync signal (HSYNC) for panel is set to 1.
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	HSYNC_END [10:0]	H'00A	R/W	These bits specify in number of panel clock cycles the interval between the reference horizontal sync signal and the point where the horizontal sync signal (HSYNC) for panel is cleared to 0.

Note: Be sure to satisfy HSYNC_START \neq HSYNC_END; otherwise, correct operation is not guaranteed.

28.7.36 Timing Control Register 2 for Vertical Sync Signal for Video (VIDEO_VSYNC_TIM2)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	VIDEO_VSYNC_START2[9:0]									
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9 to 0	VIDEO_VSYNC_START2[9:0]	H'000	R/W	These bits specify in number of lines the interval between the reference vertical sync signal and the point where the vertical sync signal (VSYNC) for video is set to 1.

28.7.37 Timing Control Register for Vertical Sync Signal for Graphics Image (GRA_VSYNC_TIM)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	GRA_VSYNC_START[9:0]									
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9 to 0	GRA_VSYNC_START[9:0]	H'000	R/W	These bits specify in number of lines the interval between the reference vertical sync signal and the point where the vertical sync signal (VSYNC) for graphics image is set to 1.

28.7.38 AC Modulation Signal Toggle Line Count Register (AC_LINE_NUM)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	AC_LINE_NUM[4:0]				
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	1	1	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4 to 0	AC_LINE_NUM [4:0]	H'0C	R/W	These bits specify the AC line number (line where the LCD_M_DISP signal should toggle) in number of lines. Specify the toggle line number – 1. Example: To toggle every 13 lines: AC_LINE_NUM = 13 – 1 = H'0C

Note: When the total number of lines of the panel is even, specify an appropriate value so that the signal toggles at odd-numbered lines.

28.7.39 DE Area Size Register (DE_SIZE)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	DE_HEIGHT[9:0]									
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	DE_WIDTH[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 26	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
25 to 16	DE_HEIGHT [9:0]	H'000	R/W	These bits specify the vertical length (height) of the data enable (DE) signal area in number of lines.
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	DE_WIDTH [10:0]	H'000	R/W	These bits specify the horizontal length (width) of the data enable (DE) signal area in number of panel clock cycles.

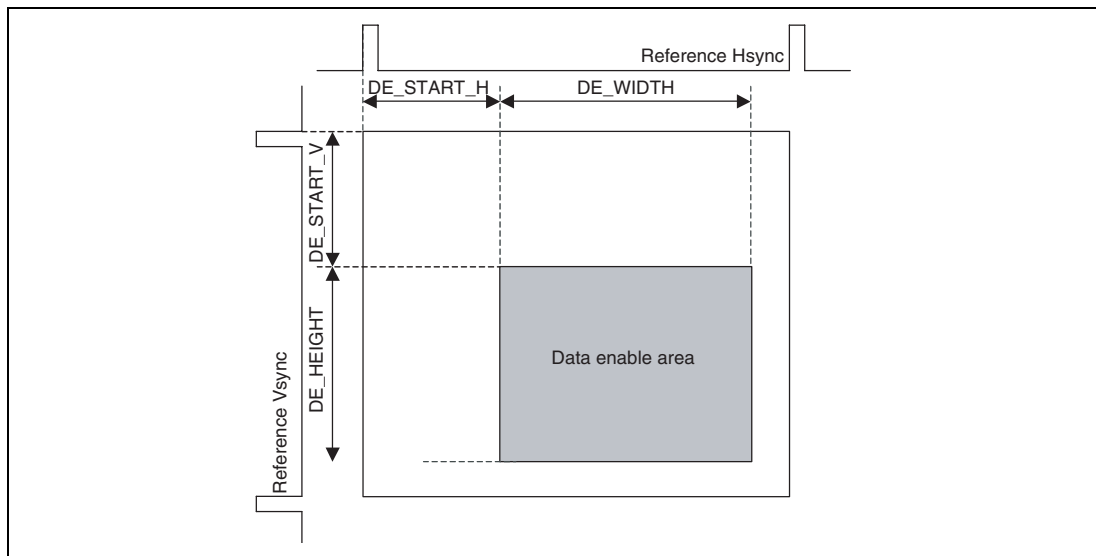

28.7.40 DE Area Start Position Register (DE_START)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
	-	-	-	-	-	-	DE_START_V[9:0]									
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	DE_START_H[10:0]										
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
31 to 26	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
25 to 16	DE_START_V[9:0]	H'000	R/W	These bits specify in number of lines the vertical interval between the reference vertical sync signal and the start of the data enable (DE) signal output.
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 0	DE_START_H[10:0]	H'000	R/W	These bits specify in number of panel clock cycles the horizontal interval between the reference horizontal sync signal and the start of the data enable (DE) signal output.

Note: Be sure to satisfy $SYN_HEIGHT > DE_HEIGHT + DE_START_V$; otherwise, correct operation is not guaranteed.

Be sure to satisfy $SYN_WIDTH > DE_WIDTH + DE_START_H$; otherwise, correct operation is not guaranteed.

**Figure 28.22 DE Area Settings**

28.8 Usage Notes

28.8.1 Input Video Format Settings

Table 28.15 shows the register settings for BT.656 input.

Table 28.15 Register Settings for BT.656 Input

Register Name	Setting
VIDEO_MODE[14]	H'0
VIDEO_MODE[13]	H'0
VIDEO_MODE[12]	Select the number of input video lines (NTSC: 525; PAL: 625).
VIDEO_TIM_CNT[25:16]	H'000
VIDEO_TIM_CNT[5]	H'0
VIDEO_TIM_CNT[4]	H'0
VIDEO_TIM_CNT[2]	H'0
VIDEO_TIM_CNT[1]	H'0
VIDEO_TIM_CNT[0]	Select the timing of the input video signal (rising or falling edge).

Table 28.16 shows the register settings for BT.601 input.

Table 28.16 Register Settings for BT.601 Input

Register Name	Setting
VIDEO_MODE[14]	H'1
VIDEO_MODE[13]	H'1
VIDEO_MODE[12]	Select the number of input video lines.
VIDEO_TIM_CNT[25:16]	H'000
VIDEO_TIM_CNT[5]	Change the DV_VSYNC input signal to the active-high signal.
VIDEO_TIM_CNT[4]	Change the DV_HSYNC input signal to the active-high signal.
VIDEO_TIM_CNT[2]	Select the timing of the DV_VSYNC input signal (rising or falling edge).
VIDEO_TIM_CNT[1]	Select the timing of the DV_HSYNC input signal (rising or falling edge).
VIDEO_TIM_CNT[0]	Select the timing of the DV_DATA input signal (rising or falling edge).

28.8.2 How to Use Video Recording Mode

This section describes how to start and stop video recording.

Table 28.17 shows the settings for starting recording, and table 28.18 shows the settings for stopping recording. When recording is restarted after being stopped, the address calculation is initialized and video storing restarts from the base address.

Table 28.17 Register Settings for Starting Video Recording

Register Name	Setting
VIDEO_MODE[20]	H'0
VIDEO_MODE[16]	H'0 (IV1-BUS is a big-endian bus)
VIDEO_MODE[4]	H'0
VIDEO_SIZE[24:16]	For NTSC: H'0F0 For PAL: H'120
VIDEO_SIZE[9:0]	H'2D0
VIDEO_VSTART[24:16]	For BT.656 NTSC: H'010 For BT.656 PAL: H'016 For BT.601: Specify the vertical start position of the valid video in the TOP field.
VIDEO_VSTART[8:0]	For BT.656 NTSC: H'117 For BT.656 PAL: H'14F For BT.601: Specify the vertical start position of the valid video in the BOTTOM field.
VIDEO_HSTART[8:0]	For BT.656 NTSC: H'114 For BT.656 PAL: H'120 For BT.601: Specify the horizontal start position of the valid video.
VIDEO_SAVE_NUM[9:0]	Specify the number of fields to be stored.
VIDEO_IMAGE_CNT[6:4]	H'0
VIDEO_IMAGE_CNT[2:0]	H'0
VIDEO_BASEADR[31:0]	Specify the base address.
VIDEO_LINE_OFFSET[31:0]	Specify the line offset.
VIDEO_FIELD_OFFSET[31:0]	Specify the field offset.

Register Name	Setting
VIDEO_DISP_SIZE[24:16]	For NTSC: H'0F0 For PAL: H'120
VIDEO_DISP_SIZE[9:0]	Specify the horizontal video size to be stored.
SG_MODE[16]	H'0
VIDEO_MODE[0]	H'1 (This setting starts recording. Set this bit at the end of the procedure.)

Table 28.18 Register Settings for Stopping Video Recording

Register Name	Setting
VIDEO_SAVE_NUM[25:16]	These bits hold the field number of which recording processing has been completed.
VIDEO_MODE[0]	H'0 (This setting stops recording. Set this bit at the end of the procedure.)

28.8.3 How to Use Video Display Mode

Table 28.19 Register Settings for Starting Video Display

Register Name	Setting
VIDEO_MODE[21]	H'1
VIDEO_MODE[20]	H'1
VIDEO_MODE[17]	H'0 (IV2-BUS is a big-endian bus)
VIDEO_MODE[16]	H'0 (IV1-BUS is a big-endian bus)
VIDEO_MODE[4]	H'1
VIDEO_INT_CNT[24]	H'0 (This interrupt enable bit is used only for video recording mode.)
VIDEO_SIZE[24:16]	For NTSC: H'0F0 For PAL: H'120
VIDEO_SIZE[9:0]	H'2D0

Register Name	Setting
VIDEO_VSTART[24:16]	For BT.656 NTSC: H'010 For BT.656 PAL: H'016 For BT.601: Specify the vertical start position of the valid video in the TOP field.
VIDEO_VSTART[8:0]	For BT.656 NTSC: H'117 For BT.656 PAL: H'14F For BT.601: Specify the vertical start position of the valid video in the BOTTOM field.
VIDEO_HSTART[8:0]	For BT.656 NTSC: H'114 For BT.656 PAL: H'120 For BT.601: Specify the horizontal start position of the valid video.
VIDEO_VSYNC_TIM1[25:16]	Refer to 28.8.3 (1), Video Display Position and Register Settings, described below.
VIDEO_VSYNC_TIM1[9:0]	Refer to 28.8.3 (1), Video Display Position and Register Settings, described below.
VIDEO_SAVE_NUM[9:0]	H'000
VIDEO_IMAGE_CNT[6:4]	Specify the vertical scaling ratio.
VIDEO_IMAGE_CNT[2:0]	Specify the horizontal scaling ratio.
VIDEO_BASEADR[31:0]	Specify the base address.
VIDEO_LINE_OFFSET[31:0]	Specify the line offset.
VIDEO_FIELD_OFFSET[31:0]	H'000
VIDEO_LINEBUFF_NUM[8:0]	Refer to 28.8.3 (1), Video Display Position and Register Settings, described below.
VIDEO_DISP_SIZE[24:16]	Specify the vertical size of the video to be displayed.
VIDEO_DISP_SIZE [9:0]	Specify the horizontal size of the video to be displayed.
VIDEO_DISP_HSTART	Specify the horizontal position of the video to be displayed.
SG_MODE [16]	H'1
VIDEO_VSYNC_TIM2	Refer to 28.8.3 (1), Video Display Position and Register Settings, described below.
VIDEO_MODE [1]	H'1
VIDEO_MODE [0]	H'1
GRCMEN2[0], [31]	H'1, H'1
GRCMEN1[0], [31]	H'1, H'1 (This setting starts display. Set this bit at the end of the procedure.)

(1) Video Display Position and Register Settings

As the display block does not have frame memory, specify through registers the vertical start position and number of line buffers for the video according to the panel specifications (HSYNC cycle). For the vertical video position, first calculate the register settings to place the video along the top end, and then calculate the settings to place the video at the center or along the bottom end.

(a) Register settings for vertical position

Step 1: Calculate the settings to place the video along the top end.

Table 28.20 List of Parameters (registers are shaded in grey)

	Register Name or Value	Unit
(1) T (Hsync_in): HSYNC cycle of the input video	0.064	ms
(2) Vertical size of the valid video	VIDEO_SIZE[24:16]	Line
(3) T (Hsync_out): HSYNC cycle for the panel	Depends on the panel specifications	ms
(4) Vertical size of the video to be displayed	VIDEO_DISP_SIZE[24:16]	Line
(5) Line buffer margin	6 or a greater value	Line
(6) Vertical start position of the valid video in the TOP field	VIDEO_VSTART[24:16]	Line
(7) Vertical start position of the valid video in the BOTTOM field	VIDEO_VSTART[8:0]	Line
(8) Number of lines between the reference Vsync and the displayable area	Depends on the panel specifications	Line

Table 28.21 Calculations of Register Settings (registers are shaded in grey)

	Register Name or Value	Unit
(9)	VIDEO_VSYNC_TIM2[9:0]	(8) – 1 Line
(10)	Difference in time between video input and output to panel	$(1) \times (2) - (3) \times (4)$ Line
(11)	Conversion of number of buffers	When (8) is negative: $(10) / 3$ When (8) is positive: $(10) / 1$ Line
(12)	VIDEO_LINEBUFF_NUM[9:0]	(11) + (5) Line
(13)	VIDEO_VSYNC_TIM1[25:16]*	When (8) is negative: $(6) - (8) + (5) / 2$ When (8) is positive: $(6) + (11) - (8) + (5) / 2$ Line
(14)	VIDEO_VSYNC_TIM1[9:0]*	When (8) is negative: $(7) - (8) + (5) / 2$ When (8) is positive: $(7) + (11) - (8) + (5) / 5$ Line

Note: * When (8) is negative, the data rate of the input video is larger than that of the video output to the panel. In this case, after video data begins to be stored in the line buffer, start reading from the buffer while only one to several lines of data are stored, so that the buffer does not overflow.

When (8) is positive, the data rate of the input video is smaller than that of the video output to the panel. In this case, start reading from the line buffer after the buffer has stored enough input data, so that the buffer does not underflow (the line buffer does not become empty).

Note that when the line buffer is large enough (for example, when the buffer can store one field of data), the above restrictions are loosened.

Step 2: To place the video at the center or along the bottom end, calculate the new settings from the values obtained in step 1.

Note: Video cannot be displayed in the last line of the panel.

Table 28.22 Calculation of Register Settings (registers are shaded in grey)

	Calculation Expression	Unit
(15)	VIDEO_VSYNC_TIM2[9:0]	(9) + start line to display Line
(16)	Conversion to the number of input video lines	$(3) \times \text{start line to display} / (1)$ Line
(17)	VIDEO_VSYNC_TIM1[25:16]	(13) – (16) Line
(18)	VIDEO_VSYNC_TIM1[9:0]	(14) – (16) Line

(b) Register settings for horizontal position

Specify the horizontal position in the VIDEO_DISP_HSTART with respect to the Hsync. The offset value is + 16.

28.8.4 How to Use Graphics Display

As graphics blocks 1 and 2 can be used in the same way, this section describes the register settings for graphics display using the register names in graphics block 1.

Table 28.23 Register Settings for Starting Graphics Display

Register Name	Setting
GRA_VSYNC_TIM	Specify the line number for displaying graphics counted from the reference VSYNC position.
GRCBUSCNT1[0]	H'0 (IV3-BUS is a big-endian bus)
GRCBUSCNT1[4]	Select the data format for IV3-BUS.
GRCBUSCNT1[8]	Select the mode of transfer through IV3-BUS
GROPSADR1	Specify the read address.
GROPSWH1	Specify the graphics image size.
GROPSOFST1	Specify the line offset for the graphics image.
GROPDPHV1	Specify the graphics image start position.
GROPBASERGB1	Specify the color for outside of the graphics image area.
GRCMEN1[0]	Set to H'1 when displaying the lower layer.
GRCMEN1[1], [31]	H'1, H'1 (This setting starts displaying graphics images. Set these bits at the end of the procedure.)

Table 28.24 Register Settings for α Control Area Display

Register Name	Setting
GROPEWH1	Specify the size of the α control area.
GROPEDPHV1	Specify the α control area start position
GROPEDPA1[31:24]	Specify the initial α value
GROPEDPA1[23:16]	Specify the value to be added or subtracted for fade-in or fade-out mode.
GROPEDPA1[15:8]	Specify the frame rate for fade-in or fade-out mode
GROPEDPA1[2:1]	Specify the fade-in or fade-out mode.
GROPEDPA1[0]	H'1 (This setting enables display of the α control area.)
GROPEDPA1[7]	H'1 (Set this bit at the end of the procedure.)

Table 28.25 Register Settings for Chroma-Keying

Register Name	Setting
GROPCRKY0_1[15:0]	Specify the chroma-key target RGB.
GROPCRKY1_1[23:16]	Specify the α value after replacement.
GROPCRKY1_1[15:0]	Specify the RGB values after replacement.
GROPCRKY0_11[16]	H'1 (This setting enables chroma-keying.)
GROPEDPA1[7]	H'1 (Set this bit at the end of the procedure.)

Figure 28.23 Relationship between Video and Graphics Display Positions and Reference Vsync

28.8.5 How to Use Control Signal Output to Panel

The control signals described in section 28.6.3, Panel Control Signal Output Function, can be generated through the register settings shown in table 28.26.

Table 28.26 Registers for Control Signal Output to Panel

Register Name	Setting
SYNCNT	Specify the polarity and timing (rising or falling edge) of the output signals.
PANEL_CLKSEL	Make the LCD_CLK settings.
SYN_SIZE	Specify the panel size.
PANEL_VSYNC_TIM	Specify the timing of LCD_VSYNC.
PANEL_HSYNC_TIM	Specify the timing of LCD_HSYNC.
DE_SIZE	Specify the LCD_DE size.
DE_START	Specify the LCD_DE position.
AC_LINE_NUM	Specify the LCD_M_DISP toggle position.

28.9 Interrupt Requests

This module issues four types of interrupt request: VSYNC cycle fluctuation detection, buffer error, field write completion, and line interrupt requests.

Table 28.27 is a list of interrupt requests.

Table 28.27 List of Interrupt Requests

Interrupt Request	Symbol	Interrupt Request Condition
VSYNC cycle fluctuation detection	VIVSYNCJ	$(\text{VIDEO_INT_CNT.V_PERIOD}=1) \& (\text{VIDEO_INT_CNT.INT_V_EN}=1)$
Buffer error	VBUFERR	$(\text{VIDEO_INT_CNT.UNDER_FLOW}=1) \& (\text{VIDEO_INT_CNT.INT_UF_EN}=1) $ $(\text{VIDEO_INT_CNT.OVER_FLOW}=1) \& (\text{VIDEO_INT_CNT.INT_OF_EN}=1) $ $(\text{GRCINTCNT1.UNDER_FLOW}=1) \& (\text{GRCINTCNT1.INT_UF_EN}=1) $ $(\text{GRCINTCNT2.UNDER_FLOW}=1) \& (\text{GRCINTCNT2.INT_UF_EN}=1)$
Field write completion	VIFIELDE	$(\text{VIDEO_INT_CNT.F_END}=1) \& (\text{VIDEO_INT_CNT.INT_F_EN}=1)$
Line interrupt	VOLINE	$(\text{SGINTCNT.LINE_STATUS}=1) \& (\text{SGINTCNT.INT_LINE_EN}=1)$

When a condition shown in table 28.27 is evaluated to 1, this module issues an interrupt request.

28.10 Usage Note

28.10.1 The Procedure of Disabling the Video Receiving Block Operation

When disabling the Video receiving block operation, please follow the procedure given below.

1. Unselect the DV_CLK function of PF8 Mode in the Control Register (PF2CR2) of General Purpose I/O Ports. (select the PF8 function)
2. Clear the VIDEO_MAIN_EXE bit in VIDEO_MODE register to 0.
3. Halt the clock to Video Display Controller3 by the Standby Control Register (STBCR7) of Power-Down Modes.
4. Select the DV_CLK function of PF8 Mode in the Control Register (PF2CR2) of General Purpose I/O Ports.
5. Supply the clock to Video Display Controller3 by the Standby Control Register (STBCR7) of Power-Down Modes.

Section 29 Sampling Rate Converter

The sampling rate converter converts the sampling rate for data produced by decoders such as WMA, MP3, or AAC.

29.1 Features

Table 29.1 Feature

Item	Channel 0	Channel 1
Data format	16-bit stereo/16-bit monaural	16-bit monaural
Input sampling rate	Selectable from 8 kHz, 11.025 kHz, 12 kHz, 16 kHz, 22.05 kHz, 24 kHz, 32 kHz, 44.1 kHz, and 48 kHz	44.1 kHz
Output sampling rate	Selectable from 44.1 kHz and 48 kHz	Selectable from 8 kHz and 16 kHz

- Processing capacity: A sample output interval is a maximum of 8 μ s and 14 μ s for channels 0 and 1, respectively. ($P\phi = 36$ MHz)
 - SNR: 80 db or higher
 - Five interrupt sources: Input data FIFO empty, output data FIFO full, output data FIFO overwrite, output data FIFO underflow, and conversion end
 - Two DMA transfer sources: Input data FIFO empty and output data FIFO full
 - Module standby mode
- Power consumption can be reduced by stopping clock supply to this module when not used.

Figure 29.1 shows a block diagram.

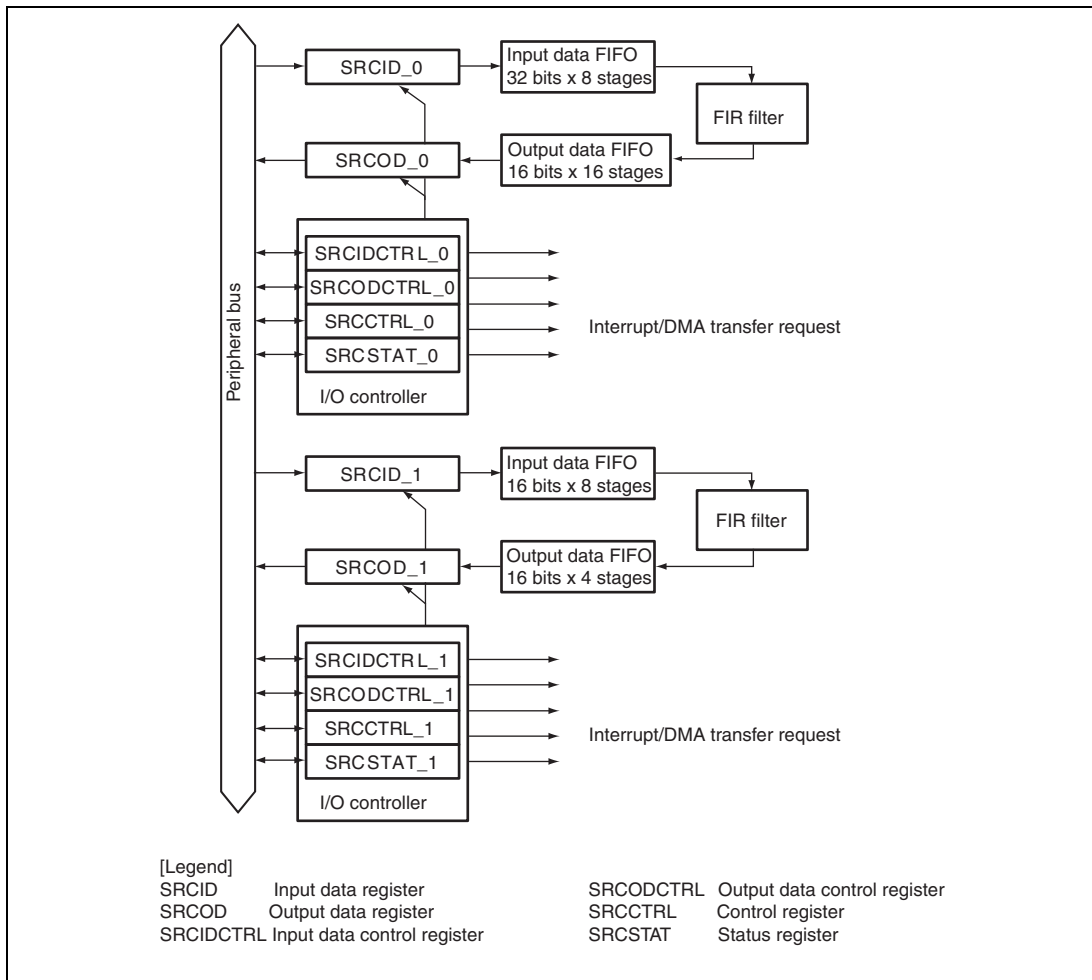

Figure 29.1 Block Diagram

29.2 Register Descriptions

Table 29.2 shows the register configuration.

Table 29.2 Register Configuration

Register Name	Abbreviation	R/W	Initial Value	Address	Access Size
Input data register_0	SRCID_0	R/W	H'00000000	H'FFFF7000	16, 32
Output data register_0	SRCOD_0	R	H'00000000	H'FFFF7004	16, 32
Input data control register_0	SRCIDCTRL_0	R/W	H'0000	H'FFFF7008	16
Output data control register_0	SRCODCTRL_0	R/W	H'0000	H'FFFF700A	16
Control register_0	SRCCTRL_0	R/W	H'0000	H'FFFF700C	16
Status register_0	SRCSTAT_0	R/(W)*	H'0002	H'FFFF700E	16
Input data register_1	SRCID_1	R/W	H'00000000	H'FFFF7800	16, 32
Output data register_1	SRCOD_1	R	H'00000000	H'FFFF7804	16, 32
Input data control register_1	SRCIDCTRL_1	R/W	H'0000	H'FFFF7808	16
Output data control register_1	SRCODCTRL_1	R/W	H'0000	H'FFFF780A	16
Control register_1	SRCCTRL_1	R/W	H'0000	H'FFFF780C	16
Status register_1	SRCSTAT_1	R/(W)*	H'0002	H'FFFF780E	16

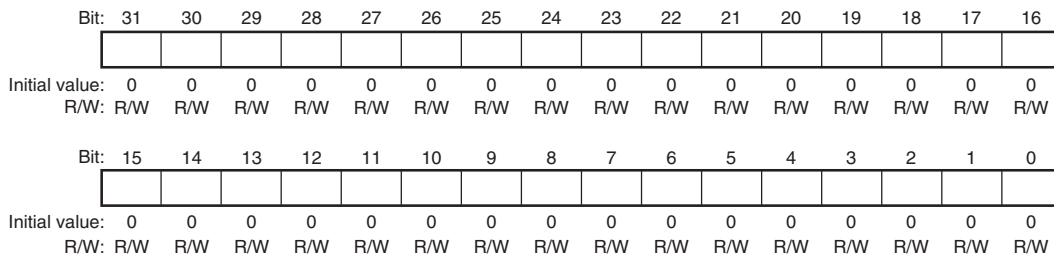

Note: * Bits 15 to 6 and 4 are read-only. Only 0 can be written to bits 5 and 3 after having read as 1.

29.2.1 Input Data Register (SRCID)

SRCID is a readable/writable register that is used to input the data before sampling rate conversion. All the bits are read as 0. The data input to SRCID is stored in the 8-stage input data FIFO. When the number of data units in the input data FIFO is 8, writing to SRCID has no effect.

(1) Input Data Register_0 (SRCID_0)

SRCID_0 is a 32-bit register. For stereo data, bits 31 to 16 are for Lch data, and bits 15 to 0 are for Rch data. For monaural data, data in bits 31 to 16 is valid, and data in bits 15 to 0 is invalid.

(2) Input Data Register_1 (SRCID_1)

SRCID_1 is a 16-bit register. Monaural data in bits 15 to 0 is valid.

The data subject to sampling rate conversion is aligned differently depending on the IED bit setting in SRCIDCTRL. Tables 29.3 and 29.4 show the relationship between the IED bit setting and data alignment.

Table 29.3 Alignment of Data before Sampling Rate Conversion (Channel 0)

IED	Lch[15:8]	Lch[7:0]	Rch[15:8]	Lch[7:0]
0	SRCID[31:24]	SRCID[23:16]	SRCID[15:8]	SRCID[7:0]
1	SRCID[23:16]	SRCID[31:24]	SRCID[7:0]	SRCID[15:8]

Table 29.4 Alignment of Data before Sampling Rate Conversion (Channel 1)

IED	Upper Byte	Lower Byte
0	SRCID[15:8]	SRCID[7:0]
1	SRCID[7:0]	SRCID[15:8]

29.2.2 Output Data Register (SRCOD)

SRCOD is a 32-bit read-only register used to output the data after sampling rate conversion. The data in the output data FIFO is read through SRCOD. When the number of data in the output data FIFO is zero after the start of conversion, the value previously read is read again.

(1) Output Data Register_0 (SRCOD_0)

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

(2) Output Data Register_1 (SRCOD_1)

The conversion result is stored in bits 31 to 16. Bits 15 to 0 are always read as 0.

Bit:	31	30	29	28	27	26	25	24	23	22	21	20	19	18	17	16
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

The data in SRCOD is aligned differently depending on the OCH and OED bit setting in SRCODCTRL. Tables 29.5 and 29.6 show the correspondence between the OCH and OED bit setting and data alignment in SRCOD.

Table 29.5 Alignment of Data in SRCOD_0

OCH	OED	SRCOD_0[31:24]	SRCOD_0[23:16]	SRCOD_0[15:8]	SRCOD_0[7:0]
0	0	Lch[15:8]	Lch[7:0]	Rch[15:8]* ²	Rch[7:0]* ²
	1	Lch[7:0]	Lch[15:8]	Rch[7:0]* ²	Rch[15:8]* ²
1* ¹	0	Rch[15:8]	Rch[7:0]	Lch[15:8]	Lch[7:0]
	1	Rch[7:0]	Rch[15:8]	Lch[7:0]	Lch[15:8]

Notes: 1. When processing monaural data, do not set the bit to 1.
2. When processing monaural data, the data in these bits is invalid.

Table 29.6 Alignment of Data in SRCOD_1

IED	SRCOD_1[31:24]	SRCOD_1[23:16]
0	Upper byte	Lower byte
1	Lower byte	Upper byte

29.2.3 Input Data Control Register (SRCIDCTRL)

SRCIDCTRL is a 16-bit readable/writable register that specifies the endian format of input data, enables/disables the interrupt requests, and specifies the triggering number of data units.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	—	IED	IEN	—	—	—	—	—	—	IFTRG[1:0]	
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R/W	R/W	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9	IED	0	R/W	Input Data Endian Specifies the endian format of the input data. 0: Big endian 1: Little endian
8	IEN	0	R/W	Input Data FIFO Empty Interrupt Enable Enables/disables the input data FIFO empty interrupt request to be issued when the number of data units in the input FIFO becomes equal to or smaller than the triggering number specified by the IFTRG1 and IFTRG0 bits, thus resulting in the IINT bit in the status register (SRCSTAT) being set to 1. 0: Input data FIFO empty interrupt is disabled. 1: Input data FIFO empty interrupt is enabled.
7 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
1, 0	IFTRG[1:0]	00	R/W	<p>Input FIFO Data Triggering Number</p> <p>Specifies the condition in terms of the number on which the IINT bit in the status register (SRCSTAT) is set to 1. When the number of data units in the input FIFO becomes equal to or smaller than the triggering number listed below, the IINT bit is set to 1.</p> <p>00: 0</p> <p>01: 2</p> <p>10: 4</p> <p>11: 6</p>

29.2.4 Output Data Control Register (SRCODCTRL)

SRCODCTRL is a 16-bit readable/writable register that specifies whether to exchange the channels for the output data, specifies the endian format of output data, enables/disables the interrupt requests, and specifies the triggering number of data units.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	—	—	—	OCH	OED	OEN	—	—	—	—	—	—	—	OFTRG[1:0]
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R	R	R	R	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10	OCH	0	R/W	Output Data Channel Exchange Specifies whether to exchange the channels for the output data register (SRCOD). When processing monaural data, do not set this bit to 1. 0: Does not exchange the channels (the same order as data input) 1: Exchanges the channels (the opposite order from data input) Note: For channel 1, this bit is reserved and always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
9	OED	0	R/W	Output Data Endian Specifies the endian format of the output data. 0: Big endian 1: Little endian
8	OEN	0	R/W	Output Data FIFO Full Interrupt Enable Enables/disables the output data FIFO full interrupt request to be issued when the number of data units in the output FIFO becomes equal to or greater than the number specified by the OFTRG1 and OFTRG0 bits, thus resulting in the OINT bit in the status register (SRCSTAT) being set to 1. 0: Output data FIFO full interrupt is disabled. 1: Output data FIFO full interrupt is enabled.
7 to 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1, 0	OFTRG[1:0]	00	R/W	Output FIFO Data Trigger Number Specifies the condition in terms of the number on which the OINT bit in the status register (SRCSTAT) is set to 1. When the number of data units in the output FIFO becomes equal to or greater than the number listed below, the OINT bit is set to 1. For channel 0: 00: 1 01: 4 10: 8 11: 12 For channel 1: 00: 1 01: 1 10: 2 11: 3

29.2.5 Control Register (SRCCTRL)

SRCCTRL is a 16-bit readable/writable register that enables/disables the module operation, enables/disables the interrupt requests, and specifies flush processing, clear processing of the internal work memory, and the input and output sampling rates.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	—	—	CEEN	SRCEN	UDEN	OVEN	FL	CL	IFS[3:0]			—	—	—	OFS	
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
15, 14	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
13	CEEN	0	R/W	Conversion End Interrupt Enable Enables/disables the conversion end interrupt to be generated when the CEF bit in SRCSTAT is set to 1 after flush processing is completed and all the output data is read. 0: Disables conversion end interrupt requests. 1: Enables conversion end interrupt requests.
12	SRCEN	0	R/W	Module Enable Enables/disables this module operation. Writing 1 while SRCEN = 0 clears the internal work memory. 0: Disables this module operation. 1: Enables this module operation. Note: When SRCEN = 1, do not change the settings of the following bits.

Register	Bit	Bit Name
SRCIDCTRL	9	IED
SRCODCTRL	10, 9	OCH, OED
SRCCTRL	7 to 4, 0	IFS[3:0], OFS

Bit	Bit Name	Initial Value	R/W	Description
11	UDEN	0	R/W	<p>Output Data FIFO Underflow Interrupt Enable</p> <p>Enables/disables the output data FIFO underflow interrupt to be generated when output data FIFO is read and the UDF bit in SRCSTAT is set to 1 while the number of data units in the output data FIFO is zero.</p> <p>0: Disables output data FIFO underflow interrupt requests.</p> <p>1: Enables output data FIFO underflow interrupt requests.</p>
10	OVEN	0	R/W	<p>Output Data FIFO Overwrite Interrupt Enable</p> <p>Enables/disables the output data FIFO overwrite interrupt request to be issued when the conversion for the next data has been completed while the number of data units in the output FIFO is eight, thus setting the OVF bit in the status register (SRCSTAT) to 1.</p> <p>When OVEN = 1: Conversion processing is stopped until the OVF bit is cleared by the CPU accessing to SRCSTAT when the output data FIFO overwrite interrupt is generated. At this time, conversion result writing to the output data FIFO is also stopped.</p> <p>OVEN = 0: The OVF bit is automatically cleared when the output data FIFO has space, and conversion processing can be continued.</p> <p>0: Output data FIFO overwrite interrupt is disabled.</p> <p>1: Output data FIFO overwrite interrupt is enabled.</p>
9	FL	0	R/W	<p>Internal Work Memory Flush</p> <p>Writing 1 to this bit starts converting the sampling rate of all the data in the input FIFO, input buffer memory, and intermediate memory (i.e., flush processing). This bit is always read as 0. When SRCEN = 0, writing 1 to this bit does not trigger flush processing.</p> <p>In addition, when 1 is written to the FL bit while the number of data units in the input buffer memory is less than the values shown in tables 29.9 and 29.10, valid output data cannot be received. Thus the internal work memory is cleared without triggering the flush processing.</p>

Bit	Bit Name	Initial Value	R/W	Description
8	CL	0	R/W	Internal Work Memory Clear Writing 1 to this bit clears the input FIFO, output FIFO, input buffer memory, intermediate memory, and accumulator. This bit is always read as 0. Even when SRCEN = 0, writing 1 to this bit clears the processing.
7 to 4	IFS[3:0]	All 0	R/W	Input Sampling Rate Specifies the input sampling rate. 0000: 8.0 kHz 0001: 11.025 kHz 0010: 12.0 kHz 0011: Setting prohibited 0100: 16.0 kHz 0101: 22.05 kHz 0110: 24.0 kHz 0111: Setting prohibited 1000: 32.0 kHz 1001: 44.1 kHz 1010: 48.0 kHz 1011: Setting prohibited 1100: Setting prohibited 1101: Setting prohibited 1110: Setting prohibited 1111: Setting prohibited Note: For channel 1, these bits are reserved and always read as 0. The write value should always be 0.
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description												
0	OFS	0	R/W	<p>Output Sampling Rate</p> <p>Specifies the output sampling rate.</p> <p>For channel 0:</p> <p>0: 44.1 kHz</p> <p>1: 48.0 kHz</p> <p>For channel 1:</p> <p>0: 8.0 kHz</p> <p>1: 16.0 kHz</p> <p>Note: When channels 0 and 1 are used at the same time, only the following settings are allowed.</p> <table border="1"> <thead> <tr> <th></th> <th>Channel 0</th> <th>Channel 1</th> </tr> <tr> <th>IFS[3:0]</th> <th>OFS</th> <th>OFS</th> </tr> </thead> <tbody> <tr> <td>0000</td> <td>0</td> <td>0</td> </tr> <tr> <td>0100</td> <td>0</td> <td>1</td> </tr> </tbody> </table>		Channel 0	Channel 1	IFS[3:0]	OFS	OFS	0000	0	0	0100	0	1
	Channel 0	Channel 1														
IFS[3:0]	OFS	OFS														
0000	0	0														
0100	0	1														

After flush processing has been completed, the number of output data units obtained as a result of conversion can be calculated by using the following formula.

$$\text{Number of output data units} = \left\lfloor \frac{\text{Number of input data units} \times \frac{\text{Output sampling rate}}{\text{Input sampling rate}}}{\text{Input sampling rate}} \right\rfloor + 1$$

- Channel 0
 - $n = \begin{cases} 6: & \text{When IFS}[3:0] = 0000 \\ 4: & \text{When IFS}[3:0] = (0001,0010) \\ 3: & \text{When IFS}[3:0] = (0100,1000) \\ 2: & \text{When IFS}[3:0] = (0101,0110) \\ 1: & \text{When IFS}[3:0] = (1001,1010) \end{cases}$
- Channel 1
 - $n = 1$

Conversion processing is not started and thus output data is not obtained until the specified number of data units are input. The minimum number of input data units necessary for obtaining the first output data depends on the IFS and OFS bit settings. Tables 29.7 to 29.10 show the relation between the settings of the IFS and OFS bits and the number of input data required.

Table 29.7 Relation between Sampling Rate Settings and Number of Initial Input Data Units Required (Channel 0)

OFS Setting (Output Sampling Rate [kHz])	IFS Setting (Input Sampling Rate [kHz])								
	0000 (8.0)	0001 (11.025)	0010 (12.0)	0100 (16.0)	0101 (22.05)	0110 (24.0)	1000 (32.0)	1001 (44.1)	1010 (48.0)
0 (44.1)	38	40	40	43	48	48	43	—	63
1 (48.0)	38	40	40	43	48	48	43	32	—

Table 29.8 Relation between Output Sampling Rate Settings and Number of Initial Input Data Units Required (Channel 1)

OFS Setting (Output Sampling Rate [kHz])	Number of Initial Input Data Units
0 (8.0)	63
1 (16.0)	63

Table 29.9 Relation between Sampling Rate Settings and Number of Input Data Units Required for Flush Processing(Channel 0)

OFS Setting (Output Sampling Rate [kHz])	IFS Setting (Input Sampling Rate [kHz])								
	0000 (8.0)	0001 (11.025)	0010 (12.0)	0100 (16.0)	0101 (22.05)	0110 (24.0)	1000 (32.0)	1001 (44.1)	1010 (48.0)
0 (44.1)	27	24	24	22	16	16	22	—	1
1 (48.0)	27	24	24	22	16	16	22	32	—

Table 29.10 Relation between Output Sampling Rate Settings and Number of Input Data Units Required for Flush Processing (Channel 1)

OFS Setting (Output Sampling Rate [kHz])	Number of Input Data Units Required for Flush Processing
0 (8.0)	1
1 (16.0)	1

29.2.6 Status Register (SRCSTAT)

SRCSTAT is a 16-bit readable/writable register that indicates the number of data units in the input and output data FIFOs, whether the various interrupt sources have been generated or not, and the flush processing status.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	OFDN[4:0]					IFDN[3:0]			—	CEF	FLF	UDF	OVF	IINT	OINT	
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	1	0
R/W:	R	R	R	R	R	R	R	R	R	R	R(W)*1	R	R(W)*1	R(W)*1	R(W)*1	R(W)*1

Note: *1 Only 0 can be written after having read as 1.

Bit	Bit Name	Initial Value	R/W	Description
15 to 11	OFDN[4:0]	All 0	R	Output FIFO Data Count Indicates the number of data units in the output FIFO. Note: For channel 1, bits 15 and 14 are reserved and always read as 0. The write value should always be 0.
10 to 7	IFDN[3:0]	All 0	R	Input FIFO Data Count Indicates the number of data units in the input FIFO.
6	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
5	CEF	0	R/(W)*1	Conversion End Flag Indicates that all the output data is read after flush processing is completed. [Clearing conditions] <ul style="list-style-type: none"> When 0 has been written to the CEF bit after reading CEF = 1. When 1 has been written to the CL bit in SRCCTRL. When 1 has been written to the SRCEN bit in SRCCTRL while SRCEN is 0. [Setting condition] <ul style="list-style-type: none"> When the number of data units in the output data FIFO is zero on completion of flush processing.

Bit	Bit Name	Initial Value	R/W	Description

0	OINT	0	R/(W)* ¹	<p>Output Data FIFO Full Interrupt Request Flag</p> <p>Indicates that the number of data units in the output FIFO has become equal to or greater than the triggering number specified by the OFTRG[1:0] bits in the output data control register (SRCODCTRL).</p> <p>[Clearing conditions]</p> <ul style="list-style-type: none"> • When 0 has been written to the OINT bit after reading OINT = 1. • When the number of data units in the FIFO has become less than the specified triggering number due to DMA transfer to the output FIFO. • When 1 has been written to the CL bit in SRCCTRL.*² • When 1 has been written to the SRCEN bit in SRCCTRL while SRCEN is 0.*² <p>[Setting condition]</p> <ul style="list-style-type: none"> • When the number of data units in the output FIFO has become equal to or greater than the specified triggering number.

Notes: 1. Only 0 can be written after having read as 1.
2. The setting is valid only in channel 0. In channel 1, the setting is invalid.

29.3 Operation

29.3.1 Initial Setting

Figure 29.2 shows a sample flowchart for initial setting.

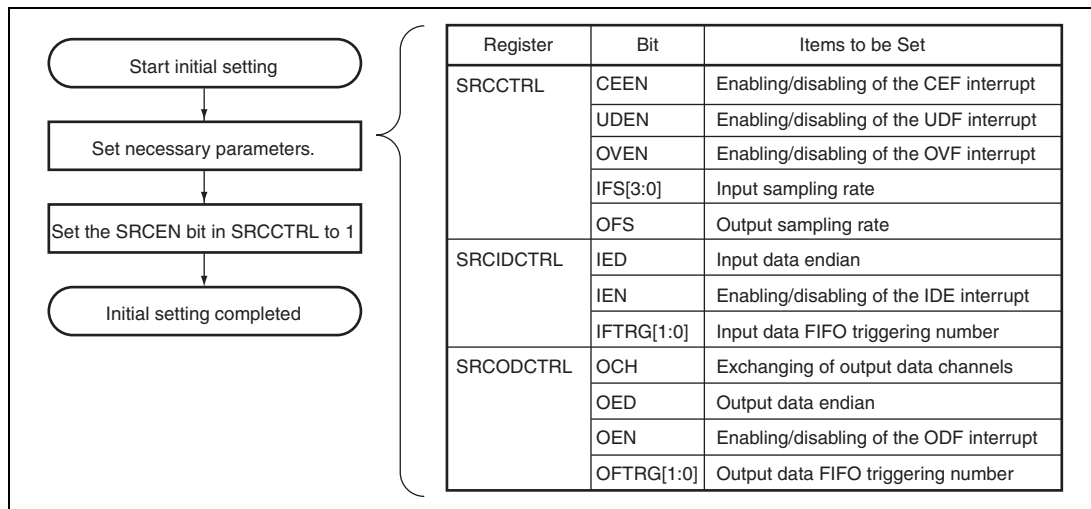

Figure 29.2 Sample Flowchart for Initial Setting

29.3.2 Data Input

Figure 29.3 is a sample flowchart for data input.

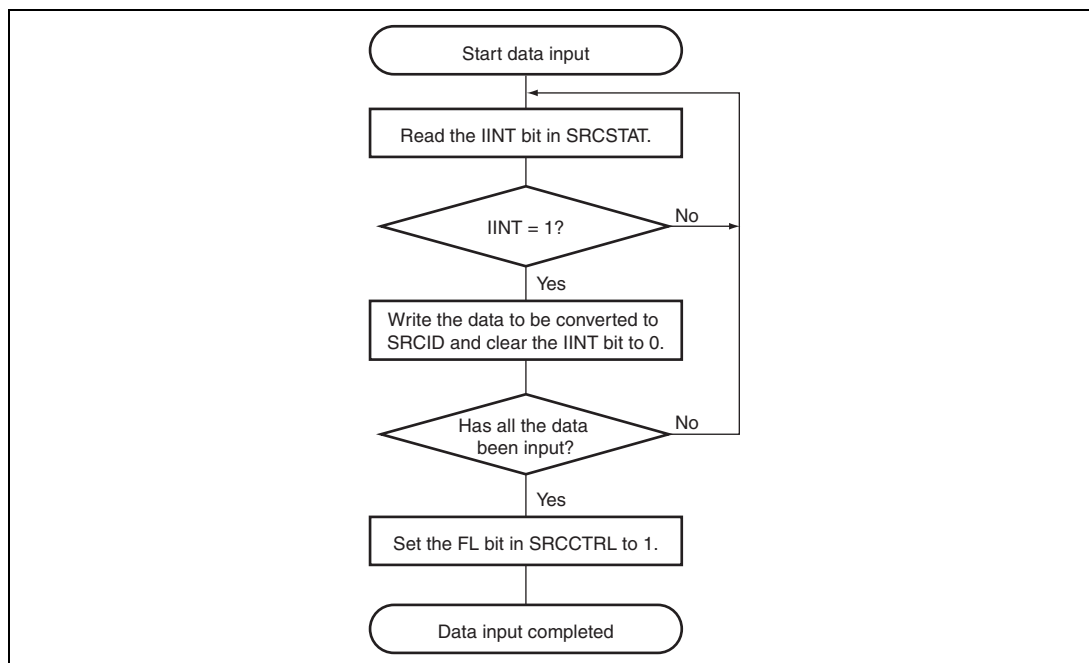

Figure 29.3 Sample Flowchart for Data Input

(1) When Interrupts are Issued to CPU

1. Set the IEN bit in SRCIDCTRL to 1.
2. When the IINT bit in SRCSTAT is set to 1, the IDE interrupt request is issued. In the interrupt processing routine, read the IINT bit and confirm that it is 1, write data to SRCID, and write 0 to the IINT bit. Then return from the interrupt processing routine.
3. Repeat step 2 until all the data has been input, and write 1 to the FL bit in SRCCTRL.

(2) When Interrupts are Used to Activate Direct Memory Access Controller

1. Assign IDEI of this module to one channel of the direct memory access controller.
2. Set the IEN bit in SRCIDCTRL to 1.
3. When the IINT bit in SRCSTAT is set to 1, the IDE interrupt request is issued thus activating the direct memory access controller. When the direct memory access controller has written data to the SRCID thus resulting in the number of data units in the input data FIFO exceeding that of the triggering number specified by the IFTRG1 and IFTRG 0 bits in SRCIDCTRL, the IINT bit is cleared to 0.
4. Repeat step 3 until all the data has been input, and write 1 to the FL bit in SRCCTRL.

(3) When Serial Sound Interface Interrupts are Used for Activating Direct Memory Access Controller to Transfer Input Data from Serial Sound Interface

1. Assign the serial sound interface to one channel of the direct memory access controller as a DMA transfer request source. Set SSIFRDR of the serial sound interface as a transfer source and SRCID of the sampling rate converter as a transfer destination, and set the serial source interface to enable reception operation.
2. When the RDF bit in SSIFSR is set to 1, the serial sound interface interrupt request is issued thus activating the direct memory access controller. The direct memory access controller then reads data from SSIFRDR and writes the data to SRCID.
3. Repeat step 2 until all the data has been input, and write 1 to the FL bit in SRCCTRL.

29.3.3 Data Output

Figure 29.4 is a sample flowchart for data output.

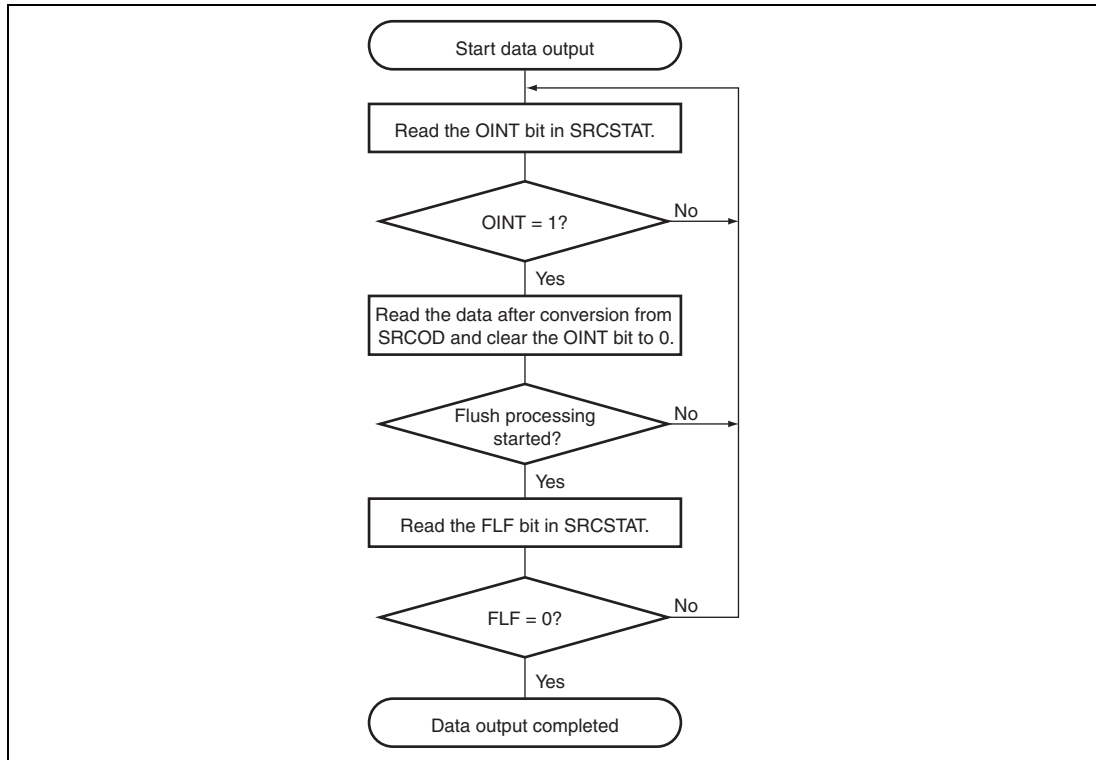

Figure 29.4 Sample Flowchart for Data Output

(1) When Interrupts are Issued to CPU

1. Set the OEN bit in SRCODCTRL to 1.
2. When the OINT bit in SRCSTAT is set to 1, the ODF interrupt request is issued. In the interrupt processing routine, read the OINT bit and confirm that it is 1, read data from SRCOD, and write 0 to the OINT bit. Then return from the interrupt processing routine.
3. After flush processing starts, repeat step 2 until the CEF bit in SRCSTAT is read as 1.

(2) When Interrupts are Used to Activate Direct Memory Access Controller

1. Assign ODFI of this module to one channel of the direct memory access controller.
2. Set the OEN bit in SRCODCTRL to 1.
3. When the OINT bit in SRCSTAT is set to 1, the ODF interrupt request is issued thus activating the direct memory access controller. When the direct memory access controller has read data from SRCOD thus resulting in the number of data units in the output data FIFO being less than the triggering number specified by the OFTRG1 and OFTRG0 bits in SRCODCTRL, the OINT bit is cleared to 0.
4. After flush processing starts, repeat step 3 until the FLF bit in SRCSTAT is read as 0.

(3) When Serial Sound Interface Interrupts are Used for Activating Direct Memory Access Controller to Transfer Output Data to Serial Sound Interface

1. Set the OVEN bit in SRCCTRL to 0 to disable the OVF interrupt request generation.
2. Assign the serial sound interface to one channel of the direct memory access controller as a DMA transfer request source. Set SRCID of the sampling rate converter as a transfer source and SSIFTDR of the serial sound interface as a transfer destination, and set the serial source interface to enable transmission operation.
3. When the TDE bit in SSIFSR is set to 1, the serial sound interface issues an interrupt request thus activating the direct memory access controller. The direct memory access controller then reads data from SRCOD and writes the data to SSIFTDR.
4. After flush processing starts, repeat step 3 until the CEF bit in SRCSTAT is read as 1.

29.4 Interrupts

This module has five interrupt sources: input data FIFO empty (IDEI), output data FIFO full (ODFI), output data FIFO overwrite (OVF), output data FIFO underflow (UDF), and conversion end (CEF). Table 29.11 summarizes the interrupts.

Table 29.11 Interrupt Requests and Generation Conditions

Interrupt Request	Abbreviation	Interrupt Condition	Direct Memory Access Controller Activation
Input data FIFO empty	IDEI	IINT = 1, IEN = 1, and SRCEN = 1	Possible
Output data FIFO full	ODFI	OINT = 1, OEN = 1, and SRCEN = 1	Possible
Output data FIFO overwrite	OVF	OVF = 1, OVEN = 1, and SRCEN = 1	Not possible
Output data FIFO underflow	UDF	UDF = 1, UDEN = 1, and SRCEN = 1	Not possible
Conversion end	CEF	CEF = 1, CEEN = 1, and SRCEN = 1	Not possible

When the interrupt condition is satisfied, the CPU executes the interrupt exception handling routine. The interrupt source flags should be cleared in the routine.

The IDEI and ODFI interrupts can activate the direct memory access controller when the direct memory access controller is set to allow this. If the direct memory access controller is activated, the interrupts from this module are not sent to the CPU. When the direct memory access controller has written data to SRCID resulting in the number of data units in the input data FIFO exceeding that of the specified triggering number, the IINT bit is cleared to 0. Similarly, when the direct memory access controller has read data from SRCOD resulting in the number of data units in the output data FIFO being less than the specified triggering number, the OINT bit is cleared to 0.

29.5 Usage Notes

29.5.1 Notes on Accessing Registers

After the following write access to SRCCTRL, three cycles of the peripheral clock (P ϕ) elapse before the corresponding bit in SRCSTAT is updated.

- Before the FLF bit in SRCSTAT is set after 1 is written to the FL bit in SRCCTRL
- Before each bit in SRCSTAT is initialized after 1 is written to the CL bit in SRCCTRL
- Before each bit in SRCSTAT is initialized after 1 is written to the SRCEN bit in SRCCTRL while the SRCEN bit is 0

On the other hand, as the CPU executes any subsequent instruction without waiting for the completion of the register writing, an instruction that immediately follows that used to write to SRCCTRL cannot accurately detect the updated state of SRCSTAT. To check the updated SRCSTAT state, dummy-read SRCCTRL or SRCSTAT after the instruction used to write to SRCCTRL.

29.5.2 Notes on Flush Processing

When 1 is written to the FL bit in SRCCTRL, this module continues conversion processing by adding 0-data to the input data end point. Flush processing, therefore, should be performed when the audio data end point is input and there is no subsequent data.

To perform conversion again after flush processing, clear the internal work memory in either of the following ways.

- Write 1 to the CL bit in SRCCTRL.
- Write 0 and then 1 to the SRCEN bit in SRCCTRL.

29.5.3 Notes on Using Two Channels at the Same Time

When channel 0 and channel 1 are used at the same time, only the settings shown in table 29.12 can be set.

Table 29.12 Settable Combinations for Using Two Channels at the Same Time

IFS[3:0]	Channel 0		Channel 1	
	CFS	Conversion Processing	OFS	Conversion Processing
0000	0	8.0 kHz to 44.1 kHz	0	44.1 kHz to 8.0 kHz
0001	0	16.0 kHz to 44.1 kHz	1	44.1 kHz to 16.0 kHz

Renesas Electronics Corporation is only able to provide information contained in this section to parties with which we have concluded a nondisclosure agreement. Please contact one of our sales representatives for details.

Section 31 On-Chip RAM

This LSI has an on-chip high-speed RAM, which achieves fast access, an on-chip large-capacity RAM for display area and work area (128 Kbytes of this RAM are shared with the on-chip data retention RAM), and an on-chip data retention RAM, which can retain data in deep standby mode. These memory units can be used to store instructions or data.

The operation and write access to the on-chip high-speed RAM and large-capacity RAM (including on-chip data retention RAM) can be enabled or disabled through the RAM enable bits and RAM write enable bits.

The on-chip data retention RAM is assigned to page 0 of the on-chip large-capacity RAM. Retention or non-retention of data by the on-chip data retention RAM in deep standby mode is selectable on a per-page basis.

31.1 Features

- Page
 - The on-chip high-speed RAM consists of four pages. The size of one page is 16 Kbytes.
 - The on-chip large-capacity RAM consists of six pages. The size of each page is determined depending on the display area sizes (QVGA, WQVGA, and VGA sizes).
 - The on-chip data retention RAM consists of four pages. Page 0 has 16-Kbytes, page 1 has 16-Kbytes, page 2 has 32-Kbytes, and page 3 has 64-Kbytes.
- Memory map
 - The on-chip RAM is located in the address spaces shown in tables 31.1 to 31.3.

Table 31.1 Address Spaces of On-Chip High-Speed RAM

Page	Address
Page 0	H'FFF80000 to H'FFF83FFF
Page 1	H'FFF84000 to H'FFF87FFF
Page 2	H'FFF88000 to H'FFF8BFFF
Page 3	H'FFF8C000 to H'FFF8FFFF

Table 31.2 Address Spaces of On-Chip Large-Capacity RAM

Page	Cache-enabled Address	Cache-disabled Address
Page 0 (256KB)	H'1C000000 to H'1C03FFFF	H'3C000000 to H'3C03FFFF
Page 1 (256KB)	H'1C040000 to H'1C07FFFF	H'3C040000 to H'3C07FFFF
Page 2 (256KB)	H'1C080000 to H'1C0BFFFF	H'3C080000 to H'3C0BFFFF
Page 3 (256KB)	H'1C0C0000 to H'1C0FFFFFF	H'3C0C0000 to H'3C0FFFFFF
Page 4 (256KB)	H'1C100000 to H'1C13FFFF	H'3C100000 to H'3C13FFFF
Page 5 (256KB)	H'1C140000 to H'1C17FFFF	H'3C140000 to H'3C17FFFF

Table 31.3 Address Spaces of On-Chip Data Retention RAM

Page	Cache-enabled Address	Cache-disabled Address
Page 0 (16KB)	H'1C000000 to H'1C003FFF	H'3C000000 to H'3C003FFF
Page 1 (16KB)	H'1C004000 to H'1C007FFF	H'3C004000 to H'3C007FFF
Page 2 (32KB)	H'1C008000 to H'1C00FFFF	H'3C008000 to H'3C00FFFF
Page 3 (64KB)	H'1C010000 to H'1C01FFFF	H'3C010000 to H'3C01FFFF

- Ports

Each page of the on-chip high-speed RAM has two independent read and write ports and is connected to the internal DMA bus (ID bus), CPU instruction fetch bus (F bus), and CPU memory access bus (M bus). (Note that the F bus is connected only to the read ports.)

The F bus and M bus are used for access by the CPU, and the ID bus is used for access by the direct memory access controller.

Each page of the on-chip large-capacity RAM has one read and write port and is connected to the internal CPU bus (IC bus), internal DMA bus (ID bus) and internal graphic buses 1 to 4 (IV1 to IV4). The on-chip RAM for data retention is included in page 0 of the on-chip large-capacity RAM. Accordingly, the on-chip RAM for data retention is shared with the read and write port of page 0 of the on-chip large-capacity RAM.

- Priority

When the same page of the on-chip high-speed RAM is accessed from different buses simultaneously, the access is processed according to the priority. The priority is ID bus > M bus > F bus.

When the same page of the on-chip large-capacity RAM is accessed from different buses simultaneously, the access is processed according to the priority. The priority is IV1 bus > IV2 bus > IV3 bus > IV4 bus > IC bus (when the IC bus does not have the bus mastership in the preceding bus cycle) > ID bus > IC bus (when the IC bus has the bus mastership in the preceding bus cycle)

- Number of access cycles

On-chip high-speed RAM: the number of cycles for access to read or write from buses F and I is one cycle of $I\phi$. Number of cycles for access from the ID bus depend on the ratio of the CPU clock ($I\phi$) to the bus clock ($B\phi$). Table 31.4 indicates number of cycles for access from the ID bus.

Table 31.4 Number of Cycles for Access to On-Chip High-Speed RAM from the ID Bus

Read/Write	Ratio of $I\phi$ and $B\phi$	Number of Access ($B\phi$) Cycles
Read	1:1	3
	2:1	2
	3:1	2
	4:1	2
	6:1	1
	8:1	1
	Write	1:1
2:1		2
3:1		2
4:1		2
6:1		1
8:1		1

Note: For the settable ratios of $I\phi$ to $B\phi$, see section 5, Clock Pulse Generator.

On-chip large-capacity RAM: the number of cycles for access to read or write from any bus is one cycle of $B\phi$.

31.2 Usage Notes

31.2.1 Page Conflict

When the same page of the on-chip high-speed RAM or the on-chip large-capacity RAM is accessed from different buses simultaneously, a conflict on the page occurs. Although each access is completed correctly, this kind of conflict degrades the memory access speed. Therefore, it is advisable to provide software measures to prevent such conflicts as far as possible. For example, no conflict will arise if different pages are accessed by each bus.

31.2.2 RAME and RAMWE Bits

Before disabling memory operation or write access to the on-chip high-speed RAM through the RAME or RAMWE bit, be sure to read from any address and then write to the same address in each page; otherwise, the last written data in each page may not be actually written to the RAM.

Figure 31.1 Examples of Read/Write

31.2.3 Data Retention

Data in the on-chip high-speed RAM and the large-capacity RAM (including on-chip data retention RAM) are retained in the states other than power-on reset and deep standby mode. In power-on reset and deep standby mode, these RAMs operate as described below.

(1) Power-on Reset

(a) On-Chip High-Speed RAM

Data are retained on a power-on reset by disabling the setting of either the RAME or RAMWE bit.

Data are not retained when the setting of the RAME and RAMWE bits are both enabled.

(b) On-Chip Large-Capacity RAM (Excluding On-Chip Data Retention RAM)

Data are retained on a power-on reset by disabling the setting of either the VRAME or VRAMWE bit.

Data are not retained when the setting of the VRAME and VRAMWE bits are both enabled.

(c) On-Chip Data Retention RAM

Data are retained on a power-on reset by disabling the setting of any of the VRAME, VRAMWE, or RRAMWE, excluding the case that deep standby mode is canceled by power-on reset.

Data are not retained when the setting of the VRAME, VRAMWE and RRAMWE bits are all enabled.

(2) Deep Standby Mode

(a) On-Chip High-Speed RAM and On-Chip Large-Capacity RAM (Excluding On-Chip Data Retention RAM)

Data are not retained.

(b) On-Chip Data Retention RAM

Data are retained in deep standby mode by enabling the setting of the RRAMKP bit, excluding the case that deep standby mode is canceled by power-on reset. In the case that deep standby mode is canceled by interrupt or pins for cancelling, power-on reset exception handling is executed, but the data are retained.

Section 32 General Purpose I/O Ports

This LSI has 9 general purpose I/O ports: A, B, C, D, E, F, G, H, and J.

All port pins are multiplexed with other peripheral module pin functions.

Each port is provided with registers for selecting the pin functions and those I/O directions of multiplex pins, data registers for storing the pin data and port registers for reading the states of the pins.

32.1 Features

- By setting the control registers, multiplexed pin functions can be selectable.
- When the general I/O function or TIOC I/O function of multi-function timer pulse unit 2 is specified, the I/O direction can be selected by I/O register settings.

Table 32.1 Number of General Purpose I/O Pins

Port	SH7266	SH7267
A	2 I/O pins	3 I/O pins
B	22 I/O pins	
C	9 I/O pins	
D	16 I/O pins	
E	6 input pins with open-drain outputs	
F	13 I/O pins	
G	2 I/O pins	25 I/O pins
H	6 input pins	
J	4 I/O pins	
Total	80 pins (68 I/O pins, 6 input pins with open-drain outputs, and 6 input pins)	104 pins (92 I/O pins, 6 input pins with open-drain outputs, and 6 input pins)

Tables 32.2 to 32.10 show the multiplex pins of this LSI. The registers and pin functions in the shaded cells are available only in the SH7267 Group.

Table 32.2 Multiplexed Pins (Port A)

Port	$\overline{\text{RES}}$ Pin input	
	H	L
	Function 1	Function 2
A	PA2	MD_BOOT1
	PA1	MD_BOOT0
	PA0	MD_CLK

Note: The function 2 of port A is enabled in the state of $\overline{\text{RES}} = \text{L}$ and always general I/O functions in the state of $\overline{\text{RES}} = \text{H}$.

- Notes:
1. The initial value depends on the boot mode of the LSI.
 2. In 16- or 32-bit access, the register can be read but cannot be written to.
 3. In 8-bit access, the register can be read but cannot be written to.

32.2.1 Port A I/O Registers 1, 0 (PAIOR1, PAIOR0)

PAIOR1 and PAIOR0 are 16-bit readable/writable registers that are used to set the pins on port A as inputs or outputs. The PA2IOR0 to PA0IOR bits correspond to the PA2 to PA0 pins, respectively. If a bit in PAIOR1 or PAIOR0 is set to 1, the corresponding pin on port A functions as output. If it is cleared to 0, the corresponding pin function as input.

Bits 15 to 1 in PAIOR1, and bits 15 to 9, 7 to 1 in PAIOR0 are reserved. These bits are always read as 0. The write value should always be 0.

(1) Port A I/O Register 1 (PAIOR1: Available Only in the SH7267 Group)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	PA2 IOR
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

(2) Port A I/O Register 0 (PAIOR0)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	PA1 IOR	-	-	-	-	-	-	-	PA0 IOR
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R/W	R	R	R	R	R	R	R	R/W

32.2.2 Port A Data Registers 1, 0 (PADR1, PADR0)

PBDR1 and PBDR0 are 16-bit readable/writable registers that store port A data. The PA2DR to PA0DR bits correspond to the PA2 to PA0 pins, respectively.

When a pin function is general output, if a value is written to PADR1 or PADR0, that value is output from the pin, and if PADR1 or PADR0 is read, the register value is returned regardless of the pin state.

When a pin function is general input, if PADR1 or PADR0 is read, the pin state, not the register value, is returned directly. If a value is written to PADR1 or PADR0, although that value is written into PADR1 or PADR0, it does not affect the pin state. Table 32.12 summarizes PADR1 and PADR0 read/write operation.

(1) Port A Data Register 1 (PADR1: Available Only in the SH7267 Group)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	-	-	PA2 DR
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	PA2DR	0	R/W	See table 32.12

(2) Port A Data Register 0 (PADR0)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	PA1 DR	-	-	-	-	-	-	-	PA0 DR
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R/W	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	PA1DR	0	R/W	See table 32.12
7 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	PA0DR	0	R/W	See table 32.12

Table 32.12 Port A Data Registers 1, 0 (PADR1, PADR0) Read/Write Operation

- Bit 0 in PADR1 and Bits 8 and 0 in PADR0

PAIOR0	Pin Function	Read Operation	Write Operation
0	General input	Pin state	Can write to PADR1 and 0, but does not affect the pin state
1	General output	PADR1, 0 value	Value written is output from the pin

32.2.3 Port A Port Register 0 (PAPR0)

PAPR0 is a 16-bit read-only register, in which the PA2PR to PA0PR bits correspond to the PA2 to PA0 pins, respectively. PAPR0 always returns the states of the pins.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	PA2 PR	PA1 PR	PA0 PR
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15 to 3	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
2	PA2PR	Pin state	R	The pin state is returned. These bits cannot be modified.
1	PA1PR	Pin state	R	
0	PA0PR	Pin state	R	

32.2.4 Port B Control Registers 0 to 5 (PBCR0 to PBCR5)

PBCR0 to PBCR5 are 16-bit readable/writable registers that are used to select the functions of the multiplexed pins on port B.

(1) Port B Control Register 5 (PBCR5)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	PB22MD[2:0]		-	PB21MD[2:0]			-	PB20MD[2:0]			
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0/1
R/W:	R	R	R	R	R	R/W	R/W	R/W	R	R/W	R/W	R/W	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
10 to 8	PB22MD[2:0]	000	R/W	<p>PB22 Mode</p> <p>Select the function of the PB22.</p> <p>000: PB22 100: RxD4</p> <p>001: A22 101: Setting prohibited</p> <p>010: $\overline{CS4}$ 110: Setting prohibited</p> <p>011: Setting prohibited 111: Setting prohibited</p>
7	—	0	R	<p>Reserved</p> <p>This bit is always read as 0. The write value should always be 0.</p>
6 to 4	PB21MD[2:0]	000	R/W	<p>PB21 Mode</p> <p>Select the function of the PB21.</p> <p>000: PB21 100: TxD4</p> <p>001: A21 101: Setting prohibited</p> <p>010: SPDIF_OUT 110: Setting prohibited</p> <p>011: Setting prohibited 111: Setting prohibited</p>
3	—	0	R	<p>Reserved</p> <p>This bit is always read as 0. The write value should always be 0.</p>
2 to 0	PB20MD[2:0]	000/001	R/W	<p>PB20 Mode</p> <p>Select the function of the PB20.</p> <p>Boot mode 0 Boot mode 1 to 3</p> <p>000: Setting prohibited 000: PB20 (initial value)</p> <p>001: A20 (initial value) 001: A20</p> <p>010: Setting prohibited 010: SPDIF_IN</p> <p>011: Setting prohibited 011: Setting prohibited</p> <p>100: Setting prohibited 100: SCK4</p> <p>101: Setting prohibited 101: Setting prohibited</p> <p>110: Setting prohibited 110: Setting prohibited</p> <p>111: Setting prohibited 111: Setting prohibited</p>

(2) Port B Control Register 4 (PBCR4)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	PB19MD[2:0]			-	PB18MD[2:0]			-	PB17MD[2:0]			-	-	PB16MD[1:0]

32.2.5 Port B I/O Registers 0, 1 (PBIOR0, PBIOR1)

PBIOR0 and PBIOR1 are 16-bit readable/writable registers that are used to set the pins on port B as inputs or outputs. The PB22IOR to PB1IOR bits correspond to the PB22 to PB1 pins, respectively. PBIOR1 and PBIOR0 are enabled when the port B pins are functioning as general-purpose I/O (PB22 to PB1) or TIOC I/O of multi-function timer pulse unit 2. In other states, they are disabled. If a bit in PBIOR1 or PBIOR0 is set to 1, the corresponding pin on port B functions as output pin. If it is cleared to 0, the corresponding pin functions as an input pin.

Bits 15 to 7 in PBIOR1 and bit 0 in PBIOR0 are reserved. These bits are always read as 0. The write value should always be 0.

(1) Port B I/O Register 1 (PBIOR1)

32.2.6 Port B Data Registers 0, 1 (PBDR0, PBDR1)

PBDR0 and PBDR1 are 16-bit readable/writable registers that store port B data. The PB22DR to PB1DR bits correspond to the PB22 to PB1 pins, respectively.

When a pin function is general output, if a value is written to PBDR1 or PBDR0, the value is output directly from the pin, and if PBDR is read, the register value is returned directly regardless of the pin state.

When a pin function is general input, if PBDR1 or PBDR0 is read, the pin state, not the register value, is returned directly. If a value is written to PBDR1 or PBDR0, although that value is written into PBDR1 or PBDR0, it does not affect the pin state. Table 32.13 summarizes PBDR1/PBDR0 read/write operation.

(1) Port B Data Register 1 (PBDR1)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

0	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.

Table 32.13 Port B Data Registers 1, 0 (PBDR1, PBDR0) Read/Write Operation

- Bits 6 to 0 of PBDR1 and Bits 15 to 1 of PBDR0

PBIOR1, 0	Pin Function	Read Operation	Write Operation
0	General input	Pin state	Can write to PBDR0/PBDR1, but it has no effect on the pin state.
	Other than general input	Pin state	Can write to PBDR0/PBDR1, but it has no effect on the pin state.
1	General output	PBDR0/PBDR1 value	Value written is output to the pin
	Other than general output	PBDR0/PBDR1 value	Can write to PBDR0/PBDR1, but it has no effect on the pin state.

32.2.7 Port B Port Registers 0, 1 (PBPR0, PBPR1)

PBPR (PBPR0, PBPR1) is 16-bit read-only register, in which the PB22PR to PB1PR bits correspond to the PB22 to PB1 pins, respectively. PBPR always returns the states of the pins regardless of the PBCR5 to PBCR0 settings.

(1) Port B Port Register 1 (PBPR1)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

32.2.9 Port C I/O Register 0 (PCIOR0)

PCIOR0 is a 16-bit readable/writable register that is used to set the pins on port C as inputs or outputs. The PC8IOR to PC0IOR bits correspond to the PC8 to PC0 pins, respectively. PCIOR0 is enabled when the port C pins are functioning as general-purpose I/O (PC8 to PC0) or TIOC I/O of multi-function timer pulse unit 2. In other states, PCIOR0 is disabled. If a bit in PCIOR0 is set to 1, the corresponding pin on port C functions as an output pin. If it is cleared to 0, the corresponding pin functions as an input pin.

Bits 15 to 9 in PCIOR0 are reserved. These bits are always read as 0. The write value should always be 0.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	PC8 IOR	PC7 IOR	PC6 IOR	PC5 IOR	PC4 IOR	PC3 IOR	PC2 IOR	PC1 IOR	PC0 IOR

32.2.10 Port C Data Register 0 (PCDR0)

PCDR0 is a 16-bit readable/writable register that stores port C data. The PC8DR to PC0DR bits correspond to the PC8 to PC0 pins, respectively.

When a pin function is general output, if a value is written to PCDR0, that value is output directly from the pin, and if PCDR0 is read, the register value is returned directly regardless of the pin state.

When a pin function is general input, if PCDR0 is read, the pin state, not the register value, is returned directly. If a value is written to PCDR0, although that value is written into PCDR0, it does not affect the pin state. Table 32.14 summarizes PCDR0 read/write operation.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	PC8 DR	PC7 DR	PC6 DR	PC5 DR	PC4 DR	PC3 DR	PC2 DR	PC1 DR	PC0 DR

1	PC1DR	0	R/W	
0	PC0DR	0	R/W	

Table 32.14 Port C Data Register 0 (PCDR0) Read/Write Operation

- Bits 8 to 0 of PCDR0

PCIOR0	Pin Function	Read Operation	Write Operation
0	General input	Pin state	Can write to PCDR0, but it has no effect on the pin state.
	Other than general input	Pin state	Can write to PCDR0, but it has no effect on the pin state.
1	General output	PCDR0 value	Value written is output from pin
	Other than general output	PCDR0 value	Can write to PCDR0, but it has no effect on the pin state

32.2.11 Port C Port Register 0 (PCPR0)

PCPR0 is a 16-bit read-only register, in which the PC8PR to PC0PR bits correspond to the PC8 to PC0 pins, respectively. PCPR0 always returns the states of the pins regardless of the PCCR0 to PCCR2 settings.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PD15 PR	PD14 PR	PD13 PR	PD12 PR	PD11 PR	PD10 PR	PD9 PR	PD8 PR	PD7 PR	PD6 PR	PD5 PR	PD4 PR	PD3 PR	PD2 PR	PD1 PR	PD0 PR

32.2.13 Port D I/O Register 0 (PDIOR0)

PDIOR0 is a 16-bit readable/writable register that is used to set the pins on port D as inputs or outputs. The PD15IOR to PD0IOR bits correspond to the PD15 to PD0 pins, respectively. The setting of PDIOR0 is valid for the pins for which general I/O function is selected and has no effect on the pins for which other function is selected. If a bit in PDIOR0 is set to 1, the corresponding pin on port D functions as an output. If it is cleared to 0, the corresponding pin functions as an input.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PD15 IOR	PD14 IOR	PD13 IOR	PD12 IOR	PD11 IOR	PD10 IOR	PD9 IOR	PD8 IOR	PD7 IOR	PD6 IOR	PD5 IOR	PD4 IOR	PD3 IOR	PD2 IOR	PD1 IOR	PD0 IOR

32.2.14 Port D Port Registers 0 (PDDR0)

PDDR0 is a 16-bit readable/writable register that stores port D data. The PD15DR to PD0DR bits correspond to the PD15 to PD0 pins, respectively.

When a pin function is general output, if a value is written to PDDR0, that value is output directly from the pin, and if PDDR0 is read, the register value is returned directly regardless of the pin state.

When a pin function is general input, if PDDR0 is read, the pin state, not the register value, is returned directly. If a value is written to PDDR0, although that value is written into PDDR0, it does not affect the pin state. Table 32.15 summarizes PDDR0 read/write operation.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	PD15 DR	PD14 DR	PD13 DR	PD12 DR	PD11 DR	PD10 DR	PD9 DR	PD8 DR	PD7 DR	PD6 DR	PD5 DR	PD4 DR	PD3 DR	PD2 DR	PD1 DR	PD0 DR

0	PD0DR	0	R/W	

Table 32.15 Port D Data Register 0 (PDDR0) Read/Write Operation

- Bits 15 to 0 of PDDR0

PCIOR0	Pin Function	Read Operation	Write Operation
0	General input	Pin state	Can write to PDDR0, but it has no effect on the pin state.
	Other than general input	Pin state	Can write to PDDR0, but it has no effect on the pin state.
1	General output	PDDR0 value	Value written is output from pin
	Other than general output	PDDR0 value	Can write to PDDR0, but it has no effect on the pin state

32.2.15 Port D Port Registers 0 (PDPR0)

PDPR0 is a 16-bit read-only register, in which the PD15PR to PD0PR bits correspond to the PD15 to PD0 pins, respectively. PDPR0 always returns the states of the pins regardless of the PDCR0 to PDCR3 settings.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

1	PD1PR	Pin state	R	
0	PD0PR	Pin state	R	

32.2.16 Port E Control Registers 0, 1 (PECR0, PECR1)

PECR1 and PECR0 are 16-bit readable/writable registers that are used to select the functions of the multiplexed pins on port E.

(1) Port E Control Register 1 (PECR1)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	PE5MD[1:0]	-	-	-	PE4MD[1:0]	
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
5, 4	PE5MD[1:0]	00	R/W	PE5 Mode Select the function of the PE5. 00: PE5 10: Setting prohibited 01: SDA2 11: DV_HSYNC
3, 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
1, 0	PE4MD[1:0]	00	R/W	PE4 Mode Select the function of the PE4. 00: PE4 10: Setting prohibited 01: SCL2 11: DV_VSYNC

(2) Port E Control Register 0 (PECR0)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	PE3MD[1:0]	-	-	PE2MD[1:0]	-	PE1MD[2:0]	-	-	PE0MD[1:0]					
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R/W	R/W	R	R	R/W	R/W	R	R/W	R/W	R/W	R	R	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15, 14	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
13, 12	PE3MD[1:0]	00	R/W	PE3 Mode Select the function of the PE3. 00: PE3 01: SDA1 10: Setting prohibited 11: IRQ3
11, 10	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
9, 8	PE2MD[1:0]	00	R/W	PE2 Mode Select the function of the PE2. 00: PE2 01: SCL1 10: Setting prohibited 11: IRQ2
7	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
6 to 4	PE1MD[2:0]	000	R/W	PE1 Mode Select the function of the PE1. 000: PE1 001: SDA0 010: IOIS16 011: IRQ1 100: TCLKA 101: \overline{ADTRG} 110: LCD_EXTCLK 111: Setting prohibited
3, 2	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
1, 0	PE0MD[1:0]	00	R/W	PE0 Mode Select the function of the PE0. 00: PE0 10: AUDIO_CLK 01: SCL0 11: IRQ0

32.2.17 Port E I/O Register 0 (PEIOR0)

PEIOR0 is a 16-bit readable/writable register that is used to set the pins on port F as inputs or outputs. The PE5IOR to PE0IOR bits correspond to the PE5 to PE0 pins respectively. PEIOR0 is enabled when the port E pins are functioning as general-purpose inputs/outputs (PE5 to PE0). In other states, it is disabled. If a bit in PEIOR0 is set to 1, the corresponding pin on port E functions as an output pin. If it is cleared to 0, the corresponding pin functions as an input pin.

Bits 15 to 6 in PEIOR0 are reserved. This bit is always read as 0. The write value should always be 0.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	PE5 IOR	PE4 IOR	PE3 IOR	PE2 IOR	PE1 IOR	PE0 IOR
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W

32.2.18 Port E Data Register 0 (PEDR0)

PEDR0 is a 16-bit readable/writable register that stores port E data. The PE5DR to PE0DR bits correspond to the PE5 to PE0 pins, respectively.

6 pins on Port E are open-drain outputs. When a pin function is general output, if 0 is written to PEDR0, 0 is output from the pin and if 1 is written to, the pin will be in the high-impedance state. If PEDR0 is read, the register value is returned directly regardless of the pin state.

When a pin function is general input, if PEDR0 is read, the pin state, not the register value, is returned directly. If a value is written to PEDR0, although that value is written into PEDR0, it does not affect the pin state. Table 32.16 summarizes PEDR0 read/write operation.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	PE5 DR	PE4 DR	PE3 DR	PE2 DR	PE1 DR	PE0 DR
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
5	PE5DR	0	R/W	See table 32.16
4	PE4DR	0	R/W	
3	PE3DR	0	R/W	
2	PE2DR	0	R/W	
1	PE1DR	0	R/W	
0	PE0DR	0	R/W	

Table 32.16 Port E Data Register 0 (PEDR0) Read/Write Operation

- Bits 5 to 0 of PEDR0

PEIOR0	Pin Operation	Read Operation	Write Operation
0	General input	Pin state	Can write to PEDR0, but it has no effect on the pin state.
	Other than general input	Pin state	Can write to PEDR0, but it has no effect on the pin state
1	General output	PEDR0 value	When PexDR=0, 0 outputs from the pin. When PexDR=1, the pin is in the high-impedance state.
	Other than general output	PEDR0 value	Can write to PEDR0, but it has no effect on the pin state

32.2.19 Port E Port Register 0 (PEPR0)

PEPR0 is a 16-bit read-only register, in which the PE5PR to PE0PR bits correspond to the PE5 to PE0 pins, respectively. PEPR0 always returns the states of the pins regardless of the PECR0 and PECR1 settings.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	PE5 PR	PE4 PR	PE3 PR	PE2 PR	PE1 PR	PE0 PR
Initial value:	0	0	0	0	0	0	0	0	0	0	PE5	PE4	PE3	PE2	PE1	PE0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15 to 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
5	PE5PR	Pin state	R	The pin state is returned. These bits cannot be modified.
4	PE4PR	Pin state	R	
3	PE3PR	Pin state	R	
2	PE2PR	Pin state	R	
1	PE1PR	Pin state	R	
0	PE0PR	Pin state	R	

32.2.20 Port F Control Register 0 to 3 (PFCR0 to PFCR3)

PFCR0 to PFCR3 are 16-bit readable/writable registers that are used to select the functions of the multiplexed pins on port F.

(1) Port F Control Register 3 (PFCR3)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	PF12MD[2:0]		
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 3	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
2 to 0	PF12MD[2:0]	000	R/W	PE12 Mode Select the function of the PE12. 000: PE12 100: TIOC3D 001: \overline{BS} 101: SPDIF_OUT 010: Setting prohibited 110: QMI/QIO1 011: MISO0 111: Setting prohibited

(2) Port F Control Register 2 (PFCR2)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	PF11MD[2:0]			-	PF10MD[2:0]			-	PF9MD[2:0]			-	PF8MD[2:0]		
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R/W	R/W	R/W	R	R/W	R/W	R/W	R	R/W	R/W	R/W	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.

Bit	Bit Name	Initial Value	R/W	Description
14 to 12	PF11MD[2:0]	000	R/W	<p>PF11 Mode</p> <p>Select the function of the PF11.</p> <p>000: PF11 100: TIOC3C</p> <p>001: A25 101: SPDIF_IN</p> <p>010: SSIDATA3 110: QMO/QIO0</p> <p>011: MOSI0 111: Setting prohibited</p>

32.2.21 Port F I/O Register 0 (PFIOR0)

PFIOR0 is a 16-bit readable/writable register that is used to set the pins on port F as inputs or outputs. The PF12IOR to PF0IOR bits correspond to the PF12 to PF0 pins, respectively. PFIOR0 is enabled when the port F pins are functioning as general-purpose I/O (PF12 to PF0) or TIOC I/O of multi-function timer pulse unit 2. In other states, they are disabled. If a bit in PFIOR0 is set to 1, the corresponding pin on port F functions as an output. If it is cleared to 0, the corresponding pin functions as an input.

Bits 15 to 13 in PFIOR0 are reserved. This bit is always read as 0. The write value should always be 0.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	PF12 IOR	PF11 IOR	PF10 IOR	PF9 IOR	PF8 IOR	PF7 IOR	PF6 IOR	PF5 IOR	PF4 IOR	PF3 IOR	PF2 IOR	PF1 IOR	PF0 IOR
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

32.2.22 Port F Data Register 0 (PFDR0)

PFDR0 is a 16-bit readable/writable register that stores port F data. The PF12DR to PF0DR bits correspond to the PF12 to PF pins respectively.

When a pin function is general output, if a value is written to PFDR0, that value is output directly from the pin, and if PEDR0 is read, the register value is returned directly regardless of the pin state.

When a pin function is general input, if PFDR0 is read, the pin state, not the register value, is returned directly. If a value is written to PFDR0, although that value is written into PFDR0, it does not affect the pin state. Table 32.17 summarizes PFDR0 read/write operation.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	PF12 DR	PF11 DR	PF10 DR	PF9 DR	PF8 DR	PF7 DR	PF6 DR	PF5 DR	PF4 DR	PF3 DR	PF2 DR	PF1 DR	PF0 DR

Table 32.17 Port F Data Register 0 (PFDR0) Read/Write Operation

- Bits 12 to 0 of PFDR0

PFIOR0	Pin Operation	Read Operation	Write Operation
0	General input	Pin state	Can write to PFDR0, but it has no effect on the pin state
	Other than general input	Pin state	Can write to PFDR0, but it has no effect on the pin state
1	General output	PFDR0 value	Value written is output from pin
	Other than general output	PFDR0 value	Can write to PFDR0, but it has no effect on the pin state

32.2.23 Port F Port Register 0 (PFPR0)

PFPR0 is a 16-bit read-only register, in which PF12PR to PF0PR bits correspond to the PF12 to PF0 pins, respectively. PFPR0 always returns the states of the pins regardless of the PFCR0 to PFCR3 settings.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

32.2.25 Port G I/O Registers 0, 1 (PGIOR0, PGIOR1)

PGIOR1 and PGIOR0 are 16-bit readable/writable registers that are used to set the pins on port G as inputs or outputs. The PG24IOR to PG0IOR bits correspond to the PG24 to PG0, respectively. PGIOR1 and PGIOR0 are enabled when the port G pins are functioning as general-purpose I/O (PG24 to PG0) or TIOC I/O of multi-function timer pulse unit 2. In other states, they are disabled. If bits in PGIOR1 and PGIOR0 are set to 1, corresponding pins on port G functions as outputs. If they are cleared to 0, the corresponding pins function as inputs.

Bits 15 to 9 in PGIOR1, and bits 8 to 4, 1, and 0 in PGIOR1 in the SH7266 Group are reserved. These bits are always read as 0. The write values should always be 0.

(1) Port G IO Register 1 (PGIOR1)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	PG24 IOR	PG23 IOR	PG22 IOR	PG21 IOR	PG20 IOR	PG19 IOR	PG18 IOR	PG17 IOR	PG16 IOR

32.2.26 Port G Data Register 0, 1 (PGDR0, PGDR1)

PGDR1 and PGDR0 are 16-bit readable/writable registers that store port G data. The PG24DR to PG0DR bits correspond to the PG24 to PG0 pins, respectively.

When a pin function is general output, if a value is written to PGDR1 or PGDR0, that value is output from the pin, and if PGDR1 or PGDR0 is read, the register value is returned directly regardless of the pin state.

When a pin function is general input, if PGDR1 or PGDR0 is read, the pin state, not the register value, is returned directly. If a value is written to PGDR1 or PGDR0, although that value is written into PGDR1 or PGDR0, it does not affect the pin state. Table 32.18 summarizes PGDR1/PGDR0 read/write operation.

(1) Port G Data Register 1 (PGDR1)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

Table 32.18 Port G Data Registers 1, 0 (PGDR1, PGDR0) Read/Write Operation

- Bits 8 to 0 of PGDR1 and Bits 15 to 0 of PGDR0

PGIOR1, 0	Pin Function	Read Operation	Write Operation
0	General input	Pin state	Can write to PGDR0/PGDR1, but it has no effect on the pin state
	Other than general input	Pin state	Can write to PGDR0/PGDR1, but it has no effect on the pin state
1	General output	PGDR0/PGDR1 value	Value written is output to pin
	Other than general output	PGDR0/PGDR1 value	Can write to PGDR0/PGDR1, but it has no effect on the pin state

32.2.27 Port G Port Register 0, 1 (PGPR0, PGPR1)

PGPR1 and PGPR0 are 16-bit read-only registers, in which the PG24PR to PG0PR bits correspond to the PG24 to PG0 pins, respectively. PGPR1 and PGPR0 always return the states of the pins regardless of the PGCR7 to PGCR0 settings.

(1) Port G Port Register 1 (PGPR1)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

32.2.28 Port H Control Register 0, 1 (PHCR0, PHCR1)

PHCR1 and PHCR0 are 16-bit readable/writable registers that are used to select the function of the multiplexed pins on port H.

(1) Port H Control Register 1 (PHCR1)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	PH5 MD0	-	-	-	PH4 MD0
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	PH5MD0	0	R/W	PH5 Mode Select the function of the PH5. 0: PH5 1: AN5
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	PH4MD0	0	R/W	PH4 Mode Select the function of the PH4. 0: PH4 1: AN4

(2) Port H Control Register 0 (PHCR0)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	PH3 MDO	-	-	-	PH2 MDO	-	-	-	PH1 MDO	-	-	-	PH0 MDO
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R	R	R	R/W	R	R	R	R/W	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
12	PH3MDO	0	R/W	PH3 Mode Select the function of the PH3. 0: PH3 1: AN3
11 to 9	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
8	PH2MDO	0	R/W	PH2 Mode Select the function of the PH2. 0: PH2 1: AN2
7 to 5	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
4	PH1MDO	0	R/W	PH1 Mode Select the function of the PH1. 0: PH1 1: AN1
3 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	PH0MDO	0	R/W	PH0 Mode Select the function of the PH0. 0: PH0 1: AN0

32.2.29 Port H Port Register 0 (PHPR0)

PHPR0 is a 16-bit read-only register, in which the PH5PR to PH0PR bits correspond to the PH5 to PH0 pins, respectively. PHPR0 always returns the states of the pins when the general input function is selected. This register is read as 1 during operation of the A/D converter.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	PH5 PR	PH4 PR	PH3 PR	PH2 PR	PH1 PR	PH0 PR
Initial value:	0	0	0	0	0	0	0	0	0	0	PH5	PH4	PH3	PH2	PH1	PH0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15 to 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
5	PH5PR	Pin state	R	The pin state is returned. These bits cannot be modified.
4	PH4PR	Pin state	R	
3	PH3PR	Pin state	R	
2	PH2PR	Pin state	R	
1	PH1PR	Pin state	R	
0	PH0PR	Pin state	R	

32.2.30 Port J Control Register 0, 1(PJCR0, PJCR1)

PJCR1 and PJCR0 are 16-bit readable/writable registers that are used to select the functions of the multiplexed pins on port J.

(1) Port J Control Register 1 (PJCR1)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	-	PJ3MD[2:0]		
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W

Note: To write to PJCR1, write by 16-bit or 32-bit access such that the write value for bits 15 to 8 is H'5A. In 8-bit access, the register cannot be written to.

Bit	Bit Name	Initial Value	R/W	Description
15 to 3	—	All 0	R	Reserved These bits are always read as 0. The write value should always be H'5A and all 0 to bits 15 to 8 and bits 7 to 3, respectively.
2 to 0	PJ3MD[2:0]	000*	R/W	PJ3 Mode Select the function of the PJ3. 000: PJ3 010: AUDIO_XOUT 001: CRx1 011: <u>WDTOVF</u> 010: CRx0/CRx1 110: Setting prohibited 011: IRQ1 111: Setting prohibited

Note: * Not initialized by a reset triggered by watchdog timer overflow.

(2) Port J Control Register 0 (PJCR0)

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	PJ2MD[2:0]		-	PJ1MD[2:0]		-	PJ0MD[2:0]				
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R/W	R/W	R/W	R	R/W	R/W	R/W	R	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 11	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
10 to 8	PJ2MD[2:0]	000	R/W	PJ2 Mode Select the function of the PJ2. 000: PG2 100: SCK0 001: CTx1 101: LCD_M_DISP 010: CRx0&CRx1 110: Setting prohibited 011: $\overline{CS2}$ 111: Setting prohibited
7	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
6 to 4	PJ1MD[2:0]	000	R/W	PJ1 Mode Select the function of the PJ1. 000: PJ1 100: RxD0 001: CRx0 101: Setting prohibited 010: IERxD 110: Setting prohibited 011: $\overline{IRQ0}$ 111: Setting prohibited
3	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
2 to 0	PJ0MD[2:0]	000	R/W	PJ0 Mode Select the function of the PJ0. 000: PJ0 100: TxD0 001: CTx0 101: A0 010: IERxD 110: Setting prohibited 011: $\overline{CS1}$ 111: Setting prohibited

32.2.31 Port J I/O register 0 (PJIOR0)

PJIOR0 is a 16-bit readable/writable register that is used to set the pins on port J as inputs or outputs. The PJ3IOR to PJ0IOR bits correspond to the PJ3 to PJ0 pins respectively. The setting of PJIOR0 is valid for the pins for which general I/O (PJ3 to PJ0) function and has no effect on the pins for which other function is selected. If a bit in PJIOR0 is set to 1, the corresponding pin on port J functions as an output pin. If it is cleared to 0, the corresponding pin functions as an input pin.

Bits 15 to 4 in PJIOR0 are reserved. These bits are always read as 0. The write value should always be 0.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	PJ3 IOR	PJ2 IOR	PJ1 IOR	PJ0 IOR
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

32.2.32 Port J Data Register 0 (PJDR0)

PJDR0 is a 16-bit readable/writable register that stores port J data. The PJ3DR to PJ0DR bits correspond to the PJ3 to PJ0 pins, respectively.

When a pin function is general output, if a value is written to PJDR0, that value is output from the pin, and if PJDR0 is read, the register value is returned directly regardless of the pin state.

When a pin function is general input, if PJDR0 is read, the pin state, not the register value, is returned directly. If a value is written to PJDR0, although that value is written into PJDR0, it does not affect the pin state. Table 32.19 summarizes PJDR0 read/write operation.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	PJ3 DR	PJ2 DR	PJ1 DR	PJ0 DR
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
3	PJ3DR	0	R/W	See table 32.19
2	PJ2DR	0	R/W	
1	PJ1DR	0	R/W	
0	PJ0DR	0	R/W	

Table 32.19 Port J Data Registers 0 (PJDR0) Read/Write Operation

- Bits 3 to 0 of PJDR0

PJIOR0	Pin Function	Read Operation	Write Operation
0	General input	Pin state	Can write to PJDR0, but it has no effect on the pin state.
	Other than general input	Pin state	Can write to PJDR0, but it has no effect on the pin state.
1	General output	PJDR0 value	Value written is output from pin
	Other than general output	PJDR0 value	Can write to PJDR0, but it has no effect on the pin state

32.2.33 Port J Port Register 0 (PJPR0)

PJPR0 is a 16-bit read-only register, in which the PJ3PR to PJ0PR bits correspond to the PJ3 to PJ0 pins, respectively. PJPR0 always returns the states of the pins regardless of the PJCR0 and PJCR1 settings.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	PJ3 PR	PJ2 PR	PJ1 PR	PJ0 PR
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	PJ3	PJ2	PJ1	PJ0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
15 to 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
3	PJ3PR	Pin state	R	The pin state is returned. These bits cannot be modified.
2	PJ2PR	Pin state	R	
1	PJ1PR	Pin state	R	
0	PJ0PR	Pin state	R	

32.2.34 Serial Sound Interface Noise Canceler Control Register (SNCR)

SNCR is 16-bit readable/writable register that controls the noise canceler in the input route from the LSI pin to a serial sound interface. Each bit can be set only when slave mode is selected for the corresponding channel of the serial sound interface. The bit should be used as it is the initial value when master mode is selected for the corresponding channel of the serial sound interface.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	-	-	-	-	-	SSI3 NCE	SSI2 NCE	SSI1 NCE	SSI0 NCE
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
3	SSI3NCE	0	R/W	Serial Sound Interface Channel 3 Noise Canceler Enable Enables or disables the noise canceler of SSISCK3, SSIWS3, and SSIDATA3. 0: Noise canceler is disabled. 1: Noise canceler is enabled.
2	SSI2NCE	0	R/W	Serial Sound Interface Channel 2 Noise Canceler Enable Enables or disables the noise canceler of SSISCK2, SSIWS2, and SSIDATA2. 0: Noise canceler is disabled. 1: Noise canceler is enabled.
1	SSI1NCE	0	R/W	Serial Sound Interface Channel 1 Noise Canceler Enable Enables or disables the noise canceler of SSISCK1, SSIWS1, and SSIDATA1. 0: Noise canceler is disabled. 1: Noise canceler is enabled.

Bit	Bit Name	Initial Value	R/W	Description
0	SSI0NCE	0	R/W	Serial Sound Interface Channel 0 Noise Canceler Enable Enables or disables the noise canceler of SSISCK0, SSIWS0, and SSIRxD0. 0: Noise canceler is disabled. 1: Noise canceler is enabled.

Section 33 Power-Down Modes

This LSI supports sleep mode, software standby mode, deep standby mode, and module standby mode. In power-down modes, functions of CPU, clocks, on-chip memory, or part of on-chip peripheral modules are halted or the power-supply is turned off, through which low power consumption is achieved. These modes are canceled by a reset or interrupt.

33.1 Features

33.1.1 Power-Down Modes

This LSI has the following power-down modes and function:

1. Sleep mode
2. Software standby mode
3. Deep standby mode
4. Module standby function

Table 33.1 shows the transition conditions for entering the modes from the program execution state, as well as the CPU and peripheral module states in each mode and the procedures for canceling each mode.

Table 33.1 States of Power-Down Modes

Power-Down Mode	Transition Conditions	Clock Pulse		CPU		High-Speed On-Chip RAM		Large-Capacity On-Chip RAM (for Data Retention)		On-Chip Peripheral Modules	Realtime Clock	Power supply	External Memory	Canceling Procedure
		Generator	CPU	Register	Memory	Memory	Retention)							
Sleep mode	Execute SLEEP instruction with STBY bit in STBCR cleared to 0	Running	Halted	Held	Running	Running	Running	Running* ²	Running	Auto-refresh				<ul style="list-style-type: none"> Interrupt Manual reset Power-on reset DMA address error
Software standby mode	Execute SLEEP instruction with STBY bit in STBCR set to 1 and DEEP bit to 0	Halted	Halted	Held	Halted (contents are held ** ⁵ * ⁶)	Halted (contents are held ** ⁵ * ⁷)	Halted	Running* ²	Running	Self-refresh				<ul style="list-style-type: none"> NMI interrupt IRQ interrupt Power-on reset
Deep standby mode	Execute SLEEP instruction with STBY and DEEP bits in STBCR set to 1	Halted	Halted	Halted	Halted (contents are not held)	Halted (contents in on-chip data-retention RAM are held* ³)	Halted	Running* ²	Halted	Self-refresh				<ul style="list-style-type: none"> NMI interrupt*⁴ Power-on reset*⁴ Realtime clock alarm interrupt*⁴ Change on the pins for canceling*⁴

Power-Down Mode	Transition Conditions	Clock Pulse Generator	State*1									
			CPU	CPU Register	High-Speed On-Chip RAM	Large-Capacity On-Chip RAM (for Data Retention)	On-Chip Peripheral Modules	Realtime Clock	Power supply	External Memory	Canceling Procedure	
Module standby mode	Set the MSTP bits in STBCR2 to STBCR8 to 1	Running	Running	Held	Running	Running	Running	Specified module halted	Halted	Running	Auto-refresh	<ul style="list-style-type: none"> Clear MSTP bit to 0 Power-on reset (only for the user debugging interface and direct memory access controller)

- Notes:
1. The pin state is retained or set to high impedance. For details, see section 38.1, Pin States.
 2. The realtime clock operates when the START bit in the RCR2 register is set to 1. For details, see section 14, Realtime Clock. When deep standby mode is canceled by a power-on reset, the running state cannot be retained. Make the initial setting for the realtime clock again.
 3. Setting the bits RRAMKP3 to RRAMKP0 in the RRAMKP register to 1 enables to retain the data in the corresponding area on the on-chip data-retention RAM during the transition to deep standby. When the deep standby is canceled by a power-on reset, the retained contents are initialized.
 4. Deep standby mode can be canceled by an interrupt (NMI or realtime clock alarm interrupt), a power-on reset, or change on the pins for canceling (PC8 to PC5, PG7 to PG4, PJ3, and PJ1). Even when deep standby mode is canceled by a source other than a reset, power-on reset exception handling is executed instead of interrupt exception handling. PG7 to PG4 can be used only in the SH7267 Group.
 5. When software standby mode is canceled by a power-on reset, the retained contents are initialized.
 6. By setting the RAME bit in SYSCR1 or RAMWE bit in SYSCR2 to disable accesses, contents in the high-speed on-chip RAM can be retained even when software standby mode is canceled by a power-on reset.
 7. By setting the VRAME bit in SYSCR3 or VRAMWE bit in SYSCR4 to disable accesses, contents in the large-capacity on-chip RAM (including on-chip data-retention RAM) can be retained even when software standby mode is canceled by a power-on reset.

33.2 Register Descriptions

Table 33.2 shows the register configuration.

Table 33.2 Register Configuration

Register Name	Abbreviation	R/W	Initial Value	Address	Access Size
Standby control register 1	STBCR	R/W	H'00	H'FFFE0014	8
Standby control register 2	STBCR2	R/W	H'00	H'FFFE0018	8
Standby control register 3	STBCR3	R/W	H'7E	H'FFFE0408	8
Standby control register 4	STBCR4	R/W	H'FF	H'FFFE040C	8

33.2.1 Standby Control Register 1 (STBCR1)

STBCR1 is an 8-bit readable/writable register that specifies the state of the power-down mode.

Note: When writing to this register, see section 33.4, Usage Notes.

Bit:	7	6	5	4	3	2	1	0
	STBY	DEEP	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7	STBY	0	R/W	Software Standby, Deep Standby
6	DEEP	0	R/W	Specifies transition to software standby mode or deep standby mode. 0x: Executing SLEEP instruction puts chip into sleep mode. 10: Executing SLEEP instruction puts chip into software standby mode. 11: Executing SLEEP instruction puts chip into deep standby mode.
5 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

[Legend]

x: Don't care

33.2.2 Standby Control Register 2 (STBCR2)

STBCR2 is an 8-bit readable/writable register that controls the operation of modules in power-down modes.

Note: When writing to this register, see section 33.4, Usage Notes.

Bit:	7	6	5	4	3	2	1	0
	MSTP 10	-	MSTP 8	MSTP 7	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0
R/W:	R/W	R	R/W	R/W	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7	MSTP10	0	R/W	Module Stop 10 When the MSTP10 bit is set to 1, the clock supply to the user debugging interface is halted. 0: The user debugging interface runs. 1: Clock supply to the user debugging interface halted.
6	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
5	MSTP8	0	R/W	Module Stop 8 When the MSTP8 bit is set to 1, the clock supply to the direct memory access controller is halted. 0: The direct memory access controller runs. 1: Clock supply to the direct memory access controller halted.

Bit	Bit Name	Initial Value	R/W	Description
4	MSTP7	0	R/W	<p>Module Stop 7</p> <p>When the MSTP7 bit is set to 1, the clock supply to the FPU is halted. After setting the MSTP7 bit to 1, the MSTP7 bit cannot be cleared by writing 0. This means that, after the clock supply to the FPU is halted by setting the MSTP7 bit to 1, the supply cannot be restarted by clearing the MSTP7 bit to 0.</p> <p>To restart the clock supply to the FPU after it was halted, reset the LSI by a power-on reset.</p> <p>0: The FPU runs. 1: Clock supply to the FPU is halted.</p>
3 to 0	—	All 0	R	<p>Reserved</p> <p>These bits are always read as 0. The write value should always be 0.</p>

33.2.3 Standby Control Register 3 (STBCR3)

STBCR3 is an 8-bit readable/writable register that controls the operation of modules in power-down modes.

Note: When writing to this register, see section 33.4, Usage Notes.

Bit:	7	6	5	4	3	2	1	0
	HIZ	MSTP 36	MSTP 35	MSTP 34	MSTP 33	MSTP 32	-	MSTP 30
Initial value:	0	1	1	1	1	1	1	0
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
7	HIZ	0	R/W	<p>Port High Impedance</p> <p>Selects whether the state of specific output pin is retained or high impedance in software standby mode or deep standby mode. As to which pins are controlled, see section 38.1, Pin States.</p> <p>This bit must not be set while the TME bit in WTSCR of the watchdog timer is 1. To set the output pin to high-impedance, set the HIZ bit to 1 only while the TME bit is 0.</p> <p>0: The pin state is retained in software standby mode or deep standby mode.</p> <p>1: The pin is set to high-impedance in software standby mode or deep standby mode.</p>
6	MSTP36	1	R/W	<p>Module Stop 36</p> <p>When the MSTP36 bit is set to 1, the clock supply to the IEBus™ controller is halted.</p> <p>0: The IEBus™ controller runs.</p> <p>1: Clock supply to the IEBus™ controller is halted.</p>
5	MSTP35	1	R/W	<p>Module Stop 35</p> <p>When the MSTP35 bit is set to 1, the clock supply to the multi-function timer pulse unit 2 is halted.</p> <p>0: The multi-function timer pulse unit 2 runs.</p> <p>1: Clock supply to the multi-function timer pulse unit 2 is halted.</p>
4	MSTP34	1	R/W	<p>Module Stop 34</p> <p>When the MSTP34 bit is set to 1, the clock supply to the SD host interface 0 is halted.</p> <p>0: The SD host interface 0 runs.</p> <p>1: Clock supply to the SD host interface 0 is halted.</p>
3	MSTP33	1	R/W	<p>Module Stop 33</p> <p>When the MSTP33 bit is set to 1, the clock supply to the SD host interface 1 is halted.</p> <p>0: The SD host interface 1 runs.</p> <p>1: Clock supply to the SD host interface 1 is halted.</p>

Bit	Bit Name	Initial Value	R/W	Description
2	MSTP32	1	R/W	<p>Module Stop 32</p> <p>When the MSTP32 bit is set to 1, the clock supply to the AD converter is halted.</p> <p>0: The AD converter runs.</p> <p>1: Clock supply to the AD converter is halted.</p>
1	—	1	R	<p>Reserved</p> <p>This bit is always read as 1. The write value should always be 1.</p>
0	MSTP30	0	R/W	<p>Module Stop 30</p> <p>When the MSTP30 bit is set to 1, the clock supply to the realtime clock is halted.</p> <p>0: The realtime clock runs.</p> <p>1: Clock supply to the realtime clock is halted.</p> <p>Note: When the realtime clock is halted, set the bits in registers shown below.</p> <ul style="list-style-type: none"> • Set bit RTCEN in the control register 2 (RCR2) to 0. • Set bits RCKSEL[1:0] in the control register 5 (RCR5) to 00 <p>After the settings above, set bit MSTP30 to 1.</p>

33.2.4 Standby Control Register 4 (STBCR4)

STBCR4 is an 8-bit readable/writable register that controls the operation of modules in power-down modes.

Note: When writing to this register, see section 33.4, Usage Notes.

Bit:	7	6	5	4	3	2	1	0
	MSTP 47	MSTP 46	MSTP 45	MSTP 44	MSTP 43	MSTP 42	MSTP 41	MSTP 40
Initial value:	1	1	1	1	1	1	1	1
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7	MSTP47	1	R/W	<p>Module Stop 47</p> <p>When the MSTP47 bit is set to 1, the clock supply to channel 0 of the serial communication unit with FIFO is halted.</p> <p>0: Channel 0 of the serial communication unit with FIFO runs.</p> <p>1: Clock supply to channel 0 of the serial communication unit with FIFO is halted.</p>
6	MSTP46	1	R/W	<p>Module Stop 46</p> <p>When the MSTP46 bit is set to 1, the clock supply to channel 1 of the serial communication unit with FIFO is halted.</p> <p>0: Channel 1 of the serial communication unit with FIFO runs.</p> <p>1: Clock supply to channel 1 of the serial communication unit with FIFO is halted.</p>
5	MSTP45	1	R/W	<p>Module Stop 45</p> <p>When the MSTP45 bit is set to 1, the clock supply to channel 2 of the serial communication unit with FIFO is halted.</p> <p>0: Channel 2 of the serial communication unit with FIFO runs.</p> <p>1: Clock supply to channel 2 of the serial communication unit with FIFO is halted.</p>
4	MSTP44	1	R/W	<p>Module Stop 44</p> <p>When the MSTP44 bit is set to 1, the clock supply to channel 3 of the serial communication unit with FIFO is halted.</p> <p>0: Channel 3 of the serial communication unit with FIFO runs.</p> <p>1: Clock supply to channel 3 of the serial communication unit with FIFO is halted.</p>

Bit	Bit Name	Initial Value	R/W	Description
3	MSTP43	1	R/W	<p>Module Stop 43</p> <p>When the MSTP43 bit is set to 1, the clock supply to channel 4 of the serial communication unit with FIFO is halted.</p> <p>0: Channel 4 of the serial communication unit with FIFO runs.</p> <p>1: Clock supply to channel 4 of the serial communication unit with FIFO is halted.</p>
2	MSTP42	1	R/W	<p>Module Stop 42</p> <p>When the MSTP42 bit is set to 1, the clock supply to channel 5 of the serial communication unit with FIFO is halted.</p> <p>0: Channel 5 of the serial communication unit with FIFO runs.</p> <p>1: Clock supply to channel 5 of the serial communication unit with FIFO is halted.</p>
1	MSTP41	1	R/W	<p>Module Stop 41</p> <p>When the MSTP41 bit is set to 1, the clock supply to channel 6 of the serial communication unit with FIFO is halted.</p> <p>0: Channel 6 of the serial communication unit with FIFO runs.</p> <p>1: Clock supply to channel 6 of the serial communication unit with FIFO is halted.</p>
0	MSTP40	1	R/W	<p>Module Stop 40</p> <p>When the MSTP40 bit is set to 1, the clock supply to channel 7 of the serial communication unit with FIFO is halted.</p> <p>0: Channel 7 of the serial communication unit with FIFO runs.</p> <p>1: Clock supply to channel 7 of the serial communication unit with FIFO is halted.</p>

33.2.5 Standby Control Register 5 (STBCR5)

STBCR5 is an 8-bit readable/writable register that controls the operation of modules in power-down modes.

Note: When writing to this register, see section 33.4, Usage Notes.

Bit:	7	6	5	4	3	2	1	0
	MSTP 57	MSTP 56	MSTP 55	-	MSTP 53	MSTP 52	MSTP 51	MSTP 50
Initial value:	1	1	1	1	1	1	1	1
R/W:	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7	MSTP57	1	R/W	Module Stop 57 When the MSTP57 bit is set to 1, the clock supply to channel 0 of the I ² C bus interface 3 is halted. 0: Channel 0 of the I ² C bus interface 3 runs. 1: Clock supply to channel 0 of the I ² C bus interface 3 is halted.
6	MSTP56	1	R/W	Module Stop 56 When the MSTP56 bit is set to 1, the clock supply to channel 1 of the I ² C bus interface 3 is halted. 0: Channel 1 of the I ² C bus interface 3 runs. 1: Clock supply to channel 1 of the I ² C bus interface 3 is halted.
5	MSTP55	1	R/W	Module Stop 55 When the MSTP55 bit is set to 1, the clock supply to channel 2 of the I ² C bus interface 3 is halted. 0: Channel 2 of the I ² C bus interface 3 runs. 1: Clock supply to channel 2 of the I ² C bus interface 3 is halted.
4	—	1	R	Reserved This bit is always read as 1. The write value should always be 1.

Bit	Bit Name	Initial Value	R/W	Description
3	MSTP53	1	R/W	<p>Module Stop 53</p> <p>When the MSTP53 bit is set to 1, the clock supply to channel 0 of the controller area network is halted.</p> <p>0: Channel 0 of the controller area network runs.</p> <p>1: Clock supply to channel 0 of the controller area network is halted.</p>
2	MSTP52	1	R/W	<p>Module Stop 52</p> <p>When the MSTP52 bit is set to 1, the clock supply to channel 1 of the controller area network is halted.</p> <p>0: Channel 1 of the controller area network runs.</p> <p>1: Clock supply to channel 1 of the controller area network is halted.</p>
1	MSTP51	1	R/W	<p>Module Stop 51</p> <p>When the MSTP51 bit is set to 1, the clock supply to channel 0 of the Renesas serial peripheral interface is halted.</p> <p>0: Channel 0 of the Renesas serial peripheral interface runs.</p> <p>1: Clock supply to channel 0 of the Renesas serial peripheral interface is halted.</p>
0	MSTP50	1	R/W	<p>Module Stop 50</p> <p>When the MSTP50 bit is set to 1, the clock supply to channel 1 of the Renesas serial peripheral interface is halted.</p> <p>0: Channel 1 of the Renesas serial peripheral interface runs.</p> <p>1: Clock supply to channel 1 of the Renesas serial peripheral interface is halted.</p>

33.2.6 Standby Control Register 6 (STBCR6)

STBCR6 is an 8-bit readable/writable register that controls the operation of each module in power-down modes.

Note: When writing to this register, see section 33.4, Usage Notes.

Bit:	7	6	5	4	3	2	1	0
	MSTP 67	MSTP 66	MSTP 65	MSTP 64	MSTP 63	MSTP 62	MSTP 61	MSTP 60
Initial value:	1	1	1	1	1	1	1	1
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7	MSTP67	1	R/W	<p>Module Stop 67</p> <p>When the MSTP67 bit is set to 1, the clock supply to channel 0 of the serial sound interface is halted.</p> <p>0: Channel 0 of the serial sound interface runs.</p> <p>1: Clock supply to channel 0 of the serial sound interface is halted.</p>
6	MSTP66	1	R/W	<p>Module Stop 66</p> <p>When the MSTP66 bit is set to 1, the clock supply to channel 1 of the serial sound interface is halted.</p> <p>0: Channel 1 of the serial sound interface runs.</p> <p>1: Clock supply to channel 1 of the serial sound interface is halted.</p>
5	MSTP65	1	R/W	<p>Module Stop 65</p> <p>When the MSTP65 bit is set to 1, the clock supply to channel 2 of the serial sound interface is halted.</p> <p>0: Channel 2 of the serial sound interface runs.</p> <p>1: Clock supply to channel 2 of the serial sound interface is halted.</p>
4	MSTP64	1	R/W	<p>Module Stop 64</p> <p>When the MSTP64 bit is set to 1, the clock supply to channel 3 of the serial sound interface is halted.</p> <p>0: Channel 3 of the serial sound interface runs.</p> <p>1: Clock supply to channel 3 of the serial sound interface is halted.</p>

Bit	Bit Name	Initial Value	R/W	Description
3	MSTP63	1	R/W	<p>Module Stop 63</p> <p>When the MSTP63 bit is set to 1, the clock supply to the CD-ROM decoder is halted.</p> <p>0: The CD-ROM decoder runs.</p> <p>1: Clock supply to the CD-ROM decoder is halted.</p>
2	MSTP62	1	R/W	<p>Module Stop 62</p> <p>When the MSTP62 bit is set to 1, the clock supply to channel 0 of the sampling rate converter is halted.</p> <p>0: Channel 0 of the sampling rate converter runs.</p> <p>1: Clock supply to channel 0 of the sampling rate converter is halted.</p>
1	MSTP61	1	R/W	<p>Module Stop 61</p> <p>When the MSTP61 bit is set to 1, the clock supply to channel 1 of the sampling rate converter is halted.</p> <p>0: Channel 1 of the sampling rate converter runs.</p> <p>1: Clock supply to channel 1 of the sampling rate converter C is halted.</p>
0	MSTP60	1	R/W	<p>Module Stop 60</p> <p>When the MSTP60 bit is set to 1, the clock supply to the USB 2.0 host/function module is halted.</p> <p>0: The USB 2.0 host/function module runs.</p> <p>1: Clock supply to the USB 2.0 host/function module is halted.</p>

33.2.7 Standby Control Register 7 (STBCR7)

STBCR7 is an 8-bit readable/writable register that controls the operation of each module in power-down modes.

Note: When writing to this register, see section 33.4, Usage Notes.

Bit:	7	6	5	4	3	2	1	0
	MSTP 77	MSTP 76	-	MSTP 74	-	MSTP 72	-	MSTP 70
Initial value:	1	1	1	1	1	1	1	1
R/W:	R/W	R/W	R	R/W	R	R/W	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
7	MSTP77	1	R/W	<p>Module Stop 77</p> <p>When the MSTP77 bit is set to 1, the clock supply to the serial I/O with FIFO is halted.</p> <p>0: The serial I/O with FIFO runs. 1: Clock supply to the serial I/O with FIFO is halted.</p>
6	MSTP76	1	R/W	<p>Module Stop 76</p> <p>When the MSTP76 bit is set to 1, the clock supply to the Renesas SPDIF interface is halted.</p> <p>0: The Renesas SPDIF interface runs. 1: Clock supply to the Renesas SPDIF interface is halted.</p>
5	—	1	R	<p>Reserved</p> <p>This bit is always read as 1. The write value should always be 1.</p>
4	MSTP74	1	R/W	<p>Module Stop 74</p> <p>When the MSTP74 bit is set to 1, the clock supply to the video display controller 3 is halted.</p> <p>0: The video display controller 3 runs. 1: Clock supply to the video display controller 3 is halted.</p>

Bit	Bit Name	Initial Value	R/W	Description
3	—	1	R	Reserved This bit is always read as 1. The write value should always be 1.
2	MSTP72	1	R/W	Module Stop 72 When the MSTP72 bit is set to 1, the clock supply to the compare match timer is halted. 0: The compare match timer runs. 1: Clock supply to the compare match timer is halted.
1	—	1	R	Reserved This bit is always read as 1. The write value should always be 1.
0	MSTP70	1	R/W	Module Stop 70 When the MSTP70 bit is set to 1, the clock supply to the NAND flash memory controller is halted. 0: The NAND flash memory controller runs. 1: Clock supply to the NAND flash memory controller is halted.

33.2.8 Standby Control Register 8 (STBCR8)

STBCR8 is an 8-bit readable/writable register that controls the operation of each module in power-down modes.

Note: When writing to this register, see section 33.4, Usage Notes.

Bit:	7	6	5	4	3	2	1	0
	MSTP 87	-	-	-	-	MSTP 82	-	-
Initial value:	1	1	1	1	1	1	1	1
R/W:	R/W	R	R	R	R	R/W	R	R

Bit	Bit Name	Initial Value	R/W	Description
7	MSTP87	1	R/W	Module Stop 87 When the MSTP87 bit is set to 1, the clock supply to the motor control PWM timer is halted. 0: The motor control PWM timer runs. 1: Clock supply to the motor control PWM timer is halted.
6 to 3	—	All 1	R	Reserved These bits are always read as 1. The write value should always be 1.
2	MSTP82	1	R/W	Module Stop 82 When the MSTP82 bit is set to 1, the clock supply to the Renesas quad serial peripheral interface is halted. 0: The Renesas quad serial peripheral interface runs. 1: Clock supply to the Renesas quad serial peripheral interface is halted.
1, 0	—	All 1	R	Reserved These bits are always read as 1. The write value should always be 1.

33.2.9 Software Reset Control Register (SWRSTCR)

SWRSTCR is an 8-bit readable/writable register that controls a software reset for the serial sound interface and IEBus™ controller and the operation of the crystal resonator for audio.

Note: When writing to this register, see section 33.4, Usage Notes.

Bit:	7	6	5	4	3	2	1	0
	AXT ALE	-	-	IEB SRST	SSIF3 SRST	SSIF2 SRST	SSIF1 SRST	SSIF0 SRST
Initial value:	0	0	0	0	0	0	0	0
R/W:	R/W	R	R	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7	AXTALE	0	R/W	AUDIO_X1 Clock Control Controls the function of AUDIO_X1 pin. 0: Runs the on-chip crystal oscillator/enables the external clock input. 1: Halts the on-chip crystal oscillator/disables the external clock input.
6, 5	—	All 0	R	Reserved This bit is always read as 0. The write value should always be 0.
4	IEBSRST	0	R/W	IEBus™ Controller Software Reset Controls the IEBus™ controller reset with software. 0: The IEBus™ controller reset is canceled. 1: The IEBus™ controller is reset.
3	SSIF3SRST	0	R/W	Serial Sound Interface Channel 3 Software Reset Controls the serial sound interface channel 3 reset with software. 0: The serial sound interface channel 3 reset is canceled. 1: The serial sound interface channel 3 is reset.

Bit	Bit Name	Initial Value	R/W	Description
2	SSIF2SRST	0	R/W	<p>Serial Sound Interface Channel 2 Software Reset</p> <p>Controls the serial sound interface channel 2 reset with software.</p> <p>0: The serial sound interface channel 2 reset is canceled.</p> <p>1: The serial sound interface channel 2 is reset.</p>
1	SSIF1SRST	0	R/W	<p>Serial Sound Interface Channel 1 Software Reset</p> <p>Controls the serial sound interface channel 1 reset with software.</p> <p>0: The serial sound interface channel 1 reset is canceled.</p> <p>1: The serial sound interface channel 1 is reset.</p>
0	SSIF0SRST	0	R/W	<p>Serial Sound Interface Channel 0 Software Reset</p> <p>Controls the serial sound interface channel 0 reset with software.</p> <p>0: The serial sound interface channel 0 reset is canceled.</p> <p>1: The serial sound interface channel 0 is reset.</p>

33.2.10 System Control Register 1 (SYSCR1)

SYSCR1 is an 8-bit readable/writable register that enables or disables access (read and write) to a specified page in the high-speed on-chip RAM.

When an RAME_n (n = 0 to 3) bit is set to 1, access to page n is enabled. When an RAME_n bit is cleared to 0, page n cannot be accessed. In this case, an undefined value is returned when reading data or fetching an instruction from page n, and writing to page n is ignored. The initial value of an RAME_n bit is 1.

Note that when clearing the RAME_n bit to 0, be sure to execute an instruction to read from or write to the same arbitrary address in each page before setting the RAME_n bit. If such an instruction is not executed, the data last written to page n may not be written to the high-speed on-chip RAM.

SYSCR1 should be set with a program located in an area other than the high-speed on-chip RAM. Furthermore, an instruction to read SYSCR1 should be located immediately after the instruction to write to SYSCR1. If not, normal access is not guaranteed.

Note: When writing to this register, see section 33.4, Usage Notes.

Bit:	7	6	5	4	3	2	1	0
	-	-	-	-	RAME3	RAME2	RAME1	RAME0
Initial value:	1	1	1	1	1	1	1	1
R/W:	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7 to 4	—	All 1	R	Reserved These bits are always read as 1. The write value should always be 1.
3	RAME3	1	R/W	RAM Enable 3 (corresponding area: page 3* in high-speed on-chip RAM) 0: Access to page 3 is disabled. 1: Access to page 3 is enabled.
2	RAME2	1	R/W	RAM Enable 2 (corresponding area: page 2* in high-speed on-chip RAM) 0: Access to page 2 is disabled. 1: Access to page 2 is enabled.

Bit	Bit Name	Initial Value	R/W	Description
1	RAME1	1	R/W	RAM Enable 1 (corresponding area: page 1* in high-speed on-chip RAM) 0: Access to page 1 is disabled. 1: Access to page 1 is enabled.
0	RAME0	1	R/W	RAM Enable 0 (corresponding area: page 0* in high-speed on-chip RAM) 0: Access to page 0 is disabled. 1: Access to page 0 is enabled.

Note: * For addresses in each page, see section 31, On-Chip RAM.

33.2.11 System Control Register 2 (SYSCR2)

SYSCR2 is an 8-bit readable/writable register that enables or disables writing to a specified page in the high-speed on-chip RAM.

When an RAME_n (n = 0 to 3) bit is set to 1, writing to page n is enabled. When an RAME_n bit is cleared to 0, writing to page n is ignored. The initial value of an RAME_n bit is 1.

Note that when clearing the RAMWE_n bit to 0, be sure to execute an instruction to read from or write to the same arbitrary address in each page before setting the RAMWE_n bit. If such an instruction is not executed, the data last written to page n may not be written to the high-speed on-chip RAM.

SYSCR2 should be set with a program located in an area other than the high-speed on-chip RAM. Furthermore, an instruction to read SYSCR2 should be located immediately after the instruction to write to SYSCR2. If not, normal access is not guaranteed.

Note: When writing to this register, see section 33.4, Usage Notes.

Bit:	7	6	5	4	3	2	1	0
	-	-	-	-	RAM WE3	RAM WE2	RAM WE1	RAM WE0
Initial value:	1	1	1	1	1	1	1	1
R/W:	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7 to 4	—	All 1	R	Reserved These bits are always read as 1. The write value should always be 1.
3	RAMWE3	1	R/W	RAM Write Enable 3 (corresponding area: page 3* in high-speed on-chip RAM) 0: Writing to page 3 is disabled. 1 Writing to page 3 is enabled.
2	RAMWE2	1	R/W	RAM Write Enable 2 (corresponding area: page 2* in high-speed on-chip RAM) 0: Writing to page 2 is disabled. 1: Writing to page 2 is enabled.
1	RAMWE1	1	R/W	RAM Write Enable 1 (corresponding area: page 1* in high-speed on-chip RAM) 0: Writing to page 1 is disabled. 1: Writing to page 1 is enabled.
0	RAMWE0	1	R/W	RAM Write Enable 0 (corresponding area: page 0* in high-speed on-chip RAM) 0: Writing to page 0 is disabled. 1: Writing to page 0 is enabled.

Note: * For addresses in each page, see section 31, On-Chip RAM.

33.2.12 System Control Register 3 (SYSCR3)

SYSCR3 is an 8-bit readable/writable register that enables or disables access (read and write) to a specified page in the large-capacity on-chip RAM.

When a VRAMEn (n = 0 to 5) bit is set to 1, access to page n is enabled. When a VRAMEn bit is cleared to 0, page n cannot be accessed. In this case, an undefined value is returned when reading data or fetching an instruction from page n, and writing to page n is ignored. The initial value of a VRAMEn bit is 1.

SYSCR3 should be set with a program located in an area other than the large-capacity on-chip RAM. Furthermore, an instruction to read SYSCR3 should be located immediately after the instruction to write to SYSCR3. If not, normal access is not guaranteed.

Note: When writing to this register, see section 33.4, Usage Notes.

Bit:	7	6	5	4	3	2	1	0
	-	-	VRA ME5	VRA ME4	VRA ME3	VRA ME2	VRA ME1	VRA ME0
Initial value:	1	1	1	1	1	1	1	1
R/W:	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7, 6	—	All 1	R	Reserved These bits are always read as 1. The write value should always be 1.
5	VRAME5	1	R/W	RAM Enable 5 (corresponding area: page 5* in large-capacity on-chip RAM) 0: Access to page 5 is disabled. 1: Access to page 5 is enabled.
4	VRAME4	1	R/W	RAM Enable 4 (corresponding area: page 4* in large-capacity on-chip RAM) 0: Access to page 4 is disabled. 1: Access to page 4 is enabled.
3	VRAME3	1	R/W	RAM Enable 3 (corresponding area: page 3* in large-capacity on-chip RAM) 0: Access to page 3 is disabled. 1: Access to page 3 is enabled.
2	VRAME2	1	R/W	RAM Enable 2 (corresponding area: page 2* in large-capacity on-chip RAM) 0: Access to page 2 is disabled. 1: Access to page 2 is enabled.
1	VRAME1	1	R/W	RAM Enable 1 (corresponding area: page 1* in large-capacity on-chip RAM) 0: Access to page 1 is disabled. 1: Access to page 1 is enabled.
0	VRAME0	1	R/W	RAM Enable 0 (corresponding area: page 0* in large-capacity on-chip RAM) 0: Access to page 0 is disabled. 1: Access to page 0 is enabled.

Note: * For addresses in each page, see section 31, On-Chip RAM.

33.2.13 System Control Register 4 (SYSCR4)

SYSCR4 is an 8-bit readable/writable register that enables or disables writing to a specified page in the large-capacity on-chip RAM.

When a VRAMWEn (n = 0 to 5) bit is set to 1, writing to page n is enabled. When a VRAMWEn bit is cleared to 0, writing to page n is ignored. The initial value of a VRAMWEn bit is 1.

SYSCR4 should be set with a program located in an area other than the large-capacity on-chip RAM. Furthermore, an instruction to read SYSCR4 should be located immediately after the instruction to write to SYSCR4. If not, normal access is not guaranteed.

Note: When writing to this register, see section 33.4, Usage Notes.

Bit:	7	6	5	4	3	2	1	0

Initial value:	1	1	1	1	1	1	1	1
R/W:	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7, 6	—	All 1	R	Reserved These bits are always read as 1. The write value should always be 1.
5	VRAMWE5	1	R/W	RAM Write Enable 5 (corresponding area: page 5* in large-capacity on-chip RAM) 0: Writing to page 5 is disabled. 1: Writing to page 5 is enabled.
4	VRAMWE4	1	R/W	RAM Write Enable 4 (corresponding area: page 4* in large-capacity on-chip RAM) 0: Writing to page 4 is disabled. 1: Writing to page 4 is enabled.
3	VRAMWE3	1	R/W	RAM Write Enable 3 (corresponding area: page 3* in large-capacity on-chip RAM) 0: Writing to page 3 is disabled. 1: Writing to page 3 is enabled.

Bit	Bit Name	Initial Value	R/W	Description
2	VRAMWE2	1	R/W	RAM Write Enable 2 (corresponding area: page 2* in large-capacity on-chip RAM) 0: Writing to page 2 is disabled. 1: Writing to page 2 is enabled.
1	VRAMWE1	1	R/W	RAM Write Enable 1 (corresponding area: page 1* in large-capacity on-chip RAM) 0: Writing to page 1 is disabled. 1: Writing to page 1 is enabled.
0	VRAMWE0	1	R/W	RAM Write Enable 0 (corresponding area: page 0* in large-capacity on-chip RAM) 0: Writing to page 0 is disabled. 1: Writing to page 0 is enabled.

Note: * For addresses in each page, see section 31, On-Chip RAM.

33.2.14 System Control Register 5 (SYSCR5)

SYSCR5 is an 8-bit readable/writable register that enables or disables writing to a specified page in the on-chip data-retention RAM.

When a RRAMWEn (n = 0 to 3) bit in SYSCR5 is set to 1, writing to page n is enabled. When a RRAMWEn bit is cleared to 0, writing to page n is ignored. The initial value of a RRAMWEn bit is 0.

SYSCR5 should be set with a program located in an area other than the on-chip data-retention RAM.

Note: When writing to this register, see section 33.4, Usage Notes.

Bit:	7	6	5	4	3	2	1	0
	-	-	-	-	RRAM WE3	RRAM WE2	RRAM WE1	RRAM WE0
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7 to 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
3	RRAMWE3	0	R/W	RAM Write Enable 3 (corresponding area: page 3* ² in on-chip data-retention RAM) 0: Writing to page 3 is disabled. 1: Writing to page 3 is enabled.
2	RRAMWE2	0	R/W	RAM Write Enable 2 (corresponding area: page 2* ² in on-chip data-retention RAM) 0: Writing to page 2 is disabled. 1: Writing to page 2 is enabled.
1	RRAMWE1	0	R/W	RAM Write Enable 1 (corresponding area: page 1* ² in on-chip data-retention RAM) 0: Writing to page 1 is disabled. 1: Writing to page 1 is enabled.
0	RRAMWE0	0	R/W	RAM Write Enable 0 (corresponding area: page 0* ² in on-chip data-retention RAM) 0: Writing to page 0 is disabled. 1: Writing to page 0 is enabled.

- Notes:
- For addresses in each page, see section 31, On-Chip RAM.
 - When the VRAME0 bit in SYSCR3 is cleared to 0 (access to page 0 in large-capacity on-chip RAM is invalid), the on-chip data-retention RAM cannot be accessed (read and written), regardless of the setting of this bit.
When the VRAMWE0 bit in SYSCR4 is cleared to 0 (writing to page 0 in large-capacity on-chip RAM is invalid), the on-chip data-retention RAM cannot be written, regardless of the setting of this bit.

33.2.15 On-Chip Data-Retention RAM Area Setting Register (RRAMKP)

RRAMKP is an 8-bit readable/writable register that selects whether the contents of the corresponding area of the on-chip data-retention RAM are retained or not in deep standby mode.

When the RRAMKP3 to RRAMKP0 bits are set to 1, the contents of the corresponding area of the on-chip data-retention RAM are retained in deep standby mode. When these bits are cleared to 0, the contents of the corresponding area of the on-chip data-retention RAM are not retained in deep standby mode.

Note: When writing to this register, see section 33.4, Usage Notes.

Bit:	7	6	5	4	3	2	1	0
	-	-	-	-	RRAM KP3	RRAM KP2	RRAM KP1	RRAM KP0
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7 to 4	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
3	RRAMKP3	0	R/W	On-Chip Data-Retention RAM Storage Area 3 (corresponding area: page 3* in on-chip data-retention RAM) 0: The contents of the on-chip data-retention RAM are not retained in deep standby mode. 1: The contents of the on-chip data-retention RAM are retained in deep standby mode.
2	RRAMKP2	0	R/W	On-Chip Data-Retention RAM Storage Area 2 (corresponding area: page 2* in on-chip data-retention RAM) 0: The contents of the on-chip data-retention RAM are not retained in deep standby mode. 1: The contents of the on-chip data-retention RAM are retained in deep standby mode.

Bit	Bit Name	Initial Value	R/W	Description
1	RRAMKP1	0	R/W	<p>On-Chip Data-Retention RAM Storage Area 1 (corresponding area: page 1* in on-chip data-retention RAM)</p> <p>0: The contents of the on-chip data-retention RAM are not retained in deep standby mode.</p> <p>1: The contents of the on-chip data-retention RAM are retained in deep standby mode.</p>
0	RRAMKP0	0	R/W	<p>On-Chip Data-Retention RAM Storage Area 0 (corresponding area: page 0* in on-chip data-retention RAM)</p> <p>0: The contents of the on-chip data-retention RAM are not retained in deep standby mode.</p> <p>1: The contents of the on-chip data-retention RAM are retained in deep standby mode.</p>

Note: * For addresses in each page, see section 31, On-Chip RAM.

33.2.16 Deep Standby Control Register (DSCTR)

DSCTR is an 8-bit readable/writable register that selects whether the states of the external memory control pins are retained or not when returning from deep standby mode and specifies the method to start the LSI.

Note: When writing to this register, see section 33.4, Usage Notes.

Bit:	7	6	5	4	3	2	1	0
	EBUS KEEPE	RAM BOOT	-	-	-	-	-	-
Initial value:	0	0	0	0	0	0	0	0
R/W:	R/W	R/W	R	R	R	R	R	R

Bit	Bit Name	Initial Value	R/W	Description
7	EBUSKEEPE	0	R/W	Retention of External Memory Control Pin State 0: The state of the external memory control pins is not retained when returning from deep standby mode. 1: The state of the external memory control pins is retained when returning from deep standby mode.
6	RAMBOOT	0	R/W	Selection of Method after Returning from Deep Standby Mode Selects an activation method after returning from deep standby mode. 0: Activated according to the boot mode specified for a reset. 1: The program is read from the on-chip data-retention RAM. Program counter (PC): H'1C000000 Stack pointer (SP): H'1C000004
5 to 0	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.

33.2.17 Deep Standby Cancel Source Select Register (DSSSR)

DSSSR is a 16-bit readable/writable register that consists of the bits for selecting a source to cancel deep standby mode. The realtime clock alarm interrupt or change on the pins for canceling (PC8 to PC5, PG7 to PG4, PJ3, and PJ1) can be selected as a cancel source. The pins for canceling can be used for canceling deep standby, regardless of pin function settings in the general I/O port.+

Note: When writing to this register, see section 33.4, Usage Notes.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0

R/W:	R	R	R	R/W	R/W	R/W	R/W	R/W	R	R/W	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
12	PG7	0	R/W	Cancel by Change on PG7 0: Deep standby mode is not canceled by change on the PG7 pin. 1: Deep standby mode is canceled by change on the PG7 pin. Note: This bit can be used only in the SH7267 Group.
11	PG6	0	R/W	Cancel by Change on PG6 0: Deep standby mode is not canceled by change on the PG6 pin. 1: Deep standby mode is canceled by change on the PG6 pin. Note: This bit can be used only in the SH7267 Group.
10	PG5	0	R/W	Cancel by Change on PG5 0: Deep standby mode is not canceled by change on the PG5 pin. 1: Deep standby mode is canceled by change on the PG5 pin. Note: This bit can be used only in the SH7267 Group.

Bit	Bit Name	Initial Value	R/W	Description
9	PG4	0	R/W	<p>Cancel by Change on PG4</p> <p>0: Deep standby mode is not canceled by change on the PG4 pin.</p> <p>1: Deep standby mode is canceled by change on the PG4 pin.</p> <p>Note: This bit can be used only in the SH7267 Group.</p>
8	NMI	0	R/W	<p>Cancel by Change on NMI</p> <p>0: Deep standby mode is not canceled by change on the NMI pin.</p> <p>1: Deep standby mode is canceled by change on the NMI pin.</p>
7	—	0	R	<p>Reserved</p> <p>This bit is always read as 0. The write value should always be 0.</p>
6	RTCAR	0	R/W	<p>Cancel by Realtime Clock Alarm Interrupt</p> <p>0: Deep standby mode is not canceled by a realtime clock alarm interrupt.</p> <p>1: Deep standby mode is canceled by a realtime clock alarm interrupt.</p>
5	PC8	0	R/W	<p>Cancel by Change on PC8</p> <p>0: Deep standby mode is not canceled by change on the PC8 pin.</p> <p>1: Deep standby mode is canceled by change on the PC8 pin.</p>
4	PC7	0	R/W	<p>Cancel by Change on PC7</p> <p>0: Deep standby mode is not canceled by change on the PC7 pin.</p> <p>1: Deep standby mode is canceled by change on the PC7 pin.</p>
3	PC6	0	R/W	<p>Cancel by Change on PC6</p> <p>0: Deep standby mode is not canceled by change on the PC6 pin.</p> <p>1: Deep standby mode is canceled by change on the PC6 pin.</p>

Bit	Bit Name	Initial Value	R/W	Description
2	PC5	0	R/W	Cancel by Change on PC5 0: Deep standby mode is not canceled by change on the PC5 pin. 1: Deep standby mode is canceled by change on the PC5 pin.
1	PJ3	0	R/W	Cancel by Change on PJ3 0: Deep standby mode is not canceled by change on the PJ3 pin. 1: Deep standby mode is canceled by change on the PJ3 pin.
0	PJ1	0	R/W	Cancel by Change on PJ1 0: Deep standby mode is not canceled by change on the PJ1 pin. 1: Deep standby mode is canceled by change on the PJ1 pin.

33.2.18 Deep Standby Cancel Edge Select Register (DSESR)

DSESR is a 16-bit readable/writable register that consists of the bits for selecting an edge to be detected for the pin specified as a deep standby cancel source with DSSSR. This register setting is always valid for canceling deep standby, regardless of the interrupt controller setting.

Note: When writing to this register, see section 33.4, Usage Notes.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	-	-	-	PG7E	PG6E	PG5E	PG4E	NMIE	-	-	PC8E	PC7E	PC6E	PC5E	PJ3E	PJ1E
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R	R	R	R/W	R/W	R/W	R/W	R/W	R	R	R/W	R/W	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
15 to 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
12	PG7E	0	R/W	PG7 Edge Detection 0: Falling edge of PG7 is detected. 1: Rising edge of PG7 is detected. Note: This bit can be used only in the SH7267 Group.
11	PG6E	0	R/W	PG6 Edge Detection 0: Falling edge of PG6 is detected. 1: Rising edge of PG6 is detected. Note: This bit can be used only in the SH7267 Group.
10	PG5E	0	R/W	PG5 Edge Detection 0: Falling edge of PG5 is detected. 1: Rising edge of PG5 is detected. Note: This bit can be used only in the SH7267 Group.
9	PG4E	0	R/W	PG4 Edge Detection 0: Falling edge of PG4 is detected. 1: Rising edge of PG4 is detected. Note: This bit can be used only in the SH7267 Group.
8	NMIE	0	R/W	NMI Edge Detection 0: Falling edge of NMI is detected. 1: Rising edge of NMI is detected.

Bit	Bit Name	Initial Value	R/W	Description
7, 6	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
5	PC8E	0	R/W	PC8 Edge Detection 0: Falling edge of PC8 is detected. 1: Rising edge of PC8 is detected.
4	PC7E	0	R/W	PC7 Edge Detection 0: Falling edge of PC7 is detected. 1: Rising edge of PC7 is detected.
3	PC6E	0	R/W	PC6 Edge Detection 0: Falling edge of PC6 is detected. 1: Rising edge of PC6 is detected.
2	PC5E	0	R/W	PC5 Edge Detection 0: Falling edge of PC5 is detected. 1: Rising edge of PC5 is detected.
1	PJ3E	0	R/W	PJ3 Edge Detection 0: Falling edge of PJ3 is detected. 1: Rising edge of PJ3 is detected.
0	PJ1E	0	R/W	PJ1 Edge Detection 0: Falling edge of PJ1 is detected. 1: Rising edge of PJ1 is detected.

33.2.19 Deep Standby Cancel Source Flag Register (DSFR)

DSFR is a 16-bit readable/writable register composed of two types of bits. One is the flag that confirms which source canceled deep standby mode. The other is the bit that releases the state of pins after canceling deep standby mode. When deep standby mode is canceled by an interrupt (NMI, realtime clock alarm interrupt, or change on the pins for canceling) and changes on the pins for canceling, this register retains the previous data although power-on reset exception handling is executed. When deep standby mode is canceled by a power-on reset, this register is initialized to H'0000.

All flags must be cleared immediately before transition to deep standby mode.

Note: When writing to this register, see section 33.4, Usage Notes.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	IO KEEP	-	-	PG7F	PG6F	PG5F	PG4F	NMIF	-	RTC ARF	PC8F	PC7F	PC6F	PC5F	PJ3F	PJ1F
Initial value:	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
R/W:	R/(W)*	R	R	R/(W)*	R/(W)*	R/(W)*	R/(W)*	R/(W)*	R	R/(W)*	R/(W)*	R/(W)*	R/(W)*	R/(W)*	R/(W)*	R/(W)*

Note: * Only 0 can be written after reading 1 to clear the flag.

Bit	Bit Name	Initial Value	R/W	Description
15	IOKEEP	0	R/(W)*	Release of Pin State Retention Releases the retention of the pin state after canceling deep standby mode 0: Pin state not retained [Clearing condition] • Writing 0 after reading 1 1: Pin state retained [Setting condition] • When deep standby mode is entered
14, 13	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
12	PG7F	0	R/(W)*	PG7 Flag 0: No change on the PG7 pin 1: Change on the PG7 pin Note: This bit can be used only in the SH7267 Group.

Bit	Bit Name	Initial Value	R/W	Description
11	PG6F	0	R/(W)*	PG6 Flag 0: No change on the PG6 pin 1: Change on the PG6 pin Note: This bit can be used only in the SH7267 Group.
10	PG5F	0	R/(W)*	PG5 Flag 0: No change on the PG5 pin 1: Change on the PG5 pin Note: This bit can be used only in the SH7267 Group.
9	PG4F	0	R/(W)*	PG4 Flag 0: No change on the PG4 pin 1: Change on the PG4 pin Note: This bit can be used only in the SH7267 Group.
8	NMIF	0	R/(W)*	NMI Flag 0: No interrupt on NMI pin 1: Interrupt on NMI pin
7	—	0	R	Reserved This bit is always read as 0. The write value should always be 0.
6	RTCARF	0	R/(W)*	RTCAR Flag 0: No realtime clock alarm interrupt generated 1: Realtime clock alarm Interrupt generated
5	PC8F	0	R/(W)*	PC8 Flag 0: No change on the PC8 pin 1: Change on the PC8 pin
4	PC7F	0	R/(W)*	PC7 Flag 0: No change on the PC7 pin 1: Change on the PC7 pin
3	PC6F	0	R/(W)*	PC6 Flag 0: No change on the PC6 pin 1: Change on the PC6 pin
2	PC5F	0	R/(W)*	PC5 Flag 0: No change on the PC5 pin 1: Change on the PC5 pin

Bit	Bit Name	Initial Value	R/W	Description
1	PJ3F	0	R/(W)*	PJ3 Flag 0: No change on the PJ3 pin 1: Change on the PJ3 pin
0	PJ1F	0	R/(W)*	PJ1 Flag 0: No change on the PJ1 pin 1: Change on the PJ1 pin

Note: * Only 0 can be written after reading 1 to clear the flag.

33.2.20 XTAL Crystal Oscillator Gain Control Register (XTALCTR)

XTALCTR is an 8-bit readable/writable register that controls the gain of the crystal oscillator for XTAL. If the realtime clock uses the XTAL input, XTALCTR retains the previous value when software standby mode or deep standby mode is canceled by a source other than a power-on reset. If the realtime clock does not use the XTAL input, XTALCTR is initialized to H'00 when software standby or deep standby mode is entered. XTALCTR is also initialized to H'00 when software standby or deep standby mode is canceled by a power-on reset.

Note: When writing to this register, see section 33.4, Usage Notes.

Bit:	7	6	5	4	3	2	1	0
	-	-	-	-	-	-	-	GAIN
Initial value:	0	0	0	0	0	0	0	0
R/W:	R	R	R	R	R	R	R	R/W

Bit	Bit Name	Initial Value	R/W	Description
7 to 1	—	All 0	R	Reserved These bits are always read as 0. The write value should always be 0.
0	GAIN	0	R/W	XTAL Crystal Oscillator Gain Select 0: Large gain 1: Small gain

33.3 Operation

33.3.1 Sleep Mode

(1) Transition to Sleep Mode

Executing the SLEEP instruction when the STBY bit in STBCR1 is 0 causes a transition from the program execution state to sleep mode. Although the CPU halts immediately after executing the SLEEP instruction, the contents of its internal registers remain unchanged. The on-chip peripheral modules continue to run in sleep mode. The clock output from the CKIO pin is continued.

(2) Canceling Sleep Mode

Sleep mode is canceled by an interrupt (NMI, IRQ, and on-chip peripheral module), a DMA address error, or a reset (manual reset or power-on reset).

- **Canceling by an interrupt**
When an NMI, IRQ, or on-chip peripheral module interrupt occurs, sleep mode is canceled and interrupt exception handling is executed. When the priority level of the generated interrupt is equal to or lower than the interrupt mask level that is set in the status register (SR) of the CPU, or the interrupt by the on-chip peripheral module is disabled on the module side, the interrupt request is not accepted and sleep mode is not canceled.
- **Canceling by a DMA address error**
When a DMA address error occurs, sleep mode is canceled and DMA address error exception handling is executed.
- **Canceling by a reset**
Sleep mode is canceled by a power-on reset or a manual reset.

33.3.2 Software Standby Mode

(1) Transition to Software Standby Mode

The LSI switches from a program execution state to software standby mode by executing the SLEEP instruction when the STBY bit and DEEP bit in STBCR1 are 1 and 0 respectively. In software standby mode, not only the CPU but also the clock and on-chip peripheral modules halt. The clock output from the CKIO pin also stops.

The contents of the CPU and cache registers remain unchanged. Some registers of on-chip peripheral modules are, however, initialized. As for the states of on-chip peripheral module registers in software standby mode, see section 36.3, Register States in Each Operating Mode.

The CPU takes one cycle to finish writing to STBCR1, and then executes processing for the next instruction. However, it takes one or more cycles to actually write. Therefore, execute a SLEEP instruction after reading STBCR1 to have the values written to STBCR1 by the CPU to be definitely reflected in the SLEEP instruction.

The procedure for switching to software standby mode is as follows:

1. Clear the TME bit in the timer control register of the watchdog timer (WTCSR) to 0 to stop the watchdog time.
2. Set the timer counter of the watchdog timer (WTCNT) to 0 and the CKS[2:0] bits in WTCSR to appropriate values to secure the specified oscillation settling time.
3. After setting the STBY and DEEP bits in STBCR1 to 1 and 0 respectively, read STBCR. Then, execute a SLEEP instruction.

(2) Canceling Software Standby Mode

Software standby mode is canceled by interrupts (NMI or IRQ) or a reset (power-on reset). Clock signal starts to be output from the CKIO pin.

- Canceling by an interrupt

When the falling edge or rising edge of the NMI pin (selected by the NMI edge select bit (NMIE) in interrupt control register 0 (ICR0) of the interrupt controller) or the falling edge or rising edge of an IRQ pin (IRQ7 to IRQ0) (selected by the IRQn sense select bits (IRQn1S and IRQn0S) in interrupt control register 1 (ICR1) of the interrupt controller) is detected, clock oscillation is started. This clock pulse is supplied only to the oscillation settling counter (watchdog timer) used to count the oscillation settling time.

After the elapse of the time set in the clock select bits (CKS[2:0]) in the watchdog timer control/status register (WTCSR) of the watchdog timer before the transition to software standby mode, the watchdog timer overflow occurs. Since this overflow indicates that the clock has been stabilized, the clock pulse will be supplied to the entire chip after this overflow. Software standby mode is thus cleared and NMI interrupt exception handling (IRQ interrupt exception handling in case of IRQ) is started. If the priority level of the generated interrupt is equal to or lower than the interrupt mask level specified in the status register (SR) of the CPU, the interrupt request is not accepted and software standby mode is not canceled.

When canceling software standby mode by the NMI interrupt or IRQ interrupt, set the CKS[2:0] bits so that the watchdog timer overflow period will be equal to or longer than the oscillation settling time.

The clock output phase of the CKIO pin may be unstable immediately after detecting an interrupt and until software standby mode is canceled.

- Canceling by a reset

When the $\overline{\text{RES}}$ pin is driven low, software standby mode is canceled and the LSI enters the power-on reset state. After that, if the $\overline{\text{RES}}$ pin is driven high, the power-on reset exception handling is started.

Keep the $\overline{\text{RES}}$ pin low until the clock oscillation settles. The internal clock will continue to be output to the CKIO pin.

(3) Note on Release from Software Standby Mode

Release from software standby mode is triggered by interrupts (NMI and IRQ) or resets (manual reset and power-on reset). If, however, a SLEEP instruction and an interrupt other than NMI and IRQ are generated at the same time, software standby mode may be canceled due to acceptance of the interrupt.

When initiating a transition to software standby mode, make settings so that interrupts are not generated before execution of the SLEEP instruction.

(4) Note on Canceling Software Standby Mode

After software standby mode is canceled, unstable clock pulses are output from the CKIO pin during oscillation settling time. To prevent malfunction due to the unstable pulses, bits 13 and 12 in FRQCR should be modified.

33.3.3 Software Standby Mode Application Example

This example describes a transition to software standby mode on the falling edge of the NMI signal, and cancellation on the rising edge of the NMI signal. The timing is shown in figure 33.1.

When the NMI pin is changed from high to low level while the NMI edge select bit (NMIE) in the interrupt control register 0 (ICR0) is set to 0 (falling edge detection), the NMI interrupt is accepted. When the NMIE bit is set to 1 (rising edge detection) by the NMI exception service routine, the STBY and DEEP bits in STBCR1 are set to 1 and 0 respectively, and a SLEEP instruction is executed, software standby mode is entered. Thereafter, software standby mode is canceled when the NMI pin is changed from low to high level.

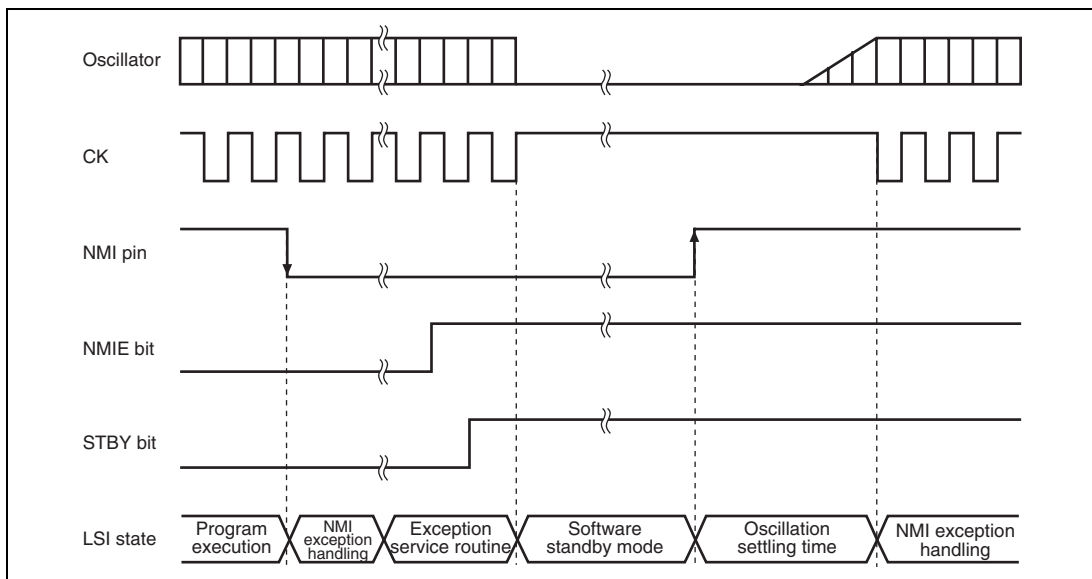

Figure 33.1 NMI Timing in Software Standby Mode (Application Example)

33.3.4 Deep Standby Mode

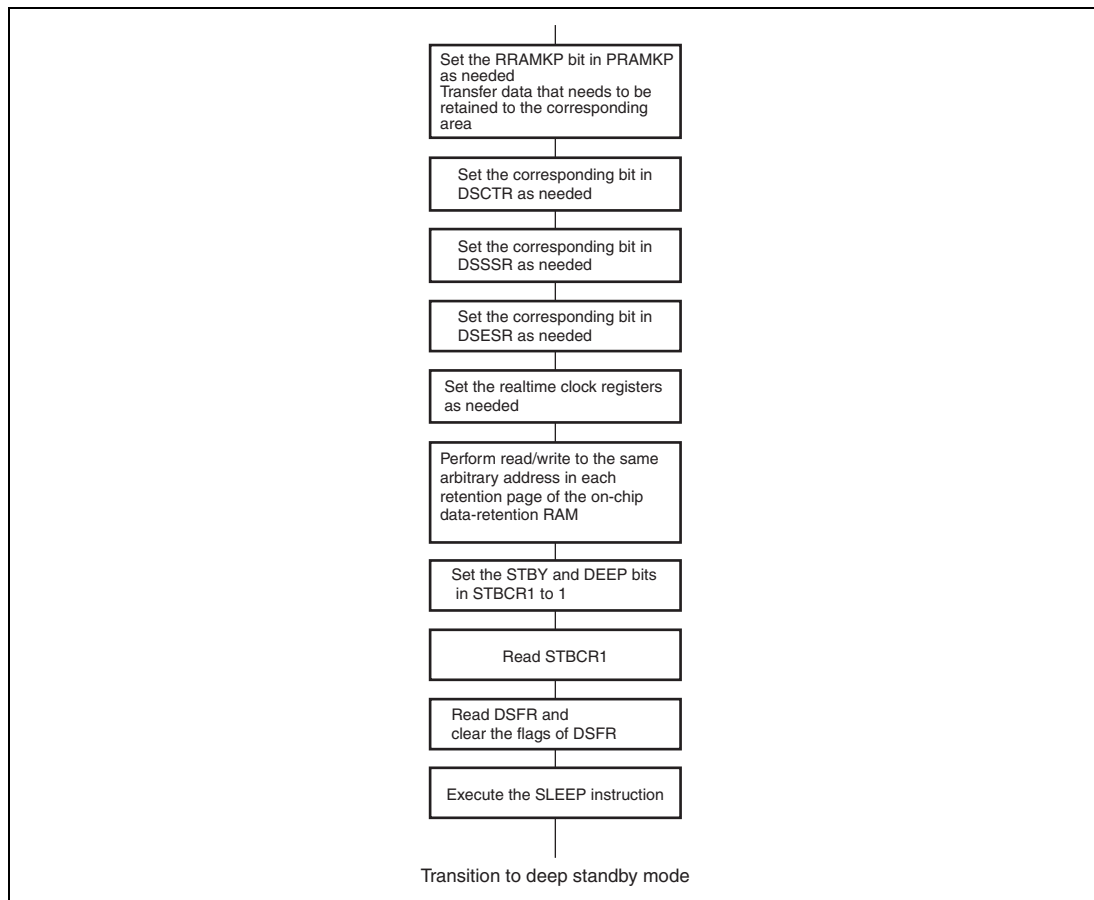

(1) Transition to Deep Standby Mode

The LSI switches from a program execution state to deep standby mode by executing the SLEEP instruction when the STBY bit and DEEP bit in STBCR1 are set to 1. In deep standby mode, not only the CPU, clocks, and on-chip peripheral modules but also power supply is turned off excluding the on-chip data-retention RAM area specified by the RRAMKP3 to RRAMKP0 bits in RRAMKP and realtime clock. This can significantly reduce power consumption. Therefore, data in the registers of the CPU, cache, and on-chip peripheral modules are not retained. Pin state values immediately before the transition to deep standby mode are retained.

The CPU takes one cycle to finish writing to DSFR, and then executes processing for the next instruction. However, it actually takes one or more cycles to write. Therefore, execute a SLEEP instruction after reading DSFR to reflect the values written to DSFR by the CPU in the SLEEP instruction without fail.

The procedure for switching to deep standby mode is as follows. Figure 33.2 also shows its flowchart.

1. Set the RRAMKP3 to RRAMKP0 bits in RRAMKP for the corresponding on-chip data-retention RAM area that must be retained. Transfer the programs to be retained to the specified areas of the on-chip data-retention RAM.
2. Set the RAMBOOT and EBUSKEEPE bits in DSCTR to specify the activation method for returning from deep standby mode and to select whether the external memory control pin status is retained or not.
3. When canceling deep standby mode by an interrupt, set the corresponding bit in DSSSR to select the pin or source to cancel deep standby mode. In this case, specify the input signal detection mode for the selected pin with the corresponding bit in DSESR.
4. Execute read and write of an arbitrary but the same address for each page in the on-chip data-retention RAM area. When this is not executed, data last written may not be written to the on-chip data-retention RAM. If there is a write to the on-chip data-retention RAM after this time, execute this processing after the last write to the on-chip data-retention RAM.
5. Set the STBY and DEEP bits in STBCR1 to 1.
6. Read out the DSFR register after clearing the flag in the DSFR register. Then execute the SLEEP instruction.

**Figure 33.2 Flowchart of Transition to Deep Standby Mode**

(2) Canceling Deep Standby Mode

Deep standby mode is canceled by interrupts (NMI or realtime clock alarm interrupt), change on the pins for canceling, or a reset (power-on reset). The realtime clock alarm interrupt can always cancel deep standby mode regardless of the interrupt priority level or the status register (SR) setting in the CPU. When canceling the mode by a source other than a reset, a power-on reset exception handling is executed instead of an interrupt exception handling.

Figure 33.3 shows the flowchart of canceling deep standby mode.

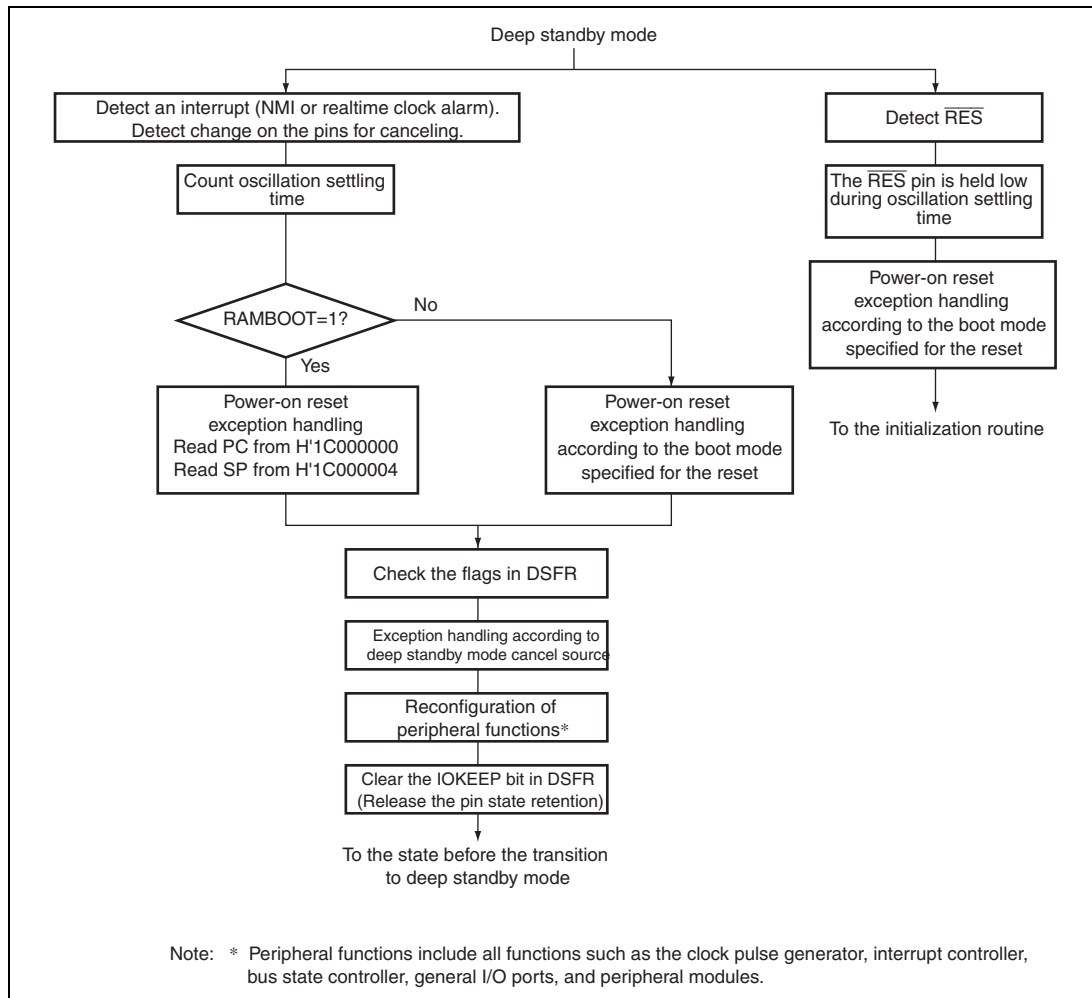

Figure 33.3 Flowchart of Canceling Deep Standby Mode

- Canceling by a source other than a reset

When the falling or rising edge of the NMI pin (selected by a corresponding bit in DSESR) or falling or rising edge of the pins for canceling (selected by a corresponding bit in DSESR) is detected or the realtime clock alarm interrupt (see section 14.4.4, Alarm Function) is generated, clock oscillation is started after the wait time for the oscillation settling time. After the oscillation settling time has elapsed, deep standby mode is cancelled and the power-on reset exception handling is executed.

The clock output phase of the CKIO pin may be unstable immediately after detecting a cancel source and until deep standby mode is canceled.

The detecting of the NMI pin, the pins for canceling, and the realtime clock alarm interrupt becomes enable when the corresponding bits in DSSSR are set. The detected cancel sources are kept, but they are reflected to DSFR after canceling the deep standby mode. When the CPU accepts any interrupts, the cancel sources that are kept are cleared. When the CPU enters the deep standby mode as the detected cancel sources are kept, the deep standby mode is canceled immediately after the CPU enters the deep standby mode.

- Canceling with a reset

Driving the $\overline{\text{RES}}$ pin low cancels deep standby mode and causes a transition to the power-on reset state. After this, driving the $\overline{\text{RES}}$ pin high initiates power-on reset exception handling. Output of the internal clock from the CKIO pin also starts by driving the $\overline{\text{RES}}$ pin low.

Keep the $\overline{\text{RES}}$ pin low until the clock oscillation has settled.

(3) Operation after Canceling Deep Standby Mode

After canceling deep standby mode, the LSI can be activated through the external memory or from the on-chip data-retention RAM, which can be selected by setting the RAMBOOT bit in DSCTR. By setting the EBUSKEEPE bit, the states of the external memory control pins can be retained even after cancellation of deep standby mode. Table 33.3 shows the pin states after cancellation of deep standby mode according to the setting of each bit. Table 33.4 lists the external memory control pins.

Table 33.3 Pin States after Cancellation of Deep Standby Mode and System Activation Method by the DSCTR Settings

EBUSKEEPE Bit	RAMBOOT Bit	Activation Method	Pin States After Cancellation of Deep Standby Mode
0	0	External memory	The states of the external memory control pins are not retained. For other pins, the retention of their states is cancelled when the IOKEEP bit is cleared.
0	1	On-chip data-retention RAM	The states of the external memory control pins are not retained. After cancellation of deep standby mode, the retention of the external memory control pin states is cancelled. For other pins, the retention of their states is cancelled when the IOKEEP bit is cleared.
1	0	—	Setting prohibited.
1	1	On-chip data-retention RAM	The states of the external memory control pin are retained. The retention of the states of the external memory control pins and other pins is cancelled when the IOKEEP bit is cleared.

Table 33.4 External Memory Control Pins in Different Modes

Boot Mode 0 (CS0 Area)	Boot Mode 2 (NAND Flash Memory)	Boot Mode 1, 3 (Serial Flash Memory)
A[20:1] D[15:0] CS0, RD, CKIO	NAF[7:0] FRE, FCLE, FALE, FEW, FCE, FRB	RSPCK0, SSL00, MOSI0, MISO0

When deep standby mode is canceled by interrupts (NMI or realtime clock alarm) or changes on the pins for canceling, the deep standby cancel source flag register (DSFR) can be used to confirm which source has canceled the mode.

Pins retain the state immediately before the transition to deep standby mode. However, in system activation through the external memory, the retention of the states of the external memory control pins is cancelled so that programs can be fetched after cancellation of deep standby mode. Other pins, after cancellation of deep standby mode, continue to retain the pin states until writing 0 to the IOKEEP bit in DSFR after reading 1 from the same bit. In system activation from the on-chip data-retention RAM, after cancellation of deep standby mode, both the external memory control pins and other pins continues to retain the pin states until writing 0 to the IOKEEP bit in DSFR after reading 1 from the same bit. Reconfiguration of peripheral functions is required to return to the previous state of deep standby mode. Peripheral functions include all functions such as the clock pulse generator, interrupt controller, general I/O ports, and peripheral modules. After the reconfiguration, the retention of the pin state can be canceled and the LSI returns to the state prior to the transition to deep standby mode by reading 1 from the IOKEEP bit in DSFR and then writing 0 to it.

(4) Notes on Transition to Deep Standby Mode

After deep standby mode is specified, interrupts other than that selected with the deep standby cancel source select register are masked. That is, only an interrupt selected with the deep standby cancel source select register will be accepted. If, however, multiple canceling sources have been specified and multiple canceling sources are input, multiple cancel source flags will be set.

In addition, if a SLEEP instruction to initiate the transition to deep standby mode coincides with the NMI, an IRQ interrupt, or a manual reset, acceptance of the interrupt may initiate the cancellation of deep standby mode.

33.3.5 Module Standby Function

(1) Transition to Module Standby Function

Setting the standby control register MSTP bits to 1 halts the supply of clocks to the corresponding on-chip peripheral modules. This function can be used to reduce the power consumption in the program execution state and sleep mode. Disable a module before placing it in the module standby mode. In addition, do not access the module's registers while it is in the module standby state.

For details on the states of registers, see section 36.3, Register States in Each Operating Mode.

(2) Canceling Module Standby Function

The module standby function can be canceled by clearing each MSTP bit to 0, or by a power-on reset (only possible for the realtime clock, user debugging interface, and direct memory access controller). When taking a module out of the module standby state by clearing the corresponding MSTP bit to 0, read the MSTP bit to confirm that it has been cleared to 0.

33.3.6 Adjustment of XTAL Crystal Oscillator Gain

The gain of the crystal oscillator can be adjusted using the GAIN bit in XTALCTR. To modify the gain, PLL settling time is needed. The settling time is counted using the on-chip watchdog timer.

1. The large gain is selected in the initial state.
2. Set the watchdog timer so that the specified settling time should be obtained and stop the watchdog timer. Specifically, the following settings are necessary:
 - TME in WTCSR = 0: Stop the watchdog timer.
 - CKS[2:0] in WTCSR: Division ratio for watchdog timer count clock
 - WTCNT: Initial counter value
(The watchdog timer starts counting on the set clock.)
3. Set the GAIN bit to the desired value.
4. The LSI is internally stopped and the watchdog timer starts counting. The clock is supplied only to the watchdog timer and other internal clocks are stopped. In this state, the CKIO pin continues to output an unstable clock. To avoid malfunction due to the unstable clock, modify the CKOEN2 bit in FRQCR appropriately. Since this state is equivalent to the software standby mode state, some registers of on-chip peripheral modules are initialized. For details, see section 36.3, Register States in Each Operating Mode.
5. When an overflow occurs on the watchdog timer, the specified clock supply is started and the LSI starts operation. The watchdog timer stops after an overflow.

33.4 Usage Notes

33.4.1 Usage Notes on Setting Registers

When writing to the registers related to power-down modes, note the following.

When writing to the register related to power-down modes, the CPU, after executing a write instruction, executes the next instruction without waiting for the write operation to complete.

Therefore, to reflect the change specified by writing to the register while the next instruction is executed, insert a dummy read of the same register between the register write instruction and the next instruction.

33.4.2 Usage Notes when the Realtime Clock is not Used

When the realtime clock is not used, set the MSTP30 bit in STBCR3 to 1 after setting the bits in registers of the realtime clock shown below.

- Set the RTCEN bit in the control register 2 (RCR2) to 0.
- Set the RCKSEL[1:0] bits in the control register 5 (RCR5) to 00.

Section 34 User Debugging Interface

This LSI incorporates a user debugging interface for emulator support.

34.1 Features

The user debugging interface has reset and interrupt request functions.

The H-UDI in this LSI is used for emulator connection.

Refer to the emulator manual for the method of connecting the emulator.

Figure 34.1 shows a block diagram.

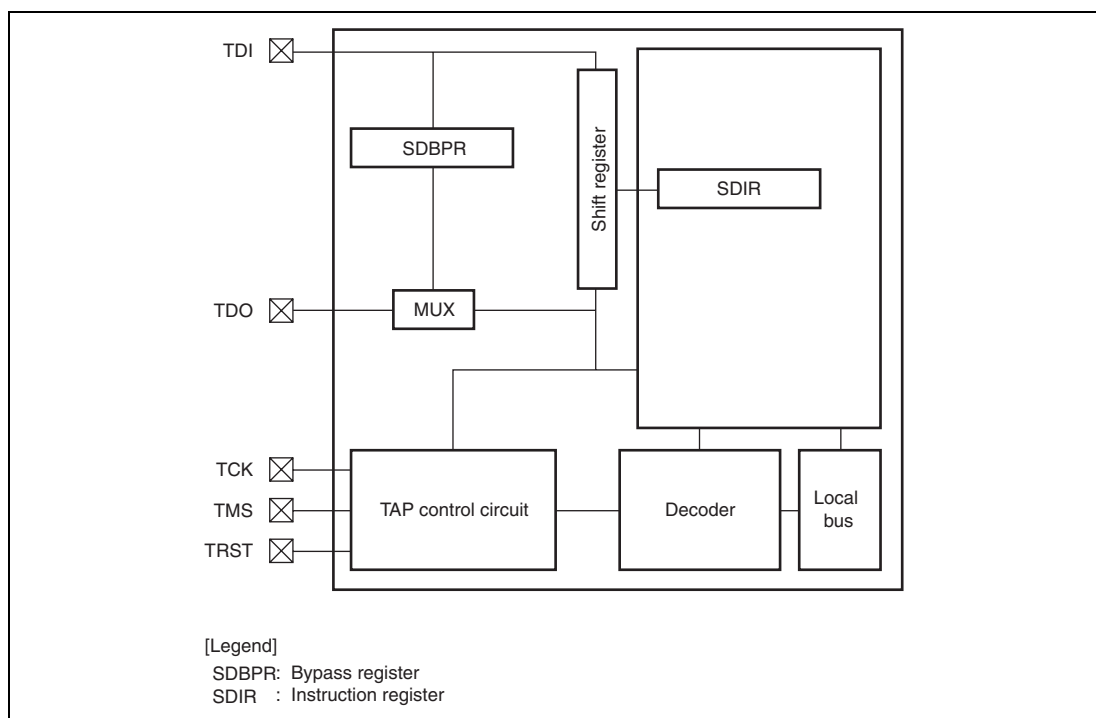

Figure 34.1 Block Diagram

34.2 Input/Output Pins

Table 34.1 Pin Configuration

Pin Name	Symbol	I/O	Function
Serial data input/output clock pin	TCK	Input	Data is serially supplied to this module from the data input pin (TDI), and output from the data output pin (TDO), in synchronization with this clock.
Mode select input pin	TMS	Input	The state of the TAP control circuit is determined by changing this signal in synchronization with TCK. For the protocol, see figure 34.2.
Reset input pin	$\overline{\text{TRST}}$	Input	Input is accepted asynchronously with respect to TCK, and when low, this module is reset. $\overline{\text{TRST}}$ must be low for a period when power is turned on regardless of using the function. See section 34.4.2, Reset Configuration, for more information.
Serial data input pin	TDI	Input	Data is transferred to this module by changing this signal in synchronization with TCK.
Serial data output pin	TDO	Output	Data is read from this module by reading this pin in synchronization with TCK. The initial value of the data output timing is the TCK falling edge, but this initial value can be changed to the TCK rising edge by inputting the TDO transition timing switching command to SDIR. See section 34.4.3, TDO Output Timing, for more information.
ASE mode select pin	$\overline{\text{ASEMD}}$ *	Input	If a low level is input at the $\overline{\text{ASEMD}}$ pin while the $\overline{\text{RES}}$ pin is asserted, ASE mode is entered; if a high level is input, product chip mode is entered. In ASE mode, dedicated emulator function can be used. The input level at the $\overline{\text{ASEMD}}$ pin should be held for at least one cycle after $\overline{\text{RES}}$ negation.

Note: * When the emulator is not in use, fix this pin to the high level.

34.3 Register Descriptions

This module has the following registers.

Table 34.2 Register Configuration for Emulation

Register Name	Abbreviation	R/W	Initial Value	Address	Access Size
Bypass register	SDBPR	—	—	—	—
Instruction register	SDIR	R	H'EFFD	H'FFFE2000	16

34.3.1 Bypass Register (SDBPR)

SDBPR is a 1-bit register that cannot be accessed by the CPU. When SDIR is set to BYPASS mode, SDBPR is connected between pins TDI and TDO pins. The initial value is undefined.

34.3.2 Instruction Register (SDIR)

SDIR is a 16-bit read-only register. This register is initialized by $\overline{\text{TRST}}$ assertion or in the TAP test-logic-reset state. This module can write to this register regardless of the CPU mode. When a reserved command is set in this register, the operation is not guaranteed. The initial value is H'EFFD.

Bit:	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	0
	TI[7:0]								-	-	-	-	-	-	-	-
Initial value:	1*	1*	1*	0*	1*	1*	1*	1*	1	1	1	1	1	1	0	1
R/W:	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R	R

Note: * The initial value of TI[7:0] is a reserved value, but replace it with a non-reserved value when setting a command.

Bit	Bit Name	Initial Value	R/W	Description
15 to 8	TI[7:0]	11101111*	R	Test Instruction The instruction of this module is transferred to SDIR as a serial input from TDI. For commands, see table 34.3.

Bit	Bit Name	Initial Value	R/W	Description
7 to 2	—	All 1	R	Reserved These bits are always read as 1.
1	—	0	R	Reserved These bits are always read as 0.
0	—	1	R	Reserved These bits are always read as 1.

Table 34.3 H-UDI Commands

Bits 15 to 8								Description
T17	T16	T15	T14	T13	T12	T11	T10	
0	1	1	0	—	—	—	—	User debugging interface reset negation
0	1	1	1	—	—	—	—	User debugging interface reset assertion
1	0	0	1	1	1	0	0	TDO transition timing switch
1	0	1	1	—	—	—	—	User debugging interface interrupt
1	1	1	1	—	—	—	—	BYPASS
Other than the above								Reserved

34.4 Operation

34.4.1 TAP Controller

Figure 34.2 shows the internal states of the TAP controller.

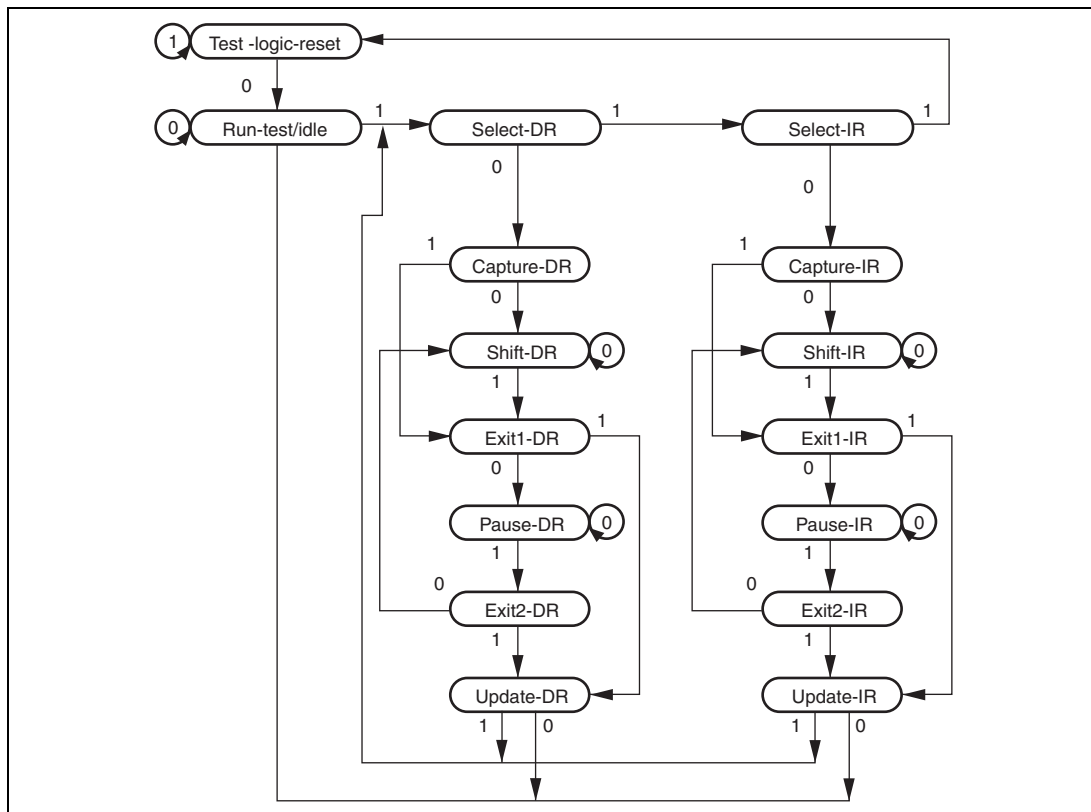

Figure 34.2 TAP Controller State Transitions

Note: The transition condition is the TMS value at the rising edge of TCK. The TDI value is sampled at the rising edge of TCK; shifting occurs at the falling edge of TCK. For details on transition timing of the TDO value, see section 34.4.3, TDO Output Timing. The TDO is at high impedance, except with shift-DR and shift-IR states. During the change to $\overline{\text{TRST}} = 0$, there is a transition to test-logic-reset asynchronously with TCK.

34.4.2 Reset Configuration

Table 34.4 Reset Configuration

$\overline{\text{ASEMD}}^{*1}$	$\overline{\text{RES}}$	$\overline{\text{TRST}}$	Chip State
H	L	L	Power-on reset and the reset of this module
		H	Power-on reset
	H	L	Reset this module only
		H	Normal operation
L	L	L	Reset hold* ²
		H	Power-on reset
	H	L	Reset this module only
		H	Normal operation

- Notes: 1. Performs product chip mode and ASE mode settings
 $\overline{\text{ASEMD}} = \text{H}$, normal mode
 $\overline{\text{ASEMD}} = \text{L}$, ASE mode
2. In ASE mode, reset hold is entered if the $\overline{\text{TRST}}$ pin is driven low while the $\overline{\text{RES}}$ pin is negated. In this state, the CPU does not start up. When $\overline{\text{TRST}}$ is driven high, the operation of this module is enabled, but the CPU does not start up. The reset hold state is cancelled by a power-on reset.

34.4.3 TDO Output Timing

A transition on the TDO pin is output on the falling edge of TCK with the initial value. However, setting a TDO transition timing switching command in SDIR via the pin and passing the Update-IR state synchronizes the TDO transition with the rising edge of TCK.

To synchronize the transition of TDO with the falling edge of TCK after setting the TDO transition timing switching command, the $\overline{\text{TRST}}$ pin must be asserted simultaneously with the power-on reset. In the case of power-on reset by the $\overline{\text{RES}}$ pin, the sync reset is still in operation for a certain period in the LSI even after the $\overline{\text{RES}}$ pin is negated. Thus, if the $\overline{\text{TRST}}$ pin is asserted immediately after the negation of the $\overline{\text{RES}}$ pin, the TDO transition timing switching command is cleared, resulting in TDO transitions synchronized with the falling edges of TCK. To prevent this, make sure to allow a period of 50 tcy or longer between the signal transitions of the $\overline{\text{RES}}$ and $\overline{\text{TRST}}$ pins.

Figure 34.3 User Debugging Interface Data Transfer Timing

34.4.4 User Debugging Interface Reset

A user debugging interface reset occurs when a user debugging interface reset assert command is set in SDIR. A user debugging interface reset is of the same kind as a power-on reset. A user debugging interface reset is cleared by setting a user debugging interface reset negate command. The required time between the user debugging interface reset assert command and user debugging interface reset negate command is the same as time for keeping the \overline{RES} pin low to apply a power-on reset.

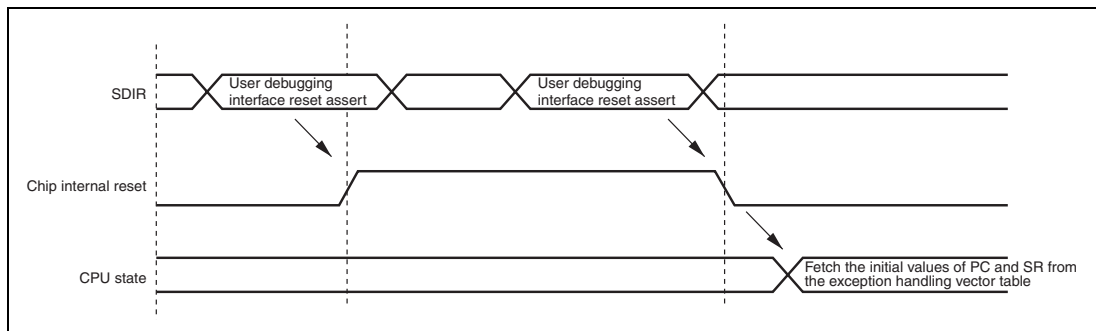

Figure 34.4 User debugging interface Reset

34.4.5 User Debugging Interface Interrupt

The user debugging interface interrupt function generates an interrupt by setting a command from the user debugging interface into SDIR. A user debugging interface interrupt is a general exception/interrupt operation, resulting in fetching the exception service routine start address from the exception handling vector table, jumping to that address, and starting program execution from that address. This interrupt request has a fixed priority level of 15.

User debugging interface interrupts are accepted in sleep mode, but not in software standby mode.

34.5 Usage Notes

1. Once a command of this module has been set, it will not be modified until another command is not set again. If the same command is to be set continuously, the command must be set after a command (BYPASS mode, etc.) that does not affect chip operations is once set.
2. In software standby mode and in this module's standby state, none of the functions of this module can be used. To retain the TAP status before and after standby mode, keep TCK high before entering standby mode.
3. Regardless of whether this module is used, make sure to keep the $\overline{\text{TRST}}$ pin low to initialize this module at power-on or in recovery from deep standby by the $\overline{\text{RES}}$ pin assertion.
4. If the TRST pin is asserted immediately after the setting of the TDO transition timing switching command and the negation of the RES pin, the TDO transition timing switching command is cleared. To avoid this case, make sure to put 50 tcyc or longer between the signal transition timing of the $\overline{\text{RES}}$ and $\overline{\text{TRST}}$ pins. For details, see section 34.4.3, TDO Output Timing.
5. When starting the TAP controller after the negation of the $\overline{\text{TRST}}$ pin, make sure to allow 200 ns or longer after the negation.

Section 35 Motor Control PWM Timer

This LSI has two channels of on-chip motor control PWM (pulse width modulator) timer with a maximum capability of eight pulse outputs for each channel.

35.1 Features

- Maximum of 16 pulse outputs
 - Two 10-bit PWM channels, each with eight outputs.
 - 10-bit counter (PWCNT) and cycle register (PWCYR).
 - Duty and output polarity can be set for each output.
- Automatic data transfer in every cycle
 - Each of four duty registers (PWDTR) is provided with buffer registers (PWBFR), with data transferred automatically every cycle.
- Duty settings selectable
 - A duty cycle of 0% to 100% can be selected by means of a duty register setting.
- Counting clock selectable
 - There is a choice of five counting clocks ($P\phi$, $P\phi/2$, $P\phi/4$, $P\phi/8$, $P\phi/16$).
- High-speed access via internal 16-bit bus
- Two interrupt sources
 - An interrupt can be requested independently for each channel by a cycle register compare match.
- Automatic transfer of register data
 - Block transfer and one-word data transfer are available by activating the direct memory access controller.
- Module stop mode can be set

Figure 35.1 shows a block diagram of the motor control PWM timer.

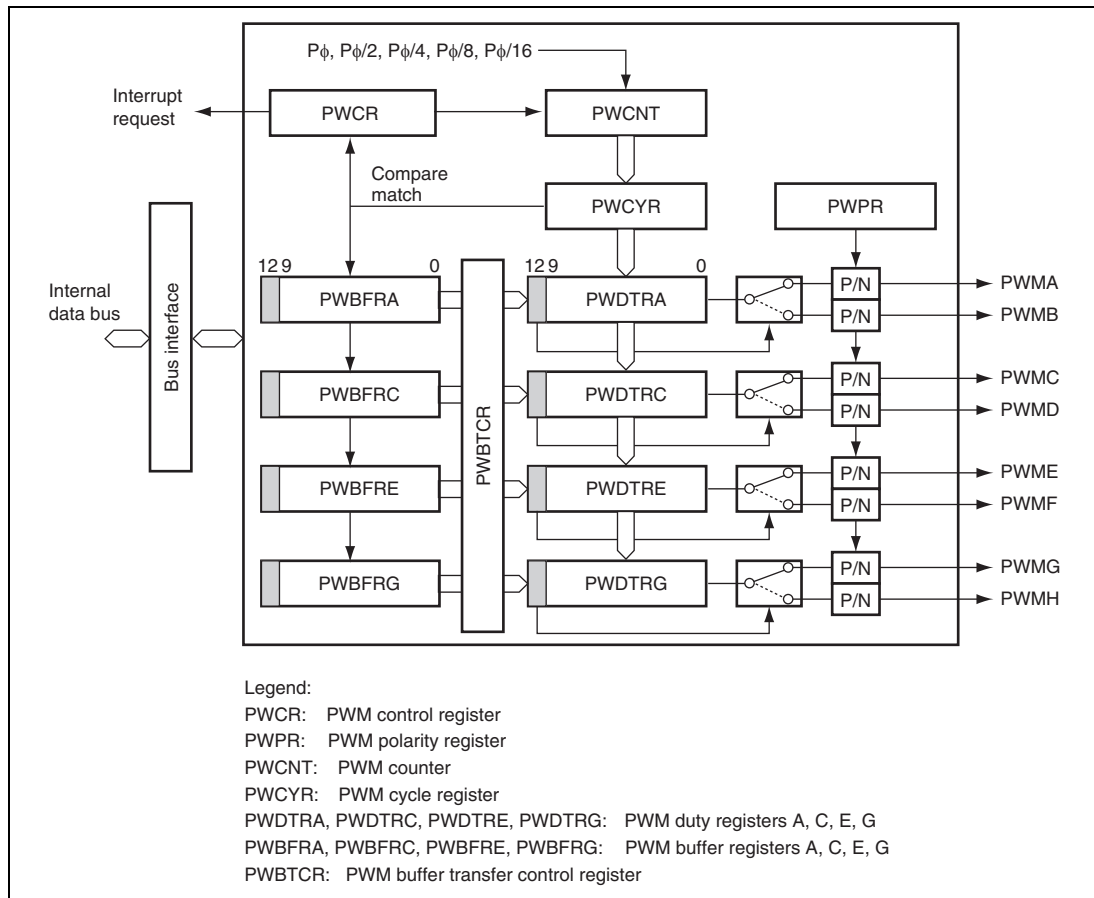

Figure 35.1 Block Diagram of Motor Control PWM Timer

35.2 Input/Output Pins

Table 35.1 shows the pin configuration of this module.

Table 35.1 Pin Configuration

Channel	Name	Abbrev.	I/O	Function
1	PWM output pin 1A	PWM1A	Output	Channel 1A PWM output
	PWM output pin 1B	PWM1B	Output	Channel 1B PWM output
	PWM output pin 1C	PWM1C	Output	Channel 1C PWM output
	PWM output pin 1D	PWM1D	Output	Channel 1D PWM output
	PWM output pin 1E	PWM1E	Output	Channel 1E PWM output
	PWM output pin 1F	PWM1F	Output	Channel 1F PWM output
	PWM output pin 1G	PWM1G	Output	Channel 1G PWM output
	PWM output pin 1H	PWM1H	Output	Channel 1H PWM output
2	PWM output pin 2A	PWM2A	Output	Channel 2A PWM output
	PWM output pin 2B	PWM2B	Output	Channel 2B PWM output
	PWM output pin 2C	PWM2C	Output	Channel 2C PWM output
	PWM output pin 2D	PWM2D	Output	Channel 2D PWM output
	PWM output pin 2E	PWM2E	Output	Channel 2E PWM output
	PWM output pin 2F	PWM2F	Output	Channel 2F PWM output
	PWM output pin 2G	PWM2G	Output	Channel 2G PWM output
	PWM output pin 2H	PWM2H	Output	Channel 2H PWM output

35.3 Register Descriptions

This module has the following registers for each channel as listed in table 35.2.

Table 35.2 Register Description

Register Name	Abbreviation	R/W	Initial Value	Address	Access Size
PWM control register_1	PWCR_1	R/W	H'00	H'FFFEF4E0	8, 16
PWM polarity register_1	PWPR_1	R/W	H'00	H'FFFEF4E4	8, 16
PWM cycle register_1	PWCYR_1	R/W	H'FFFF	H'FFFEF4E6	16
PWM buffer register_1A	PWBFR_1A	R/W	H'EC00	H'FFFEF4E8	16
PWM buffer register_1C	PWBFR_1C	R/W	H'EC00	H'FFFEF4EA	16
PWM buffer register_1E	PWBFR_1E	R/W	H'EC00	H'FFFEF4EC	16
PWM buffer register_1G	PWBFR_1G	R/W	H'EC00	H'FFFEF4EE	16
PWM control register_2	PWCR_2	R/W	H'00	H'FFFEF4F0	8, 16
PWM polarity register_2	PWPR_2	R/W	H'00	H'FFFEF4F4	8, 16
PWM cycle register_2	PWCYR_2	R/W	H'FFFF	H'FFFEF4F6	16
PWM buffer register_2A	PWBFR_2A	R/W	H'EC00	H'FFFEF4F8	16
PWM buffer register_2C	PWBFR_2C	R/W	H'EC00	H'FFFEF4FA	16
PWM buffer register_2E	PWBFR_2E	R/W	H'EC00	H'FFFEF4FC	16
PWM buffer register_2G	PWBFR_2G	R/W	H'EC00	H'FFFEF4FE	16
PWM buffer transfer control register	PWBTCR	R/W	H'00	H'FFFEF406	8, 16

35.3.1 PWM Control Register_n (PWCR_n) (n = 1, 2)

PWCR_n performs interrupt control, starting/stopping of the counter, and counter clock selection. It also contains a flag that indicates a compare match with the cycle register.

Bit	7	6	5	4	3	2	1	0
Bit Name	—	—	IE	CMF	CST	CKS2	CKS1	CKS0
Initial Value	1	1	0	0	0	0	0	0
R/W	—	—	R/W	R/(W)*	R/W	R/W	R/W	R/W

Bit	Bit Name	Initial Value	R/W	Description
7, 6	—	All 1	—	Reserved These bits are always read as 1 and cannot be modified.
5	IE	0	R/W	Interrupt Enable Enables or disables an interrupt request in the event of a compare match with PWCYR_n of the corresponding channel. 0: Interrupt disabled 1: Interrupt enabled
4	CMF	0	R/(W)*	Compare Match Flag Indicates the occurrence of a compare match with PWCYR_n of the corresponding channel. [Setting condition] When $PWCNT_n = PWCYR_n - 1$ [Clearing conditions] <ul style="list-style-type: none"> • When 0 is written to CMF after reading CMF = 1 • When the direct memory access controller is activated by a compare match interrupt, and the DTA bit in DMDR of the direct memory access controller is 1 (When the CPU is used to clear this flag by writing 0 while the corresponding interrupt is enabled, be sure to read the flag after writing 0 to it.)

Bit	Bit Name	Initial Value	R/W	Description
3	CST	0	R/W	Counter Start Selects starting or stopping of PWCNT_n of the corresponding channel. 0: PWCNT_n is stopped 1: PWCNT_n is started
2	CKS2	0	R/W	Clock Select
1	CKS1	0	R/W	These bits select the operating clock for PWCNT_n of the corresponding channel. 000: Counts on P ϕ /1 001: Counts on P ϕ /2 010: Counts on P ϕ /4 011: Counts on P ϕ /8 1XX: Counts on P ϕ /16
0	CKS0	0	R/W	

[Legend]

X: Don't care

Note: * Only 0 can be written, to clear the flag.

35.3.2 PWM Polarity Register_n (PWPR_n) (n = 1, 2)

PWPR_n selects the PWM output polarity.

Bit	7	6	5	4	3	2	1	0
Bit Name	OPSnH	OPSnG	OPSnF	OPSnE	OPSnD	OPSnC	OPSnB	OPSnA
Initial Value	0	0	0	0	0	0	0	0

Bit	Bit Name	Initial Value	R/W	Description
7	OPSnH	0	R/W	Output Polarity Select
6	OPSnG	0	R/W	Each of these bits selects the PWM output polarity.
5	OPSnF	0	R/W	0: PWM direct output
4	OPSnE	0	R/W	1: PWM inverse output
3	OPSnD	0	R/W	
2	OPSnC	0	R/W	
1	OPSnB	0	R/W	
0	OPSnA	0	R/W	

(n = 1, 2)

35.3.3 PWM Counter_n (PWCNT_n) (n = 1, 2)

PWCNT_n is a 10-bit up-counter incremented by the input clock. The input clock is selected by clock select bits CKS2 to CKS0 in PWCR_n.

PWCNT_n can not be directly accessed by the CPU. PWCNT_n is initialized to H'FC00, when the CST bit in PWCR_n is cleared to 0.

35.3.4 PWM Cycle Register_n (PWCYR_n) (n = 1, 2)

PWCYR_n is a 16-bit readable/writable register that sets the PWM conversion cycle.

Bit:	15	14	13	12	11	10	9	8
	PWC Y15	PWC Y14	PWC Y13	PWC Y12	PWC Y11	PWC Y10	PWC Y9	PWC Y8
Initial value:	1	1	1	1	1	1	1	1
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W
Bit:	7	6	5	4	3	2	1	0

Initial value:	1	1	1	1	1	1	1	1
R/W:	R/W	R/W	R/W	R/W	R/W	R/W	R/W	R/W

When a PWCYR_n compare match occurs, PWCNT_n is cleared and data is transferred from the buffer register (PWBFR_n) to the duty register (PWDTR_n).

PWCYR_n should be written to only while PWCNT_n is stopped. A value of H'FC00 must not be set to PWCYR_n.

Figure 35.2 Cycle Register Compare Match

35.3.5 PWM Duty Registers_nA, nC, nE, nG (PWDTR_nA, PWDTR_nC, PWDTR_nE, PWDTR_nG) (n = 1, 2)

There are four PWDTR_n registers (PWDTR_nA, PWDTR_nC, PWDTR_nE, and PWDTR_nG). The PWDTR_nA is used for outputs PWMnA and PWMnB, PWDTR_nC for outputs PWMnC and PWMnD, PWDTR_nE for outputs PWMnE and PWMnF, and PWDTR_nG for outputs PWMnG and PWMnH.

PWDTR_n can not be directly accessed by the CPU. When a PWCYR_n compare match occurs, data is transferred from the buffer register (PWBFR_n) to the duty register (PWDTR_n). PWDTR_n is initialized to H'00 when the CST bit is cleared to 0.

35.4 Bus Master Interface

35.4.1 16-Bit Data Registers

PWCYR_n and PWBFR_n are 16-bit registers. These registers are linked to the bus master by a 16-bit data bus, and can be read or written in 16-bit units. They cannot be read or written by 8-bit access; 16-bit access must always be used.

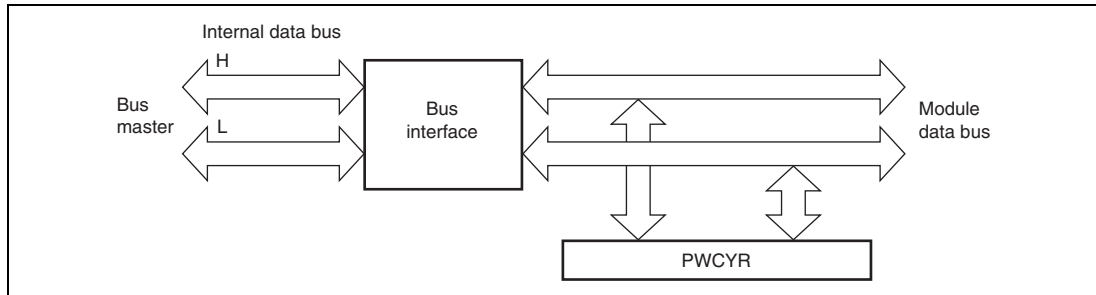

Figure 35.5 16-Bit Register Access Operation (Bus Master ↔ PWCYR_n (16 Bits))

35.4.2 8-Bit Data Registers

PWCR_n, PWPR_n, and PWBTCR are 8-bit registers that can be read and written to in 8-bit units. These registers are linked to the bus master by a 16-bit data bus, and can be read or written by 16-bit access; in this case, the lower eight bits are read as H'FF.

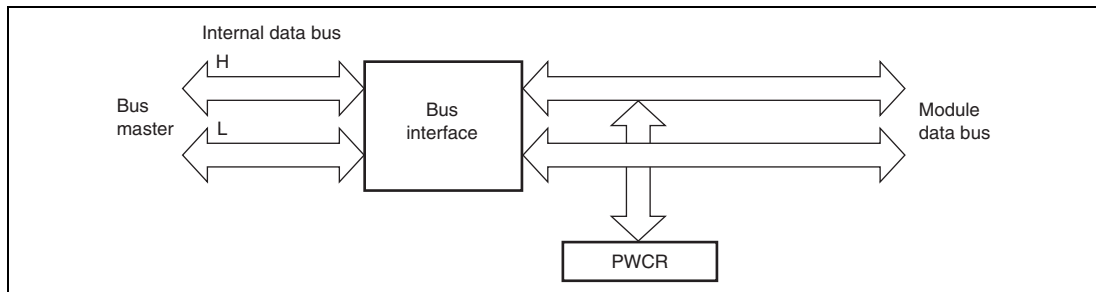

Figure 35.6 8-Bit Register Access Operation (Bus Master ↔ PWCR_n (Upper Eight Bits))

35.5 Operation

35.5.1 PWM Operation

PWM waveforms are output from pins PWM1A to PWM1H and PWM2A to PWM2H as shown in figure 35.7.

(1) Initial Settings

Set the PWM output polarity in PWPR_n; select the clock to be input to PWCNT_n with the CKS2 to CKS0 bits in PWCRn; set the PWM conversion cycle in PWCYR_n; and set the first frame of data in PWBFR_nA, PWBFR_nC, PWBFR_nE, and PWBFR_nG.

(2) Activation

When the CST bit in PWCR_n is set to 1, PWCNT_n starts counting up. On compare match between PWCNT_n and PWCYR_n, data is transferred from the buffer register to the duty register and the CMF bit in PWCR_n is set to 1. At the same time, if the IE bit in PWCR_n has been set to 1, an interrupt can be requested or the direct memory access controller can be activated.

(3) Waveform Output

The PWM outputs selected by the OTS bits in PWDTR_nA, PWDTR_nC, PWDTR_nE, and PWDTR_nG go high when a compare match occurs between PWCNT_n and PWCYR_n. The PWM outputs not selected by the OTS bit are low. When a compare match occurs between PWCNT_n and PWDTR_nA, PWDTR_nC, PWDTR_nE, or PWDTR_nG, the corresponding PWM output goes low. If the corresponding bit in PWPR_n is set to 1, the output is inverted.

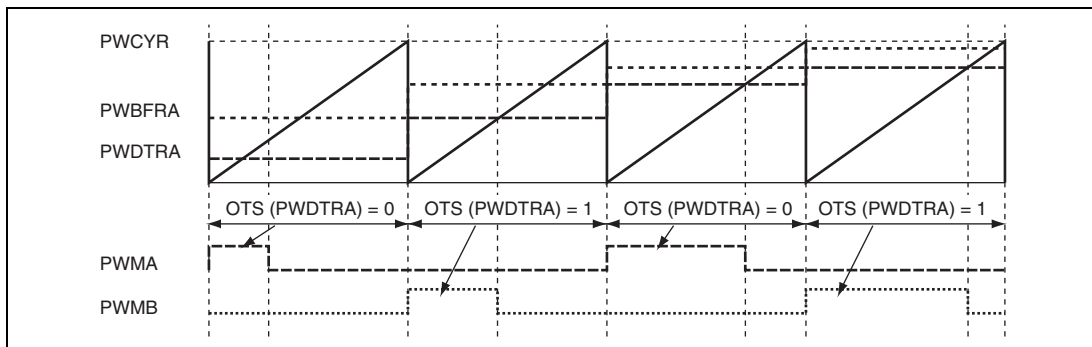

Figure 35.7 PWM Operation

(4) Next Frame

When a compare match occurs between PWCNT_n and PWCYR_n, data is transferred from the buffer register to the duty register. PWCNT_n is reset and starts counting up from H'000. The CMF bit in PWCR_n is set, and if the IE bit in PWCR_n has been set, an interrupt can be requested or the direct memory access controller can be activated.

(5) Stopping

When the CST bit in PWCR_n is cleared to 0, PWCNT_n is reset and stops. All PWM outputs go low (or high if the corresponding bit in PWPR_n is set to 1).

35.5.2 Buffer Transfer Control

Setting a corresponding bit in the PWM buffer transfer control register disables a buffer transfer on compare match. This prevents the output from changing when compare match occurs while the buffer register is being changed. A buffer transfer on compare match is resumed after cleaning the bit.

Figure 35.8 Disabling Buffer Transfer

35.6 Usage Note

35.6.1 Conflict between Buffer Register Write and Compare Match

If a PWBFR_n write is performed in the state immediately after a cycle register compare match, the buffer register and duty register are both modified. PWM output changed by the cycle register compare match is not changed by modification of the duty register due to conflict. This may result in unanticipated duty output.

Buffer register modification must be completed before automatic transfer by the direct memory access controller, exception handling due to a compare match interrupt, or the occurrence of a cycle register compare match on detection of the rise of CMF (compare match flag) in PWCR_n.

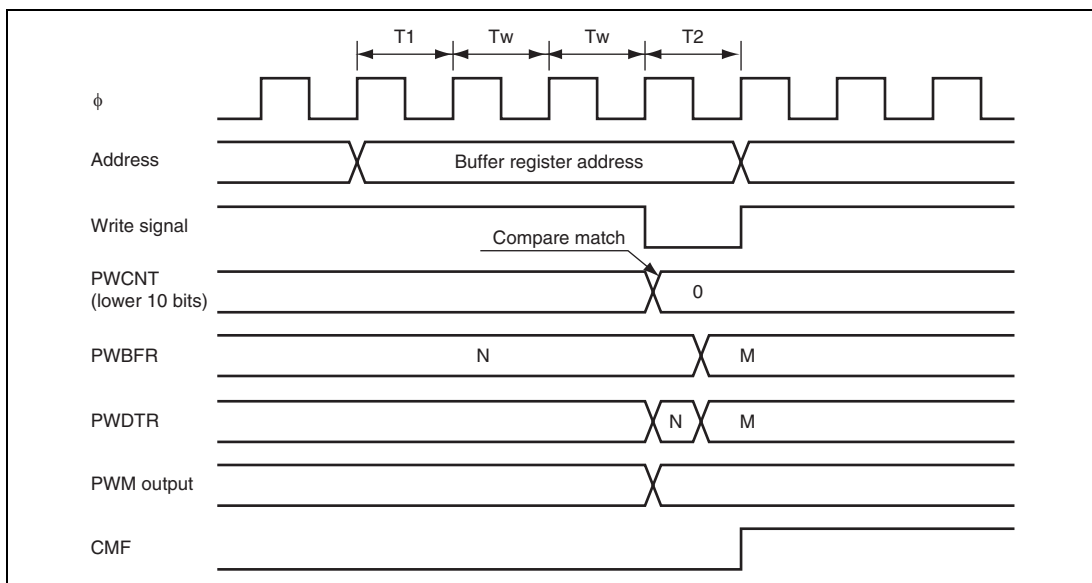

Figure 35.9 Conflict between Buffer Register Write and Compare Match

Section 36 List of Registers

This section gives information on the on-chip I/O registers of this LSI in the following structures.

1. Register Addresses (by functional module, in order of the corresponding section numbers)
 - Registers are described by functional module, in order of the corresponding section numbers.
 - Access to reserved addresses which are not described in this register address list is prohibited.
 - When registers consist of 16 or 32 bits, the addresses of the MSBs are given when big endian mode is selected.
 - An asterisk (*) in the column "Access Size" indicates that the unit of access in reading differs from that in writing for the given register. For details, see the register descriptions in the relevant section.
2. Register Bits
 - Bit configurations of the registers are described in the same order as the Register Addresses (by functional module, in order of the corresponding section numbers).
 - Reserved bits are indicated by "-" in the bit name.
 - No entry in the bit-name column indicates that the whole register is allocated as a counter or for holding data.
3. Register States in Each Operating Mode
 - Register states are described in the same order as the Register Addresses (by functional module, in order of the corresponding section numbers).
 - For the initial state of each bit, refer to the description of the register in the corresponding section.
 - The register states described are for the basic operating modes. If there is a specific reset for an on-chip peripheral module, refer to the section on that on-chip peripheral module.

4. Notes when Writing to the On-Chip Peripheral Modules

- To access an on-chip module register, two or more peripheral module clock (P ϕ) cycles are required. When the CPU writes data to the internal peripheral registers, the CPU performs the succeeding instructions without waiting for the completion of writing to registers. For example, a case is described here in which the system is transferring to the software standby mode for power savings. To make this transition, the SLEEP instruction must be performed after setting the STBY bit in the STBCR register to 1. However a dummy read of the STBCR register is required before executing the SLEEP instruction. If a dummy read is omitted, the CPU executes the SLEEP instruction before the STBY bit is set to 1, thus the system enters sleep mode not software standby mode. A dummy read of the STBCR register is indispensable to complete writing to the STBY bit. To reflect the change by internal peripheral registers while performing the succeeding instructions, execute a dummy read of registers to which write instruction is given and then perform the succeeding instructions.

36.1 Register Addresses (by functional module, in order of the corresponding section numbers)

Module Name	Register Name	Abbreviation	Number of Bits	Address	Access Size
Clock pulse generator	Frequency control register	FRQCR	16	H'FFFE0010	16

- Notes: 1. Retains the previous value after an internal power-on reset by means of the watchdog timer.
2. The BN3 to BN0 bits are initialized.
3. Flag handling continues.
4. Counting up continues.
5. Bits RTCEN and START are retained.

6. Bits BC3 to BC0 are initialized.
7. Transfer operations can be continued.
8. Initialized by $\overline{\text{TRST}}$ assertion or in the Test-Logic-Reset state of the TAP controller.
9. Initialized when realtime clock is not using EXTAL.

Section 37 Electrical Characteristics

37.1 Absolute Maximum Ratings

Table 37.1 Absolute Maximum Ratings

Item	Symbol	Value	Unit	
Power supply voltage (I/O)	PV_{CC}	-0.3 to 4.6	V	
Power supply voltage (Internal)	V_{CC}	-0.3 to 1.7	V	
PLL power supply voltage	$PLL V_{CC}$	-0.3 to 1.7	V	
Analog power supply voltage	AV_{CC}	-0.3 to 4.6	V	
Analog reference voltage	AV_{ref}	-0.3 to $AV_{CC} + 0.3$	V	
USB transceiver analog power supply voltage (I/O)	$USBAPV_{CC}$	-0.3 to 4.6	V	
USB transceiver digital power supply voltage (I/O)	$USBDPV_{CC}$	-0.3 to 4.6	V	
USB transceiver analog power supply voltage (internal)	$USBAV_{CC}$	-0.3 to 1.7	V	
USB transceiver digital power supply voltage (internal)	$USBDV_{CC}$	-0.3 to 1.7	V	
Power supply for USB 480 MHz (internal)	$USBV_{CC}$	-0.3 to 1.7	V	
Input voltage	Analog input pin	V_{AN}	-0.3 to $AV_{CC} + 0.3$	V
	VBUS	V_{in}	-0.3 to 5.5	V
	Other input pins	V_{in}	-0.3 to $PV_{CC} + 0.3$	V
Operating temperature	Regular specifications	T_{opr}	-20 to +85	°C
	Wide-range specifications		-40 to +85	
Storage temperature	T_{stg}	-55 to +125	°C	

Caution: Permanent damage to the LSI may result if absolute maximum ratings are exceeded.

37.2 Power-On/Power-Off Sequence

The 1.2-V power supply (V_{CC} , $PLL V_{CC}$, $USB A V_{CC}$, $USB D V_{CC}$, and $USB U V_{CC}$) and 3.3-V power supply ($P V_{CC}$, $A V_{CC}$, $USB A P V_{CC}$, and $USB D P V_{CC}$) can be turned on and off in any order.

When turning on the power, be sure to drive both the \overline{TRST} and \overline{RES} pins low; otherwise, the output pins and input/output pins output undefined levels, resulting in system malfunction.

When turning off the power, drive the \overline{TRST} and \overline{RES} pins low if the undefined output may cause a problem.

37.3 DC Characteristics

- Conditions used to obtain DC characteristics (2) in table 37.2 other than current consumption
 $V_{CC} = PLLV_{CC} = USBDV_{CC} = USBUV_{CC} = 1.15$ to 1.35 V,
 $PV_{CC} = USBDPV_{CC} = 3.0$ to 3.6 V, $AV_{CC} = 3.0$ to 3.6 V, $USBAV_{CC} = 1.15$ to 1.35 V,
 $USBAPV_{CC} = 3.0$ to 3.6 V, $V_{SS} = PLLV_{SS} = AV_{SS} = USBDV_{SS} = USBAV_{SS} = USBDPV_{SS} =$
 $USBAPV_{SS} = USBUV_{SS} = 0$ V, $T_a = -20$ to 85 °C (regular specifications), -40 to 85 °C (wide-range specifications)
- Conditions used to obtain DC characteristics (2) in table 37.2 for current consumption
 $V_{CC} = PLLV_{CC} = USBDV_{CC} = USBUV_{CC} = 1.25$ V, $PV_{CC} = USBDPV_{CC} = 3.3$ V, $AV_{CC} = 3.3$ V,
 $USBAV_{CC} = 1.25$ V, $USBAPV_{CC} = 3.3$ V, $V_{SS} = PLLV_{SS} = AV_{SS} = USBDV_{SS} = USBAV_{SS} =$
 $USBDPV_{SS} = USBAPV_{SS} = USBUV_{SS} = 0$ V, $Av_{ref} = 3.3$ V, $VBUS = 5.0$ V
 $T_a = -20$ to 85 °C (regular specifications),
 -40 to 85 °C (wide-range specifications)
 $I\phi = 144.00$ MHz, $B\phi = 72.00$ MHz, $P\phi = 36.00$ MHz

Table 37.2 DC Characteristics (1) [Common Items]

Item		Symbol	Min.	Typ.	Max.	Unit	Test Conditions
Power supply voltage		PV_{CC}	3.0	3.3	3.6	V	
		V_{CC}	1.15	1.25	1.35	V	
PLL power supply voltage		$PLLV_{CC}$	1.15	1.25	1.35	V	
Analog power supply voltage		AV_{CC}	3.0	3.3	3.6	V	
USB power supply voltage		$USBAPV_{CC}$	3.0	3.3	3.6	V	
		$USBDPV_{CC}$					
		$USBAV_{CC}$	1.15	1.25	1.35	V	
		$USBDV_{CC}$ $USBUV_{CC}$					
Input leakage current	All input pins	I_{inl}	—	—	1.0	μ A	$V_{in} = 0.5$ to $PV_{CC} - 0.5$ V
Three-state leakage current	All input/output pins, all output pins (except PE5 to PE0) (off state)		—	—	1.0	μ A	$V_{in} = 0.5$ to $PV_{CC} - 0.5$ V
		PE5 to PE0	—	—	10	μ A	
Input capacitance	All pins	C_{in}	—	—	20	pF	

Table 37.2 DC Characteristics (2) [Current Consumption]

Item	Power Supply	Symbol	Typ.	Max.	Unit	Test Conditions
Current consumption in normal operation	Vcc + PLLVcc	Icc	60	80	mA	
	PVcc	PIcc*	75	—	mA	
	AVcc	AIcc	1	4	mA	During A/D conversion
			1	3	μA	Waiting for A/D conversion
	AVref	AIref	1	4	mA	During A/D conversion and waiting for A/D conversion
	USBAVcc + USBDVcc + USBUVcc	UIcc	19	22	mA	In USB high-speed operation
	USBAPVcc + USBDPVcc	UPIcc	44	47	mA	In USB high-speed operation
VBUS	VIcc	8.5	10	μA		
Current consumption in sleep mode	Vcc+PLLVcc	Isleep	35	60	mA	
						For the other power supply, the current consumption is the same as in normal operation.
Current consumption in software standby mode	Vcc + PLLVcc	Isstby	3	12	mA	Ta > 50 °C
			1.5	—	μA	
	Vcc + PLLVcc	Isstby	1	5	mA	Ta ≤ 50 °C
			1	—	μA	
						For the other power supply, the current consumption is the same as in normal operation.

Item	Power Supply	Symbol	Typ.	Max.	Unit	Test Conditions
Current consumption in deep standby mode	Ta > 50 °C Vcc +	I _{dstby}	4	27	μA	RAM 0 Kbytes retained, RTC_X1 selected
	PLL _{Vcc} +					
	USB _{AVcc} +		6	40	μA	RAM 16 Kbytes retained, RTC_X1 selected
	USB _{DVcc} +					
	USB _{UVcc}		8	53	μA	RAM 32 Kbytes retained, RTC_X1 selected
				12	80	μA
			20	132	μA	RAM 128 Kbytes retained, RTC_X1 selected
<p>When the 12-MHz signal from EXTAL is selected, 5 and 6 μA are added to the "Typ." and "Max." values above, respectively.</p> <p>When the 48-MHz signal from USB_X1 is selected, 20 and 25 μA are added to the "Typ." and "Max." values above, respectively.</p>						
	PV _{cc} +	P _I dstby	3.5	16	μA	RTC is not operating
	AV _{cc} +		7.5	20	μA	RTC_X1 selected
	AV _{ref} +		1	—	mA	12-MHz frequency from EXTAL selected, small gain*
	USB _{APVcc} +					
	USB _{DPVcc}		3.5	—	mA	48-MHz frequency from USB_X1 selected*
	VBUS	V _{Icc}	8.5	10	μA	

Item	Power Supply	Symbol	Typ.	Max.	Unit	Test Conditions
Current consumption in deep standby mode	Ta ≤ 50 °C Vcc + PLLVcc + USBVcc + USBDVcc + USBVcc	I _{dstby}	3	19	μA	RAM 0 Kbytes retained, RTC_X1 selected
			4.5	29	μA	RAM 16 Kbytes retained, RTC_X1 selected
			6	39	μA	RAM 32 Kbytes retained, RTC_X1 selected
			9	58	μA	RAM 64 Kbytes retained, RTC_X1 selected
			15	97	μA	RAM 128 Kbytes retained, RTC_X1 selected
			<p>When the 12-MHz signal from EXTAL is selected, 5 and 6 μA are added to the "Typ." and "Max." values above, respectively.</p> <p>When the 48-MHz signal from USB_X1 is selected, 20 and 25 μA are added to the "Typ." and "Max." values above, respectively.</p>			
	PVcc +	P _I dstby	3	12	μA	RTC not operating
	AVcc +		7	16	μA	RTC_X1 selected
	AVref +		1	—	mA	12-MHz frequency from EXTAL selected, small gain*
	USBAPVcc +		3.5	—	mA	48-MHz signal from USB_X1 selected*
	USBDPVcc					
	VBUS	V _I cc	8.5	10	μA	

Note: * Reference value. The actual operating current greatly depends on the system (such as slow rising/falling edges caused by IO load and toggle frequency). Be sure to determine the value using the actual system.

Table 37.2 DC Characteristics (3) [Except I²C Bus Interface 3, and USB 2.0 Host/Function Module-Related Pins]

Item	Symbol	Min.	Typ.	Max.	Unit	Test Conditions	
Input high voltage (except Schmitt pins)	V_{IH}	2.2	—	$PV_{CC} + 0.3$	V		
Input low voltage (except Schmitt pins)	V_{IL}	-0.3	—	0.8	V		
Schmitt trigger input characteristics	V_{T^+}	$PV_{CC} \times 0.75$	—	—	V		
	V_{T^-}	—	—	0.5	V		
	$V_{T^+} - V_{T^-}$	0.2	—	—	V		
Output high voltage	V_{OH}	$PV_{CC} - 0.5$	—	—	V	$I_{OH} = -2.0$ mA	
Output low voltage	V_{OL}	—	—	0.4	V	$I_{OL} = 2.0$ mA	
RAM standby voltage	Software standby mode (high-speed on-chip RAM and large-capacity on-chip RAM)	V_{RAMS}	0.85	—	—	V	Measured with V_{CC} (= PLL V_{CC}) as parameter
	Deep standby mode (only the on-chip RAM for data retention)	V_{RAMD}	1.15	—	—	V	

Table 37.2 DC Characteristics (4) [I²C Bus Interface 3-Related Pins*]

Item	Symbol	Min.	Typ.	Max.	Unit	Test Conditions
Input high voltage	V_{IH}	$PV_{CC} \times 0.7$	—	$PV_{CC} + 0.3$	V	
Input low voltage	V_{IL}	-0.3	—	$PV_{CC} \times 0.3$	V	
Schmitt trigger input characteristics	$V_{IH} - V_{IL}$	$PV_{CC} \times 0.05$	—	—	V	
Output low voltage	V_{OL}	—	—	0.4	V	$I_{OL} = 3.0$ mA

Note: * The PE5/SDA2/DV_HSYNC to PE0/SCL0/AUDIO_CLK/IRQ0 pins are open-drain pins.

Table 37.2 DC Characteristics (5) [USB 2.0 Host/Function Module-Related Pins*]

Item	Symbol	Min.	Typ.	Max.	Unit	Test Conditions
Reference resistance	R _{REF}	5.6 kΩ ± 1%	5.6 kΩ ± 1%	5.6 kΩ ± 1%		
Input high voltage (VBUS)	V _{IH}	4.02	—	5.25	V	
Input low voltage (VBUS)	V _{IL}	-0.3	—	0.5	V	
Input high voltage (USB_X1)	V _{IH}	PV _{CC} - 0.5	—	PV _{CC} + 0.3	V	
Input low voltage (USB_X1)	V _{IL}	-0.3	—	0.5	V	

Note: * REFRIN, VBUS, USB_X1, and USB_X2 pins

Table 37.2 DC Characteristics (6) [USB 2.0 Host/Function Module-Related Pins* (Low-Speed, Full-Speed, and High-Speed Common Items)]

Item	Symbol	Min.	Typ.	Max.	Unit	Test Conditions
DP pull-up resistance (when function is selected)	R _{pu}	0.900	—	1.575	kΩ	In idle mode
		1.425	—	3.090	kΩ	In transmit/ receive mode
DP and DM pull-down resistance (when host is selected)	R _{pd}	14.25	—	24.80	kΩ	

Note: * DP and DM pins

Table 37.2 DC Characteristics (7) [USB 2.0 Host/Function Module-Related Pins* (Low-Speed and Full-Speed)]

Item	Symbol	Min.	Typ.	Max.	Unit	Test Conditions
Input high voltage	V_{IH}	2.0	—	—	V	
Input low voltage	V_{IL}	—	—	0.8	V	
Differential input sensitivity	V_{DI}	0.2	—	—	V	$ (DP) - (DM) $
Differential common mode range	V_{CM}	0.8	—	2.5	V	
Output high voltage	V_{OH}	2.8	—	3.6	V	$I_{OH} = -200 \mu A$
Output low voltage	V_{OL}	0.0	—	0.3	V	$I_{OL} = 2 \text{ mA}$
Output signal crossover voltage	V_{CRS}	1.3	—	2.0	V	$C_L = 50 \text{ pF}$ (full-speed) $C_L = 200 \text{ to } 600 \text{ pF}$ (low-speed)

Note: * DP and DM pins

Table 37.2 DC Characteristics (8) [USB 2.0 Host/Function Module-Related Pins* (High-Speed)]

Item	Symbol	Min.	Typ.	Max.	Unit	Test Conditions
Squelch detection threshold voltage (differential voltage)	V_{HSSQ}	100	—	150	mV	
Common mode voltage range	V_{HSCM}	-50	—	500	mV	
Idle state	V_{HSOI}	-10.0	—	10.0	mV	
Output high voltage	V_{HSOH}	360	—	440	mV	
Output low voltage	V_{HSOL}	-10.0	—	10.0	mV	
Chirp J output voltage (difference)	V_{CHIRPJ}	700	—	1100	mV	
Chirp K output voltage (difference)	V_{CHIRPK}	-900	—	-500	mV	

Note: * DP and DM pins

Table 37.3 Permissible Output Currents

Item		Symbol	Min.	Typ.	Max.	Unit
Permissible output low current (per pin)	PE5 to PE0	I_{OL}	—	—	10	mA
	Output pins other than above				2	mA
Permissible output low current (total)		ΣI_{OL}	—	—	150	mA
Permissible output high current (per pin)		$-I_{OH}$	—	—	2	mA
Permissible output high current (total)		$\Sigma -I_{OH}$	—	—	150	mA

Caution: To protect the LSI's reliability, do not exceed the output current values in table 37.3.

37.4 AC Characteristics

Signals input to this LSI are basically handled as signals in synchronization with a clock. The setup and hold times for input pins must be followed.

- Conditions for AC characteristics

$V_{cc} = PLLV_{cc} = USBDV_{cc} = USBUV_{cc} = 1.15$ to 1.35 V,
 $PV_{cc} = USBDPV_{cc} = 3.0$ to 3.6 V, $AV_{cc} = 3.0$ to 3.6 V, $USBV_{cc} = 1.15$ to 1.35 V, $USBAPV_{cc} = 3.0$ to 3.6 V, $V_{ss} = PLLV_{ss} = AV_{ss} = USBDV_{ss} = USBV_{ss} = USBAPV_{ss} = USBAPV_{ss} = USBUV_{ss} = 0$ V, $T_a = -20$ to 85 °C (regular specifications), -40 to 85 °C (wide-range specifications)

Table 37.4 Maximum Operating Frequency

Item	Symbol	Min.	Max.	Unit	Remarks
Operating frequency	CPU clock (I ϕ)	f	60.00	144.00	MHz
	Bus clock (B ϕ)		60.00	72.00	MHz
	Peripheral clock (P ϕ)		10.00	36.00	MHz

37.4.1 Clock Timing

Table 37.5 Clock Timing

Item	Symbol	Min.	Max.	Unit	Figure
EXTAL clock input frequency (when EXTAL is supplied to USB 2.0 host/function module)	f _{EX}	12MHz \pm 100ppm			Figure 37.1
EXTAL clock input frequency (when EXTAL isn't supplied to USB 2.0 host/function module)		10.00	12.00	MHz	
EXTAL clock input cycle time (when EXTAL isn't supplied to USB 2.0 host/function module)	t _{EXcyc}	83.33	100.00	ns	
AUDIO_X1 clock input frequency (crystal resonator connected)	f _{EX}	10.00	25.00	MHz	
AUDIO_X1 clock input cycle time (crystal resonator connected)	t _{EXcyc}	40.00	100.00	ns	
AUDIO_X1, AUDIO_CLK clock input frequency (external clock input)	f _{EX}	1.00	25.00	MHz	
AUDIO_X1, AUDIO_CLK clock input cycle time (external clock input)	t _{EXcyc}	40.00	1000.00	ns	

Item	Symbol	Min.	Max.	Unit	Figure
USB_X1 clock input frequency (when high-speed transfer function is used)	f_{EX}	48 MHz \pm 100 ppm			Figure 37.1
USB_X1 clock input frequency (when high-speed transfer function is not used and host controller function is used)		48 MHz \pm 500 ppm			
USB_X1 clock input frequency (when neither high-speed transfer function nor host controller function is used)		48 MHz \pm 2500 ppm			
EXTAL, AUDIO_X1, AUDIO_CLK, USB_X1 clock input low pulse width	t_{EXL}	0.4	0.6	t_{EXcyc}	
EXTAL, AUDIO_X1, AUDIO_CLK, USB_X1 clock input high pulse width	t_{EXH}	0.4	0.6	t_{EXcyc}	
EXTAL, AUDIO_X1, AUDIO_CLK, USB_X1 clock input rise time	t_{EXr}	—	4	ns	
EXTAL, AUDIO_X1, AUDIO_CLK, USB_X1 clock input fall time	t_{EXf}	—	4	ns	
CKIO clock output frequency	f_{OP}	60.00	72.00	MHz	
CKIO clock output cycle time	t_{cyc}	13.88	16.66	ns	Figures 37.2 (1) and 37.2 (2)
CKIO clock output low pulse width 1	t_{CKOL1}	$t_{cyc}/2$ — $-t_{CKO1}$	—	ns	Figure 37.2 (1)
CKIO clock output high pulse width 1	t_{CKOH1}	$t_{cyc}/2$ — $-t_{CKO1}$	—	ns	
CKIO clock output rise time 1	t_{CKO1}	—	3	ns	
CKIO clock output fall time 1	t_{CKO1}	—	3	ns	
CKIO clock output low pulse width 2	t_{CKOL2}	$t_{cyc}/2$ — $-t_{CKO2}$	—	ns	Figure 37.2 (2)
CKIO clock output high pulse width 2	t_{CKOH2}	$t_{cyc}/2$ — $-t_{CKO2}$	—	ns	
CKIO clock output rise time 2	t_{CKO2}	—	2	ns	
CKIO clock output fall time 2	t_{CKO2}	—	2	ns	
Power-on oscillation settling time	t_{OSC1}	10	—	ms	Figure 37.3
Oscillation settling time 1 on return from standby	t_{OSC2}	10	—	ms	Figure 37.4

Item	Symbol	Min.	Max.	Unit	Figure
Oscillation settling time 2 on return from standby	t_{osc3}	10	—	ms	Figure 37.5
Real time clock oscillation settling time	t_{ROSC}	3	—	s	Figure 37.6
Mode hold time	t_{MDH}	200	—	ns	Figures 37.3 and 37.4

- Notes:
1. The maximum value (fmax) of $B\phi$ (external bus clock) depends on the number of wait cycles and the system configuration of your board.
 2. $1/2 t_{\text{cyc}}$ indicated in minimum and maximum values for the item of delay, setup, and hold times represents a half cycle from the rising edge with a clock. That is, $1/2 t_{\text{cyc}}$ describes a reference of the falling edge with a clock.
 3. Values when SDRAM is used.

Section 38 States and Handling of Pins

This section describes pin states in each operating mode and how to handle pins.

38.1 Pin States

Table 38.1 shows the pin states in each operating mode.

As for the input/output functions, input buffers are listed on the upper column and output buffers on the lower column.

In addition, table 38.2 shows the pin states during the bus mastership is released, which differ from the states in the normal state.

Table 38.1 Pin States

Pin Function				Pin State						
Type	Pin Name			Normal State (Other than States at Right)	Power-On Reset*1	Pin State Retained*2			Power-Down State	
						EBUSKEEPE*3(Other than States at Right)		Power-On Reset*4	Deep Standby Mode	Software Standby Mode

	FCLE	Z
	$\overline{\text{FWE}}$	Z
	NAF7 to NAF0	Z

[Legend]

- I: Input
- O: Output
- H: High-level output
- L: Low-level output
- Z: High-impedance

- Notes: 1. Indicates the power-on reset by low-level input to the $\overline{\text{RES}}$ pin. The pin states after a power-on reset by the user debugging interface reset assert command or the watchdog timer overflow is the same as the initial pin states at normal operation (see section 32, General Purpose I/O Ports).
2. After the chip has shifted to the power-on reset state from deep standby mode by the input on any of pins NMI, PC8 to PC5, PJ3, and PJ1, the pins retain the state until the IOKEEP bit in the deep standby cancel source flag register (DSFR) is cleared (see section 33, Power-Down Modes).

3. The EBUSKEEPE bit in deep standby control register (DSTCR) (see section 33, Power-Down Modes).
4. This LSI enters the power-on reset state for a certain period after recovery from deep standby control mode (see section 33, Power-Down Modes).
5. Depends on the setting of the RCKSEL bit in the realtime clock control register 5 (RCR5) (see section 14, Realtime Clock).
6. When pins for the connection with a crystal resonator are not used, the input pins (EXTAL, RTC_X1, AUDIO_X1, and USB_X1) must be fixed (pull-up/down resistor, power supply, or ground.) and the output pins (XTAL, RTC_X2, AUDIO_X2, and USB_X2) must be open.
7. Depends on the setting of the CKOEN bit in the frequency control register (FRQCR) of the clock pulse generator (see section 5, Clock Pulse Generator).
8. Depends on the setting of the AXTALE bit in the software reset control register (SWRSTCR) (see section 33, Power-Down Modes).
9. Depends on the setting of the HIZ bit in the standby control register 3 (STBCR3) (see section 33, Power-Down Modes).
10. Depends on the setting of the HIZMEM bit in the common control register (CMNCR) of the bus state controller (see section 9, Bus State Controller).
11. Depends on the setting of the HIZCNT bit in the common control register (CMNCR) of the bus state controller (see section 9, Bus State Controller).
12. Depends on the setting of the corresponding bit in the deep standby cancel source select register (DSSSR) (see section 33, Power-Down Modes).
13. Depends on the setting of the RTCEN bit in the realtime clock control register 2 (RCR2) (see section 14, Realtime Clock).
14. Z when the TAP controller of the user debugging interface is neither the Shift-DR nor Shift-IR state.
15. These are the pin states in product chip mode ($\overline{ASEMD} = H$). See the Emulation Manual for the pin states in ASE mode ($\overline{ASEMD} = L$).
16. When this is an output, the output is fixed to either the High or Low level. There is no oscillation.

38.2 Treatment of Unused Pins

How unused pins are to be handled is indicated below.

Table 38.3 Handling of Pins that are not in Use (Except for User Debugging Interface and Emulator Interface Pins)

Pin	Handling
NMI	Fix this pin at a high level (pull up or connect to a power-supply).
DP, DM, and VBUS	Connect these pins to USBDPVss.
REFRIN	Connect this pin, via a $5.6\text{ k}\Omega \pm 20\%$ resistor, to USBAPVcc.
1.2-V power dedicated to the USB (USBAPVcc, USBDVcc, USBUVcc)	Supply power at 1.2 V
3.3-V power dedicated to the USB (USBAPVcc, USBDPVcc)	Supply power at 3.3 V
Dedicated USB ground (USBAPVss, USBDPVss, USBAVss, USBDVss, USBUVss)	Connect to ground
AVref	Connect this pin to AVcc.
Dedicated A/D power (AVcc)	Supply power at 3.3 V
Dedicated A/D ground (AVss)	Connect to ground
Dedicated input pins other than those listed above	Fix the level on the pins (pull them up or down, or connect them to the power-supply or ground level).
Input/output pins other than those listed above	Make the input-pin settings and then fix the level (pull them up or down); alternatively, make the output-pin settings and leave the pins open-circuit.
Dedicated output pins	Open-circuit

Note: We recommend that the values of pull-up or pull-down resistors are in the range from 4.7 k Ω to 100 k Ω .

Table 38.4 Handling of Pins that are not in Use (When User Debugging Interface is Not Used in Product Chip Mode)

Pin	Handling
$\overline{\text{ASEMD}}$	Fix this pin at a high level (pull up or connect to the power-supply level).
$\overline{\text{TRST}}$	Fix this pin at a low level (pull down or connect to the ground level).
TCK, TMS, TDI	Fix the level on the pins (pull them up or down, or connect them to the power-supply or ground level).
TDO, $\overline{\text{ASEBRKAK}}/\overline{\text{ASEBRK}}$	Open-circuit

- Notes:
1. When using the user debugging interface, handle these pins as described in the manual for the emulator.
 2. We recommend that the values of pull-up or pull-down resistors are in the range from 4.7 k Ω to 100 k Ω .

38.3 Handling of Pins in Deep Standby Mode

How pins are to be handled in deep standby mode is indicated below.

For the states of pins in deep standby mode, refer to the corresponding items under section, 38.1, Pin States. Handling of unused pins as described under section 38.2, Treatment of Unused Pins, also applies in deep standby mode.

Table 38.5 Handling of Pins in Deep Standby Mode

Pin	Handling
1.2-V power (Vcc, PLLVcc, USBDVcc, USBUVcc, USBAVcc)	Supply power at 1.2 V
3.3-V power (PVcc, AVcc, USBDPVcc, USBAPVcc)	Supply power at 3.3 V
Ground (Vss, PLLVss, USBDVss, USBUVss, USBAVss, AVss, USBDPVss, USBAPVss)	Connect to ground
VBUS	Fix the level on this pin (pull it up or down, or connect it to the power-supply or ground level) or open circuit. However, note that current as indicated in table 37.2, DC Characteristics (2) [Current Consumption] will be drawn by the pin fixed to the high level.
REFRIN	Connect this pin to USBAPVss via a 5.6 kΩ ± 1 % resistor
AVref	Fix the level on this pin (from 3.0 V to AVcc)
EXTAL, RTC_X1, USB_X1	Connect the pins to the crystal oscillator or the clock-input signal, or to a fixed level (pull them up or down, or connect them to the power-supply or ground level)
XTAL, RTC_X2, USB_X2	Connect the pins to the crystal oscillator or open circuit
Dedicated input pins other than those listed above	Fix the level on the pins (pull them up or down, or connect them to the power-supply or ground level).
Input/output pins (other than those listed above) in the input state	Fix the level on the pins (pull them up or down).
Input/output pins (other than those listed above) in the high-impedance state	Fix the level on the pins (pull them up or down) or open circuit.

Pin	Handling
Input/output pins (other than those listed above) in the output state	Open-circuit
Dedicated output pins other than those listed above	Open-circuit

Note: We recommend that the values of pull-up or pull-down resistors are in the range from 4.7 k Ω to 100 k Ω .

38.4 Recommended Combination of Bypass Capacitor

Mount a multilayer ceramic capacitor between a pair of the power supply pins as a bypass capacitor. These capacitors must be placed as close as the power supply pins of the LSI. The capacitance of the capacitors should be used 0.1 μF to 0.33 μF (recommended values). For details of the capacitor related to the crystal resonator, see section 5, Clock Pulse Generator.

Figures 38.1 and 38.2 are examples of externally allocated capacitors in the SH7266 Group and SH7267 Group, respectively.

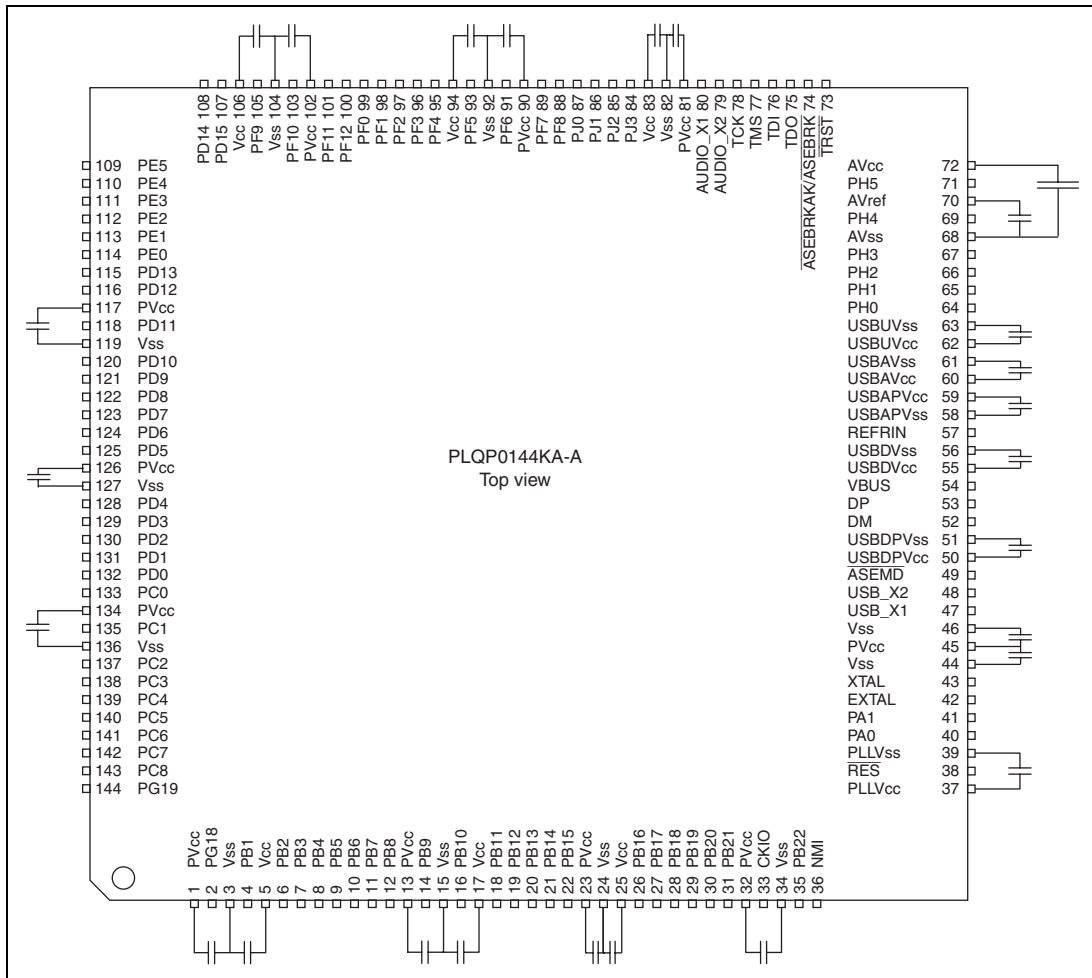

Figure 38.1 Example of Externally Allocated Capacitors in the SH7266 Group

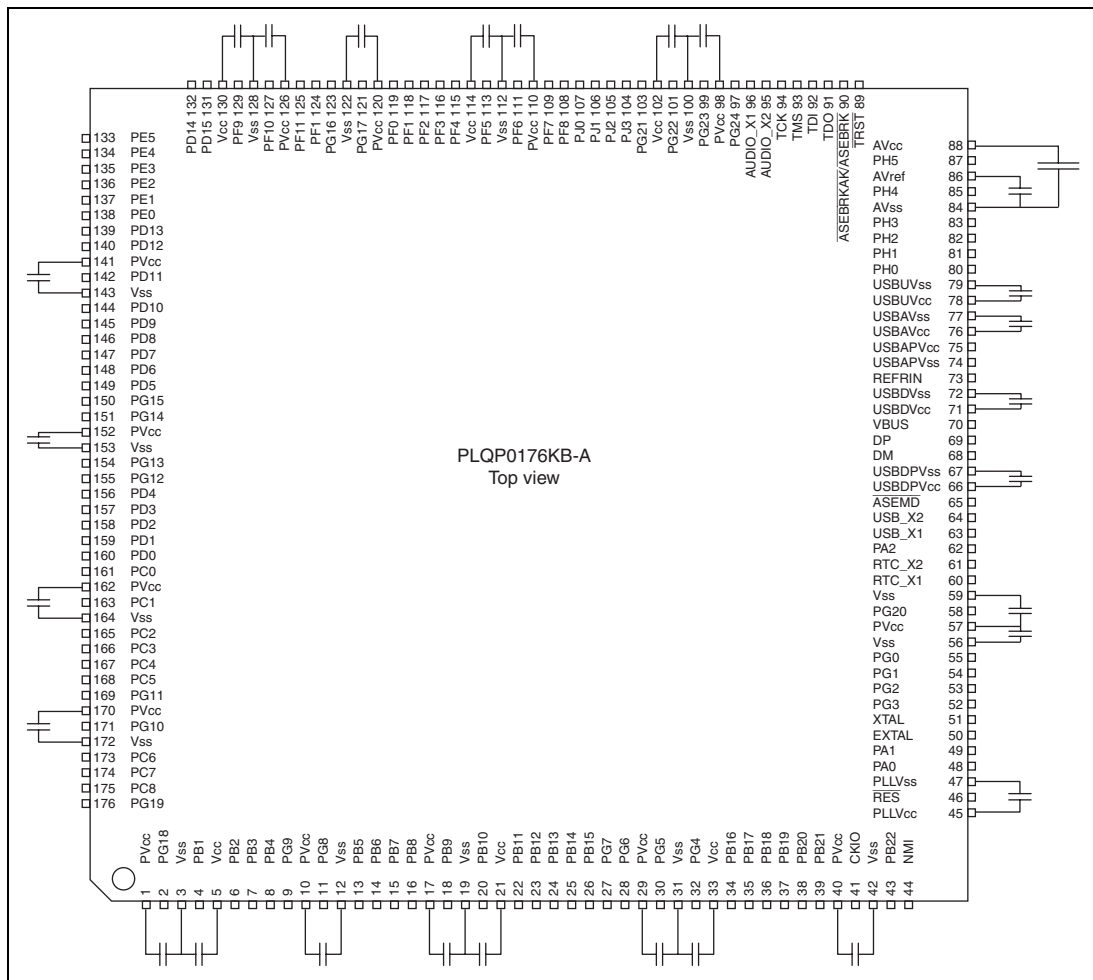

Figure 38.2 Example of Externally Allocated Capacitors in the SH7267 Group

USBINDX	1441	Searching cache	206
USBLENG.....	1442	Sector access mode	1358
USBREQ	1439	Self-refreshing	312
USBVAL	1440	Sending a break signal	750
WRCSR	645	Serial bit clock control	974
WTCNT	641	Serial communication interface	
WTCSR	642	with FIFO.....	685
XTALCTR.....	1825	Serial communication interface	
Relationship between access size and		with FIFO timing	2030
number of bursts	295	Serial I/O with FIFO	977
Relationship between non-normal		Serial I/O with FIFO timing.....	2040
transfer operations	870	Serial sound interface.....	929
Relationship between refresh requests		Serial sound interface timing	2038
and bus cycles.....	314	Setting analog input voltage.....	1320
Renesas quad serial peripheral		Setting I/O ports for controller	
interface	827	area network.....	1118
Renesas serial peripheral interface	753	Shift instructions	75
Renesas serial peripheral		Sign extension of word data.....	48
interface timing.....	2031	Single address mode	399
Renesas SPDIF interface	1189	Single mode	1306
Reset sequence.....	1092	Single read	299
Reset state.....	84	Single write	302
Reset-synchronized PWM mode	514	Single-SPI mode	871
Restoration from bank	191	Slave mode operation.....	819
Restoration from stack.....	192	Slave receive operation	914
Restriction on direct memory access		Slave transmit operation.....	911
controller usage.....	750	Sleep mode.....	1093, 1826
RISC-type instruction set.....	48	Slot illegal instructions	136
Roles of mailboxes	1028	Software standby mode.....	1827
Rounding	95	SRAM interface with byte selection	324
		Stack after interrupt exception	
S		handling	182
Sampling rate converter	1665	Stack status after exception	
Saving to bank	190	handling ends	139
Saving to stack.....	192	Standby control circuit.....	107
Scan mode	1311	Status register (SR)	42
SD host interface	1695	Stopping and resuming	
SD host interface timing	2055	CD-DSP operation	1295
SDRAM interface	287	Supported DMA transfers	396
		Syndrome calculation.....	1286

System configuration example	788
System control instructions	77
System matrix	1041

T

T bit	49
TAP controller	1843
Target-sector buffering function.....	1290
TDO output timing	1844
Test mode settings	1090
Time slave	1104
Time trigger control (TT control).....	1038
Time triggered transmission	1099
Timestamp	1037
Timing to clear an interrupt source.....	196
Transfer format	791, 792, 862, 863
Transfer rate.....	893
Trap instructions	136
TTW[10] (time trigger window).....	1039
Tx-trigger control field	1038
Tx-trigger time (TTT).....	1038
Types of exception handling and priority order.....	119

U

Unconditional branch instructions with no delay slot.....	49
--	----

USB 2.0 host/function module.....	1369
USB 2.0 host/function module timing.....	2048
User debugging interface	1839
User debugging interface interrupt	162
User debugging interface interrupt	1845
User debugging interface reset.....	1845
User debugging interface timing.....	2057
Using alarm function	682
Using interval timer mode	650
Using watchdog timer mode	648

V

Vector base register (VBR).....	43
Video display controller 3.....	1573
Video display controller 3 timing	2052

W

Wait between access cycles	336
Watchdog timer.....	639
Watchdog timer timing	2029
Write-back buffer (only for operand cache)	209

Refer to "<http://www.renesas.com/>" for the latest and detailed information.

Renesas Electronics America Inc.
2880 Scott Boulevard Santa Clara, CA 95050-2554, U.S.A.
Tel: +1-408-588-6000, Fax: +1-408-588-6130

Renesas Electronics Canada Limited
1101 Nicholson Road, Newmarket, Ontario L3Y 9C3, Canada
Tel: +1-905-898-5441, Fax: +1-905-898-3220

Renesas Electronics Europe Limited
Dukes Meadow, Millboard Road, Bourne End, Buckinghamshire, SL8 5FH, U.K
Tel: +44-1628-585-100, Fax: +44-1628-585-900

Renesas Electronics Europe GmbH
Arcadiastrasse 10, 40472 Düsseldorf, Germany
Tel: +49-211-6503-0, Fax: +49-211-6503-1327

Renesas Electronics (China) Co., Ltd.
7th Floor, Quantum Plaza, No.27 ZhichunLu Haidian District, Beijing 100083, P.R.China
Tel: +86-10-8235-1155, Fax: +86-10-8235-7679

Renesas Electronics (Shanghai) Co., Ltd.
Unit 204, 205, AZIA Center, No.1233 Lujiazui Ring Rd., Pudong District, Shanghai 200120, China
Tel: +86-21-5877-1818, Fax: +86-21-6887-7858 / -7898

Renesas Electronics Hong Kong Limited
Unit 1601-1613, 16/F., Tower 2, Grand Century Place, 193 Prince Edward Road West, Mongkok, Kowloon, Hong Kong
Tel: +852-2886-9318, Fax: +852-2886-9022/9044

Renesas Electronics Taiwan Co., Ltd.
7F, No. 363 Fu Shing North Road Taipei, Taiwan, R.O.C.
Tel: +886-2-8175-9600, Fax: +886-2-8175-9670

Renesas Electronics Singapore Pte. Ltd.
1 HarbourFront Avenue, #06-10, Keppel Bay Tower, Singapore 098632
Tel: +65-6213-0200, Fax: +65-6278-8001

Renesas Electronics Malaysia Sdn.Bhd.
Unit 906, Block B, Menara Amcorp, Amcorp Trade Centre, No. 18, Jln Persiaran Barat, 46050 Petaling Jaya, Selangor Darul Ehsan, Malaysia
Tel: +60-3-7955-9390, Fax: +60-3-7955-9510

Renesas Electronics Korea Co., Ltd.
11F., Samik Lavied' or Bldg., 720-2 Yeoksam-Dong, Kangnam-Ku, Seoul 135-080, Korea
Tel: +82-2-558-3737, Fax: +82-2-558-5141
