#### DATASHEET

### VERSACLOCK<sup>®</sup> LOW POWER CLOCK GENERATOR

### IDT5P49EE602

### Description

The IDT5P49EE602 is a programmable clock generator intended for low power, battery operated consumer applications. There are four internal PLLs, each individually programmable, allowing for up to six differrent output frequencies. The frequencies are generated from a single reference clock. The reference clock can come from either a TCXO or fundamental mode crystal. An additional 32.768kHz crystal oscillator is available to provide a real time clock or non-critical performance MHz processor clock.

The IDT5P49EE602 can be programmed through the use of the  $I^2C$  interfaces. The programming interface enables the device to be programmed when it is in normal operation or what is commonly known as in system programmable. An internal EEPROM allows the user to save and restore the configuration of the device without having to reprogram it on power-up.

Each of the four PLLs has an 8-bit reference divider and a 11-bit feedback divider. This allows the user to generate four unique non-integer-related frequencies. The PLL loop bandwidth is programmable to allow the user to tailor the PLL response to the application. For instance, the user can tune the PLL parameters to minimize jitter generation or to maximize jitter attenuation.

Spread spectrum generation is supported on one of the PLLs. The device is specifically designed to work with display applications to ensure that the spread profile remains consistent for each HSYNC in order to reduce ROW noise. It also may operate in standard spread sepctrum mode.

There are total five 8-bit output dividers. The outputs are connected to the PLLs via the switch matrix. The switch matrix allows the user to route the PLL outputs to any output bank. This feature can be used to simplify and optimize the board layout. In addition, each output's slew rate and enable/disable function can be programmed.

#### **Target Applications**

- Smart Mobile Handset
- Personal Navigation Device (PND)
- Camcorder
- DSC
- Portable Game Console
- Personal Media Player

#### **Features**

- Four internal PLLs
- Internal non-volatile EEPROM
  - Internal I<sup>2</sup>C EEPROM master interface
- FAST (400kHz) mode I<sup>2</sup>C serial interfaces
- Input Frequencies
  - TCXO: 10 MHz to 40 MHz
  - Crystal: 8 MHz to 30 MHz
  - RTC Crystal: 32.768 kHz
- Output Frequency Ranges: kHz to 120 MHz
- Each PLL has an 8-bit reference divider and a 11-bit feedback-divider
- 8-bit output-divider blocks
- One of the PLLs support Spread Spectrum generation capable of configuration to pixel rate, with adjustable modulation rate and amplitude to support video clock with no visible artifacts
- I/O Standards:
   Outputs 1.8V/2.5V/3.3 V LVTTL/ LVCMOS
- 3 independent adjustable VDDO groups.
- Programmable Slew Rate Control
- Programmable Loop Bandwidth Settings
- Programmable output inversion to reduce bimodal jitter
- Individual output enable/disable
- Power-down/Sleep mode
  - $-10\mu A$  max in power down mode
  - 32kHz clock output active sleep mode
  - 100µA max in sleep mode
- 1.8V VDD Core Voltage
- Available in 24pin 4x4mm QFN packages
- -40 to +85 C Industrial Temp operation

### **Pin Assignment**

### **Pin Descriptions**

| Pin Name | Pin # | I/O | Pin Type   | Pin Description  |  |
|----------|-------|-----|------------|--|--|
| OUT3     | 1     | 0   | Adjustable | Configurable clock output 3. Single-ended output voltage levels are register controlled by either VDDO1, VDDO2 or VDDO3.   |  |
| OUT2     | 2     | 0   | Adjustable | Configurable clock output 2. Single-ended output voltage levels are register controlled by either VDDO1, VDDO2 or VDDO3.   |  |
| SEL0*    | 3     | I   | LVTTL      | Configuration select pin. Weak internal pull down resistor.  |  |
| VDDO1    | 4     |     | Power      | Device power supply. Connect to 1.8 to 3.3V. Using register settings, select output voltage levels for OUT0-OUT4. VDDO1 must be greater than or equal to both VDDO2 and VDDO3. |  |
| X132k    | 5     | I   | LVTTL      | 32kHz CRYSTAL_IN Reference crystal input   |  |
| X232k    | 6     | 0   | LVTTL      | 32kHz CRYSTAL_OUT Reference crystal feedback.  |  |
| VDDx     | 7     |     | Power      | Crystal oscillator power supply. Connect to 1.8V. Use filtered analog power supply if available.   |  |
| GND      | 8     |     | Power      | Connect to Ground.   |  |
| VDD      | 9     |     | Power      | Device power supply. Connect to 1.8V.  |  |
| VDDO2    | 10    |     | Power      | Device power supply. Connect to 1.8 to 3.3V. Using register settings, select output voltage levels for OUT0-OUT3. VDDO2 must be equal or less than VDDO1.                      |  |
| OUT1     | 11    | 0   | Adjustable | Configurable clock output 1. Single-ended output voltage levels are register controlled by either VDDO1, VDDO2 or VDDO3.   |  |
| SEL1*    | 12    | Ι   | LVTTL      | Configuration select pin. Weak internal pull down resistor.  |  |

| GND      | 13 |     | Power      | Connect to Ground.   |  |
|----------|----|-----|------------|--|--|
| VDD      | 14 |     | Power      | Device power supply. Connect to 1.8V.  |  |
| OUT0     | 15 | 0   | Adjustable | Configurable clock output 0. Single-ended output voltage levels are register controlled by either VDDO1, VDDO2 or VDDO3.                                       |  |
| VDDO3    | 16 |     | Power      | Device power supply. Connect to 1.8 to 3.3V. Using register settings, select output voltage levels for OUT0/3/6/7/8/9. VDDO3 must be equal or less than VDDO1. |  |
| SCLK     | 17 | Ι   | LVTTL      | I <sup>2</sup> C clock. Logic levels set by VDDO1. 5V tolerant.  |  |
| OUT4B    | 18 | 0   | Adjustable | Configurable clock output 4B. Output voltage levels are controlled by VDDO1.   |  |
| OUT4A    | 19 | 0   | Adjustable | Configurable clock output 4A. Output voltage levels are controlled by VDDO1.   |  |
| SDA      | 20 | I/O | Open Drain | Bidirectional I <sup>2</sup> C data. Logic levels set by VDDO1. 5V tolerant.   |  |
| VDD      | 21 |     | Power      | Device power supply. Connect to 1.8V.  |  |
| GND      | 22 |     | Power      | Connect to Ground.   |  |
| XIN/ REF | 23 | I   | LVTTL      | MHz CRYSTAL_IN Reference crystal input or external reference clock input. Maximum clock input voltage is 1.8V.   |  |
| XOUT     | 24 | 0   | LVTTL      | MHz CRYSTAL_OUT Reference crystal feedback. Float pin if using reference input clock.  |  |

Note \*: SEL pins should be controlled by 1.8V LVTTL logic; 3.3V tolerant.

Note 1: Outputs are user programmable to drive single-ended 1.8V/2.5V/3.3V LVTTL as indicated above.

Note 2: Default configuration CLK3=Buffered Reference output. All other outputs are off.

Note 3: Do not power up with SEL[1:0] = 00 (in Power down/Sleep mode).

#### **Ideal Power Up Sequence**

- 1)  $V_{DD}$  and  $V_{DD}x$  must come up first, followed by  $V_{DD}O$
- 2) V<sub>DD</sub>O1 must come up within 1ms after VDD and VDDX come up
- 3)  $V_{DD}O2/3$  must be equal to, or lower than,  $V_{DD}O1$
- 4)  $V_{DD}$  and  $V_{DD}x$  have approx. the same ramp rate
- 5)  $V_{DD}O1$  and  $V_{DD}O2/3$  have approx. same ramp rate

### **Ideal Power Down Sequence**

- 1)  $V_{DD}O$  must drop first, followed by  $V_{DD}$  and  $V_{DD}x$
- 2)  $V_{\text{DD}}$  and  $V_{\text{DD}}x$  must come down within 1ms after  $V_{\text{DD}}\text{O1}$  comes down
- 3)  $V_{DD}O2/3$  must be equal to, or lower than,  $V_{DD}O1$
- 4)  $V_{DD}$  and  $V_{DD}x$  have approx. the same ramp rate
- 5)  $V_{DD}O1$  and  $V_{DD}O2/3$  have approx. same ramp rate

#### Crystal Input (XIN/REF)

The crystal oscillators should be fundamental mode quartz crystals; overtone crystals are not suitable. Crystal frequency should be specified for parallel resonance with  $50\Omega$  maximum equivalent series resonance. 0

ONXTALB=0 bit needs to be set for XIN/REF.

#### **Crystal Load Capacitors**

The device crystal connections should include pads for small capacitors from X1 to ground and from X2 to ground. These capacitors are used to adjust the stray capacitance of the board to match the nominally required crystal load capacitance. Because load capacitance can only be increased in this trimming process, it is important to keep stray capacitance to a minimum by using very short PCB traces (and no vias) between the crystal and device. Crystal capacitors must be connected from each of the pins X1 and X2 to ground.

The crystal cpacitors are internal to the device and have an effective value of 4pF.

#### Reference Pre-Divider, Reference Divider, Feedback-Divider and Post-Divider

Each PLL incorporates an 8-bit reference-scaler and a 11-bit feedback divider which allows the user to generate four unique non-integer-related frequencies. PLLA and PLLD each have a feedback pre-divider that provides additional multiplication for kHz reference clock applications. Each output divider supports 8-bit post-divider. The following equation governs how the output frequency is calculated.

$$F_{OUT} = \frac{F_{IN} * (\frac{XDIV*M}{D})}{ODIV} (Eq. 2)$$

Where  $F_{IN}$  is the reference frequency, XDIV is the feedback pre-divider value, M is the feedback-divider value, D is the reference divider value, ODIV is the total post-divider value, and  $F_{OUT}$  is the resulting output frequency. Programming any of the dividers may cause glitches on the outputs.

# SPREAD SPECTRUM GENERATION (PLLB)

PLLB has spread spectrum generation capability, which users have the option of turning on and off. Spread spectrum profile, frequency, and spread are fully programmable (within limits). The programmable spread spectrum generation parameters are NC[10:0], MOD[12:0], and NSS[10:0] bits. To enable spread spectrum, set SSENB\_B=0.

The spread spectrum circuitry was specifically developed to accommodate video display applications. The spread modulation frequency can be defined to exactly equal the horizontal line frequency (HSYNC)

#### NC[10:0]

These bits are used to determine the number of pulses per spread spectrum cycle. For video applications, NC is the number of pixels on the horizontal display row (or integer multiple of displayed pixels in a row). By matching the spread period to the screen, no tearing or "shimmer" will be apparent.

NC must be an even number to insure that the upward spread transition has the same number of steps as the downward spread transition.

For non-video applications, this can also be seen as the number of clock cycles for a complete spread spectrum period.

#### MOD[12:0]

These bits relate the reference frequency to the target average spread output frequency ( $F_{MID}$ ).  $F_{MID}$  is the midpoint between  $F_{MAX}$  (maximum frequency) and  $F_{MIN}$  (minimum frequency).

 $F_{MID} = (F_{MAX} + F_{MIN}) / 2$ 

 $MOD = (F_{REF} * NC) / (2 * F_{MID})$ 

#### NSS[10:0]

These bits control the amplitude of the spread modulation.

 $NSS = (NC / 2) + (NC / 8) * (F_{MAX} - F_{MIN}) / F_{MID}$ 

#### Modulation frequency:

 $F_{MOD} = F_{MID} / NC (Eq. 11)$ 

### Video Example

 $F_{REF} = 25MHz$ ,  $F_{OUT} = 27$  MHz, 640 pixels per line, center spread of ±1%. Find the necessary spread spectrum register settings.

 $F_{MID} = F_{OUT}$ 

NC = 640 or 320 or 160 (integer number of spread periods/screen)

MOD = (25MHz \* 640)/(2 \* 27MHz) = 296

NSS = (640/2)+(640/8)\*(27.27MHz-26.73MHz)/27MHz = 322.

 $F_{MOD} = 27MHz/640 = 42.2kHz.$ 

#### **Non-Video Example**

 $F_{REF}$  = 25MHz,  $F_{OUT}$  = 27 MHz, 32kHz modulation rate, center spread of ±1%. Find the necessary spread spectrum register settings.

 $F_{MID} = F_{OUT}$ 

 $F_{MOD} = 32$ kHz = 27MHz/NC.

NC = 844

MOD = (25MHz \* 844)/(2 \* 27MHz) = 391

NSS = (844/2)+(844/8)\*(27.27MHz-26.73MHz)/27MHz = 424.

### VSYNC, HSYNC, DOT\_CLK – Modulation Rate Relationship

#### LOOP FILTER

The loop filter for each PLL can be programmed to optimize the jitter performance. The low-pass frequency response of the PLL is the mechanism that dictates the jitter transfer characteristics. The loop bandwidth can be extracted from the jitter transfer. A narrow loop bandwidth is good for jitter attenuation while a wide loop bandwidth is best for low jitter generation. The specific loop filter components that can be programmed are the resistor via the RZ[4:0] bits, zero capacitor via the CZ[2:0] bits, pole capacitor via the CP[1:0] bits, and the charge pump current via the IP#[2:0] bits.

The following equations govern how the loop filter is set:

Zero capacitor (Cz) = 280pF

Pole capacitor (Cp) = 30pF

Charge pump (Ip) = IP#[2:0] uA

VCO gain (Kvco) = 350MHz/V \*  $2\pi$ 

#### PLL Loop Bandwidth:

Charge pump gain  $(K\phi)$  = Ip /  $2\pi$ 

VCO gain (Kvco) = 350MHz/V \*  $2\pi$ 

M = Total multiplier value (See the PRE-SCALERS, FEEDBACK-DIVIDERS, POST-DIVIDERS section for more detail)

$$\omega c = (Rz * K\phi * Kvco * Cz)/(M * (Cz + Cp))$$

 $Fc = \omega c / 2\pi$ 

Note, the phase/frequency detector frequency (FPFD) is typically seven times the PLL closed-loop bandwidth (Fc) but too high of a ratio will reduce your phase margin thus compromising loop stability.

To determine if the loop is stable, the phase margin ( $\phi$ m) would need to be calculated as follows.

#### Phase Margin:

 $\omega z = 1 / (Rz * Cz)$ 

 $\omega p = (Cz + Cp)/(Rz * Cz * Cp)$ 

 $\phi m = (360 / 2\pi) * [tan^{-1}(\omega c / \omega z) - tan^{-1}(\omega c / \omega p)]$ 

To ensure stability in the loop, the phase margin is recommended to be >  $60^{\circ}$  but too high will result in the lock time being excessively long. Certain loop filter parameters would need to be compromised to not only meet a required loop bandwidth but to also maintain loop stability.

#### **Damping Factor:**

 $\zeta = Rz/2 * (Kvco * Ip * Cz)^{1/2}/M$ 

#### Example

Fc = 150KHz is the desired loop bandwidth. The total A\*M value is 160. The  $\zeta$ (damping factor) target should be 0.7, meaning the loop is critically damped. Given Fc and A\*M, an optimal loop filter setting needs to be solved for that will meet both the PLL loop bandwidth and maintain loop stability.

Choose a mid-range charge pump from register table

Icp= 11.9uA.

Koh \* Kvco = 350MHz/V \* 40uA = 12000A/Vs

 $\omega c = 2\pi * Fc = 9.42x10^{5} s^{-1}$ 

 $\omega p = (Cz + Cp)/(Rz * Cz * Cp) = \omega z (1 + Cz / Cp)$ 

Solving for Rz, the best possible value Rz=30kOhms (RZ[1:0]=10) gives

 $\zeta$ = 1.4 (Ideal range for  $\zeta$  is 0.7 to 1.4)

Solving back for the PLL loop bandwidth, Fc=149kHz.

The phase margin must be checked for loop stability.

$$\begin{split} \phi m &= (360 \ / \ 2\pi) \ ^* \ [tan_{^-1} \ (9.42 x 10^5 \ s^{^-1} \ / \ 1.19 x 10^5 \ s^{^-1}) \\ &- \ tan^{^-1} (9.42 x 10^5 \ s^{^-1} \ / \ 1.23 x 10^6 \ s^{^-1})] = 45^\circ \end{split}$$

The phase margin would be acceptable with a fairly stable loop.

### SEL[1:0] Function

The IDT5P49EE602 can support up to three unique configurations. Users may pre-program all configurations, selected using SEL[1:0] pins. Alternatively, users may use I2C interface to configure these registers on- the-fly.

Always power with SEL1=1 and/or SEL0=1.

SEL1 SEL0 **Configuration Selections** 0 0 Power Down/Sleep Mode 0 1 Select CONFIG0 1 0 Select CONFIG1 1 1 Select CONFIG2

### **Configuration OUTx IO Standard**

Users can configure the individual output IO standard from

### **Programming the Device**

I<sup>2</sup>C may be used to program the IDT5P49EE602.

- Device (slave) address = 7'b1101010

#### I<sup>2</sup>C Programming

The IDT5P49EE602 is programmed through an I<sup>2</sup>C-Bus serial interface, and is an I<sup>2</sup>C slave device. The read and write transfer formats are supported. The first byte of data after a write frame to the correct slave address is interpreted as the register address; this address auto-increments after each byte written or read.

1 - Slave will be read by master

R/W

The first byte transmitted by the Master is the Slave Address followed by the R/W bit. The Slave acknowledges by sending a "1" bit.

#### First Byte Transmitted on I<sup>2</sup>C Bus

Power Down/Sleep Mode is selected by the No PD bit. No PD=0 enables Power Down mode with no outputs. No PD=1 enables sleep mode with 32kHz output on OUT2.

a single 3.3V power supply. Each output can support 1.8V/ 2.5V or 3.3V LVCMOS. VDDO1 must have the highest voltage of any pin on the device. VDDO2 and VDDO3 may have any value between 1.8V and VDDO1.

The frame formats are shown in the following illustration.

Framing

#### External I<sup>2</sup>C Interface Condition

KEY:

From Master to Slave

From Master to Slave, but can be omitted if followed by the correct sequence

Normally data transfer is terminated by a STOP condition generated by the Master. However, if the Master still wishes to communicate on the bus, it can generate a repeated START condition, and address another Slave address without first generating a STOP condition.

From Slave to Master

#### SYMBOLS:

ACK - Acknowledge (SDA LOW) NACK - Not Acknowledge (SDA HIGH) Sr - Repeated Start Condition S - START Condition

P-STOP Condition

#### **EEPROM Interface**

The IDT5P49EE602 can store its configuration in an internal EEPROM. The contents of the device's internal programming registers can be saved to the EEPROM by issuing a save instruction (ProgSave) and can be loaded back to the internal programming registers by issuing a restore instruction (ProgRestore).

To initiate a save or restore using  $I^2C$ , only two bytes are transferred. The Device Address is issued with the read/write bit set to "0", followed by the appropriate command code. The save or restore instruction executes

after the STOP condition is issued by the Master, during which time the IDT5P49EE602 will not generate Acknowledge bits. The IDT5P49EE602 will acknowledge the instructions after it has completed execution of them. During that time, the  $I^2C$  bus should be interpreted as busy by all other users of the bus.

On power-up of the IDT5P49EE602, an automatic restore is performed to load the EEPROM contents into the internal programming registers. The IDT5P49EE602 will be ready to accept a programming instruction once it acknowledges its 7-bit I<sup>2</sup>C address.

#### Progwrite

| s | Address | R/W | ACK   | Command Code     | ACK   | Register | ACK   | Data   | ACK   | Р |
|---|---------|-----|-------|------------------|-------|----------|-------|--------|-------|---|
|   | 7-bits  | 0   | 1-bit | 8-bits: xxxxxx00 | 1-bit | 8-bits   | 1-bit | 8-bits | 1-bit |   |

#### **Progwrite Command Frame**

Writes can continue as long as a Stop condition is not sent and each byte will increment the register address.

#### Progread

Note: If the expected read command is not from the next higher register to the previous read or write command, then set a known "read" register address prior to a read operation by issuing the following command:

| s | Address | R/W | ACK   | Command Code     | ACK   | Register | АСК   | $\overline{\mathscr{A}}$ |
|---|---------|-----|-------|------------------|-------|----------|-------|--------------------------|
|   | 7-bits  | 0   | 1-bit | 8-bits: xxxxxx00 | 1-bit | 8-bits   | 1-bit | $\square$                |

#### Prior to Progread Command Set Register Address

The user can ignore the STOP condition above and use a repeated START condition instead, straight after the slave acknowledgement bit (i.e., followed by the Progread command):

| S | Address | R/W | ACK   | ID Byte | ACK   | Data_1 | ACK   | Data_2 | ACK   | Data_last | NACK  | Ρ |
|---|---------|-----|-------|---------|-------|--------|-------|--------|-------|-----------|-------|---|
|   | 7-bits  | 1   | 1-bit | 8-bits  | 1-bit | 8-bits | 1-bit | 8-bits | 1-bit | 8-bits    | 1-bit |   |

#### **Progread Command Frame**

Progsave

| s | Address | R/W | ACK   | Command Code    | ACK   | Р |
|---|---------|-----|-------|-----------------|-------|---|
|   | 7-bits  | 0   | 1-bit | 8-bits:xxxxxx01 | 1-bit |   |

Note:

PROGWRITE is for writing to the IDT5P49EE602 registers. PROGREAD is for reading the IDT5P49EE602 registers. PROGSAVE is for saving all the contents of the IDT5P49EE602 registers to the EEPROM. PROGRESTORE is for loading the entire EEPROM contents to the IDT5P49EE602 registers.

#### Progrestore

| s | Address | R/W | ACK   | Command Code    | ACK   | Р |  |
|---|---------|-----|-------|-----------------|-------|---|--|
|   | 7-bits  | 0   | 1-bit | 8-bits:xxxxxx10 | 1-bit |   |  |

During PROGRESTORE, outputs will be turned off to ensure that no improper voltage levels are experienced before initialization.

### I<sup>2</sup>C Bus DC Characteristics

| Symbol           | Parameter             | Conditions             | Min        | Тур | Max       | Unit |
|------------------|-----------------------|------------------------|------------|-----|-----------|------|

#### 1) No activity is allowed on $I^2C$ lines until VDD>1.62V.

2) A device must internally provide a hold time of at least 300 ns for the SDA signal (referred to the V<sub>IH</sub>MIN of the SCL signal) to bridge the undefined region of the falling edge of SCL.

### I<sup>2</sup>C Bus AC Characteristics for Fast Mode<sup>1</sup>

| Symbol                | Parameter                                | Min                     | Тур | Max | Unit |
|-----------------------|--|-------------------------|-----|-----|------|
| F <sub>SCLK</sub>     | Serial Clock Frequency (SCL)             | 0                       |     | 400 | kHz  |
| t <sub>BUF</sub>      | Bus free time between STOP and START     | 1.3                     |     |     | μs   |
| t <sub>SU:START</sub> | Setup Time, START                        | 0.6                     |     |     | μs   |
| t <sub>HD:START</sub> | Hold Time, START                         | 0.6                     |     |     | μs   |
| t <sub>SU:DATA</sub>  | Setup Time, data input (SDA)             | 100                     |     |     | ns   |
| t <sub>HD:DATA</sub>  | Hold Time, data input (SDA) <sup>2</sup> | 0                       |     |     | μs   |
| t <sub>OVD</sub>      | Output data valid from clock             |                         |     | 0.9 | μs   |
| CB                    | Capacitive Load for Each Bus Line        |                         |     | 400 | pF   |
| t <sub>R</sub>        | Rise Time, data and clock (SDA, SCL)     | 20 + 0.1xC <sub>B</sub> |     | 300 | ns   |
| t <sub>F</sub>        | Fall Time, data and clock (SDA, SCL)     | 20 + 0.1xC <sub>B</sub> |     | 300 | ns   |
| t <sub>HIGH</sub>     | HIGH Time, clock (SCL)                   | 0.6                     |     |     | μs   |
| t <sub>LOW</sub>      | LOW Time, clock (SCL)                    | 1.3                     |     |     | μs   |
| t <sub>SU:STOP</sub>  | Setup Time, STOP                         | 0.6                     |     |     | μs   |

#### 1) No activity is allowed on $I^2C$ lines until VDD>1.62V.

2) A device must internally provide a hold time of at least 300 ns for the SDA signal (referred to the V<sub>IH</sub>MIN of the SCL signal) to bridge the undefined region of the falling edge of SCL.

### Absolute Maximum Ratings

Stresses above the ratings listed below can cause permanent damage to the IDT5P49EE602. These ratings, which are standard values for IDT commercially rated parts, are stress ratings only. Functional operation of the device at these or any other conditions above those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods can affect product reliability. Electrical parameters are guaranteed only over the recommended operating temperature range.

| Symbol           | Description                          | Мах                          | Unit |
|------------------|--------------------------------------|------------------------------|------|
| V <sub>DD</sub>  | Internal Power Supply Voltage        | -0.5 to +4.6                 | V    |
| VI               | Input Voltage                        | -0.5 to +4.6                 | V    |
| Vo               | Output Voltage (not to exceed 4.6 V) | -0.5 to V <sub>DD</sub> +0.5 | V    |
| TJ               | Junction Temperature                 | 150                          | °C   |
| T <sub>STG</sub> | Storage Temperature                  | -65 to +150                  | °C   |

### **Recommended Operation Conditions**

| Symbol                | Parameter   | Min   | Тур | Max   | Unit |
|-----------------------|---|-------|-----|-------|------|
| $V_{DD}$ , $V_{DD}x$  | Power supply voltage for core VDD   | 1.71  | 1.8 | 1.89  | V    |
| V <sub>DDOX</sub>     | Power supply voltage for outputs VDDO1/2/3  | 1.71  | 1.8 | 1.89  | V    |
|                       |   | 2.375 | 2.5 | 2.625 | V    |
|                       |   | 3.135 | 3.3 | 3.465 | V    |
| T <sub>A</sub>        | Operating temperature, ambient  | -40   |     | +85   | °C   |
| C <sub>LOAD_OUT</sub> | Maximum load capacitance (3.3V LVTTL only)  |       |     | 15    | pF   |
| C <sub>LOAD_OUT</sub> | Maximum load capacitance (1.8V or 2.5V LVTTL only)  |       |     | 8     | pF   |
| F <sub>IN</sub>       | External reference crystal  | 8     |     | 30    | MHz  |
|                       | External reference clock CLKIN  | 1     |     | 40    | -    |
| t <sub>PU</sub>       | Power up time for all $V_{DD}$ s to reach minimum specified voltage (power ramps must be monotonic) | 0.05  |     | 5     | ms   |

### **Capacitance** ( $T_A$ = +25 °C, f = 1 MHz, $V_{IN}$ = 0V)

| Symbol                 | Parameter                        | Min | Тур | Max | Unit |
|------------------------|----------------------------------|-----|-----|-----|------|
| C <sub>IN</sub>        | Input Capacitance                |     | 3   |     | pF   |
| <b>Crystal Specifi</b> | cations                          |     |     |     |      |
| XTAL_FREQ              | Crystal frequency                | 8   |     | 30  | MHz  |
| XTAL_MIN               | Minimum crystal load capacitance |     | 7   |     | pF   |
| XTAL_MAX               | Maximum crystal load capacitance |     | 20  |     | pF   |

### DC Electrical Characteristics for 3.3 Volt LVTTL<sup>1</sup>

| Symbol            | Parameter              | Test Conditions        | Min | Тур | Мах  | Unit |
|-------------------|------------------------|------------------------|-----|-----|------|------|
| V <sub>OH</sub>   | Output HIGH Voltage    | I <sub>OH</sub> = 33mA | 2.4 |     | VDDO | V    |
| V <sub>OL</sub>   | Output LOW Voltage     | I <sub>OH</sub> = 33mA |     |     | 0.4  | V    |
| I <sub>OZDD</sub> | Output Leakage Current | 3-state outputs        |     |     | 5    | μA   |

### DC Electrical Characteristics for 2.5Volt LVTTL<sup>1</sup>

| Symbol            | Parameter              | Test Conditions        | Min | Тур | Max  | Unit |
|-------------------|------------------------|------------------------|-----|-----|------|------|
| V <sub>OH</sub>   | Output HIGH Voltage    | I <sub>OH</sub> = 25mA | 2.1 |     | VDDO | V    |
| V <sub>OL</sub>   | Output LOW Voltage     | I <sub>OH</sub> = 25mA |     |     | 0.4  | V    |
| I <sub>OZDD</sub> | Output Leakage Current | 3-state outputs        |     |     | 5    | μA   |

### DC Electrical Characteristics for 1.8Volt LVTTL<sup>1</sup>

| Symbol            | Parameter              | Test Conditions         | Min       | Тур | Max       | Unit |
|-------------------|------------------------|-------------------------|-----------|-----|-----------|------|
| V <sub>OH</sub>   | Output HIGH Voltage    | VDD = 1.71V to 1.89V    | 0.65*VDDO |     | VDDO      | V    |
| V <sub>OL</sub>   | Output LOW Voltage     |                         |           |     | 0.35*VDDO | V    |
| V <sub>IH</sub>   | Input HIGH Voltage     | SEL[1:0], 3.3V tolerant | 0.75VDD   |     |           | V    |
| V <sub>IL</sub>   | Input LOW Voltage      | SEL[1:0], 3.3V tolerant |           |     | 0.25VDD   | V    |
| I <sub>OZDD</sub> | Output Leakage Current | 3-state outputs         |           |     | 5         | μA   |

### Power Supply Characteristics for LVTTL Outputs

1: See "Recommended Operating Conditions" table. Alway completely power up VDD and VDDx prior to applying VDDO power.

### **AC Timing Electrical Characteristics**

(Spread Spectrum Generation = OFF)

| Symbol           | Parameter                   | Test Conditions  | Min.               | Тур. | Max. | Units |
|------------------|-----------------------------|--|--------------------|------|------|-------|
| f <sub>IN</sub>  | Input Frequency             | Input Frequency Limit (CLKIN)  | 1 <sup>1</sup>     |      | 40   | MHz   |
| 1 / t1           | Output Frequency            | Frequency Single Ended Clock output limit (LVTTL) 3.3V   |                    |      |      |       |
|                  |                             | Single Ended Clock output limit (LVTTL) 2.5V   | -                  |      | 110  | MHz   |
|                  |                             | Single Ended Clock output limit (LVTTL) 1.8V   | _                  |      | 100  | MHz   |

| f <sub>PFD</sub> | PFD Frequency               | PFD operating Frequency Range  | 0.300 <sup>1</sup> |      | 20   | MHz   |
| t2               | Input Duty Cycle            | Duty Cycle for Input   | 40                 |      | 60   | %     |
| t3               | Output Duty Cycle           | Measured at VDD/2  | 45                 |      | 55   | %     |
| t4               | Slew Rate, SLEWx(bits) = 00 | Single-Ended 3.3V LVCMOS Output clock rise<br>and fall time, 20% to 80% of VDD (Output<br>Load = 7 pF)                             |                    | 5.1  |      | V/ns  |
|                  | Slew Rate, SLEWx(bits) = 01 | Single-Ended 3.3V LVCMOS Output clock rise<br>and fall time, 20% to 80% of VDD (Output<br>Load = 7 pF)                             |                    | 4.4  |      | -     |
|                  | Slew Rate, SLEWx(bits) = 10 | Single-Ended 3.3V LVCMOS Output clock rise<br>and fall time, 20% to 80% of VDD (Output<br>Load = 7 pF)                             |                    | 2.8  |      | -     |
|                  | Slew Rate, SLEWx(bits) = 11 | Single-Ended 3.3V LVCMOS Output clock rise<br>and fall time, 20% to 80% of VDD (Output<br>Load = 7 pF)                             |                    | 1.8  |      | -     |
| t5               | Clock Jitter                | Peak-to-peak period jitter, CLK outputs<br>measured at VDD/2; f <sub>PFD</sub> >= 10 MHz<br>Single output frequency only.          |                    |      | 100  | ps    |
|                  |                             | Peak-to-peak period jitter, CLK outputs<br>measured at VDD/2; f <sub>PFD</sub> >= 10 MHz<br>Multiple output frequencies switching. |                    |      | 200  | ps    |
| t6               | Output Skew                 | Skew between output to output on the same bank   |                    |      | 75   | ps    |
|                  |                             | Skew between any output (Same freq and IO type, FOUT >10MHz)   |                    |      | 200  | ps    |
| t7               | Lock Time                   | PLL Lock Time from Power-up (using MHz reference clock) <sup>2</sup>   |                    | 5    | 20   | ms    |
|                  |                             | PLL Lock Time from Power-up using 32.768kHz reference clock)   |                    | 1    | 3    | S     |
|                  |                             | PLL Lock time from shutdown mode   |                    | 5    | 10   | ms    |

Input clock (square wave) may be used at 1 MHz.
 Time from supply voltage crosses VDD=1.62V to PLLs are locked.

### **Spread Spectrum Generation Specifications**

| Symbol              | Parameter       | Description   | Min            | Тур | Мах | Unit              |

### Marking Diagram (NL24)

Notes:

1. "#" is the lot number.

- 2. YYWW is the last two digits of the year and week that the part was assembled.
- 3. "\$" is the assembly mark code.
- 4. "I" indicates industrial temperature range.

### **Thermal Characteristics for 24QFN**

| Parameter                           | Symbol        | Conditions       | Min. | Тур. | Max. | Units |
|-------------------------------------|---------------|------------------|------|------|------|-------|
| Thermal Resistance Junction to      | $\theta_{JA}$ | Still air        |      | 50.1 |      | °C/W  |
| Ambient                             | $\theta_{JA}$ | 1 m/s air flow   |      | 43.1 |      | °C/W  |
|                                     | $\theta_{JA}$ | 2.5 m/s air flow |      | 39.4 |      | °C/W  |
| Thermal Resistance Junction to Case | $\theta_{JC}$ |                  |      | 61.7 |      | °C/W  |

### Landing Pattern

| 0.28 |
|------|

| 2.63 |
|      |

Unit : mm

### Package Outline and Package Dimensions (24-pin 4mm x 4mm QFN)

Package dimensions are kept current with JEDEC Publication No. 95

### **Ordering Information**

| Part / Order Number | Marking     | Shipping Packaging | Package      | Temperature   |
|---------------------|-------------|--------------------|--------------|---------------|
| 5P49EE602NLGI       | See page 22 | Tubes              | 24pin VFQFPN | -40 to +85° C |
| 5P49EE602NLGI8      | See page 22 | Tape and Reel      | 24pin VFQFPN | -40 to +85° C |

#### "G" after the two-letter package code are the Pb-Free configuration and are RoHS compliant.

While the information presented herein has been checked for both accuracy and reliability, Integrated Device Technology (IDT) assumes no responsibility for either its use or for the infringement of any patents or other rights of third parties, which would result from its use. No other circuits, patents, or licenses are implied. This product is intended for use in normal commercial applications. Any other applications such as those requiring extended temperature range, high reliability, or other extraordinary environmental requirements are not recommended without additional processing by IDT. IDT reserves the right to change any circuitry or specifications without notice. IDT does not authorize or warrant any IDT product for use in life support devices or critical medical instruments.

#### **Revision History**

| Rev. | Originator | Date     | Description of Change  |  |
|------|------------|----------|--|--|
|      | R.Willner  | 10/16/09 | Preliminary Datasheet release.   |  |
| А    | R.Willner  | 11/20/09 | No_PD bit inclusion - 32kHz clock on/off in Config 00.   |  |
| В    | R.Willner  | 3/26/10  | Typographical changes. Correct spread spectrum calculations.   |  |
| С    | R.Willner  | 6/11/10  | Typographical changes. Default conditions.   |  |
| D    | R.Willner  | 9/08/10  | Updated thermal pad and dimensions on package drawing. Input Clock max voltage swing 1.8V. Power ramp sequence.  |  |
| Е    | R. Willner | 10/29/10 | Typographical changes. Loop filter calculations. Default register bit corrections.   |  |
| F    | R. Willner | 01/19/11 | Corrected notes for top-side marking.  |  |
| G    | R. Willner | 04/13/11 | <ol> <li>Updated SCLK and SDA pin descriptions</li> <li>Updated DC Electrical Char table for 1.8V LVTTL; added VIH and VIL.</li> <li>Updated "Lock Time/PLL Lock Time from shutdown mode" Typ. and Max. specs in AC Timing Electrical Char table.</li> </ol> |  |
| Н    | R. Willner | 05/04/11 | Added Landing Pattern diagram.   |  |
| J    | A.T.       | 09/29/11 | Updated Power-up/Power-down Sequence notes.  |  |
| К    | R. Willner | 10/13/11 | Added VDDO power sequencing time and VDDO limits.  |  |
| L    | R. Willner | 11/18/14 | <ol> <li>Added pin 1 indicator dot on marking diagram.</li> <li>Corrected typo in Register Map table; SLEWx[0:1] was changed to SLEWx[1:0]</li> </ol>  |  |
