## Improved, Quad, SPST Analog Switches

#### Abstract

General Description Maxim's redesigned DG441/DG442 analog switches now feature on-resistance matching ( $4 \Omega$ max) between switches and guaranteed on-resistance flatness over the signal range ( $9 \Omega \mathrm{max}$ ). These low on-resistance switches conduct equally well in either direction. They guarantee low charge injection (10pC max), low power consumption ( 1.65 mW ), and an ESD tolerance of 2000V minimum per Method 3015.7. The new design offers lower off-leakage current over temperature (less than 5 nA at $+85^{\circ} \mathrm{C}$ ). The DG441/DG442 are quad, single-pole/single-throw (SPST) analog switches. The DG441 has four normally closed switches, and the DG442 has four normally open switches. Switching times are less than 250ns for tON and less than 170ns for toff. These devices operate from a single +10 V to +30 V supply, or bipolar $\pm 4.5 \mathrm{~V}$ to $\pm 20 \mathrm{~V}$ supplies. Maxim's improved DG441/DG442 continue to be fabricated with a 44 V silicon-gate process.

|  | Applications |
| :--- | :--- |
| Sample-and-Hold Circuits | PBX, PABX |
| Communication Systems | Guidance and Control |
| Test Equipment | Systems |
| Battery-Operated Systems | Audio-Signal Routing |
| Heads-Up Displays | Military Radios |
| Fax Machines | Modems |

New Features

- Plug-In Upgrades for Industry-Standard DG441/DG442
- Improved rDS(ON) Match Between Channels(4 $\mathrm{Imax}^{\text {max }}$
- Guaranteed rFLAT(ON) Over Signal Range (9 9 max)
- Improved Charge Injection (10pC max)
- Improved Off-Leakage Current Over Temperature ( $<5 \mathrm{nA}$ at $+85^{\circ} \mathrm{C}$ )
- Withstand Electrostatic Discharge (2000V min) per Method 3015.7

Existing Features

- Low rds(on) (85 ${ }^{\text {max) }}$
- Single-Supply Operation +10V to +30V

Bipolar-Supply Operation $\pm 4.5 \mathrm{~V}$ to $\pm 20 \mathrm{~V}$

- Low Power Consumption (1.65mW max)
- Rail-to-Rail Signal Handling
- TTLCMOS-Logic Compatible

Ordering Information

| PART | TEMP RANGE | PIN-PACKAGE |
| :--- | :--- | :--- |
| DG441CJ | $0^{\circ} \mathrm{C}$ to $+70^{\circ} \mathrm{C}$ | 16 Plastic DIP |
| DG441CY | $0^{\circ} \mathrm{C}$ to $+70^{\circ} \mathrm{C}$ | 16 Narrow SO |
| DG441C/D | $0^{\circ} \mathrm{C}$ to $+70^{\circ} \mathrm{C}$ | Dice* |
| DG441DJ | $-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$ | 16 Plastic DIP |
| DG441DY | $-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$ | 16 Narrow SO |

Ordering Information continued at end of data sheet.
Note: Devices are available in both leaded and lead(Pb)-free packaging. Specify lead-free by adding the + symbol at the end of the part number when ordering.
*Contact factory for dice specifications.

| Lead Temperature (soldering, 10s) ............................. |  |

Note 1: Signals on S, D, or IN exceeding V+ or V- are clamped by internal diodes. Limit forward current to maximum current ratings.
Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

## ELECTRICAL CHARACTERISTICS—Single Supply

$\left(\mathrm{V}+=12 \mathrm{~V}, \mathrm{~V}-=0 \mathrm{~V}, \mathrm{~V}_{\mathrm{GND}}=0 \mathrm{~V}, \mathrm{~V}_{\mathrm{INH}}=2.4 \mathrm{~V}, \mathrm{~V}_{\mathrm{INL}}=0.8 \mathrm{~V}, \mathrm{~T}_{\mathrm{A}}=\mathrm{T}_{\mathrm{MIN}}\right.$ to $\mathrm{T}_{\mathrm{MAX}}$, unless otherwise noted. $)$

Note 2: Typical values are for design aid only, are not guaranteed, and are not subject to production testing. The algebraic convention, where the most negative value is a minimum and the most positive value a maximum, is used in this data sheet.
Note 3: Guaranteed by design.
Note 4: On-resistance match between channels and flatness is guaranteed only with bipolar-supply operation. Flatness is defined as the difference between the maximum and the minimum value of on-resistance as measured at the extremes of the specified analog range.
Note 5: Leakage parameters $I_{S(O F F)}, I_{D(O F F)}$, and $I_{D(O N)}$ are $100 \%$ tested at the maximum rated hot temperature and guaranteed by correlation at $+25^{\circ} \mathrm{C}$.
Note 6: Off-Isolation Rejection Ratio $=20 \log \left(V_{D} / V_{S}\right), V_{D}=$ output, $V_{S}=$ input to off switch.
Note 7: Between any two switches.
Typical Operating Characteristics
( $\mathrm{T}_{\mathrm{A}}=+25^{\circ} \mathrm{C}$, unless otherwise noted.)

| - | - | EP | Exposed Pad. Connect EP to V+. Do not use EP as a sole V+ connection. (Thin QFN package only.) |

## Applications Information

Operation with Supply Voltages Other Than $\pm 15 \mathrm{~V}$
Using supply voltages other than $\pm 15 \mathrm{~V}$ reduces the analog signal range. The DG441/DG442 switches operate with $\pm 4.5 \mathrm{~V}$ to $\pm 20 \mathrm{~V}$ bipolar supplies or with $\mathrm{a}+10 \mathrm{~V}$ to +30 V single supply; connect V - to 0 V when operating with a single supply. Also, all device types can operate with unbalanced supplies such as +24 V and -5 V . The Typical Operating Characteristics graphs show typical on-resistance with $\pm 20 \mathrm{~V}, \pm 15 \mathrm{~V}, \pm 10 \mathrm{~V}$, and $\pm 5 \mathrm{~V}$ sup-
plies. (Switching times increase by a factor of two or more for operation at $\pm 5 \mathrm{~V}$.)

Overvoltage Protection
Proper power-supply sequencing is recommended for all CMOS devices. Do not exceed the absolute maximum ratings because stresses beyond the listed ratings can cause permanent damage to the devices. Always sequence $\mathrm{V}+$ on first, followed by V - and logic inputs. If power-supply sequencing is not possible, add two small, external signal diodes in series with supply pins for overvoltage protection (Figure 1). Adding external diodes reduces the analog-signal range to 1 V below V+ and 1V above V-, but low switch resistance and low leakage characteristics are unaffected. Device operation is unchanged, and the difference between $V+$ and $V$ - should not exceed $+44 V$.
