## Data Sheet

## Description

The SFH551/1-1 receiver is a transimpedance amplifier with an integrated photodiode and TTL open-collector output stage. The active area of this detector combined with the molded microlens gives an efficient coupling from the end of the polymer optical fiber. This receiver enables data rates up to 5 MBd and works with the Avago SFH757 transmitter diode.

The SFH551/1-1 is fully DC coupled and therefore no line code is needed. The internal Schmitt trigger ensures stable output states over the whole dynamic range. If light with intensity above the threshold level is coupled into the SFH551/1-1, the electrical output will be logical "low" and vice versa.

With noisefree Vcc and GND, an undefined output signal is not possible. Nevertheless, the SFH551/1-1 must not be used without shielding from ambient light. If ambient light could reach the threshold level, the SFH551/1-1V component should be chosen. The plastic connector housing of the SFH V-series shields the ambient light perfectly.

SFH series components are optimized for easy coupling. No fiber stripping is required; just insert the cut fiber into the selected SFH component.

## Ordering Information

SFH551/1-1

| Type | Ordering Code |
| :--- | :--- |
| SFH551/1-1 | SP000063860 |
| SFH551/1-1V | SP000063855 |

## Features

- Bipolar IC with open-collector output
- Digital output, full TTL compatible
- Sensitive in visible and near IR range
- Transfer rate $\leq 5 \mathrm{MBd}$
- Low switching threshold
- 2.2 mm aperture holds standard $980 / 1000 / 2200 \mu \mathrm{~m}$ plastic fibers
- No fiber stripping required
- Molded microlens for efficient coupling

## Plastic Direct Fiber Connector housing (V-housing)

- Locking screw attached to the connector
- Interference-free transmission by the light-tight housing
- Transmitter and receiver can be positioned flexibly
- No cross talk
- Auto insertable and wave solderable
- Supplied in tubes

## Applications

- Household electronics
- Power electronics
- Optical networks

Application Literature

## SFH551/1-1

The transparent plastic package has an aperture where a 2.2 mm fiber end can be inserted. This coupling method is very easy and extremely cost-effective.

## SFH551/1-1V

The V-housing allows easy coupling of unconnectorized 2.2 mm polymer optical fiber by an axial locking screw.

The SFH551/1-1 receiver is a transimpedance amplifier with a TTL open-collector output stage, therefore a pull-up resistor of at least $330 \Omega$ is necessary (see Figure 1). To minimize interference a bypass capacitor ( 100 nF ) must be placed near (distance $\leq 3 \mathrm{~cm}$ ) the SFH551/1-1 ports. In critical applications a shorter distance is better.

## Functionality

The SFH551/1-1 photodiode is silicon based and directly connected to a transimpedance amplifier that works as a pre-amplifier. A differential amplifier is connected in series and works as a post-amplifier. Its output is passed to the internal Schmitt trigger that drives a bipolar NPN transistor. The data-out signal is from the collector of this bipolar transistor.

Package Dimensions
SFH551/1-1

## Dimensions in mm

## SFH551/1-1V

Dimensions in mm

## Package V-housing Color

SFH V-series components are color coded just like other Avago fiber optic components. The SFH757V transmitter has a white colored housing; the SFH250V and SFH551/11 V receiver components have a black colored housing. This prevents mistakes while making connections. Product designation and date of manufacture are printed on the housing.

## Package V-housing mounting pins

SFH V-series components have two pins that are electrically isolated from the inner circuit. The pins are only designed for mounting the V-housing to the PCB surface. This helps increase stability, which is needed during fixing the fiber end by the axial locking screw.

The retention force between the soldered mounting pins and the V-housing of the SFH component is about 20 N (with a vertical exertion of force). This is an approximate value.

## Package V-housing axial locking screw

Components of the SFH V-series are equipped with an axial locking screw for easy coupling to the unconnectorized 2.2 mm polymer optical fiber. The force that is necessary to pull a jammed fiber out of the V-housing is typically 50 N (with a torque of 15 cNm for tightening the locking screw). This is an approximate value that is very dependent on the fiber and torque combination.
