

#### FEATURES

Ultra-low power consumption (1Mbps): 0.58mA/Channel

High data rate: 10Mbps

High common-mode transient immunity:

$\pi$ 12xx3x: 75 kV/ $\mu$ s typical

$\pi$ 12xx6x: 120 kV/ $\mu$ s typical

High robustness to radiated and conducted noise

Low propagation delay: 9 ns typical

Isolation voltages:

$\pi$ 12xx3x: AC 3000Vrms

$\pi$ 12xx6x: AC 5000Vrms

High ESD rating:

ESDA/JEDEC JS-001-2017

Human body model (HBM)  $\pm$ 8kV

Safety and regulatory approvals:

UL certificate number: E494497

3000Vrms/5000Vrms for 1 minute per UL 1577

CSA Component Acceptance Notice 5A

VDE certificate number: 40053041/40052896

DIN VDE V 0884-11:2017-01

$V_{IORM} = 565V$  peak/1200V peak

CQC certification per GB4943.1-2011

3 V to 5.5 V level translation

Wide temperature range:  $-40^{\circ}C$  to  $125^{\circ}C$

RoHS-compliant, NB SOIC-8, WB SOIC-16 package

#### APPLICATIONS

General-purpose multichannel isolation

Industrial field bus isolation

Isolation Industrial automation systems

Isolated switch mode supplies

Isolated ADC, DAC

Motor control

#### GENERAL DESCRIPTION

The  $\pi$ 1xxxx is a 2PaiSemi digital isolators product family that includes over hundreds of digital isolator products. By using matured standard semiconductor CMOS technology and 2PaiSemi *iDivider*<sup>®</sup> technology, these isolation components provide outstanding performance characteristics and reliability superior to alternatives such as optocoupler devices and other integrated isolators.

Intelligent voltage divider technology (*iDivider*<sup>®</sup> technology) is a new generation digital isolator technology invented by 2PaiSemi. It uses the principle of capacitor voltage divider to transmit voltage signal

directly cross the isolator capacitor without signal modulation and demodulation.

The  $\pi$ 1xxxx isolator data channels are independent and are available in a variety of configurations with a withstand voltage rating of 1.5 kV rms to 5.0 kV rms and the data rate from DC up to 600Mbps (see the Ordering Guide). The devices operate with the supply voltage on either side ranging from 3.0 V to 5.5 V, providing compatibility with lower voltage systems as well as enabling voltage translation functionality across the isolation barrier. The fail-safe state is available in which the outputs transition to a preset state when the input power supply is not applied.

## ABSOLUTE MAXIMUM RATINGS

T<sub>A</sub> = 25°C, unless otherwise noted.

Table 7. Absolute Maximum Ratings<sup>4</sup>

Parameter	Rating
Supply Voltages (V <sub>DD1</sub> -GND <sub>1</sub> , V <sub>DD2</sub> -GND <sub>2</sub> )	-0.5 V to +7.0 V
Input Voltages (V <sub>IA</sub> , V <sub>IB</sub> ) <sup>1</sup>	-0.5 V to V <sub>DDx</sub> + 0.5 V
Output Voltages (V <sub>OA</sub> , V <sub>OB</sub> ) <sup>1</sup>	-0.5 V to V <sub>DDx</sub> + 0.5 V
Average Output Current per Pin <sup>2</sup> Side 1 Output Current (I <sub>O1</sub> )	-10 mA to +10 mA
Average Output Current per Pin <sup>2</sup> Side 2 Output Current (I <sub>O2</sub> )	-10 mA to +10 mA
Common-Mode Transients Immunity <sup>3</sup>	-200 kV/μs to +200 kV/μs
Storage Temperature (T <sub>ST</sub> ) Range	-65°C to +150°C
Ambient Operating Temperature (T <sub>A</sub> ) Range	-40°C to +125°C

Notes:

<sup>1</sup> V<sub>DDx</sub> is the side voltage power supply V<sub>DD</sub>, where x = 1 or 2.

<sup>2</sup> See Figure 9 for the maximum rated current values for various temperatures.

<sup>3</sup> See Figure 17 for Common-mode transient immunity (CMTI) measurement.

<sup>4</sup> Stresses at or above those listed under Absolute Maximum Ratings may cause permanent damage to the device. These are stress rating only; functional operation of the device at these or any other conditions above those indicated in the operational section of this specification is not implied. Operation beyond the maximum operating conditions for extended periods may affect product reliability.

## RECOMMENDED OPERATING CONDITIONS

Don't Care <sup>4</sup>	Unpowered <sup>3</sup>	Powered <sup>2</sup>	Low	High	Default output <sup>5</sup>
Don't Care <sup>4</sup>	Powered <sup>2</sup>	Unpowered <sup>3</sup>	High Impedance	High Impedance	

Notes:

<sup>1</sup>  $V_{ix}/V_{ox}$  are the input/output signals of a given channel (A or B).  $V_{DD1}/V_{DD0}$  are the supply voltages on the input/output signal sides of this given channel.

<sup>2</sup> Powered means  $V_{DDx} \geq 2.95$  V

<sup>3</sup> Unpowered means  $V_{DDx} < 2.30$  V

<sup>4</sup> Input signal ( $V_{ix}$ ) must be in a low state to avoid powering the given  $V_{DD1}$  through its ESD protection circuitry.

<sup>5</sup> If the  $V_{DD1}$  goes into unpowered status, the channel outputs the default logic signal after around 1 $\mu$ s. If the  $V_{DD1}$  goes into powered status, the channel outputs the input status logic signal after around 3 $\mu$ s.

## APPLICATIONS INFORMATION

### OVERVIEW

The  $\pi$ 1xxxxx are 2PaiSemi digital isolators product family based on 2PaiSemi unique **iDivider**® technology. Intelligent voltage **Divider** technology (**iDivider**® technology) is a new generation digital isolator technology invented by 2PaiSemi. It uses the principle of capacitor voltage divider to transmit signal directly cross the isolator capacitor without signal modulation and demodulation. Compare to the traditional Opto-couple technology, icoupler technology, OOK technology, **iDivider**® is a more essential and concise isolation signal transmit technology which leads to greatly simplification on circuit design and therefore significantly improves device performance, such as lower power consumption, faster speed, enhanced anti-interference ability, lower noise.

By using matured standard semiconductor CMOS technology and the innovative **iDivider**® design, these isolation components provide outstanding performance characteristics and reliability superior to alternatives such as optocoupler devices and other integrated isolators. The  $\pi$ 1xxxxx isolator data channels are independent and are available in a variety of configurations with a withstand voltage rating of 1.5 kV rms to 5.0 kV rms and the data rate from DC up to 600Mbps (see the Ordering Guide).

The  $\pi$ 120Mxx/ $\pi$ 121Mxx/ $\pi$ 122Mxx are the outstanding dual-channel digital isolators with the enhanced ESD capability. The devices transmit data across an isolation barrier by layers of silicon dioxide isolation.

The devices operate with the supply voltage on either side ranging from 3.0 V to 5.5 V, offering voltage translation of 3.3 V and 5 V logic. The  $\pi$ 120Mxx/ $\pi$ 121Mxx/ $\pi$ 122Mxx have very low propagation delay and high speed. The input/output design techniques allow logic and supply voltages over a wide range from 3.0 V to 5.5 V, offering voltage translation of 3.3 V and 5 V logic. The architecture is designed for high common-mode transient immunity and high immunity to electrical noise and magnetic interference.

See the Ordering Guide for the model numbers that have the fail-safe output state of low or high.

### PCB LAYOUT

Figure 15. Recommended Printed Circuit Board Layout

The low-ESR ceramic bypass capacitors must be connected between  $V_{DD1}$  and  $GND_1$  and between  $V_{DD2}$  and  $GND_2$ . The bypass capacitors are placed on the PCB as close to the isolator device as possible. The recommended bypass capacitor value is between 0.1  $\mu$ F and 10  $\mu$ F.

The user may also include resistors (50–300  $\Omega$ ) in series with the inputs and outputs if the system is excessively noisy, or in order to enhance the anti ESD ability of the system.

Avoid reducing the isolation capability, Keep the space underneath the isolator device free from metal such as planes, pads, traces and vias.

To minimize the impedance of the signal return loop, keep the solid ground plane directly underneath the high-speed signal path, the closer the better. The return path will couple between the nearest ground plane to the signal path. Keep suitable trace width for controlled impedance transmission lines interconnect.

To reduce the rise time degradation, keep the length of input/output signal traces as short as possible, and route low inductance loop for the signal path and its return path.

### JITTER MEASUREMENT

The eye diagram shown in the figure below provides the jitter measurement result for the  $\pi$ 120Mxx/ $\pi$ 121Mxx/ $\pi$ 122Mxx. The Keysight 81160A pulse function arbitrary generator works as the data source for the  $\pi$ 120Mxx/ $\pi$ 121Mxx/ $\pi$ 122Mxx, which generates 10Mbps pseudo random bit sequence (PRBS). The Keysight DSOS104A digital storage oscilloscope captures the  $\pi$ 120Mxx/ $\pi$ 121Mxx/ $\pi$ 122Mxx output waveform and recovers the eye diagram with the SDA jitter tools and eye diagram analysis tools. The result shows a typical measurement jitter data.

Figure 16.  $\pi$ 120Mxx/ $\pi$ 121Mxx/ $\pi$ 122Mxx Eye Diagram

### CMTI MEASUREMENT

Figure 17. Common-mode transient immunity (CMTI) measurement

To measure the Common-Mode Transient Immunity (CMTI) of  $\pi$ 1xxxxx isolator under specified common-mode pulse magnitude (VCM) and specified slew rate of the common-mode pulse (dVCM/dt) and other specified test or ambient conditions, The common-mode pulse generator (G1) will be capable of providing fast rise and fall pulses of specified magnitude and duration of the common-mode pulse (VCM), such that the maximum common-mode slew rates (dVCM/dt) can be applied to  $\pi$ 1xxxxx isolator coupler under measurement. The common-mode pulse is applied between one side ground  $GND_1$  and the other side ground  $GND_2$  of  $\pi$ 1xxxxx isolator, and shall be capable of providing positive transients as well as negative transients.
