

Data Sheet

π 140U/ π 141U/ π 142U

FEATURES

Ultra low power consumption (150Kbps):

0.55mA/Channel

High data rate: π 14xAxx: 600Mbps
 π 14xExx: 200Mbps
 π 14xMxx: 10Mbps
 π 14xUxx: 150kbps

High common-mode transient immunity: 150 kV/ μ s typical

High robustness to radiated and conducted noise

Isolation voltages:

π 14xx3x: AC 3000Vrms

π 14xx6x: AC 6000Vrms

High ESD rating:

ESDA/JEDEC JS-001-2017

Human body model (HBM) \pm 8kV, all pins

Safety and regulatory approvals (Pending):

UL certificate number: E494497

3000Vrms/6000Vrms for 1 minute per UL 1577

CSA Component Acceptance Notice 5A

VDE certificate number: 40047929

DIN V VDE V 0884-10 (VDE V 0884-10):2006-12

V_{IORM} = 707V peak/1200V peak

CQC certification per GB4943.1-2011

3 V to 5.5 V level translation

AEC-Q100 qualification

Wide temperature range: -40°C to 125°C

16-lead, RoHS-compliant, SOIC_N, SOIC_W and SSOP package

APPLICATIONS

General-purpose multichannel isolation

Industrial field bus isolation

GENERAL DESCRIPTION

The π 1xxxx is a 2PaiSemi digital isolators product family that includes over hundreds of digital isolator products. By using matured standard semiconductor CMOS technology and 2PaiSEMI *iDivider* technology, these isolation components provide outstanding performance characteristics and reliability superior to alternatives such as optocoupler devices and other integrated isolators.

Intelligent voltage divider technology (*iDivider* technology) is a new generation digital isolator technology invented by 2PaiSEMI. It uses the principle of capacitor voltage divider to transmit voltage signal directly cross the isolator capacitor without signal modulation and demodulation.

The π 1xxxx isolator data channels are independent and are available in a variety of configurations with a withstand voltage

rating of 1.5 kV rms to 6.0 kV rms and the data rate from DC up to 600Mbps (see the Ordering Guide). The devices operate with the supply voltage on either side ranging from 3.0 V to 5.5 V, providing compatibility with lower voltage systems as well as enabling voltage translation functionality across the isolation barrier. The fail-safe state is available in which the outputs transition to a preset state when the input power supply is not applied.

Notes:

¹ V_{ix}/V_{Ox} are the input/output signals of a given channel (A or B). V_{DDI}/V_{DDO} are the supply voltages on the input/output signal sides of this given channel.

² Powered means $V_{DDx} \geq 2.9$ V

³ Unpowered means $V_{DDx} < 2.3$ V

⁴ Input signal (V_{ix}) must be in a low state to avoid powering the given V_{DDI} through its ESD protection circuitry.

⁵ If the V_{DDI} goes into unpowered status, the channel outputs the default logic signal after around 1 μ s. If the V_{DDI} goes into powered status, the channel outputs the input status logic signal after around 3 μ s.

APPLICATIONS INFORMATION

OVERVIEW

The π 1xxxx are 2PaiSemi digital isolators product family based on 2PaiSEMI unique **iDivider** technology. Intelligent voltage **Divider** technology (**iDivider** technology) is a new generation digital isolator technology invented by 2PaiSEMI. It uses the principle of capacitor voltage divider to transmit signal directly cross the isolator capacitor without signal modulation and demodulation. Compare to the traditional Opto-couple technology, icoupler technology, OOK technology, **iDivider** is a more essential and concise isolation signal transmit technology which leads to greatly simplification on circuit design and therefore significantly improves device performance, such as lower power consumption, faster speed, enhanced anti-interference ability, lower noise.

By using matured standard semiconductor CMOS technology and the innovative **iDivider** design, these isolation components provide outstanding performance characteristics and reliability superior to alternatives such as optocoupler devices and other integrated isolators. The π 1xxxx isolator data channels are independent and are available in a variety of configurations with a withstand voltage rating of 1.5 kV rms to 6.0 kV rms and the data rate from DC up to 600Mbps (see the Ordering Guide).

The π 140Uxx/ π 141Uxx/ π 142Uxx are the outstanding 150Kbps quad-channel digital isolators with the enhanced ESD capability. the devices transmit data across an isolation barrier by layers of silicon dioxide isolation.

The devices operate with the supply voltage on either side ranging from 3.0 V to 5.5 V, offering voltage translation of 3.3 V, and 5 V logic.

The π 140Uxx/ π 141Uxx/ π 142Uxx have very low propagation delay and high speed. The input/output design techniques allow logic and supply voltages over a wide range from 3.0 V to 5.5 V, offering voltage translation of 3.3 V and 5 V logic. The architecture is designed for high common-mode transient immunity and high immunity to electrical noise and magnetic interference.

See the Ordering Guide for the model numbers that have the fail-safe output state of low or high.

PCB LAYOUT

The low-ESR ceramic bypass capacitors must be connected between V_{DD1} and GND_1 and between V_{DD2} and GND_2 . The bypass capacitors are placed on the PCB as close to the isolator device as possible. The recommended bypass capacitor value is between 0.1 μ F and 10 μ F. To enhance the robustness of a design, the user may also include resistors (50–300 Ω) in series with the inputs and outputs if the system is excessively noisy.

Avoid reducing the isolation capability, Keep the space underneath the isolator device free from metal such as planes, pads, traces and vias.

To minimize the impedance of the signal return loop, keep the solid ground plane directly underneath the high-speed signal path, the closer the better. The return path will couple between the nearest ground plane to the signal path. Keep suitable trace width for controlled impedance transmission lines interconnect.

To reduce the rise time degradation, keep the length of input/output signal traces as short as possible, and route low inductance loop for the signal path and It's return path.

CMTI MEASUREMENT

To measure the Common-Mode Transient Immunity (CMTI) of π 1xxxx isolator under specified common-mode pulse magnitude (V_{CM}) and specified slew rate of the common-mode pulse (dV_{CM}/dt) and other specified test or ambient conditions, The common-mode pulse generator (G_1) will be capable of providing fast rising and falling pulses of specified magnitude and duration of the common-mode pulse (V_{CM}) and the maximum common-mode slew rates (dV_{CM}/dt) can be applied to π 1xxxx isolator coupler under measurement. The common-mode pulse is applied between one side ground GND_1 and the other side ground GND_2 of π 1xxxx isolator and shall be capable of providing positive transients as well as negative transients.
