LTC4416/LTC4416-1 36 V , Low Loss Dual PowerPath Controllers for Large PFETs

## feATURES

- Designed Specifically to Drive Large and Small $\mathbf{Q}_{G}$ PFETs
- Very Low Loss Replacement for Power Supply OR'ing Diodes
- Wide Operating Voltage Range: 3.6V to 36V
- $-40^{\circ} \mathrm{C}$ to $125^{\circ} \mathrm{C}$ Operating Temperature Range
- Reverse Battery Protection
- Automatic Switching Between DC Sources
- Low Quiescent Current: $35 \mu$ A per Channel
- Load Current Sharing
- MOSFET Gate Protection Clamp
- Precision Input Control Comparators for Setting Switchover Threshold Points
- Open-Drain Feedback Points for Customer Specified Hysteresis Control
- Minimal External Components
- Space Saving 10-Lead MSOP Package

## APPLICATIONS

- High Current PowerPath Switch
- Industrial and Automotive Applications
- Uninterruptible Power Supplies
- Logic Controlled Power Switch
- Battery Backup System
- Emergency Systems with Battery Backups

## DESCRIPTION

The LTC ${ }^{\circledR} 4416 /$ LTC4416-1 control two sets of external P-channel MOSFETs to create two near ideal diode functions for power switchover circuits. This permits highly efficient OR'ing of multiple power sources for extended battery life and low self heating. When conducting, the voltage drop across the MOSFET is typically 25 mV . For applications with a wall adapter or other auxiliary power source, the load is automatically disconnected from the battery when the auxiliary source is connected.

The LTC4416 integrates two interconnected PowerPath ${ }^{\text {TM }}{ }^{\text {T }}$ controllers with soft switchover control. The "soft-off" switchover permits the users to transfer between two dissimilar voltages without excessive voltage undershoot (or $V_{\text {DROOP }}$ ) inthe output supply. The LTC4416/LTC4416-1 also containa "fast-on" feature that dramatically increases gate drive current when the forward inputvoltage exceeds 25 mV . The LTC4416 "fast off" feature is engaged when the sense voltage exceeds the input voltage by 25 mV . The LTC4416-1 enables the fast off under the same conditions and when the other external P-channel device is selected using the enablepins.

The wide operating supply range supports operationfrom one to eightLi-Ion cells in series. The low quiescentcurrent ( $35 \mu \mathrm{~A}$ perchannel) is independent of the load current. The gatedriver includes an internal voltage clamp for MOSFET protection.
The LTC4416/LTC4416-1 are available in low profile 10-lead MSOP packages.

TYPICAL APPLICATION
LTC4416 vs Schottky Diode Forward Voltage Drop

Under and Overvoltage Shutdown Operation

UV ENABLED AT $5 \mathrm{~V}, \mathrm{~V}_{\text {IN }}$ RESTORED TO LOAD WHEN $\mathrm{V}_{\text {IN }}$ RISES TO 5.5 V
OV ENABLED AT 13.5V, $V_{I N}$ RESTORED TO LOAD WHEN $V_{I N}$ FALLS TO 12 V

## ABSOLUTE MAXIMUM RATINGS

Note 1: Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. Exposure to any Absolute Maximum Rating condition for extended periods may affect device reliability and lifetime.
Note 2: The LTC4416E is guaranteed to meet performance specifications from $0^{\circ} \mathrm{C}$ to $85^{\circ} \mathrm{C}$. Specifications over the $-40^{\circ} \mathrm{C}$ to $85^{\circ} \mathrm{C}$ operating temperature range are assured by design, characterization and correlation with statistical process controls. The LTC4416I is guaranteed and tested over the $-40^{\circ} \mathrm{C}$ to $125^{\circ} \mathrm{C}$ operating temperature range.
Note 3: This results in the same supply current as would be observed with an external P-channel MOSFET connected to the LTC4416 and operating in forward regulation.
Note 4: Only 3 of 9 permutations illustrated. This specification is the same when power is provided through $\mathrm{V}_{S}$ or V 2 . This specification is only valid when $\mathrm{V} 1, \mathrm{~V} 2$ and $\mathrm{V}_{\mathrm{S}}$ are within 28 V of each other.
Note 5: V1 and V2 are held at 12 V and G 1 and G 2 are forced to $9 \mathrm{~V} . \mathrm{V}_{\mathrm{S}}$ is set at 12 V to measure the source current at either G1 or G2.
Note 6: V1 and V2 are held at 12 V and G 1 and G 2 are forced to $9 \mathrm{~V} . \mathrm{V}_{\mathrm{S}}$ is set at 11.96 V to measure the sink current at either G1 or G2.
Note 7: V1 and V2 are held at 12 V and G 1 and G 2 are forced to 9 V . $\mathrm{V}_{\mathrm{S}}$ is set at 11.875 V to measure the sink current at either G1 or G2.

Note 8: V 1 and V 2 are held at 12 V and $\mathrm{V}_{\mathrm{S}}$ is stepped from 12.2 V to 11.8 V to trigger the event. G 1 and G 2 voltages are initially $\mathrm{V}_{\mathrm{G}(\text { OFF })}$.
Note 9: V 1 and V 2 are held at 12 V and $\mathrm{V}_{\mathrm{S}}$ is stepped from 11.8 V to 12.2 V to trigger the event. G 1 and G 2 voltages are initially $\mathrm{V}_{\mathrm{G}(0 \mathrm{O})}$.
Note 10: H 1 and $\overline{\mathrm{H}} 2$ are forced to 2 V . E1 and $\overline{\mathrm{E} 2}$ are forced to 1.5 V to measure the off current of H 1 and $\underline{\overline{\mathrm{H}}}$. H 1 and $\overline{\mathrm{H} 2}$ are forced with 1 mA to measure the on voltage of H 1 and $\overline{\mathrm{H} 2}$.
Note 11: H 1 and H 2 are forced to 2 V . E1 and $\overline{\mathrm{E} 2}$ are stepped from 1.3 V to 1.1 V to measure $\mathrm{t}_{\mathrm{S}(0 \mathrm{~N})}$. E 1 and E 2 are stepped from 1.1 V to 1.3 V to measure $\mathrm{t}_{\mathrm{S}(\mathrm{OFF})}$.
Note 12: V1 and V2 are held at 12 V and G 1 and G 2 are forced to 9 V . $\mathrm{V}_{\mathrm{S}}$ is set to 12.05 V to measure the source current at either G1 or G2.
Note 13: V1 and V2 are held at 12 V and G 1 and G2 are forced to 9 V . $\mathrm{V}_{\mathrm{S}}$ is set to 12 V to measure the source current at either G1 or G2 when the channel is deselected.
Note 14: V 1 and V 2 are held at $12 \mathrm{~V}, \mathrm{~V}_{\mathrm{S}}=11.96 \mathrm{~V}$ and G 1 and G 2 have a 4 k resistor each to 9 V . Measure the delay after the channel is disabled until the gate signal begins to pull high.

## PIn fUnCTIOnS

H1 (Pin 1): Open-Drain Comparator Output of the E1 Pin. If $\mathrm{E} 1>\mathrm{V}_{\text {REF }}$, the H 1 pin will go high impedance, otherwise the pin will be grounded. The maximum voltage permitted on this pin is 7 V . This pin provides support for setting up hysterisis to an external resistor network.

E1 (Pin 2): LTC4416 Comparator Enable Input. A high signal greater than $\mathrm{V}_{\text {REF }}$ will enable the V1 path. The ideal diode action will then determine if the V1 path should turn on by controlling any PFET(s) connected to the G1 pin. If the E1 signal is driven low, the V1 path will perform a "soft-off" provided the PFET(s) are properly configured for blocking DC current. An internal current sink will pull the E1 pin down when the E1 input exceeds 1.5 V .

E1 (Pin 2): LTC4416-1 Comparator Enable Input. A high signal greater than $\mathrm{V}_{\text {REF }}$ will enable the V1 path. The ideal diode action will then determine if the V1 path should turn on by controlling any PFET(s) connected to the G1 pin. If the E1 signal is driven low, the V1 path will be quickly disabled by enabling the "fast-off" feature, pulling the G1 gate high. An internal current sink will pull the E1 pin down when the E1 input exceeds 1.5 V .

GND (Pin 3): Ground. This pin provides a power return path for all the internal circuits.
E2 (Pin 4): LTC4416 Comparator Enable Input. A low signal less than $\mathrm{V}_{\text {REF }}$ will enable the V 2 path. The ideal diode action will then determine if the V2 path should turn on by controlling any PFET(s) connected to the G2 pin. If the E2 signal is driven high, the V2 path will perform a "soft-off" provided the PFET(s) are properly configured for blocking DC current. An internal current sink will pull the $\overline{\mathrm{E} 2}$ pin down when the $\overline{\mathrm{E} 2}$ input exceeds 1.5 V .
E2 (Pin 4): LTC4416-1 Comparator Enable Input. A low signal less than $\mathrm{V}_{\text {REF }}$ will enable the V2 path. The ideal diode action will then determine if the V 2 path should turn on by controlling any PFET(s) connected to the G2 pin. If the E2 signal is driven high, the V2 path will be quickly disabled by enabling the "fast-off" feature, pulling the G2 gate high. An internal current sink will pull the $\overline{E 2}$ pin down when the E2 input exceeds 1.5 V .
$\overline{\mathrm{H} 2}$ (Pin 5): Open-Drain Comparator Output of the $\overline{\mathrm{E} 2}$ Pin. If $\mathrm{E} 2>\mathrm{V}_{\text {REF }}$, the H 2 pin will go high impedance, otherwise
the pin will be grounded. The maximum voltage permitted on this pin is 7 V . This pin provides support for setting up hysterisis to an external resistor network.

G2 (Pin 6): Second P-Channel MOSFET Power Switch Gate Drive Pin. This pin is directed by the second power controller to maintain a forward regulation voltage ( $\mathrm{V}_{\mathrm{FR}}$ ) of 25 mV between the V 2 and $V_{S}$ pins when V 2 is greater than $\mathrm{V}_{\mathrm{S}}$. When V 2 is less than $\mathrm{V}_{\mathrm{S}}$, the G 2 pin will pull up to the $V_{S}$ pin voltage, turning off the second P -channel power switch.

V2 (Pin 7): Second Input Supply Voltage. Supplies power to the second power controller and the band-gap reference. V2 is one of the two voltage sense inputs to the second internal power controller (the other input to the second internal power controller is the $\mathrm{V}_{S} \mathrm{pin}$ ). This input is usually supplied power from the second, or backup, power source. This pin can be bypassed to ground with a capacitor in the range of $0.1 \mu \mathrm{~F}$ to $10 \mu \mathrm{~F}$ if needed to suppress load transients.
V (Pin 8): Power Sense Input Pin. Supplies power to the internal circuitry of both the first and second power controller and the band-gap reference. This pin is also a voltage sense input to both internal analog controllers (the other input to the first controller is the V1 pin and the other input to the second controller is the V2 pin.) This input may also be supplied power from an auxiliary source which also supplies current to the load.
V1 (Pin 9): First Input Supply Voltage. Supplies power to the first power controller and the band-gap reference. V1 is one of the two voltage sense inputs to the first internal power controller (the other input to the first internal power controller is the $\mathrm{V}_{S}$ pin). This input is usually supplied power from the first, or primary, power source. This pin can be bypassed to ground with a capacitor in the range of $0.1 \mu \mathrm{~F}$ to $10 \mu \mathrm{~F}$ if needed to suppress load transients.
G1 (Pin 10): First P-Channel MOSFET Power Switch Gate Drive Pin. This pin is directed by the first power controller to maintain a forward regulation voltage $\left(V_{F R}\right)$ of 25 mV between the V 1 and $\mathrm{V}_{\mathrm{S}}$ pins when V 1 is greater than $\mathrm{V}_{\mathrm{S}}$. When V 1 is less than $\mathrm{V}_{\mathrm{S}}$, the G 1 pin will pull up to the $\mathrm{V}_{\mathrm{S}}$ pin voltage, turning off the first P-channel power switch.

## LTC4416/LTC4416-1

## BLOCK DIAGRAM

## OPERATION

Operation can best be understood by referring to the Block Diagram which illustrates the internal circuit blocks. The LTC4416/LTC4416-1 are divided into three sections, namely:

1. The channel 1 controller consisting of $\mathrm{A} 1, \mathrm{C} 1$, the "first analog contoller," the G1 drivers and the H1 output driver.

## 2. The band-gap reference

3. The channel 2 controller consisting of $\mathrm{A} 2, \mathrm{C} 2$, the "second analog controller," the G2 drivers and the $\overline{\mathrm{H} 2}$ output driver.

Each of the three sections has its own derived internal power supply referred to as a rail. RAIL1 provides power to the channel 1 controller. RAIL2 provides power to the channel 2 controller. The internal RAILBG provides power to the band-gap reference. The internal rail1 derives its power from the higher voltage of V 1 and $\mathrm{V}_{\mathrm{S}}$. The internal rail2 derives its power from the higher voltage of V2 and $V_{S}$. RAILBG derives its power from the highest voltage of $\mathrm{V} 1, \mathrm{~V} 2$, and $\mathrm{V}_{\mathrm{S}}$. All three sections share a common ground connected to the GND pin.

## OPERATION

The band-gap reference provides internal bias currents used by the channel 1 and channel 2 controllers. It also provides a precision voltage reference, $\mathrm{V}_{\text {REF }}$, used by comparators C1 and C2. The band-gap reference is powered as long as a minimum operational voltage is present on either V1, V2, or $\mathrm{V}_{\mathrm{S}}$.
The C1 and C2 comparators provide a fixed comparison between the E1 and E2 inputs, respectively, and the internal $V_{\text {REF }}$ signal. The comparator outputs are directly represented by the H 1 and $\overline{\mathrm{H} 2}$ open-drain outputs. The output states of H 1 and $\overline{\mathrm{H} 2}$ are not dependent upon the relative voltage difference between $\mathrm{V}_{\mathrm{V} 1}-\mathrm{V}_{\mathrm{VS}}$ and $\mathrm{V}_{\mathrm{V} 2}-\mathrm{V}_{\mathrm{VS}}$, respectively. If $\mathrm{V}_{\mathrm{E} 1}$ is less than $\mathrm{V}_{\mathrm{REF}}$, the H 1 open-drain output will be low impedance to GND. If $\mathrm{V}_{\mathrm{E} 2}$ is less than $\mathrm{V}_{\mathrm{REF}}$, the $\overline{\mathrm{H} 2}$ open-drain output will be low impedance to GND.
The A1 and A2 circuits act both as a high side transconductance amplifiers and as comparators. Both A1 and A2 act identically when the analog controllers are fully enabled. The relationship of the G1 current is represented by Figure 1.
When $V_{V 1}-V_{V S}<V_{R T 0}$, the A1 activates the reverse turnoff condition and the $\mathrm{I}_{\mathrm{G} 1}$ current is $\mathrm{I}_{\mathrm{G}(\mathrm{OFF})}$. When $\mathrm{V}_{\mathrm{RTO}}<$ $V_{V 1}-V_{V S}<V_{F R}$, the A1 acts as a class A output and the $I_{G 1}$ current is fixed at $I_{G(S R C)}$. As the $V_{V 1}-V_{V S}$ voltage

Figure 1. $I_{G 1}$ vs $V_{V 1}-V_{V S}$
approaches the forward regulation voltage, $\mathrm{V}_{\mathrm{FR}}$, the $\mathrm{I}_{\mathrm{G}(\mathrm{SNK})}$ current will be proportional to $\mathrm{V}_{\mathrm{V} 1}-\mathrm{V}_{\mathrm{VS}}$. When $\mathrm{V}_{\mathrm{V} 1}-\mathrm{V}_{V S}$ $>\mathrm{V}_{\mathrm{FON}}$, the A 1 activates the fast-on condition, $\mathrm{t}_{\mathrm{G}(\mathrm{ON})}$, and the $I_{G 1}$ current is set to $I_{G F O N(S N K)}$.

## LTC4416 OPERATION

The interaction of the LTC4416 analog controllers distinguish the operation of the LTC4416 from a simple circuit using two PowerPath controllers. Table 1 explains the different operation modes of the analog controllers.

Table 1. LTC4416 Operational Modes

| E1 | $\overline{\mathbf{E 2}}$ | Operation Mode | $\mathbf{I}_{\mathbf{G}(\mathbf{O F F )}}$ | $\mathbf{I}_{\mathbf{G}(\mathbf{O F F )}} \mathbf{~}$ |
| :---: | :---: | :--- | :---: | :---: |
| 1 | 0 | Load Sharing | Enabled | Enabled |
| 1 | Sense | V1 is Less Than V2 | Enabled |  |
| Sense | 0 | V1 is Greater Than V2 |  | Enabled |
| 0 | X | Channel 1 Disabled. <br> Do Not Use | Disabled |  |
| X | 1 | Channel 2 Disabled. <br> Do Not Use |  | Disabled |
| 0 | 1 | Both Channels Disabled | Disabled | Disabled |

The LTC4416 has six modes of operation. Each mode of operation is dependent upon the configuration of the E1 and E2 input pins.

## Load Sharing Operation

The load sharing mode configures the LTC4416 into two independent PowerPath controllers. This is accomplished by fully enabling both the first analog controller and the second analog controller. Both channels will implement the gate drive outlined in Figure 1.

## V1 is Less Than V2 Operation

Channel 1 is fully enabled. If $V_{V 1}-V_{V S}<V_{R T O}$, channel 1 will implement all of the $\mathrm{I}_{\mathrm{G} 1}$ currents listed in Figure 1.

When $V_{\text {E2 }}$ is above the $V_{\text {REF }}$ threshold, channel 2 is in a "soft-off mode". This means that G2 will only provide an $I_{G(S R C)}$ current instead of either an $I_{G(S R C)}$ or an $I_{G(0 F F)}$ current.

When $\mathrm{V}_{\overline{\mathrm{E} 2}}$ is below the $\mathrm{V}_{\text {REF }}$ threshold, channel 2 is fully enabled, and $G 2$ will become active implementing the $I_{G}$ output current listed in Figure 1.

## LTC4416/LTC4416-1

## OPERATION

## V1 is Greater Than V2 Operation

When $V_{E 1}$ is below the $V_{R E F}$ threshold, channel 1 is in a "soft-off mode". This means that G1 will only provide an $\mathrm{I}_{\mathrm{G}(\mathrm{SRC})}$ current instead of an $\mathrm{I}_{\mathrm{G}(\mathrm{SNK})}$ or an $\mathrm{I}_{\mathrm{GFON}(\mathrm{SNK})}$ current.
When $V_{E 1}$ is above the $V_{R E F}$ threshold, channel 1 is immediately fully enabled, and G1 will become active implementing the output current listed in Figure 1.
Channel 2 is fully enabled. If $\mathrm{V}_{\mathrm{V} 1}-\mathrm{V}_{\mathrm{VS}}<\mathrm{V}_{\mathrm{RTO}}$, channel 2 will implement all of the $\mathrm{I}_{\mathrm{G} 2}$ currents listed in Figure 1.

## Channel 1 is Disabled

The LTC4416 is not designed to have channel 1 disabled by grounding E1 and leaving E2 in an indeterminate state. If this happens, the channel 2 PowerPath controller will not have reverse turn-off capability. No electrical harm to the LTC4416 will occur.

## Channel 2 is Disabled

The LTC4416 is not designed to have channel 2 disabled by connecting E2 high and leaving E1 in an indeterminate state. If this happens, the channel 1 PowerPath controller will not have reverse turn-off capability. No electrical harm to the LTC4416 will occur.

## Both Channels Disabled

When both channels of the LTC4416 are disabled, both G1 and G2 currents are set to $\mathrm{I}_{\mathrm{G}(\mathrm{SRC})}$.

## LTC4416-1 OPERATION

The LTC4416-1 is designed for overvoltage/undervoltage protection or when either voltage path must be turned off rapidly, regardless of the status of the other voltage input. The LTC4416-1 does not implement the soft-off feature implemented in the LTC4416. The E1 and E2 inactive will force the $I_{G}$ current of their respective channel to $I_{G(O F F)}$. Table 2 explains the operation of the E1 and E2 inputs. The term "active" implies that $I_{G(O F F)}$ current is forced on the $G n$ pins regardless of the $V_{V_{n}}-V_{V s}$ value. The term "enabled" implies that $\mathrm{I}_{\mathrm{G}(\text { OFF })}$ current is provide on the Gn pins if and only if $\mathrm{V}_{\mathrm{Vn}}-\mathrm{V}_{\mathrm{Vs}}<\mathrm{V}_{\text {RTO }}$.

Table. 2 LTC4416-1 Operational Modes

| $\mathbf{E 1}$ | $\overline{\mathbf{E} 2}$ | Operation Mode | $\mathbf{I}_{\mathbf{G}(\mathbf{0 F F}) \mathbf{1}}$ | $\mathbf{I}_{\mathbf{G}(\mathbf{O F F}) \mathbf{2}}$ |
| :---: | :---: | :--- | :---: | :---: |
| 0 | $X$ | Undervoltage Protection | Active |  |
| $X$ | 1 | Overvoltage Protection |  | Active |
| 1 | $X$ | Channel 1 PowerPath | Enabled |  |
| $X$ | 0 | Channel 2 PowerPath |  | Enabled |

## APPLICATIONS InFORMATION

## LTC4416

The LTC4416 is designed to support three major applications. The first two applications assume that V1 is the primary power source and V 2 is the backup power source. The first application is where the V1 power supply is normally less than V 2 . The second application is where the V 1 power supply is normally greater than V 2 . The third application addresses the load sharing case where both V 1 and V 2 are relatively equal in value.

## V1 is Less Than V2

Figure 2 illustrates the external resistor configuration for this case.

Figure 2

## APPLICATIONS INFORMATION

This configuration would be used where V 1 is a 12 V power supply and the V 2 power supply is a 4 -cell Li-Ion battery pack. When V1 is 12V, $\overline{\mathrm{E} 2}$ disables the V2 source from being connected to $\mathrm{V}_{\mathrm{S}}$ through Q2A and Q2B by forcing G 2 to $\mathrm{V} 2, \overline{\mathrm{H}} 2$ is open circuit. E1 is connected to a voltage greater than the $\mathrm{V}_{\text {REF }}$ to keep the V 1 to $\mathrm{V}_{\mathrm{S}}$ path active. The $V_{S}$ output can be shut completely off by grounding the E1 input. The LTC4416 takes its power from the higher of V1, V 2 and $\mathrm{V}_{\mathrm{S}}$. This configuration will provide power from V1 to $\mathrm{V}_{S}$ until the V 1 supply drops below 9 V .
When V1 drops below 9V, the $\overline{\mathrm{H} 2}$ pin closes to GND, G2 drops to a $\mathrm{V}_{\text {CLAMP }}$ below V 2 and G 1 rises to the $\mathrm{V}_{S}$ voltage level. V2 will supply current to $\mathrm{V}_{\mathrm{S}}$ until V 1 rises above 10.8 V . The H1 output will be open until the E1 input drops below the $\mathrm{V}_{\text {REF }}$ voltage level.

The V1 $\mathrm{V}_{\text {FAIL }}$ is determined by:

$$
\begin{aligned}
V_{\text {FAIL }} & =V_{\text {ETH }} \cdot \frac{R 2 \mathrm{~A}+\mathrm{R} 2 \mathrm{C}}{R 2 \mathrm{C}} \\
& =1.2222 \cdot \frac{158 \mathrm{k}+24.9 \mathrm{k}}{24.9 \mathrm{k}}=8.98 \mathrm{~V}
\end{aligned}
$$

The V1 VRESTORE is determined by:

$$
\begin{aligned}
V_{\text {RESTORE }} & =V_{\text {ETH }} \bullet \frac{(R 2 A+(R 2 C \| R 2 E))}{R 2 C \| R 2 E} \\
& =1.222 \mathrm{~V} \bullet \frac{158 \mathrm{k}+(24.9 \mathrm{k} \| 105 \mathrm{k})}{24.9 \mathrm{k} \| 105 \mathrm{k}}=10.81 \mathrm{~V}
\end{aligned}
$$

## V1 is Greater Than V2

Figure 3 illustrates the external resistor configuration for this case.
This configuration would be used where V1 is a 12 V power supply and the V2 power supply is a 3-cell Li-Ion battery pack. When V1 is 16 V , E1 enables the V1 source as being the primary supply, thus disabling the V 2 supply since $\mathrm{V} 1>\mathrm{V} 2$. When $\mathrm{E} 1>\mathrm{V}_{\text {REF }}$, the H 1 outputis open. The $\mathrm{V}_{\mathrm{S}}$ output can be shut completely off by grounding the H 1 input and forcing $\overline{E 2}>V_{\text {REF }}$. The LTC4416 takes its power from the higher of $\mathrm{V} 1, \mathrm{~V} 2$ and $\mathrm{V}_{\mathrm{S}}$. This configuration will provide power from V1 to $\mathrm{V}_{S}$ until the V 1 supply drops below 12 V .

Figure 3
When V1 drops below 12V, the H 1 pin closes to GND, G2 drops to a $\mathrm{V}_{\text {CLAMP }}$ below V 2 and G 1 rises to the V 1 voltage level. V2 will supply current to $\mathrm{V}_{\mathrm{S}}$ until V1 rises above 13.5 V . The $\overline{\mathrm{H} 2}$ output will be shorted to GND until the E2 input goes above the $V_{\text {REF }}$ voltage level.
The V1 $\mathrm{V}_{\text {FAIL }}$ is determined by:

$$
\begin{aligned}
V_{\text {FAIL }} & =V_{\text {ETH }} \cdot \frac{R 1 A+R 1 C}{R 1 C} \\
& =1.222 \mathrm{~V} \cdot \frac{221 \mathrm{k}+24.9 \mathrm{k}}{24.9 \mathrm{k}}=12.07 \mathrm{~V}
\end{aligned}
$$

The V1 $\mathrm{V}_{\text {RESTORE }}$ is determined by:

$$
\begin{aligned}
V_{\text {RESTORE }} & =V_{\text {ETH }} \bullet \frac{(R 1 A+(R 1 C \| R 1 D))}{R 1 C \| R 1 D} \\
& =1.222 \mathrm{~V} \cdot \frac{221 \mathrm{k}+(24.9 \mathrm{k} \| 187 \mathrm{k})}{24.9 \mathrm{k} \| 187 \mathrm{k}}=13.51 \mathrm{~V}
\end{aligned}
$$

## Load Sharing

Figure 4 illustrates the configuration for this case.
This configuration would be used where V1 and V2 are relatively the same voltage. In this case the LTC4416 acts as two interconnected ideal diode controllers. $V_{S}$ will be supplied by the higher of the two supplies, V 1 and V 2 . If V1 and V2 are exactly the same, then $50 \%$ of the current for $V_{S}$ will be supplied by each supply. As the two supplies

## LTC4416/LTC4416-1

## APPLICATIONS INFORMATION

differ by more than $100 \mathrm{mV}, 100 \%$ of the load will come from the higher of V1 or V2.
The user has the option of using E1 and $\overline{\mathrm{E} 2}$ to disable one of the two supplies by connecting them to a digital controller. If E1 is brought low, V1 will no longer supply current to $\mathrm{V}_{\mathrm{S}}$. If E 2 is brought high, V 2 will no longer supply current to $V_{S}$. If $E 1$ is brought low and $\overline{E 2}$ is brought high, $\mathrm{V}_{S}$ will be disabled.

Figure 5 shows the same application without the shutdown option. It has one-half the losses of Figure 4 and is configured for 5 V rails.

Figure 4

Figure 5. Dual PowerPath for Current Sharing

## LTC4416-1

The LTC4416-1 will support all three of the LTC4416 applications without the "soft-off" feature. The only difference in the two designs is the LTC4416-1 will rapidly switch off the load from a supply whenever a channel is
disabled. This rapid turn-off feature is desirable when the supply cannot tolerate certain voltage excursions under load, or when the load is being protected from a rapidly changing input supply.

## Under and OvervoItage Shutdown

Refer to Figure 6 for an application circuit which disables the power to the load when the input voltage gets too low or too high. When $\mathrm{V}_{\text {IN }}$ starts from zero volts, the load to the output is disabled until $\mathrm{V}_{\mathrm{IN}}$ reaches 5.5 V . The V 1 path is enabled and the load remains on the input until the supply exceeds 13.5 V . At that voltage, the V 2 path is disabled. As the input falls, the voltage source will be reconnected to the load when the input drops to 12 V and the V 2 path is enabled. Finally, the load will be removed from the input supply when the voltage drops below 5 V .

UV ENABLED AT 5V, $\mathrm{V}_{\text {IN }}$ RESTORED TO LOAD WHEN $\mathrm{V}_{\text {IN }}$ RISES TO 5.5 V OV ENABLED AT 13.5V, $\mathrm{V}_{\text {IN }}$ RESTORED TO LOAD WHEN $\mathrm{V}_{\text {IN }}$ FALLS TO 12V

Figure 6
Undervoltage

$$
\begin{aligned}
\begin{aligned}
V_{\text {FAIL }} & =V_{\text {ETH }} \bullet \frac{R 1 A+R 1 C}{R 1 C} \\
& =1.222 \mathrm{~V} \cdot \frac{75 \mathrm{k}+24.3 \mathrm{k}}{24.3 \mathrm{k}}=4.99 \mathrm{~V} \\
V_{\text {RESTORE }} & =V_{\text {ETH }} \cdot \frac{(\mathrm{R} 1 \mathrm{~A}+(\mathrm{R} 1 \mathrm{C} \| \mathrm{R} 1 \mathrm{D}))}{\mathrm{R} 1 \mathrm{C} \| \mathrm{R} 1 \mathrm{D}} \\
& =1.222 \mathrm{~V} \cdot \frac{75 \mathrm{k}+(24.3 \mathrm{k} \| 182 \mathrm{k})}{24.3 \mathrm{k} \| 182 \mathrm{k}}=5.497 \mathrm{~V}
\end{aligned}
\end{aligned}
$$

## APPLICATIONS InFORMATION

Overvoltage

$$
\begin{aligned}
V_{\text {FAIL }} & =V_{\text {ETH }} \cdot \frac{R 2 A+R 2 C \| R 2 E}{R 2 C \| R 2 E} \\
& =1.2222 \mathrm{~V} \cdot \frac{221 \mathrm{k}+24.9 \mathrm{k} \| 187 \mathrm{k}}{24.9 \mathrm{k} \| 187 \mathrm{k}}=13.51 \mathrm{~V} \\
V_{\text {RESTORE }} & =V_{\text {ETH }} \cdot \frac{R 2 \mathrm{~A}+\mathrm{R} 2 \mathrm{C}}{R 2 \mathrm{C}} \\
& =1.222 \mathrm{~V} \cdot \frac{221 \mathrm{k}+24.9 \mathrm{k}}{24.9 \mathrm{k}}=12.07 \mathrm{~V}
\end{aligned}
$$

The over and undervoltage lockoutcircuits are shown here working in tandem. It is possible to configure the circuit for either over or undervoltage lockout by using only one of the voltage paths and eliminating the components from the other. Refer to Figure 7 for an LTC4416-1 configured for overvotlage protection. If the input does not go below ground, transistor Q1 can be eliminated.
The LTC4416-1 should be used in this configuration rather than the LTC4416 because the LTC4416-1 will turn-off rapidly if an over or undervoltage condition is detected. Referto Figure 8for a comparison of the transient response of the two ICs using the circuit configuration of Figure 6 . The LTC4416 will not turn-off quickly in an overvoltage or undervoltage condition because the "fast-off" feature is not enabled. This will cause the output to travel beyond the desired range.

Figure 7. LTC4416-1 Configured for Overvoltage Protection

Figure 9 contains a rapidly changing input voltage on a much smaller time scale in comparison to Figure 8. The LTC4416 will require the $\mathrm{t}_{\mathrm{E}(\text { OFF) }}$ time prior to the rapid pullup current being applied. The gate voltage will be pulled high with $I_{G(O F F)}$ which has a minimum current of $500 \mu \mathrm{~A}$. The discharge time of the gate will be dependent on the capacitance of the external FET and the initial gate-source voltage of the circuit. The total time delay will equal:

$$
\begin{aligned}
\mathrm{t}_{\text {DELAY }} & =\mathrm{t}_{\mathrm{E}(\text { OFF })}+\mathrm{t}_{\text {DISCHARGE }} \\
& =\mathrm{t}_{\mathrm{E}(\text { OFF })}+\frac{\mathrm{C}_{\mathrm{GS}} \cdot \Delta \mathrm{~V}}{\mathrm{I}_{\mathrm{G}(\text { OFF })}}
\end{aligned}
$$

## PACKAGE DESCRIPTION

## MS Package <br> 10-Lead Plastic MSOP

(Reference LTC DWG \# 05-08-1661)

## RELATGD PARTS

| PART NUMBER | DESCRIPTION | COMMENTS |
| :---: | :---: | :---: |
| LTC1473 | Dual PowerPath Switch Driver | Switches and Isolates Sources Up to 30V |
| LTC1479 | PowerPath Controller for Dual Battery Systems | Complete PowerPath Management for Two Batteries; DC Power Source, Charger and Backup |
| LTC1558/LTC1559 | Back-Up Battery Controller with Programmable Output | Adjustable Backup Voltage from 1.2V NiCd Button Cell, Includes Boost Converter |
| LT®1579 | 300mA Dual Input Smart Battery Back-Up Regulator | Maintains Output Regulation with Dual Inputs, 0.4 V Dropout at 300 mA |
| LTC1733/LTC1734 | Monolithic Linear Li-Ion Chargers | Thermal Regulation, No External MOSFET/Sense Resistor |
| LTC1998 | 2.5 A , 1\% Accurate Programmable Battery Detector | Adjustable Trip Voltage/Hysteresis, ThinSOT ${ }^{\text {TM }}$ |
| LTC4055 | USB Power Controller and Li-Ion Linear Charger | Automatic Battery Switchover, Thermal Regulation, Accepts Wall Adapter and USB Power, $4 \mathrm{~mm} \times 4 \mathrm{~mm}$ QFN |
| LTC4066 | USB Power Controller and Battery Charger | Charges Single Cell Li-lon Batteries Directly from a USB Port, Thermal Regulation, $50 \mathrm{~m} \Omega$ Ideal Diode, $4 \mathrm{~mm} \times 4 \mathrm{~mm}$ QFN24 Package |
| LTC4085 | USB Power Manager with Ideal Diode Controller and Li-Ion Charger | Charges Single Cell Li-lon Batteries Directly from a USB Port, Thermal Regulation, $200 \mathrm{~m} \Omega$ Ideal Diode $<50 \mathrm{~m} \Omega$ Option, $4 \mathrm{~mm} \times 3 \mathrm{~mm}$ DFN14 Package |
| LTC4354 | Negative Voltage Diode-OR Controller and Monitor | Replaces Power Schottky Diodes; 80V Operation |
| LTC4410 | USB Power Manager in ThinSOT | Enables Simultaneous Battery Charging and Operation of USB Component Peripheral Devices |
| LTC4411 | SOT-23 Ideal Diode | 2.6A Forward Current, 28mV Regulated Forward Voltage |
| LTC4412HV | 36V, Low Loss PowerPath Controller in MSOP | $-40^{\circ} \mathrm{C}$ to $-125^{\circ} \mathrm{C}$ Operation; Automatic Switching Between DC Sources |
| LTC4413 | Dual 2.6A, 2.5V to 5.5V Ideal Diodes in $3 \mathrm{~mm} \times 3 \mathrm{~mm}$ DFN | $100 \mathrm{~m} \Omega$ ON Resistance, $1 \mu \mathrm{~A}$ Reverse Leakage Current, 28 mV Regulated Forward Voltage |
| LTC4414 | 36V, Low Loss PowerPath Controller for Large PFETs | Drives Large $Q_{G}$ PFETs, Very Low Loss Replacement for Power Supply O'Ring Diodes, 3.5 V to 36 V AC/DC Adapter Voltage Range, MSOP-8 Package |

ThinSOT is a trademark of Linear Technology Corporation.
