NTE1952
Integrated Circuit
Positive 3 Terminal Voltage Regulator, Low Dropout Voltage, 8V, 1A

Description:

The NTE1952 positive voltage regulator features the ability to source 1A of output current with a dropout voltage of typically 0.5V and a maximum of 1V over the entire temperature range. Furthermore, a quiescent current reduction circuit has been included which reduces the ground current when the differential between the input voltage and the output voltage exceeds approximately 3V. The quiescent current with 1A of output current and an input–output differential of 5V is therefore only 30mA. High quiescent currents only exist when the regulator is in the dropout mode ($V_{IN} – V_{OUT} \leq 3V$).

Features:

- Dropout Voltage: 0.5V (Typ) @ I_O = 1A
- Output Current in Excess of 1A
- Reverse Battery Protection
- Internal Short Circuit Current Limit

Absolute Maximum Ratings: (T_A = +25°C unless otherwise specified)

Input Voltage, V_I
- Survival Voltage (≤100ms) 60V
- Operational Voltage 26V

Internal Power Dissipation (Note 1), P_D . . . . . Internally Limited
