

Product Specification

2.5Gbps, 850nm VCSEL, TO-46 Package

HFE4094-542

PRODUCT FEATURES

- 850nm multi-mode oxide isolated VCSEL
- Capable of modulation operation from DC to 2.5Gbps
- TO-46 tilt window metal can component
- Designed for drive currents between 3-15mA average
- Packaged with a back monitor
- Un-Attenuated window can

These products are high-performance 850nm VCSELs (Vertical Cavity Surface-Emitting Lasers) designed for high-speed data communications and packaged with a custom designed power monitor diode. The power monitor diode can be used with appropriate feedback control circuitry to set a maximum power level for the VCSEL. These combined features simplify design for high data rate communication and eye safety.

These products are high radiance VCSELs designed to convert electrical current into optical power that can be used in fiber optic communications and other applications. As the current varies above threshold, the light intensity increases proportionally.

These products are designed to be used with inexpensive silicon or gallium arsenide detectors, but excellent performance can also be achieved with some indium gallium arsenide detectors (see HFD3081-108 and HFD3081-203 product data sheets).

The low drive current requirement makes direct drive from PECL (Positive Emitter Coupled Logic) or ECL (Emitter Coupled Logic) gates possible and eases driver design.

These are designed to interface with 50/125 and 62.5/125mm multi-mode fiber. They produce circularly symmetric, non-astigmatic, narrow divergence beams that, with appropriate lensing, fiber couple all of the emitter power

Notice

Stresses greater than those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operations section for extended periods of time may affect reliability.

Notice

The inherent design of this component causes it to be sensitive to electrostatic discharge (ESD). To prevent ESD-induced damage and/or degradation to equipment, take normal ESD precautions when handling this product

Notes:

1. Reliability is a function of temperature, see www.finisar.com for details.
2. For the purpose of these tests, I_F is DC current.
3. Threshold current varies as $(T_A - T_O)^2$. It may either increase or decrease with temperature, depending upon relationship of T_A to T_O . The magnitude of the change is proportional to the threshold at T_O .
4. Slope efficiency is defined as $\Delta P_O / \Delta I_F$.
5. To compute the value of Slope Efficiency at a temperature T, use the following equation:

$$\eta(T) \approx \eta(25^\circ\text{C}) * [1 + (\Delta\eta / \Delta T) * (T - 25)]$$
6. Rollover is the power at which a further current increase does not result in a power increase.
7. Rise and fall times specifications are the 20% - 80%. Most of the devices will measure <135ps fall time. Rise and fall times are sensitive to drive electronics.
8. To compute the value of Series Resistance at a temperature T, use the following equation:

$$R_S(T) \approx R_S(25^\circ\text{C}) * [1 + (\Delta R_S / \Delta T) * (T - 25)]$$
9. Beam divergence is defined as the total included angle between the $1/e^2$ intensity points.
10. These specifications are for the TO-46 component alone. Reflections introduced by any subsequent higher level assembly may affect these values.
11. Monitor current tracking is defined as follows:

$$\text{Deltrk} = \frac{I_{PD}(P_O = 0.75\text{mW}) / 0.75\text{mW}}{I_{PD}(P_O = 0.45\text{mW}) / 0.45\text{mW}}$$

III. Typical Performance Curves

Emitted Power vs. Current: Power varies approximately linearly with current above threshold.

Threshold Current vs. Temperature: Threshold current varies parabolically with temperature; thus it can be nearly constant for a limited temperature range.
