## FEATURES

5 V Power Supply Stereo Audio DAC System
Accepts 16-/18-/20-/24-Bit Data
Supports 24-Bit, 192 kHz Sample Rate PCM Audio Data
Supports SACD Bit Stream and External Digital Filter Interface
Accepts a Wide Range of PCM Sample Rates Including: 32 kHz, 44.1 kHz, 48 kHz, 88.2 kHz, 96 kHz, and 192 kHz
Multibit Sigma-Delta Modulator with "Perfect Differential Linearity Restoration" for Reduced Idle Tones and Noise Floor
Data Directed Scrambling DAC-Low Sensitivity to Jitter
Supports SACD Playback with "Bit Expansion" Filter
Differential Current Output for Optimum Performance
8.64 mA p-p Differential Output

120 dB SNR/DNR (not muted) at 48 kHz Sample Rate
(A-Weighted Stereo)
123 dB SNR/DNR (Mono)
-110 dB THD + N
110 dB Stop-Band Attenuation with $\pm 0.0002 \mathrm{~dB}$
Pass-Band Ripple
$8 \times$ Oversampling Digital Filter
On-Chip Clickless Volume Control
Supports SACD-Mute Pattern Detection
Supports $64 \mathrm{f}_{\mathrm{S}} / 128 \mathrm{f}_{\mathrm{S}}$ DSD SACD with Phase Mode Internal Digital Filter Pass-Through for External Filter
Master Clock: $\mathbf{2 5 6} \mathrm{f}_{\mathrm{s}} \mathbf{5 1 2} \mathrm{f}_{\mathrm{s}}, \mathbf{7 6 8} \mathrm{f}_{\mathrm{S}}$
Hardware and Software Controllable Clickless Mute
Serial (SPI) Control for Serial Mode, Number of Bits, Sample Rate, Volume, Mute, De-Emphasis, Mono Mode
Digital De-Emphasis for 32 kHz, 44.1 kHz, and 48 kHz Sample Rates
Flexible Serial Data Port with Right-Justified, LeftJustified, I²S, and DSP Modes
28-Lead SSOP Plastic Package
APPLICATIONS
High End DVD Audio
SACD
CD
Home Theater Systems
Automotive Audio Systems
Sampling Musical Keyboards
Digital Mixing Consoles
Digital Audio Effects Processors

## PRODUCT OVERVIEW

The AD1955 is a complete, high performance, single-chip, stereo digital audio playback system. It is comprised of a multibit sigmadelta modulator, high performance digital interpolation filters, and continuous-time differential current output DACs. Other features include an on-chip clickless stereo attenuator and mute capability, programmed through an SPI compatible serial control port. The AD1955 is fully compatible with all known DVD audio formats including 192 kHz as well as 96 kHz sample frequencies and 24 bits. It is also backward compatible by supporting $50 \mu \mathrm{~s} /$ $15 \mu \mathrm{~s}$ digital de-emphasis intended for "redbook" compact discs, as well as de-emphasis at 32 kHz and 48 kHz sample rates.

The AD1955 has a very flexible serial data input port that allows for glueless interconnection to a variety of ADCs, DSPs, SACD decoders, external digital filters, AES/EBU receivers, and
(continued on page 12)

## CAUTION

ESD（electrostatic discharge）sensitive device．Electrostatic charges as high as 4000 V readily accumulate on the human body and test equipment and can discharge without detection．Although the AD1955 features proprietary ESD protection circuitry，permanent damage may occur on devices subjected to high energy electrostatic discharges．Therefore，proper ESD precautions are recommended to avoid performance degradation or loss of functionality．

PIN FUNCTION DESCRIPTIONS

| Pin No. | I/O | Mnemonic | Description |
| :---: | :---: | :---: | :---: |
| 1 |  | DVDD | Digital Power Supply Connected to Digital 5 V Supply |
| 2 | Input | LRCLK/EF_WCLK | Left/Right Clock Input for Input Data in PCM Mode Word Clock in External Filter Mode |
| 3 | Input | BCLK/EF_BCLK | Bit Clock Input for Input Data in PCM Mode Bit Clock Input in External Filter Mode |
| 4 | Input | SDATA/EF_LDATA | MSB First, Twos Complement Serial Audio Data Two Channel (left and right), 16-Bit to 24-Bit Data in PCM Mode Left Channel Data in External Filter Mode |
| 5 | Input | EF_RDATA | Not used in PCM Mode Right channel data in External Filter Mode |
| 6 | I/O | DSD_SCLK | Serial Clock Input for DSD Data. This clock should be $64 \times 44.1 \mathrm{kHz}$, 2.8224 MHz or $128 \times 44.1 \mathrm{kHz}, 5.6448 \mathrm{MHz}$ in Normal Mode, $128 \times$ $44.1 \mathrm{kHz}, 5.6448 \mathrm{MHz}$ or $256 \times 44.1 \mathrm{kHz}, 11.2896 \mathrm{MHz}$ in Phase Mode. |
| 7 | Input | DSD_LDATA | DSD Left Channel Data Input |
| 8 | Input | DSD_RDATA | DSD Right Channel Data Input |
| 9 | I/O | DSD_PHASE | DSD Phase Reference Signal. This clock should be $64 \times 44.1 \mathrm{kHz}$, 2.8224 MHz . If not used, this pin should be connected low. |
| 10 |  | AGND | Analog Ground |
| 11 | Output | IOUTR+ | Right Channel Positive Analog Output |
| 12 | Output | IOUTR- | Right Channel Negative Analog Output |
| 13 | Output | FILTR | Voltage Reference Filter Capacitor Connection. Bypass and decouple the voltage reference with parallel $10 \mu \mathrm{~F}$ and $0.1 \mu \mathrm{~F}$ capacitors to AGND. |
| 14 |  | IREF | Connection Point for External Bias Resistor |
| 15 |  | AVDD | Analog Power Supply Connected to Analog 5 V Supply |
| 16 | Output | FILTB | Filter Capacitor Connection with Parallel $10 \mu \mathrm{~F}$ and $0.1 \mu \mathrm{~F}$ Capacitors to AGND |
| 17 | Output | IOUTL- | Left Channel Negative Analog Output |
| 18 | Output | IOUTL+ | Left Channel Positive Analog Output |
| 19 |  | AGND | Analog Ground |
| 20 | Output | ZEROR | Right Channel Zero Flag Output. This pin goes high when the right channel has no signal input or the DSD mute pattern is detected. |
| 21 | Output | ZEROL | Left Channel Zero Flag Output. This pin goes high when the left channel has no signal input or the DSD mute pattern is detected. |
| 22 | Input | MUTE | Mute. Assert high to mute both stereo analog outputs. Deassert low for normal operation. |
| 23 | Input | $\overline{\text { PD/RST }}$ | Power Down/Reset. The AD1955 is placed in a reset state and the digital circuitry is powered down when this pin is held low. The AD1955 is reset on the rising edge of this signal. The serial control port registers are reset to the default values. Connect high for normal operation. |
| 24 | Input | CDATA | Serial Control Input, MSB First, Containing 16 Bits of Unsigned Data. Used for specifying control information and channel-specific attenuation. |
| 25 | Input | $\overline{\text { CLATCH }}$ | Latch Input for Control Data |
| 26 | Input | CCLK | Clock Input for Control Data. Control input data must be valid on the rising edge of CCLK. CCLK may be continuous or gated. |
| 27 | Input | MCLK | Master Clock Input. Connect to an external clock source. |
| 28 |  | DGND | Digital Ground |

TPC 32. Wideband FFT Plot, $64 \times f_{S} D S D$, SR=44.1 kHz, 0 dBFS @ 10 kHz

## (continued from page 1)

sample rate converters. The AD1955 can be configured in leftjustified, $I^{2} S$, right-justified, or DSP serial port compatible modes. It can support MSB first, twos complement format, 16, 18, 20, and 24 bits in all standard PCM modes. The AD1955 also has an interface for SACD playback and an external digital filter interface for use with an external digital interpolation filter or HDCD decoder. The AD1955 uses a 5 V power supply. It is fabricated on a single monolithic integrated circuit and is housed in a $28-$ lead SSOP package for operation over the temperature range $-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$.

## OPERATING FEATURES

## Serial Data Input Port

The AD1955's flexible serial data input port accepts standard PCM audio data and external digital filter output data in twos complement, MSB-first format in PCM/External Digital Filter Mode, and a dedicated SACD serial port accepts DSD bit stream data in SACD Mode. If the PCM Mode is selected by Control Register 0 Bits 12 and 13, the left channel data field always precedes the right channel data field. The serial data format and word length in PCM Mode are set by the mode select bits (Bits 4 and 5 and Bits 2 and 3, respectively) in the SPI control register.
In all data formats except for the Right-Justified Mode, the serial port will accept an arbitrary number of bits up to a limit of 24 (extra bits will not cause an error, but they will be truncated internally). In Right-Justified Mode, Control Register 0, Bits 2 and 3 are used to set the word length to $16,18,20$, or 24 bits. The default on power up is 24 -bit, $I^{2} S$.
In the External Digital Filter Mode, selected by Control Register 0 Bits 12 and 13, Bits 2 and 3 are used to set the word length to $16,18,20$, or 24 bits and the format is set with Bits 4 and 5 . For a burst-mode clock, the format should be set to left-justified. DSP Mode is not used. The LRCLK is always falling-edge active. The default on power-up is 24-bit mode in PCM and External Digital Filter Mode.
In SACD Mode, selected by Control Register 0 Bits 12 and 13, the SACD port will accept a DSD bit stream.
When the SPI Control Port is not being used, the SPI pins (24, 25 , and 26) should be tied to DGND or DVDD.

## Serial Data Format in PCM Mode

The supported formats are shown in Figure 1. For detailed timing, see Figure 2.
In Left-Justified Mode, LRCLK is high for the left channel and low for the right channel. Data should be valid on the rising edge of BCLK. The MSB is left-justified to an LRCLK transition, with no MSB delay.
In $I^{2} S$ Mode, LRCLK is low for the left channel and high for the right channel. Data should be valid on the rising edge of BCLK. The MSB is left-justified to an LRCLK transition but with a single BCLK period delay.
In DSP serial port mode, LRCLK must pulse high for at least one bit clock period before the MSB of the left channel is valid, and LRCLK must pulse high again for at least one bit clock period before the MSB of the right channel is valid. Data should be valid on the falling edge of BCLK. The DSP serial port mode can be used with any word length up to 24 bits.
In this mode, it is the responsibility of the DSP to ensure that the left data is transmitted with the first LRCLK pulse after RESET, and that synchronism is maintained from that point forward.
In Right-Justified Mode ( 16 bits shown), LRCLK is high for the left channel and low for the right channel. Data should be valid on the rising edge of BCLK.
In normal operation, there are 64 bit clocks per frame (or 32 per half-frame). When the SPI word length control bits (Bits 2 and 3 in Control Register 0) are set to 24 bits ( $0: 0$ ), the serial port will begin to accept data starting at the eighth bit clock pulse after the LRCLK transition. When the word length control bits are set to 20 -bit mode, data is accepted starting at the $12^{\text {th }}$ bit clock position. In 18-bit mode, data is accepted starting at the $14^{\text {th }}$ bit clock position. In 16 -bit mode, data is accepted starting at the 16 th bit clock position.
Note that the AD1955 is capable of a $32 \times \mathrm{f}_{\mathrm{S}}$ BCLK frequency "packed mode" where the MSB is left-justified to an LRCLK transition, and the LSB is right-justified to the next LRCLK transition. LRCLK is high for the left channel, and low for the right channel. Data is valid on the rising edge of BCLK. Packed mode can be used when the AD1955 is programmed in LeftJustified Mode.

## Serial Data Format in External Digital Filter Mode

In the External Digital Filter Mode, the AD1955 will accept up to 24-bit serial, twos complement, MSB-first data from an external digital filter, an HDCD decoder, or a general-purpose DSP. If the External Digital Filter Mode is selected by Control Register 0, Bits 12 and 13, Pin 2 to Pin 5 are assigned as the word clock input (EF_WCLK, Pin 2), bit clock input (EF_BCLK, Pin 3), left channel data input (EF_LDATA, Pin 4), and right channel data input (EF_RDATA, Pin 5), respectively, to accept $8 \mathrm{f}_{\mathrm{S}}(48 \mathrm{kHz}), 4 \mathrm{f}_{\mathrm{S}}(96 \mathrm{kHz})$, or $2 \mathrm{f}_{\mathrm{S}}(196 \mathrm{kHz})$ oversampled data.
Left and right channel data should be valid on the rising edge of EF_BCLK. The mode can be set to Left- or Right-Justified. A burst mode BCLK can be used in Left-Justified Mode.

## Serial Data Format in SACD Mode

In the SACD Mode, the AD1955 supports both normal mode or phase modulation mode, which are selected by Control Register 1, Bit 6 . If normal mode is selected, DSD_SCLK, DSD_LDATA, and DSD_RDATA are used to interface with DSD decoder chip. In this mode, the DSD data is clocked in the AD1955 using the rising edge of DSD_SCLK with a $64 \mathrm{f}_{\mathrm{S}}$ rate, 2.8224 MHz . DSD_PHASE pin should be connected LOW.
If Phase Modulation Mode is selected, the DSD_PHASE pin is also used to interface with the DSD decoder. In this mode, a $64 \mathrm{f}_{\mathrm{S}}$ DSD_PHASE signal is used as a reference signal to receive the data from the decoder. The DSD data is clocked into the AD1955 with a $128 \mathrm{f}_{\mathrm{S}}$ DSD_SCLK.
The AD1955 can operate as a master or slave device. In Master Mode, the AD1955 will output DSD_SCLK and DSD_PHASE (if in Phase Modulation Mode) to a DSD decoder and will support Normal Mode and Phase Modulation Mode 0. In Slave Mode, the AD1955 will accept DSD_SCLK and DSD_PHASE (if in Phase Modulation Mode) from a DSD decoder and supports all of the normal and phase modulation modes.
When the SACD Port is not being used, the SACD pins (Pins $6,7,8$, and 9 ) should be tied to a valid logic level. Please note that there are weak pull-ups ( 0.6 mA typical) on DSD_SCLK and DSD_PHASE.

## Master Clock

The AD1955 must be set to the proper sample rate and master clock rate using Control Registers 0 and 1. The allowable master clock frequencies for each interpolation mode are shown below.

In the SACD Mode, the AD1955 accepts a $256 \mathrm{f}_{\mathrm{S}}, 512 \mathrm{f}_{\mathrm{S}}$, or $768 \mathrm{f}_{\mathrm{S}}$ Master Clock, where $\mathrm{f}_{\mathrm{S}}$ is nominally 44.1 kHz . In Slave Mode, by default, the rising edge of DSD_SCLK should coincide with the rising edge of MCLK. Control Register 1, Bit 2 should be set to 1 if the rising edge of DSD_SCLK coincides with the falling edge of MCLK. In Master Mode this bit can be used to select the MCLK edge used to generate the DSD clock outputs.

## Zero Detection

When the AD1955 detects that the audio input data is continuously zero during 1024 LRCLK periods in PCM Mode or 8192 LRCLK periods in $8 \mathrm{f}_{\mathrm{S}}$ External Digital Filter Mode, ZEROL (Pin 21) or ZEROR (Pin 20) is set to active.
When the AD1955 is in SACD Mode, it will detect an SACD mute pattern. If the input bit stream shows a mute pattern for about 22 ms , the AD1955 will set ZEROL (Pin 21) or ZEROR (Pin 20) to active. The outputs can be set to active high or low using Control Register 1, Bit 8.

## Reset/Power-Down

The AD1955 will be reset when the $\overline{\mathrm{PD} / \mathrm{RST}}$ pin is set low. The part may be powered down using Bit 15, Control Register 0.

## Audio Outputs

Active I/V converters should be used, which will hold the DAC outputs at a constant voltage level. Passive I/V conversion should not be used, since the DAC performance will be seriously degraded. For best THD + N performance over temperature, a reference voltage of 2.80 V should be used with the I/V converters. For a lower parts count, the voltage at FILTR can be used. In this instance, THD + N performance at high temperature can be improved by reducing $\mathrm{I}_{\text {REF }}$, with an attendant reduction in gain (linear dependence) and DNR/SNR (square-root dependence).
The AD1955 audio outputs sink a current proportional to the input signal, superimposed on a steady bias current. The cur-rent-to-voltage (I/V) converters used need to be able to supply this bias current, as well as the signal current, or a resistor or current source can be used to a positive voltage to null this current in order to center the range of the I/V converters.
If pull-up resistors are used to bring the output of the I/V converters to 0 V for maximum headroom and THD balance, as shown in the applications circuits, the following equation can be used:

$$
R_{\text {PULLUP }}=\left[V_{S U P P L Y}-V_{B I A S}\right] /\left[I_{B I A S}+\left(V_{B I A S} / R_{I / V}\right)\right]
$$

In the External Filter Mode, the AD1955 accepts master clock frequencies depending on the input sample rate as shown below.

PCM Mode

| Interpolation Mode | Allowable Master Clock Frequencies ( $\times \mathrm{f}_{\mathbf{S}}$ ) |  |  |  |  |  |  |  | Nominal Input Sample Rate ( $\mathbf{k H z \text { ) }}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | 64 | 96 | 128 | 192 | 256 | 384 | 512 | 768 |  |
| 48 kHz (INT 8×) Mode |  |  |  |  | - |  | - | $\bullet$ | 32, 44.1, 48 |
| 96 kHz (INT 4×) Mode |  |  | $\bullet$ |  | - | - |  |  | 88.2, 96 |
| 192 kHz (INT $2 \times$ ) Mode | - |  | - | $\bullet$ |  |  |  |  | 176.4, 192 |

| External Filter Mode |  |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Input Sample Rate | Allowable Master Clock Frequencies ( $\times \mathrm{f}_{\mathbf{S}}$ ) |  |  |  |  |  |  |  | Nominal Input Sample Rate (to External Filter) (kHz) |
|  | 64 | 96 | 128 | 192 | 256 | 384 | 512 | 768 |  |
| $8 \times \mathrm{f}_{\text {S }}$ |  |  |  |  | - |  | - | - | 32, 44.1, 48 |
| $4 \times \mathrm{f}_{\text {S }}$ |  |  | $\bullet$ |  | $\bullet$ | - |  |  | 88.2, 96 |
| $2 \times \mathrm{f}_{\mathrm{S}}$ | - |  | - | - |  |  |  |  | 176.4, 192 |

For example, with the stereo circuits given in Figures 7 through 10 , this gives:

$$
[12.0 \mathrm{~V}-2.80 \mathrm{~V}] /[3.24 \mathrm{~mA}+(2.80 \mathrm{~V} / 2.00 \mathrm{~K})]=1.98 \mathrm{k} \Omega
$$

A $2.00 \mathrm{k} \Omega$ resistor is used.
The supply used should be as quiet as possible.

## Serial Control Port

The AD1955 has an SPI compatible control port to permit programming the internal control registers. The SPI control port is a 3-wire serial port. Its format is similar to the Motorola SPI format except that the input data-word is 16 bits wide. The serial bit clock may be completely asynchronous to the sample rate of the DAC. The following figure shows the format of the SPI signal Note that the CCLK may be continuous or a 16 -clock burst.

## SPI REGISTER DEFINITIONS

Table I. DAC Control Register 0

| Bit | Description | Value | Definition |
| :---: | :---: | :---: | :---: |
| 15 | Power-Down | $\begin{aligned} & 0 \\ & 1 \end{aligned}$ | Operation <br> Powered Down |
| 14 | Mute | $\begin{aligned} & 0 \\ & 1 \end{aligned}$ | Not Muted Muted |
| 13:12 | Data Format | $\begin{aligned} & 00 \\ & 01 \\ & 10 \\ & 11 \end{aligned}$ | PCM <br> External DF <br> SACD Slave <br> SACD Master |
| 11:10 | Output Format | $\begin{aligned} & 00 \\ & 01 \\ & 10 \\ & 11 \end{aligned}$ | Stereo <br> Not Allowed <br> Mono Left <br> Mono Right |
| 9:8 | PCM Sample Rate | $\begin{aligned} & 00 \\ & 01 \\ & 10 \\ & 11 \end{aligned}$ | $\begin{aligned} & 48 \mathrm{kHz} \\ & 96 \mathrm{kHz} \\ & 192 \mathrm{kHz} \\ & \text { Reserved } \end{aligned}$ |

| 3:2 | PCM/EF Serial Data Width | $\begin{aligned} & 00 \\ & 01 \\ & 10 \\ & 11 \end{aligned}$ | 24 bits 20 bits 18 bits 16 bits |
| 1:0 | SPI Register Address | 00 |  |

Table II. DAC Control Register 1

| Bit | Description | Value | Definition |
| :--- | :--- | :--- | :--- |
| $10: 9$ | MCLK Mode | 00 | $256 \times \mathrm{f}_{\mathrm{S}}$ |
|  |  | 01 | $512 \times \mathrm{f}_{\mathrm{S}}$ |
|  |  | 10 | $768 \times \mathrm{f}_{\mathrm{S}}$ |
| 8 | Zero Flag Polarity | 0 | Reserved |
| 7 |  | 11 | Active High |
|  | SACD Bit Rate | 0 | $64 \times \mathrm{f}_{\mathrm{S}}$ |
| 6 | SACD Mode | 1 | $128 \times \mathrm{f}_{\mathrm{S}}$ |
| $5: 4$ | SACD Phase Select | 0 | Normal |
|  |  | 1 | Phase Mode |
|  |  | 00 | Phase 0 |
| 3 | SACD Bit Inversion | 0 | Phase 1 |
|  |  | 10 | Phase 2 |
| 2 | SACD MCLK to | 0 | Normal |
|  | BCLK Phase | 1 | Rising Edge |
| $1: 0$ | SPI Register Address | 01 | Falling Edge |

Default $=0$
Table III. DAC Volume Registers

| Bit | Description | Value | Definition |
| :--- | :--- | :--- | :--- |
|  |  | $14-$-Bit |  |
| $15: 2$ | Volume | Unsigned |  |
| $1: 0$ | SPI Register Address | 10 | Left Volume |
|  |  | 11 | Right Volume |

[^3]
notes

1. DSP MODE DOES NOT IDENTIFY CHANNEL.
2. LRCLK NORMALLY OPERATES AT $f_{S}$ EXCEPT FOR DSP MODE, WHICH IS $2 \times f_{s}$.
3. BCLK FREQUENCY IS NORMALLY $64 \times$ LRCLK BUT MAY BE OPERATED IN BURST MODE.
