Your Total Design Partner

When you need a custom sensor, Cherry provides the design expertise and development tools needed to bring your product to market quickly. We focus on innovation within our core competencies of magnetics, packaging, electronic design, and sealing technologies to assure our customers reliable sensing solutions.

Consider a few of the capabilities Cherry can deliver to your next custom sensor project:

- Using a solid model design concept developed by the customer, Cherry design engineers apply 3D magnetic modeling to ensure appropriate airgaps and magnetic fields are designed in at the start of the project.

- When harsh environments are involved, Cherry recommends appropriate packaging and sealing technology. Our packaging innovations have resulted in sensors that perform under extreme conditions: temperatures up to 150°C, immersion in solvents to IP68, and exposure to salt spray, dust, gravel and repeated thermal shock.
- With Cherry's in-house stereolithography and prototype line, we can quickly provide a highly engineered design.
- We match the latest solid state magnetic sensor technologies to proprietary circuits capable of providing EMI, ESD, EMC and Conducted Immunity resistance tough enough to exceed automotive standards.
- To simulate the wide range of environments that our products experience in the field, Cherry's testing facilities provide concept evaluation, design and product validation, and continuous conformance testing to international standards.
- In-house high-density circuit board assembly assures the quality of our electronics.
- TS-16949 certified factories on multiple continents provide you with advantages in speed, cost and flexibility.

Put Cherry's broad capabilities to work for you in your most demanding applications.

Current Sink Interfacing

3-Wire Sinking Interface

Sinking outputs are often used in negative logic applications, where a low signal is required for an active state. There, sinking outputs normally have current flowing into the device output lead when the device is active. Also called “open collector outputs,” sinking outputs are compatible with any logic family since a wide voltage range may be used for Vcc. Furthermore, the voltage level used to power the Hall effect assembly may differ from the pull-up resistor to which it is attached. The external pull-up resistor connected between the output and Vcc is required for proper operation. With the resistor connected as shown, the output will be “pulled up” to Vcc when off and (approximately) to ground when on.

Recommended pull-up resistor values are as follows:

Volts dc	5	9	12	15	24
Ohms	1k	1.8k	2.4k	3k	3k

REED AND GEARTOOTH

Sensor Operation

MP Series Reed Sensors

A Reed Sensor is an omnipolar, magnetically activated switch. It can be approached by a magnet from any angle, with either pole. Several possible operating methods are shown at right.

Rotational Magnet Travel

Operating a Speed Sensor

Although commonly called a geartooth sensor, a solid-state speed sensor can detect the motion of various ferrous objects with some type of discontinuous surface.

Examples of appropriate targets include:

- Sprockets
- Bolt Heads
- Roller Chains
- Cavities in a Smooth Surface

Solid-State Speed Sensor

For best results, we recommend targets made from low carbon cold rolled steel. Other factors that influence sensor performance include geartooth height and width, space between teeth, shape of the teeth and thickness of the target. As a general guideline, consider a target with the following minimum parameters:

Tooth Height	Tooth Width	Distance Between Teeth	Target Thickness
.200"	.100"	.400"	.250"

Cherry's solid-state magnetic position sensors also make excellent speed sensors when coupled with a rotating ring magnet. Advantages of this approach include:

- lower sensor cost
- larger airgaps and
- absolute zero-speed sensing.
