

DESCRIPTION

The LX5506 is a power amplifier designed for the FCC Unlicensed National Information Infrastructure (U-NII) band, HyperLAN2 and Japan WLAN applications in the 4.9-5.95 GHz frequency range. The PA is implemented as a three-stage monolithic microwave integrated circuit (MMIC) with active bias and complete on-chip input matching. The device is manufactured with an InGaP/GaAs Heterojunction Bipolar Transistor (HBT) IC process (MOCVD). It operates at a single positive voltage supply of 3.3V (nominal), with +26dBm of P1dB and up to 23dB power gain in the 5.15 - 5.85GHz frequency range with a simple output matching capacitor pair.

For OFDM operation (64QAM, 54Mbps), the PA provides +18dBm linear output power with a very low EVM (Error-Vector Magnitude) of 3%, and consumes about 190mA total DC current. At higher supply voltage of 5V, the same device provides +24dBm linear OFDM output power with 5% EVM.

The LX5506 is available in a 16-pin 3mmx3mm micro-lead package (MLP). The compact footprint, low profile, and excellent thermal capability of the MLP package makes the LX5506 an ideal solution for broadband, high-gain power amplifier requirements for IEEE 802.11a, and HiperLAN2 portable WLAN applications.

- 4) For Vref<2.9V operation please contact technical support for BOM modification.
- 5) C6 can be eliminated when VC/VCC pins are tied together in multilayer board layout.
- 6) C7 ensures ~100ns switching time for PA on/off.
- 7) For PA switching speed test C8 should be moved to input side of the switch.

Note: For higher output power applications VC can be increased up to 5V with +/-10% tolerance. Contact Microsemi for details on application circuit schematic and BOM.
