8-Bit Shift Register/Latch with 3-STATE Outputs

General Description

The CD4094B consists of an 8-bit shift register and a 3-STATE 8-bit latch. Data is shifted serially through the shift register on the positive transition of the clock. The output of the last stage (Q_S) can be used to cascade several devices. Data on the Q_S output is transferred to a second output, Q'_S, on the following negative clock edge.

The output of each stage of the shift register feeds a latch, which latches data on the negative edge of the STROBE input. When STROBE is HIGH, data propagates through the latch to 3-STATE output gates. These gates are enabled when OUTPUT ENABLE is taken HIGH.
Features

■ Wide supply voltage range: 3.0V to 18V

■ High noise immunity: 0.45 V_{DD} (typ.)

■ Low power TTL compatibility:
   Fan out of 2 driving 74L or 1 driving 74LS

■ 3-STATE outputs

Devices also available in Tape and Reel. Specify by appending the suffix letter "X" to the ordering code.

Operating Temperature Range (T_A)	–40°C to +85°C

Note 2: "Absolute Maximum Ratings" are those values beyond which the safety of the device cannot be guaranteed; they are not meant to imply that the devices should be operated at these limits. The tables of "Recommended Operating Conditions" and "Electrical Characteristics" provide conditions for actual device operation.

Note 3: V_{SS} = 0V unless otherwise specified.
