## Functional description

The AS7C1025B is a high-performance CMOS 1,048,576-bit Static Random Access Memory (SRAM) devices organized as $131,072 \times 8$ bits. They are designed for memory applications where fast data access, low power, and simple interfacing are desired.
Equal address access and cycle times ( $\mathrm{t}_{\mathrm{AA}}, \mathrm{t}_{\mathrm{RC}}, \mathrm{t}_{\mathrm{WC}}$ ) of $10 / 12 / 15 / 20 \mathrm{~ns}$ with output enable access times ( $\mathrm{t}_{\mathrm{OE}}$ ) of 5/6/7/8 ns are ideal for highperformance applications. The chip enable input $\overline{\mathrm{CE}}$ permits easy memory and expansion with multiple-bank memory systems.
When $\overline{\mathrm{CE}}$ is high, the device enters standby mode. If inputs are still toggling, the device will consume $\mathrm{I}_{\mathrm{SB}}$ power. If the bus is static, then full standby power is reached $\left(\mathrm{I}_{\mathrm{SB} 1}\right)$. For example, the AS7C1026B is guaranteed not to exceed 55 mW under nominal full standby conditions.

A write cycle is accomplished by asserting write enable ( $\overline{\mathrm{WE}})$ and chip enable $(\overline{\mathrm{CE}})$. Data on the input pins I/O0 through I/O7 is written on the rising edge of $\overline{\mathrm{WE}}$ (write cycle 1 ) or $\overline{\mathrm{CE}}$ (write cycle 2 ). To avoid bus contention, external devices should drive I/O pins only after outputs have been disabled with output enable ( $\overline{\mathrm{OE}})$ or write enable $(\overline{\mathrm{WE}})$.
A read cycle is accomplished by asserting output enable ( $\overline{\mathrm{OE}}$ ) and chip enable ( $\overline{\mathrm{CE}}$ ), with write enable ( $\overline{\mathrm{WE}}$ ) high. The chips drive I/O pins with the data word referenced by the input address. When either chip enable or output enable is inactive or write enable is active, output drivers stay in high-impedance mode.
All chip inputs and outputs are TTL-compatible, and operation is from a single 5 V supply. The AS7C1025B is packaged in common industry standard packages.

This is a stress rating only and functional operation of the device at these or any other conditions outside those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

## Notes

During $\mathrm{V}_{\mathrm{CC}}$ power-up, a pull-up resistor to $\mathrm{V}_{\mathrm{CC}}$ on $\overline{\mathrm{CE}}$ is required to meet $\mathrm{I}_{\mathrm{SB}}$ specification.
2 This parameter is sampled, but not $100 \%$ tested.
3 For test conditions, see AC Test Conditions, Figures A and B.
$4 \mathrm{t}_{\mathrm{CLZ}}$ and $\mathrm{t}_{\mathrm{CHZ}}$ are specified with $\mathrm{CL}=5 \mathrm{pF}$, as in Figure B. Transition is measured $\pm 500 \mathrm{mV}$ from steady-state voltage.
5 This parameter is guaranteed, but not $100 \%$ tested.
$6 \quad \overline{\mathrm{WE}}$ is high for read cycle.
$7 \quad \overline{\mathrm{CE}}$ and $\overline{\mathrm{OE}}$ are low for read cycle.
8 Address is valid prior to or coincident with $\overline{\mathrm{CE}}$ transition low.
9 All read cycle timings are referenced from the last valid address to the first transitioning address.
10 N/A
11 All write cycle timings are referenced from the last valid address to the first transitioning address.
2 N/A.
$3 \mathrm{C}=30 \mathrm{pF}$, except all high Z and low Z parameters where $\mathrm{C}=5 \mathrm{pF}$.
