The LXT-811-S transducer converts temperature from an input sensor to the output current signal 4...20mA. A device works as a current loop regulator with galvanic separation between an input sensor and the output. The LXT-811-S is self powered from the current loop. A device assures cold junction compensation (if thermocouple is connected as input signal) or it makes input wire resistance compensation (if resistive element is connected). LXtconfig software is dedicated for setting sensor type, measurement range, sensor break signalization, fine calibration and it allows to define custom sensor characteristic. There is possibility to deliver device for non-standard signals on demand.

LXtconfig is a software dedicated for easy configuration of the device. It runs on PC computer and requires Windows operating system.

Features of the software:

- easy menu,
- read current configuration of a device,
- read/write configuration setting from/to a file,
- configuration printout,
- password (optional) against any changes,
- input signal simulation (monitor mode),
- data logging to a file in the CSV format (easy import into MS Excel),
- graphical chart logged data,
- chart printout.
