Capacitive proximity sensors

OsiSense XT

Detection of insulated or conductive materials

Applications: detection of any object irrespective of material or conductivity, for example: metals, minerals, wood, plastic, glass, cardboard, fluids, etc.

Cylindrical sensors, flush mountable, metal case

Detection of insulated or conductive materials: presence, passage of paper, cardboard, glass, etc.

Form	Cylindrical

Presentation

Advantages

- No physical contact with the object to be detected.
- High operating rates.
- Solid-state product, no moving parts (service life not related to number of operating cycles).
- Detection of any object irrespective of material or conductivity, for example: metals, minerals, wood, plastic, glass, cardboard, leather, ceramic, fluids, etc.

Operating principle

An electrical field is created between 2 electrodes on the front face of the sensor. These electrodes constitute a capacitor with a capacitance of:

$$C = \epsilon_0 * \epsilon_r * A/d \text{ where:}$$

$\epsilon_0 = 8.854\ 187 \text{ pF/m}$ (permittivity in free space)

ϵ_r : relative permittivity of the material present between the 2 electrodes

A: dimensions of electrodes

d: distance between electrodes

All materials where $\epsilon_r > 2$ will be detected.

When an object of any material ($\epsilon_r > 2$) passes the sensing face of the sensor, it modifies the coupling capacitance ($C1$).

This variation in capacitance ($C1 > C0$) instigates the starting of the oscillator which, in turn, causes the output driver to operate and provides an output signal.

Types of sensor

Sensors flush mountable in support

The special feature of these versions is the shape of the electrical field which is rectilinear and confined within the dimensions of the product.

Cylindrical and block type models used for the detection of insulated materials (wood, plastic, cardboard, glass...), conductive materials (metal...) or liquid through an insulated partition (glass, plastic...) with a maximum thickness of 4 mm.

These products are recommended for:

- comparatively short detection distances,
- applications requiring flush mounting of the sensor,
- detection through a partition (example: detection of glass through cardboard),
- side by side mounting.

Sensors non flush mountable in support

Cylindrical models (plastic case).

The spherical shape of the electrical field enables detection of any type of material whether it be solid, liquid, granular... (metal, water, oil, plastic pellets, powder, flour...). Detection can be achieved through a partition or by direct contact (immersion) of the active surface with the object to be detected.

Distances to be adhered to around the sensing face. (See characteristics page 15).

Mounting precautions

Non flush mountable models cannot be flush mounted in their support. The non flush mountable models require a free zone around the active head. (See page 15).

Terminology

Definitions

In order to ensure that customers can make reliable product comparisons and selection, the standard IEC 60947-5-2 defines various sensing distances, such as:

Nominal sensing distance (S_n)

The rated operating distance for which the sensor is designed. It does not take into account any variations (manufacturing tolerances, temperature, voltage).

Effective sensing distance (S_r)

The effective sensing distance is measured at the rated voltage (U_n) and the rated ambient temperature ($23\text{ °C} \pm 5\text{ °C}$)

It must be between 90% and 110% of S_n .

Usable sensing distance (S_u)

The usable sensing distance is measured at the limits of the permissible variations in the ambient temperature and at a supply voltage equal to 85% and 110% of the rated voltage.

It must be between 80% and 120% of S_r .

Assured operating distance (S_a)

This is the operating zone of the sensor.

The assured operating distance is between 0 and 72% of S_n .

Standard metal target

The standard IEC 60947-5-2 defines the standard metal target as a square mild steel (Fe 360) plate, 1 mm thick.

The side dimension of the plate is either equal to the diameter of the circle engraved on the sensing face of the sensor or 3 times the nominal sensing distance (S_n).

PE = pick-up point, the target is detected

PR = drop-out point, the target is no longer detected

Repeat accuracy

The repeat accuracy (R) is the repeatability of the sensing distance between successive operations. Readings are taken over a period of time whilst the sensor is subjected to voltage and temperature variations: 8 hours, 10 to 30 °C, $U_n \pm 5\%$.

It is expressed as a percentage of the effective sensing distance S_r .

Differential travel

The differential travel (H) or hysteresis, is the distance between the operating point, as the standard metal target moves towards the sensor, and the release point, as it moves away.

This hysteresis is essential for the stable operation of the sensor.

Terminology (continued)

Sensitivity of the sensor

All our sensors incorporate a sensitivity adjustment potentiometer. This enables the sensitivity of the sensor to be adjusted to suit the type of object to be detected.

Depending on the sensor version, the sensitivity adjustment potentiometer is either mounted on the side or the rear.

The sensors are factory preset for nominal sensitivity.

Depending on the application, adjustment of the sensitivity could be necessary as follows:

- increasing the sensitivity for objects which have a weak influence (weaker): paper, cardboard, glass, plastic,
- decreasing the sensitivity for objects which have a strong influence (stronger): metals, liquids.

However, in the event of severe variations in the ambient conditions, do not increase the sensitivity of the sensor such that it is set to its maximum operating limits.

An increase in sensitivity causes an increase in the switching hysteresis.

Operating distances

The operating distance of the sensor is related to the dielectric constant (ϵ_r) of the object material to be detected.

The higher the value of ϵ_r , the easier the detection of the object will be.

The assured operating distance depends on the object material: $S_a = S_n \times F_c$

S_a = assured operating distance,

S_n = nominal sensing distance of the sensor,

F_c = correction factor related to the object material.

Example: sensor XT130B1PAL2 used to detect a rubber object.

$S_n = 10 \text{ mm}$, $F_c = 0.3$.

Assured operating distance $S_a = 10 \times 0.3 \text{ mm}$.

The list below indicates the dielectric constant values of the most common object materials, together with their correction factors (F_c) for the nominal sensing distance of the sensor.

Material	ϵ_r	F_c	Material	ϵ_r	F_c
Air	1	0	Petrol	2.2	0.2

Environment

■ **Electromagnetic interference**

The sensors undergo electromagnetic interference testing in accordance with the recommendations of standard IEC 60947-5-2 (electrostatic discharges, radiated electromagnetic fields, fast transients, impulse voltages).

■ **Thermal influences**

It is advisable to remain within the values stated on the characteristic pages so as to avoid sensing distance drift and possible incorrect operation of the sensor.

■ **Chemical agents**

To ensure a long service life, it is essential that any chemicals coming into contact with the case of the sensor are non corrosive.

■ **Earthing**

Earthing of an object that has high conductivity increases the sensing distance.

Additional information relating to outputs

Refer to corresponding pages relating to inductive proximity sensors for:

- Terminology.
- Details and specific aspects of 2-wire and 3-wire type connection.
- Connecting several sensors in series or parallel.

Application examples:

Bottle filling

■ **Bottle arrival**

- Bottles are fed on a conveyor for filling. Sensors 1 and 2 are in an unoperated state.
- Adjustment:
 - sensor 1 is adjusted to detect the bottle,
 - sensor 2 is adjusted to detect the water in the bottle.

■ **Bottle filling**

As soon as the bottle enters the detection zone of sensor 1, the filling operation commences. Sensor 2 remains in the unoperated state.

■ **Filling complete**

Sensor 2 detects that the required level has been reached and stops further filling.

Reminder: the wall of the container must be non metallic and its thickness ≤ 4 mm

Livestock feeder filling

Capacitive technology is particularly suited for the detection of feed levels in automatic dispensers for livestock. Any type of feed can be detected (pellets, powders, broths, grains, pastas, etc.). The materials used, as well as the degree of protection of the sensor, have been specially selected to tolerate the acidic and dusty environments associated with this application.

Fast transients	IEC 61000-4-4	kV	2							

(1) These sensors do not incorporate overload or short-circuit protection and therefore, it is essential to connect a "quick-blow" fuse in series with the load (see page 12).

(2) The supply cable can have a 14 mm maximum diameter sheath.

Application example (XT230A2MDB)

Automatic feed system for livestock

Capacitive proximity sensors

OsiSense XT

Cylindrical, non flush mountable. Plastic case

AC or DC supply

Dimensions

Fuse terminal block

Description	Sold in lots of	Unit reference	Weight kg
Fuse terminal block for 5 x 20 fuses, grey	50	AB1FUSE435U5X	0.016

Dimensions

XT7C40●●●●●

- (1) Output LED
- (2) Supply LED (depending on model)
- (3) 1 tapped entry for 13P cable gland
- (4) 2 elongated holes $\varnothing 5.3 \times 7$

Capacitive proximity sensors

OsiSense XT
For detection of insulated materials
40 x 40 x 117 format.
Plastic case, plug-in. Turret head
AC or DC supply

Characteristics			
Sensor type		XT7C40●C440	XT7C40FP262
Connection		Screw terminals, clamping capacity 4 x 1.5 mm ² (1)	Screw terminals, clamping capacity 3 x 1.5 mm ² (1)
Degree of protection	Conforming to IEC 60529	IP 67	
Operating zone	mm	0...10.8	
Repeat accuracy		≤ 0.1 Sr	
Product certifications		UL, CSA, CE	
Differential travel		≤ 0.2 Sr	
Operating temperature	°C	- 25...+ 70	
Output state indication		Yellow LED: output Green LED: supply	Yellow LED: output
Rated supply voltage	V	⎓ 12...48	~ 24...240 (50/60 Hz)
Voltage limits (including ripple)	V	⎓ 10...58	~ 20...264
Switching capacity	mA	0...200 with overload and short-circuit protection	5...350 (2 A inrush) (2)
Voltage drop, closed state	V	≤ 2	≤ 5.5
Residual current, open state	mA	–	≤ 1.5
Current consumption, no-load	mA	≤ 10	–
Maximum switching frequency	Hz	100	25
Delays	First-up	ms	≤ 30
	Response	ms	≤ 5
	Recovery	ms	≤ 5

(1) Cable gland not included with sensor. Suitable 13P cable gland: XSZPE13.

(2) These sensors do not incorporate overload or short-circuit protection and therefore, it is essential to connect a "quick-blow" fuse in series with the load (see page 12).

Wiring schemes

3-wire ⎓

NO + NC output

2-wire ~ programmable

NO or NC output, depending on position of link

Setting-up

Minimum mounting distances (mm)

Side by side

Face to face

XT7 flush mountable

$e \geq 40$

$e \geq 120$

Flush mounting

To avoid interference by the immediate surroundings, it may be necessary to reduce the sensitivity when flush mounting the sensor.
