

# Features

- RoHS-compliant for all 6 substances
- Wide input voltage range 12 to 154 VDC
- Output: 50 to 80 VDC
- Class III equipment (no isolation input/output)
- Extremely high efficiency
- · Excellent surge and transient protection
- Externally adjustable output voltage
- · Programmable undervoltage lockout and inhibit
- · Interruption time with external capacitor
- EN 50155, 50121-3-2 observed

Safety-approved to IEC/EN 60950-1 and UL/CSA 60950-1  $2^{\,nd}$  Ed.

# Description

The boost converters were designed in accordance with the standards EN 50155 and EN 50121-3-2 to meet the requirements of various railway and industrial applications in rugged environment. They are particularly suitable to expand the input voltage range of power supplies (e.g. 110IMY15 or 110IMY70 Series DC-DC converters). An additional circuit allows for providing a predefined interruption time. When the input voltage exceeds a predefined output voltage level, the input voltage is directly fed forward. The converters exhibit an input EMC-filter.

The boost converters are available in a fully enclosed case or open-frame (option Z).

# **Functional Description**

The IBX15 boost converter is designed as step-up converter in order to increase the input voltage  $V_i$  to the regulated boost voltage  $V_{oBr}$ .

When  $V_i$  exceeds  $V_{oB tr}$ , the output voltage follows  $V_i$ . The resulting voltage (see fig. 1) is within the range of  $V_{oB tr}$  to  $V_{i max}$ , which is suitable for adequate DC-DC converters, e.g. 20IMX15 or 24IMX70 for 12IBX15-25 and 110IMY15 or 110IMY70 for 24/36IBX15-50. The IBX15 converters have no input-to-output isolation; isolation is provided by the DC-DC converters connected to the output.

The inrush current is not limited, but the output capacitor of the IBX15 and the input capacitors of the connected DC-DC converters are relatively small.

The switching frequency is approximately  $2 \times 200$  kHz (interleaved). A current limiting circuit protects the main FETs from overload. However, the output is not short-circuit proof.

The logic is biased by an auxiliary converter with a switching frequency of approx. 350 kHz. The boost voltage  $V_{\rm oB}$  can be

Vo versus Vi depending on VoBtr.

trimmed by resistor  $R_{\rm BA}$  to a higher level  $V_{\rm oB\ tr}$ . This allows together with an external storage capacitor  $C_{\rm hu}$  the realization of an interruption time as requested by the railway standard EN 50155. No other components are needed.

# **Electrical Input Data**

General Conditions:

 $- T_A = 25$  °C, unless  $T_C$  is specified.

# **Input Protection and Fuse**

No fuse is incorporated inside the converter. Consequently, an external fuse or a circuit breaker at system level should be installed to protect against severe defects; see table 4.

Reverse polarity protection is provided by an antiparallel diode across the input, causing the external input fuse or circuit breaker to trip.

**Note:** The fuses in table 4 apply to batteries with  $V_{i \text{ nom}} = 24 \text{ or } 36$  V. In applications using batteries with higher voltage, fuses with lower current may suit better.

Table 4: Recommended external fuses in the non-earthed input line

| 27                                      | 27                    | 27                    | 38                |  |  |

current. Table 5 shows the values of the resistor  $R_{\rm PUL}$ , connected between PUL and Vi-, versus the resultant minimum input voltage and the resultant maximum input current.

Note: If PUL is connected to Vi-, the converter is disabled (shutdown).

# Efficiency

Fig. 3

Efficiency versus input voltage and output current (24IBX15-50-0G)

# **Interruption Time**

The interruption time of a system comprised of a step-up converter IBX15 (Rev. AB or later) and connected converters

Fig. 4 System with increased interruption time

can easily be increased by an external capacitor  $C_{\rm hu}$  and adjusting the boost voltage  $V_{\rm oB\,tr}$  to a higher level. As an example, fig. 4 shows a 36IBX15-50 supplying a DC-DC converter 110IMY70-12.

Formula for the external boost capacitor  $C_{hu}$ :

$$C_{\rm hu} = \frac{2 \bullet P_{\rm o} \bullet t_{\rm hu}}{(V_{\rm oB tr}^2 - V_{\rm i min}^2)}$$

whereas:

 $C_{hu}$  = external boost capacitance [mF]

P<sub>o</sub> = output power = input power of the supplied converter [W]

 $t_{hu}$  = interruption or hold-up time [ms]

 $V_{i \min}$  = min. input voltage of supplied converters [V]

 $V_{\text{oB tr}}$  = boost voltage trimmed using  $R_{\text{BA}}$  [V]

The external boost capacitor is loaded by a current source to the preselected boost voltage  $V_{\text{oB tr}}$ . This current source is activated after  $V_{\text{o}}$  has reached or exceeded  $V_{\text{oB tr}}$ . If the input voltage is increasing further, the boost capacitor is not charged beyond  $V_{\text{oB tr}}$ . Consequently, its rated voltage needs not to be much higher than  $V_{\text{oB tr}}$ .

In the case of input voltage loss, the output voltage  $V_{oB}$  drops rapidly to  $V_{oB tr}$  until the diode  $D_{hu}$  connects the output with the

Fig. 5

Increased interruption time.  $V_i = 110 \text{ V}$ ,  $C_{hu} = 560 \ \mu\text{F}/100 \text{ V}$ ,  $P_o = 90 \text{ W}$ ,  $V_{oB \text{ tr}} = 80 \text{ V}$ ,  $R_{BA} = 0 \ \Omega$ . (24IBX15-50-0G)

# **Electrical Output Data**

General Conditions: -  $T_A = 25$  °C, unless  $T_C$  is specified.  $V_i < V_{oB min}$ ,  $I_o < I_{o nom}$

<sup>1</sup> For other values use the formula in section Interruption Time !

# **Parallel or Series Operation**

Not possible.

# **Thermal Considerations**

If a converter, mounted on a PCB, is located in free, quasistationary air (convection cooling) at the indicated maximum ambient temperature  $T_{A max}$  (see table *Temperature specifications*) and is operated at its nominal operating conditions, the case temperature measured at the measuring point of case temperature  $T_C$  (see *Mechanical Data*) will approach the indicated value  $T_{C max}$  after the warm-up phase. However, the relationship between  $T_A$  and  $T_C$  depends heavily on the conditions of operation and integration into a system. The thermal conditions are influenced by input voltage, output current, airflow, temperature of surrounding components and surfaces, and the properties of the printed circuit board.  $T_{A max}$ is therefore only an indicative value.

**Caution:** The case temperature  $T_C$  measured at the measuring point of case temperature  $T_C$  (see *Mechanical Data*) shall under no circumstances exceed the specified maximum value. The installer must ensure that under all operating conditions  $T_C$  remains within the limits stated in the table *Temperature specifications*.

### **Overtemperature Protection**

The converters are protected from possible overheating by an internal temperature monitoring circuit. It shuts down the converter above the internal temperature limit, and automatically restarts, after the temperature dropped.

24IBX15:  $I_o$  versus temperature  $I_{o nom} = 1.6 \text{ A}, V_i = 16.8 \text{ V}, V_{oB tr} = 50 \text{ V}$ 

# **Auxiliary Functions**

# **Boost Voltage Adjust**

The regulated boost voltage  $V_{\text{OB tr}}$  can be adjusted by an external adjust resistor  $R_{\text{BA}}$ ; see fig. 1. The values of  $R_{\text{BA}}$  are specified in table 6.

| Table 6: Typical values for R <sub>BA</sub> and the resultant boost         |

| 11.2                                    | 70                     | 0.92                      | 70                     | 1.26                      |
| 4.3                                     | 75                     | 0.84                      | 75                     | 1.16                      |
| 0                                       | 80                     | 0.79                      | 80                     | 1.08                      |

Of course, the real output voltage  $V_{\rm o}$  follows  $V_{\rm i}$  when  $V_{\rm i}$  is higher than  $V_{\rm Br}$ . However, the voltage on pin 11 will never exceed the adjusted value of  $V_{\rm oB\ tr}$ . The external capacitor  $C_{\rm hu}$  must only be rated to  $V_{\rm oB\ tr}$ .

The max. output current will decrease with higher  $V_{OB tr}$ , but the output power remains constant, because the supplied 110IMY converters need lower input current with higher input voltage.

# **Out-OK Signal**

An open-collector signal controls the function of the boost converter. When  $V_{oBr}$  is exceeded, the D-output is connected with a FET to Go– (pin 15); see table 7.

| Characteristics |                | Conditions                             | min | typ | max | Unit |
|-----------------|----------------|--|-----|-----|-----|------|
| Vok             | Out-OK voltage | Output okay, I <sub>OK</sub> <50 mA    |     | 0.3 | 0.5 | V    |
| loк             | Out-OK current | Output fail, $V_{OK} \le 80 \text{ V}$ |     | 15  | 60  | μA   |

transient voltages which typically occur in many installations,

but especially in battery-driven mobile applications. The

auxiliary converter has a separate input filter.

# **Electromagnetic Compatibility (EMC)**

A suppressor diode together with the input choke and an the output capacitor form an effective protection against high input

# **Electromagnetic Immunity**

Table 8: Immunity type tests

<sup>1</sup> i = input, o = output, c = case (not for option Z)

 $^{2}$  A = normal operation, no deviation from specification, B = temporary deviation from specs. possible.

<sup>3</sup> Corresponds to EN 50121-3-2:2006, table 9.3

<sup>4</sup> Corresponds to EN 50121-3-2:2006 table 9.1 and exceeds EN 50121-4:2006 table 1.1.

<sup>5</sup> Corresponds to EN 50121-3-2:2006 table 9.2 and EN 50121-4:2006 table 1.2 (compliance with digital mobile phones).

<sup>6</sup> Corresponds to EN 50121-3-2:2006 table 7.2 and EN 50121-4:2006 table 2.2.

<sup>7</sup> Measured with an external input capacitor: 600 µF due to the standard network impedance for surge testing

 $^{8}$  Corresponds to EN 50121-3-2:2006 table 7.1 and EN 50121-4:2006 table 2.2.

# **Electromagnetic Emissions**

The EMC requirements must be observed at the end product system level. However, the company tests the converters to EMC standards. The integrated input filter reduces the reflected input current and improves EMC features. Further improvements are possible by adding simple external filters; see fig. below.

*Fig. 7 Input filter for disturbance tests* 

The large input capacitor C1 (100  $\mu F$  /200 V) provides stability during surge tests. The other components are:

C2 = 4.7 nF, Y2; C51 = C52 = 10 nF, Y2 C3 = 3  $\mu$ F, X7R; C4 = 5  $\mu$ F, X7R L1 = 4.4 mH

Fig. 8

Conducted emissions of 24IBX15-50-0G.  $V_i = 24 V$ ,  $V_o = 50 V$ , 2 A; case connected to PE; with input filter fig. 7

| 17  | PUL  | Programmable undervoltage lockout / inhibit |  |

### Installation Instructions

Connection to the system shall be made via a printed circuit board with hole diameters of 1.4 mm  $\pm$ 0.1 mm for the pins.

The converter must be connected to a secondary circuit.

Do not open the converter!

Ensure that a converter failure (e.g. by an internal short-circuit) does not result in hazardous conditions.

**Note:** To prevent excessive current flowing through the input supply lines in case of a malfunction an external fuse should be installed in a non-earthed input supply line; see *table 4*.

### Standards, Approvals, Isolation

The converters have been approved according to UL/CSA 60950-1 and IEC/EN 60950-1 2<sup>nd</sup> Ed. The CE mark is fitted.

All pins are tested against the case with 1500 VAC (2120 VDC) for  $\geq$ 1 s as routine test in the factory according to EN 50514 and IEC/EN 60950.

The converters are subject to manufacturing surveillance in accordance with the above mentioned standards and with ISO9001:2008.

CB scheme is available.

### **Railway Applications**

To comply with railway standards, all components are coated with a protective lacquer (except option Z).

### **Protection Degree and Cleaning Liquids**

The protection degree of the converters is IP 40, except openframe models (option Z).

In order to avoid possible damage, any penetration of cleaning fluids should be prevented, since the converters are not hermetically sealed.

However, open-frame models (option Z) leave the factory unlacquered; they may be lacquered by the customer, for instance together with the mother board. Cleaning liquids are not permitted – except washing at room temperature with isopropyl alcohol and de-inonized/destilled water (1 : 1).

The mother board can also be cleaned, before fitting the openframe converter.

**Note:** Other cleaning liquids may damage the adhesive joints of the ferrite cores.

# Options

Option Z: Open-frame model without case.

NUCLEAR AND MEDICAL APPLICATIONS - These products are not designed or intended for use as critical components in life support systems, equipment used in hazardous environments, or nuclear control systems.

TECHNICAL REVISIONS - The appearance of products, including safety agency certifications pictured on labels, may change depending on the date manufactured. Specifications are subject to change without notice.
