

#### **Features**

- Meets EIA/TIA-232 and V.28/V.24 Specifications at 3V
- Two Drivers and Two Receivers
- Constant Date Rate Under Different C-Loading
- Operates Up to 470kbps
- On-Chip Voltage Converters Require Only Four External 0.1µF Capacitors
- Wide Power Supply Range: Single +3V to +5.5V
- 1µA Low Power Shutdown With Receivers Active (TP3222N)
- Drop-in Replacements for SP3232, SP3222, MAX3232, MAX3222
- TP3232N is a Low Power Upgrade for 5V HIN232, HIN202, MAX232, MAX242

## **Applications**

- Battery-Powered Equipment
- Cell Phones Smart Phones
- Cell-Phone Data Cables
- Notebook, Subnotebook and Palmtop Computers
- Printers
- xDSL Modems

### **Description**

The 3PEAK TP32xxN devices are 3.0V to 5.5V RS-232 transmitters/receivers which meet EIA/TIA-232 and V.28 /V.24 specifications, even at  $V_{\rm CC}=3.0V$ . Each receiver converts TIA/RS-232-F inputs to TTL/CMOS levels.

The devices have a typical threshold of 1.26V, a typical hysteresis of 0.5V, and can accept ±25V inputs. Data rates greater than 470kbps are guaranteed at worst case load conditions. The devices are fully compatible with 3.3V-only systems, mixed 3.3V and 5.0V systems, and 5.0V-only systems.

The TP3232N/TP3222N has two receivers and two transmitters. The TP3222N features a  $1\mu A$  shutdown mode that reduces power consumption in battery powered portable systems. The TP3222N receivers remain active in shutdown mode, allowing monitoring of external devices while consuming only  $1\mu A$  of supply current.

#### **Order Information**

| Model Name | Order Number | Package      | Transport Media, Quantity | Marking<br>Information |
|------------|--------------|--------------|---------------------------|------------------------|
| TP3232N    | TP3232N-SR   | 16-Pin SOIC  | Tape and Reel, 2,500      | 3232N                  |
| TP3232N    | TP3232N-TR   | 16-Pin TSSOP | Tape and Reel, 3,000      | 3232N                  |
| TP3222N    | TP3222N-SR   | 18-Pin SOIC  | Tape and Reel, 3,000      | 3222N                  |

#### **Absolute Maximum Ratings Note 1**

| $V_{\text{CC}}$ to GND0.3V to +6V              |
|--|
| $\mbox{V}_{+}$ to GND (Note 1)0.3V to +7V      |
| V- to GND (Note 1)+0.3V to -7V                 |
| V <sub>+</sub> +  V-  (Note 1)+13V             |
| Input Voltages                                 |
| TIN, EN, SHDN0.3V to +6V                       |
| R_IN to GND±25V                                |
| Output Voltages                                |
| T_OUT to GND±6.0V                              |
| R_OUT, R_OUTB0.3V to (VCC + 0.3V)              |
| Short-Circuit Duration, T_OUT to GNDContinuous |

#### **Recommended Operating Conditions Note 1**

| Temperature Range                              | 40°C to +125°C |
|--|----------------|
| Supply Voltage (V <sub>CC</sub> )              | 3.3V or 5V     |
| Rx Input Voltage                               | 15V to +15V    |
| Thermal Resistance, $\Theta_{JA}$ (Typical)    |                |
| 16-Pin SOIC Package                            | 100°C/W        |
| 16-Pin TSSOP Package                           | 145°C/W        |
| 18-Pin SOIC Package                            | 75°C/W         |
| Maximum Junction Temperature (Plastic Package) | +150°C         |
| Maximum Storage Temperature Range              | 65°C to +150°C |

Note 1: V+ and V- can have maximum magnitudes of 7V, but their absolute difference cannot exceed 13V.

## **Electrical Characteristics**

Test Conditions:  $V_{CC} = 3.3V$  to 5.5V, TA = +25°C, C1 - C4 = 0.1 $\mu$ F, Unless Otherwise Specified. Boldface limits apply over the operating temperature range

## **Detailed Description**

## **Charge-Pump Voltage Converter**

The integrated charge pump in TP3232N/TP3222N generates negative power supply from a single supply VCC. The charge pump requires a flying capacitors (C1, C2) and a reservoir capacitors (C3, C4) to generate V- supplies(Figure1). At the same time a decoupling capacitor shall be applied between VCC and ground. Typical value for the flying capacitor is 0.1uF. Typical value of the decoupling capacitor shall be same as or larger than that of the flying capacitor. The TP3232N/TP3222N's charge pump could provides output voltages of +5V and -5V under single +5V VCC.

Figure 1. Slew-Rate Test Circuits

#### **RS-232 Transmitters**

The transmitters are inverting level translators that convert TTL/CMOS-logic levels to  $\pm 5V$  EIA/TIA-232-compliant levels. The TP3232N/TP3222N transmitters guarantee a 470kbps data rate with worst-case loads of  $3k\Omega$  in parallel with 1000pF, providing compatibility with PC-to-PC communication software. Transmitters can be paralleled to drive multiple receivers or mice. The TP3222N transmitters are disabled and the outputs are forced into a high-impedance state when the device is in shutdown mode (SHDN = GND). The TP3232N/TP3222N's transmitter inputs have a  $400k\Omega$  active positive-feedback resistor, allowing unused inputs to be left unconnected.

#### **RS-232 Receivers**

The receivers convert RS-232 signals to CMOS-logic output levels. The TP3222N receivers have inverting three-state outputs. Drive EN high to place the receiver(s) into a high impedance. Receivers can be either active or inactive in shutdown (Table 1).

| SHDN | EN | T_OUT          | T_OUT R-OUT    |        |
|------|----|----------------|----------------|--------|
| 0    | 0  | High impedance | Active         | Active |
| 0    | 1  | High impedance | High impedance | Active |
| 1    | 0  | Active         | Active         | Active |
| 1    | 1  | Active         | High impedance | Active |

**TABLE 1 Shutdown and Enable Control Truth Table** 

#### **TP3222N**

Supply current falls to less than  $1\mu A$  in shutdown mode(SHDN = low). When shut down, the device's charge pumps are shut off, V- is pulled to ground, and the transmitter outputs are disabled (high impedance). The time required to recover from shutdown is typically  $80\mu s$ .

### **Applications Information**

#### **Capacitor Selection**

The capacitor type used for C1–C4 is not critical for proper operation; polarized or nonpolarized capacitors can be used. The charge pump requires 0.1µF capacitors for 3.3V operation. Increasing the capacitor values (e.g., by a factor of 2) reduces ripple on the transmitter outputs and slightly reduces power consumption. C2, C3, and C4 can be increased without changing C1's value. However, do not increase C1 without also increasing the values of C2, C3, C4, and CBYPASS to maintain the proper ratios (C1 to the other capacitors). When using the minimum required capacitor values, make sure the capacitor value does not degrade excessively with temperature. If in doubt, use capacitors with a larger nominal value. The capacitor's equivalent series resistance (ESR), which usually rises at low temperatures, influences the amount of ripple on V+ and V-.

## **Power-Supply Decoupling**

In most circumstances, a  $0.1\mu F$  VCC bypass capacitor is adequate. In applications sensitive to power-supply noise, use a capacitor of the same value as charge pump capacitor C1. Connect bypass capacitors as close to the IC as possible.

## **Operation Down to 3V**

Transmitter outputs meet EIA/TIA-562 levels of ±3V with supply voltages as low as 3V.

#### From Shutdown

As they become active, the two transmitter outputs are shown going to opposite RS-232 levels (one transmitter input is high; the other is low). Each transmitter is loaded with  $3k\Omega$  in parallel with 2500pF. The transmitter outputs display no ringing or undesirable transients as they come out of shutdown. Note that the transmitters are enabled about 80 $\mu$ s after power up.

### **High Data Rates**

The TP3232N/TP3222N maintain the RS-232 ±3V minimum transmitter output voltage even at high data rates. All transmitters were driven simultaneously at 470kbps into RS-232 loads in parallel with 5000pF. For Figure 4, a single transmitter was driven at 333kbps, and all transmitters were loaded with an RS-232 receiver in parallel with 1000pF.
