

200 mA ultra-low quiescent current LDO

Datasheet - production data

**Description**

The STLQ020 is a 200 mA low-dropout voltage regulator, able to work with an input voltage ranging from 2 V to 5.5 V.

The typical dropout voltage at maximum load is 160 mV.

The ultra-low quiescent current, which is just 0.3 μA at no load on the adjustable version, extends battery-life of applications requiring very long standby time.

Even though the device intrinsic consumption is ultra-low, STLQ020 is able to provide fast transient response and good PSRR performance, thanks to its adaptive biasing circuit.

Enable pin puts the STLQ020 in shutdown mode, reducing total current consumption to 1 nA.

The STLQ020 is designed to keep the quiescent current under control and at a low value also during dropout operation, helping to extend even more the operating time of battery-powered devices.

It also includes short-circuit constant-current limiting and thermal protection.

Several small package options are available.

Features

- Operating input voltage range: 2 V to 5.5 V
- Output current up to 200 mA
- Ultra-low quiescent current:
 - 300 nA typ. at no load (ADJ version)
 - 100 μA typ. at 200 mA load
- Controlled I_q in dropout conditions
- Very low-dropout voltage: 160 mV at 200 mA
- Output voltage accuracy: 2% at room temperature, 3% in full temperature range
- Output voltage versions: from 0.8 V to 4.5 V, with 50 mV step and adjustable
- Logic-controlled electronic shutdown
- Output discharge feature (optional)
- Internal overcurrent and thermal protections
- Temperature range: from -40 °C to +125 °C
- Packages: DFN6-2x2, SOT323-5L, Flip-Chip4

Applications

- Smartphones/tablets
- Image sensors
- Wearable accessories
- Healthcare devices
- Metering

7 Application information

7.1 External capacitors

The STLQ020 voltage regulator requires external low ESR capacitors to assure the control loop stability. These capacitors must be selected to meet the requirements of minimum capacitance and equivalent series resistance defined in the following chapters. Input and output capacitors should be located as close as possible to the relevant pins.

Input capacitor

An input capacitor, with a minimum value of 1 μF , must be located as close as possible to the input pin of the device and returned to a clean analog ground. A good quality, low-ESR ceramic capacitor is suggested. It helps to ensure stability of the control loop, reduces the effects of inductive sources and improves ripple rejection. Capacitance higher than 1 μF can be chosen in case of fast load transients in application.

Output capacitor

STLQ020 requires a low-ESR capacitor connected on its output, to keep the control loop stable and reduce the risk of ringing and oscillations. The control loop is designed to be stable with any good quality ceramic capacitor (such as X5R/X7R types) with a minimum value of 1 μF and equivalent series resistance in the [3 – 500 m Ω] range. It is important to highlight that the output capacitor must maintain its capacitance and ESR in the stable region over the full operating temperature, load and input voltage ranges, to assure stability. Therefore, capacitance and ESR variations must be taken into account in the design phase to ensure the device works in the expected stability region. There is no maximum limit to the output capacitance, provided that the above conditions are respected.

7.2 Output voltage adjustment (adjustable version)

In the adjustable version, available on the DFN6-2x2 and SOT323-5L packages, the output voltage can be adjusted to any voltage, starting from 0.8 V (V_{ADJ}) up to the input voltage minus the voltage drop (V_{DROP}) across the internal power pass element, by connecting a resistor divider between the ADJ pin and the output, allowing the remote voltage sensing.

The resistor divider should be selected using the following equation:

Equation 1

$$V_{\text{OUT}} = V_{\text{ADJ}} (1 + R_1 / R_2)$$

with $V_{\text{ADJ}} = 0.8 \text{ V}$ (typ.) and $V_{\text{OUT}} < V_{\text{IN}} - V_{\text{DROP(MAX)}}$

For best accuracy and stability the resistor divider should be designed in order to allow that a current of at least 500 nA flows across it. The current flowing into the ADJ pin is typically less than 1 nA, therefore causing negligible change in final the output voltage.

7.3 Enable pin operation

This is a logic control pin, CMOS level-compatible, which can be used to turn On/Off the regulator. It is active high, so when it is pulled down, the device enters the shutdown mode, drastically reducing the current consumption, to less than a few nA.

Since it is not internally pulled-up, when the enable feature is not used, this pin must not be left floating. It can be tied to V_{IN} to keep the regulator output in ON state all the time.

To assure reliable operation, the signal source used to drive the EN pin, must be able to swing above and below the specified thresholds listed in the electrical characteristics table (V_{EN}).

7.4 Power dissipation

A proper PCB design is recommended, to ensure that the device internal junction temperature is kept below 125°C, in all the operating condition.

Depending on the package option, the thermal energy generated by the device flows from the die surface to the PCB copper area through the package leads, solder bumps and/or exposed pad.

The PCB copper area acts as a heat sink. The footprint copper pads should be as wide as possible to spread and dissipate the heat to the surrounding environment. Thermal vias to the inner or backside copper layers improve the overall thermal performance of the device.

The power dissipation of the LDO depends on the input voltage, output voltage and output current, and is given by:

Equation 2

$$P_D = (V_{IN} - V_{OUT}) I_{OUT}$$

The junction temperature of the device is:

Equation 3

$$T_{J_MAX} = T_A + R_{thJA} \times P_D$$

where: T_{J_MAX} is the maximum junction of the die, 125 °C; T_A is the ambient temperature; R_{thJA} is the thermal resistance junction-to-ambient.

With the above equation it is possible to calculate the maximum allowable power dissipation, therefore the maximum load current for a certain voltage drop. Appropriate de-rating of the operating condition can be applied accordingly.

7.5 Protection features

Current limit

The STLQ020 embeds a constant-current limit circuit, which acts in case of overload or short-circuit on the output, clamping the load current to a safe value (typ. 380 mA).

Normal operation is restored if the overload disappears, but prolonged operation in current limit may lead to high power dissipation inside the LDO and subsequently to thermal shutdown.

Thermal protection

An internal thermal feedback loop disables the output voltage if the die temperature reaches approximately 160 °C. This feature protects the device from excessive temperature that could lead to permanent damage to the LDO.

Once the thermal protection is triggered and the device is shut down, normal operation is automatically recovered if the die temperature falls below 140 °C (thermal protection hysteresis of 20 °C typically)

Important note: to keep the device power consumption below 500 nA in low load/no load condition, the internal thermal protection is kept disabled for load current below 1 mA.

Current and thermal limit protections are designed to protect the LDO from excessive power dissipation and not intended to replace a proper thermal and electrical design of the application.

Continuous operation above the maximum ratings may lead to permanent damage to the device.

8 Package information

In order to meet environmental requirements, ST offers these devices in different grades of ECOPACK® packages, depending on their level of environmental compliance. ECOPACK® specifications, grade definitions and product status are available at: www.st.com. ECOPACK® is an ST trademark.

IMPORTANT NOTICE – PLEASE READ CAREFULLY

STMicroelectronics NV and its subsidiaries ("ST") reserve the right to make changes, corrections, enhancements, modifications, and improvements to ST products and/or to this document at any time without notice. Purchasers should obtain the latest relevant information on ST products before placing orders. ST products are sold pursuant to ST's terms and conditions of sale in place at the time of order acknowledgement.

Purchasers are solely responsible for the choice, selection, and use of ST products and ST assumes no liability for application assistance or the design of Purchasers' products.

No license, express or implied, to any intellectual property right is granted by ST herein.

Resale of ST products with provisions different from the information set forth herein shall void any warranty granted by ST for such product.

ST and the ST logo are trademarks of ST. All other product or service names are the property of their respective owners.

Information in this document supersedes and replaces information previously supplied in any prior versions of this document.
