## Features

- Low power consumption
- Low voltage drop
- Low temperature coefficient
- High input voltage - up to 30 V
- Output voltage accuracy: tolerance $\pm 2 \%$
- Over current protection
- TO-92, SOT89-3, and 8-pin SOP-EP packages

## Applications

- Battery-powered equipment
- Communication equipment
- Audio/Video equipment

## General Description

The HT73xx-3 device series are low power high voltage regulators implemented in CMOS technology which have the advantages of low voltage drop and low quiescent current. They allow input voltages as high as 30 V . They are available with several fixed output voltages ranging from 2.1 V to 5.0 V . The softstart function inhibits the problem of output overshoot during power on.
Although designed primarily as fixed voltage regulators, these devices can be used with external components to obtain variable voltages and currents.

## Selection Table

| Part No. | Output Voltage | Package | Marking |
| :---: | :---: | :---: | :---: |
| HT7321-3 | 2.1 V | $\begin{gathered} \text { TO-92 } \\ \text { SOT89-3 } \\ \text { 8SOP-EP } \end{gathered}$ | 73xx-3 (for TO-92, SOT89-3) <br> HT73xx-3 (for 8SOP-EP) |
| HT7323-3 | 2.3 V |  |  |
| HT7325-3 | 2.5 V |  |  |
| HT7327-3 | 2.7 V |  |  |
| HT7330-3 | 3.0 V |  |  |
| HT7333-3 | 3.3 V |  |  |
| HT7336-3 | 3.6 V |  |  |
| HT7340-3 | 4.0 V |  |  |
| HT7344-3 | 4.4 V |  |  |
| HT7350-3 | 5.0 V |  |  |

Note: "xx" stands for output voltages.

## Pin Descriptions

| Pin No. |  |  | Pin Name | Pin Description |
| :---: | :---: | :---: | :---: | :---: |
| TO-92 | SOT89-3 | 8SOP-EP |  |  |
| 1 | 1 | 5 | GND | Input pin |
| 2 | 2 | 8,9 | VIN | Output pin |
| 3 | 3 | 1 | OUT | No connection |
| - | - | $2,3,4,6,7$ | NC |  |

Absolute Maximum Ratings

| Parameter |  | Value | Unit |
| :---: | :---: | :---: | :---: |
| $\mathrm{V}_{\text {IN }}$ |  | -0.3 to +33 | V |
| Operating Temperature Range, $\mathrm{T}_{\mathrm{a}}$ |  | -40 to +85 | ${ }^{\circ} \mathrm{C}$ |
| Maximum Junction Temperature, $\mathrm{T}_{\mathrm{J}(\mathrm{MAX})}$ |  | +150 | ${ }^{\circ} \mathrm{C}$ |
| Storage Temperature Range |  | -65 to +165 | ${ }^{\circ} \mathrm{C}$ |
| Junction-to-Ambient Thermal Resistance, $\theta_{\text {JA }}$ | TO-92 | 200 | ${ }^{\circ} \mathrm{C} / \mathrm{W}$ |
|  | SOT89-3 | 200 | ${ }^{\circ} \mathrm{C} / \mathrm{W}$ |
|  | 8SOP-EP | 125 | ${ }^{\circ} \mathrm{C} / \mathrm{W}$ |
| Power Dissipation, $\mathrm{P}_{\mathrm{D}(\mathrm{MAX})}$ | TO-92 | 0.50 | W |
|  | SOT89-3 | 0.50 | W |
|  | 8SOP-EP | 0.80 | W |

Note: $\mathrm{P}_{\mathrm{D}(\mathrm{MAX})}$ is measured at $\mathrm{T}_{\mathrm{a}}=25^{\circ} \mathrm{C}$

## Recommended Operating Range

| Parameter | Value | Unit |
| :---: | :---: | :---: |
| $\mathrm{V}_{\text {IN }}$ | $V_{\text {out }}+2$ to 30 | V |

## Electrical Characteristics

$\mathrm{V}_{\mathbb{N}}=\left(\mathrm{V}_{\text {out }}+2 \mathrm{~V}\right), \mathrm{T}_{\mathrm{a}}=+25^{\circ} \mathrm{C}$ and $\mathrm{C}_{\mathbb{N}}=\mathrm{C}_{\text {out }}=10 \mu \mathrm{~F}$, unless otherwise specified

| Symbol | Parameter | Test Conditions | Min. | Typ. | Max. | Unit |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| VIn | Input Voltage | - | - | - | 30 | V |
| $\mathrm{V}_{\text {OUT }}$ | Output Voltage Range | - | 2.1 | - | 5.0 | V |
| Vo | Output Voltage Accuracy | lout $=10 \mathrm{~mA}$ | -2 | - | 2 | \% |
| lout | Output Current | - | 250 | - | - | mA |
| $\Delta \mathrm{V}_{\text {OUt }}$ | Load Regulation | $1 \mathrm{~mA} \leq$ lout $\leq 100 \mathrm{~mA}$ | - | 45 | 90 | mV |
| V DiF | Dropout Voltage | lout $=1 \mathrm{~mA}$, V out Change $=2 \%{ }^{(\text {Note) }}$ | - | 6 | 15 | mV |
|  |  | lout $=30 \mathrm{~mA}$, V Vout Change $=2 \%$ (Note) | - | 120 | 300 |  |
| Iss | Quiescent Current | $\mathrm{lout}=0 \mathrm{~mA}$ | - | 1.0 | 1.5 | uA |
| $\frac{\Delta V_{\text {OUT }}}{\Delta \mathrm{V}_{\text {IN }} \times \mathrm{V}_{\text {OUT }}}$ | Line Regulation | $\left(\mathrm{V}_{\text {OUT }}+2 \mathrm{~V}\right) \leq \mathrm{V}_{\text {IN }} \leq 30 \mathrm{~V}$, lout $=40 \mathrm{~mA}$ | - | 0.2 | 0.4 | \%/V |
| $\frac{\Delta V_{\text {OUT }}}{\Delta T a \times V_{\text {OUT }}}$ | Temperature Coefficient | lout $=40 \mathrm{~mA},-40^{\circ} \mathrm{C}<\mathrm{Ta}_{\mathrm{a}}<85^{\circ} \mathrm{C}$ | - | $\pm 100$ | - | ppm/ ${ }^{\circ} \mathrm{C}$ |
| locp | Over Current Protection | $\mathrm{V}_{1 \times}=12 \mathrm{~V}$ | - | 350 | 700 | mA |

Note: Dropout voltage is defined as the input voltage minus the output voltage that produces a $2 \%$ change in the output voltage from the value at $\mathrm{V}_{\text {IN }}=\mathrm{V}_{\text {out }}+2 \mathrm{~V}$ with a fixed load.

## Typical Performance Characteristic

Test Condition: $\mathrm{V}_{\text {IN }}=\mathrm{V}_{\text {OUT }}+2 \mathrm{~V}$, $\mathrm{I}_{\text {Out }}=10 \mathrm{~mA}, \mathrm{C}_{\text {IN }}=10 \mu \mathrm{~F}, \mathrm{C}_{\text {OUT }}=10 \mu \mathrm{~F}$ and $\mathrm{T}_{\mathrm{a}}=25^{\circ} \mathrm{C}$, unless otherwise noted

Line Regulation: HT7333-3 (lout=10mA)

Iss vs $\mathrm{V}_{\mathrm{in}}$ : HT7333-3 (lout=0mA)

Iss vs lout: HT7333-3 ( $\mathrm{V}_{\text {IN }}=5.3 \mathrm{~V}$ )

Dropout Voltage: HT7333-3

## Application Information

The devices are 3-terminal low dropout series linear voltage regulators. It is important the following application points are noted if correct operation is to be achieved.

## External Circuit

It is important that external capacitors are connected to both the input and output pins. For the input pin suitable bypass capacitors as shown in the application circuits should be connected especially in situations where a battery power source is used which may have a higher impedence. For the output pin, a suitable capacitor should also be connected especially in situations where the load is of a transient nature, in which case larger capacitor values should be selected to limit any output transient voltages.

## Thermal Considerations

The maximum power dissipation depends on the thermal resistance of the IC package, the PCB layout, the rate of the surrounding airflow and the difference between the junction and ambient temperature. The maximum power dissipation can be calculated by the following formula:

$$
P_{D(M A X)}=\left(T_{\mathrm{J}(\mathrm{MAX)}}-\mathrm{T}_{\mathrm{a}}\right) / \theta_{\mathrm{JA}}
$$

where $\mathrm{T}_{\mathrm{J} \text { (MAX) }}$ is the maximum junction temperature, $\mathrm{T}_{\mathrm{a}}$ is the ambient temperature and $\theta_{\mathrm{JA}}$ is the junction-to-ambient thermal resistance of the IC package in degrees per watt. The following table shows the $\theta_{\text {JA }}$ values for various package types.

| Package | $\boldsymbol{\theta}_{\mathrm{JA}}$ Value ${ }^{\circ} \mathrm{C} / \mathbf{W}$ |
| :---: | :---: |
| SOT89-3 | $200^{\circ} \mathrm{C} / \mathrm{W}$ |
| TO-92 | $200^{\circ} \mathrm{C} / \mathrm{W}$ |
| 8 SOP-EP | $125^{\circ} \mathrm{C} / \mathrm{W}$ |

For maximum operating rating conditions, the maximum junction temperature is $150^{\circ} \mathrm{C}$. However, it is recommended that the maximum junction temperature does not exceed $125^{\circ} \mathrm{C}$ during normal operation to maintain an adequate margin for device reliability. The derating curves of different packages for maximum power dissipation are as follows:

## Power Dissipation Calculation

In order to keep the device within its operating limits and to maintain a regulated output voltage, the power dissipation of the device, given by $\mathrm{P}_{\mathrm{D}}$, must not exceed the Maximum Power Dissipation, given by $\mathrm{P}_{\mathrm{D}(\operatorname{mAX)}}$. Therefore $\mathrm{P}_{\mathrm{D}} \leq \mathrm{P}_{\mathrm{D}(\mathrm{MAX})}$. From the diagram it can be seen that almost all of this power is generated across the pass transistor which is acting like a variable resistor in series with the load to keep the output voltage constant. This generated power which will appear as heat, must never allow the device to exceed its maximum junction temperature.

In practical applications the regulator may be called upon to provide both steady state and transient currents due to the transient nature of the load. Although the device may be working well within its limits with its steady state current, care must be taken with transient loads which may cause the current to rise close to its maximum current value. Care must be taken with transient loads and currents as this will result in device junction temperature rises which must not exceed the maximum junction temperature. With both steady state and transient currents, the important current to consider is the average or more precisely the RMS current which is the value of current that will appear as heat generated in the device. The following diagram shows how the average current relates to the transient currents.

As the quiescent current of the device is very small it can generally be ignored and as a result the input current can be assumed to be equal to the output current. Therefore the power dissipation of the device, $\mathrm{P}_{\mathrm{D}}$, can be calculated as the voltage drop across the input and output multiplied by the current, given by the equation, $P_{\mathrm{D}}=\left(\mathrm{V}_{\text {IN }}-\mathrm{V}_{\text {out }}\right) \times \mathrm{I}_{\text {IN }}$. As the input current is also equal to the load current the power dissipation $\mathrm{P}_{\mathrm{D}}=$ $\left(\mathrm{V}_{\text {IN }}-\mathrm{V}_{\text {out }}\right) \times \mathrm{I}_{\text {LOAD. }}$. However, with transient load currents, $\mathrm{P}_{\mathrm{D}}=\left(\mathrm{V}_{\mathrm{IN}}-\mathrm{V}_{\text {out }}\right) \times \mathrm{I}_{\text {Load (aVG) }}$ as shown in the figure.
