

### GENERAL DESCRIPTION

The SGM706 microprocessor supervisory circuit reduces the complexity and number of components required to monitor power-supply and monitor microprocessor activity. It significantly improves system reliability and accuracy compared to separate ICs or discrete components.

The SGM706 provides power-supply monitoring circuitry that generates a reset output during power-up, power-down and brownout conditions. The reset output remains operational with  $V_{CC}$  as low as 1V. Independent watchdog monitoring circuitry is also provided. This is activated if the watchdog input has not been toggled within 1.6 seconds.

In addition, there is a 1.25V threshold detector for power-fail warning, low-battery detection, or monitoring an additional power supply. An active-low manual-reset input ( $\overline{MR}$ ) is also included.

The SGM706 is available in Green SOIC-8 package. The SGM706-S is available in both Green SOIC-8 and MSOP-8 packages. They operate over an ambient temperature range of  $-40^{\circ}\text{C}$  to  $+85^{\circ}\text{C}$ .

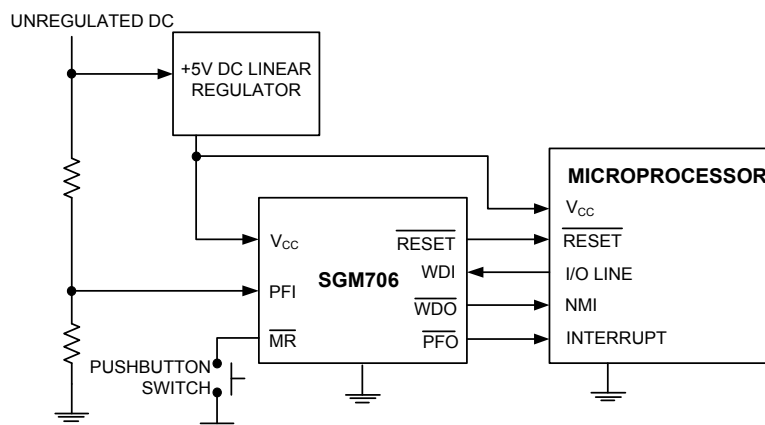

### FEATURES

- **Precision Supply-Voltage Monitor**
  - 4.65V for SGM706-L
  - 4.40V for SGM706-M
  - 4.0V for SGM706-J
  - 3.08V for SGM706-T
  - 2.93V for SGM706-S
  - 2.63V for SGM706-R
- **Guaranteed  $\overline{\text{RESET}}$  Valid at  $V_{CC} = 1\text{V}$**
- **200ms Reset Pulse Width**
- **Debounced TTL/CMOS-Compatible Manual-Reset Input**
- **Independent Watchdog Timer (1.6sec) Timeout**
- **Voltage Monitor for Power-Fail or Low-Battery Warning**
- **$-40^{\circ}\text{C}$  to  $+85^{\circ}\text{C}$  Operating Temperature Range**
- **SGM706 is Available in Green SOIC-8 Package**
- **SGM706-S is Available in both Green SOIC-8 and MSOP-8 Packages**

### APPLICATIONS

- Computers
- Controllers
- Intelligent Instruments
- Automotive Systems
- Critical  $\mu\text{P}$  Power Monitoring

### TYPICAL APPLICATION

**SGM706**

**PACKAGE/ORDERING INFORMATION**

MODEL	RESET THRESHOLD (V)	PACKAGE DESCRIPTION	ORDERING NUMBER	PACKAGE MARKING	PACKAGE OPTION
SGM706	4.65	SOIC-8	SGM706-LYS8G/TR	SGM706-LYS8 XXXXX	Tape and Reel, 4000
	4.40	SOIC-8	SGM706-MYS8G/TR	SGM706-MYS8 XXXXX	Tape and Reel, 4000
	4.0	SOIC-8	SGM706-JYS8G/TR	SGM706-JYS8 XXXXX	Tape and Reel, 4000
	3.08	SOIC-8	SGM706-TYS8G/TR	SGM706-TYS8 XXXXX	Tape and Reel, 4000
	2.93	SOIC-8	SGM706-SYS8G/TR	SGM706-SYS8 XXXXX	Tape and Reel, 4000
	2.93	MSOP-8	SGM706-SYMS8G/TR	SGM706S YMS8 XXXXX	Tape and Reel, 4000
	2.63	SOIC-8	SGM706-RYS8G/TR	SGM706-RYS8 XXXXX	Tape and Reel, 4000

NOTE: XXXXX = Date Code and Vendor Code.

Green (RoHS & HSF): SG Micro Corp defines "Green" to mean Pb-Free (RoHS compatible) and free of halogen substances. If you have additional comments or questions, please contact your SGMICRO representative directly.

**ABSOLUTE MAXIMUM RATINGS**

(Typical values are at T<sub>A</sub> = +25°C, unless otherwise noted.)

Terminal Voltage (with respect to GND)

- V<sub>CC</sub> ..... -0.3V to 6.0V
- All Other Inputs ..... -0.3V to (V<sub>CC</sub> + 0.3V)
- Input Current, V<sub>CC</sub> ..... 20mA
- GND ..... 20mA
- Output Current, (all outputs) ..... 20mA
- Operating Temperature Range ..... -40°C to +85°C
- Junction Temperature ..... 150°C
- Storage Temperature ..... -65°C to +150°C
- Lead Temperature (Soldering, 10sec) ..... 260°C
- ESD Susceptibility
- HBM ..... 4000V
- MM ..... 300V

**OVERSTRESS CAUTION**

Stresses beyond those listed may cause permanent damage to the device. Functional operation of the device at these or any other conditions beyond those indicated in the operational section of the specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

**ESD SENSITIVITY CAUTION**

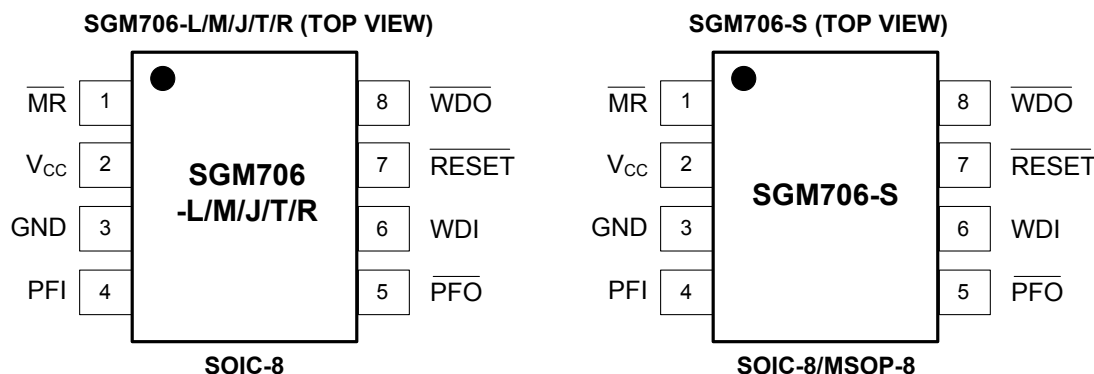

This integrated circuit can be damaged by ESD if you don't pay attention to ESD protection. SGMICRO recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage. ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

**DISCLAIMER**

SG Micro Corp reserves the right to make any change in circuit design, specification or other related things if necessary without notice at any time.

## SGM706

### PIN CONFIGURATIONS

### PIN DESCRIPTION

PIN	NAME	FUNCTION
1	$\overline{\text{MR}}$	Manual-Reset Input triggers a reset pulse when pulled below 0.8V. This active-low input has an internal 250 $\mu\text{A}$ ( $V_{\text{CC}} = +5\text{V}$ ) pull-up current. It can be driven from a TTL or CMOS logic line as well as shorted to ground with a switch.
2	$V_{\text{CC}}$	Power Supply Voltage that is monitored.
3	GND	0V Ground Reference for all signals.
4	PFI	Power-Fail Voltage Monitor Input. When PFI is less than 1.25V, $\overline{\text{PFO}}$ goes low. Connect PFI to GND or $V_{\text{CC}}$ when not used.
5	$\overline{\text{PFO}}$	Power-Fail Output goes low and sinks current when PFI is less than 1.25V; otherwise $\overline{\text{PFO}}$ stays high.
6	WDI	Watchdog Input. If WDI remains high or low for 1.6sec, the internal watchdog timer runs out and WDO goes low (BLOCK DIAGRAM). Floating WDI or connecting WDI to a high-impedance three-state buffer disables the watchdog feature. The internal watchdog timer clears whenever reset is asserted, WDI is three-stated, or WDI sees a rising or falling edge.
7	$\overline{\text{RESET}}$	Active-Low Reset Output pulses low for 200ms when triggered, and stays low whenever $V_{\text{CC}}$ is below the reset threshold (4.65V for SGM706-L, 4.4V for SGM706-M, 4.0V for SGM706-J, 3.08V for SGM706-T and 2.93V for SGM706-S, 2.63V for SGM706-R). It remains low for 200ms after $V_{\text{CC}}$ rises above the reset threshold or $\overline{\text{MR}}$ goes from low to high. A watchdog timeout will not trigger $\overline{\text{RESET}}$ unless $\overline{\text{WDO}}$ is connected to $\overline{\text{MR}}$ .
8	$\overline{\text{WDO}}$	Watchdog Output pulls low when the internal watchdog timer finishes its 1.6sec count and does not go high again until the watchdog is cleared. $\overline{\text{WDO}}$ also goes low during low-line conditions. Whenever $V_{\text{CC}}$ is below the reset threshold, $\overline{\text{WDO}}$ stays low; however, unlike $\overline{\text{RESET}}$ , $\overline{\text{WDO}}$ does not have a minimum pulse width. As soon as $V_{\text{CC}}$ rises above the reset threshold, $\overline{\text{WDO}}$ goes high with no delay.

## SGM706

### ELECTRICAL CHARACTERISTICS

( $V_{CC} = 4.75V$  to  $5.5V$  for SGM706-L;  $V_{CC} = 4.5V$  to  $5.5V$  for SGM706-M;  $V_{CC} = 4.07V$  to  $5.5V$  for SGM706-J;  $V_{CC} = 3.14V$  to  $5.5V$  for SGM706-T;  $V_{CC} = 2.95V$  to  $5.5V$  for SGM706-S;  $V_{CC} = 2.68V$  to  $5.5V$  for SGM706-R;  $T_A = -40^{\circ}C$  to  $+85^{\circ}C$ , unless otherwise noted.)

PARAMETER		CONDITIONS	MIN	TYP	MAX	UNITS

### APPLICATION NOTES

#### Ensuring a Valid $\overline{\text{RESET}}$ Output Down to $V_{CC} = 0V$

When  $V_{CC}$  falls below 1V, the SGM706  $\overline{\text{RESET}}$  output no longer sinks current—it becomes an open circuit. High-impedance CMOS logic inputs can drift to undetermined voltages if left undriven. If a pull-down resistor is added to the  $\overline{\text{RESET}}$  pin as shown in Figure 1, any stray charge or leakage currents will be drained to ground, holding  $\overline{\text{RESET}}$  low. Resistor value (R1) is not critical. It should be about 100k $\Omega$ , large enough not to load  $\overline{\text{RESET}}$  and small enough to pull  $\overline{\text{RESET}}$  to ground.

Figure 1.  $\overline{\text{RESET}}$  Valid to Ground Circuit

#### Monitoring Voltages Other Than the Unregulated DC Input

Monitor voltages other than the unregulated DC by connecting a voltage divider to PFI and adjusting the ratio appropriately. If required, add hysteresis by connecting a resistor (with a value approximately 10 times the sum of the two resistors in the potential divider network) between PFI and  $\overline{\text{PFO}}$ . A capacitor between PFI and GND will reduce the power-fail circuit's sensitivity to high-frequency noise on the line being monitored.  $\overline{\text{RESET}}$  can be asserted on other voltages in addition to the +5V  $V_{CC}$  line. Connect  $\overline{\text{PFO}}$  to  $\overline{\text{MR}}$  to initiate a  $\overline{\text{RESET}}$  pulse when PFI drops below 1.25V. Figure 2 shows the SGM706 configured to assert  $\overline{\text{RESET}}$  when the +5V supply falls below the reset threshold, or when the +12V supply falls below approximately 11V.

Figure 2. Monitoring Both +5V and +12V

#### Monitoring a Negative Voltage

The power-fail comparator can also monitor a negative supply rail (Figure 3). When the negative rail is good (a negative voltage of large magnitude),  $\overline{\text{PFO}}$  is low, and when the negative rail is degraded (a negative voltage of lesser magnitude),  $\overline{\text{PFO}}$  is high. By adding the resistors and transistor as shown, a high  $\overline{\text{PFO}}$  triggers reset. As long as  $\overline{\text{PFO}}$  remains high, the SGM706 will keep reset asserted ( $\overline{\text{RESET}} = \text{low}$ ,  $\text{RESET} = \text{high}$ ). Note that this circuit's accuracy depends on the PFI threshold tolerance, the  $V_{CC}$  line, and the resistors.

$$\frac{5 - 1.25}{R1} = \frac{1.25 - V_{TRIP}}{R2} \quad V_{TRIP} < 0$$

Figure 3. Monitoring a Negative Voltage

#### Interfacing to $\mu\text{Ps}$ with Bidirectional Reset Pins

$\mu\text{Ps}$  with bidirectional reset pins, such as the Motorola 68HC11 series, can contend with the SGM706  $\overline{\text{RESET}}$  output. If, for example, the  $\overline{\text{RESET}}$  output is driven high and the Microprocessor wants to pull it low, indeterminate logic levels may result. To correct this, connect a 4.7k $\Omega$  resistor between the  $\overline{\text{RESET}}$  output and the  $\mu\text{P}$  reset I/O, as in Figure 4. Buffer the  $\overline{\text{RESET}}$  output to other system components.

Figure 4. Interfacing to Microprocessors with Bidirectional Reset I/O
