

HIGH PERFORMANCE CURRENT MODE PWM CONTROLLERS

■ DESCRIPTION

The HG UC3844/3845 are high performance fixed frequency current mode controllers that specifically designed for Off-Line and DC to DC converter applications with minimal external parts count.

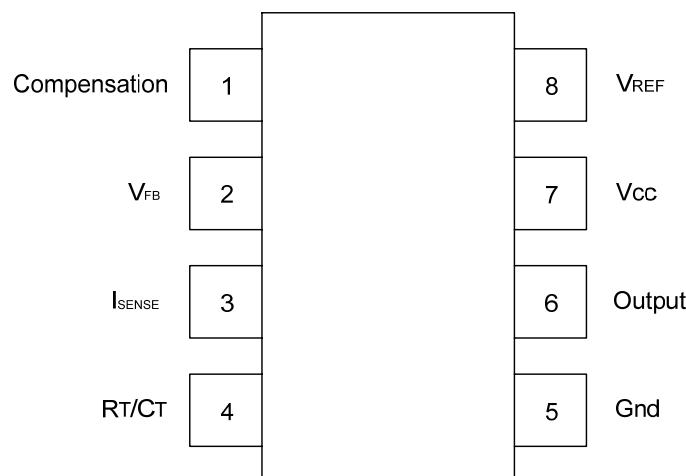

The differences between **UC3844** and **UC3845** are the maximum duty cycle ranges and under-voltage lockout thresholds. The **UC3844** ideally suited to off-line applications with UVLO thresholds of $16V_{(ON)}$ and $10V_{(OFF)}$, and **UC3845** has UVLO thresholds of $8.5V_{(ON)}$ and $7.6V_{(OFF)}$ for lower voltage applications.

■ FEATURES

■ PIN CONFIGURATION

■ PIN DESCRIPTION

PIN NO	PIN NAME	FUNCTION
1	Compensation	Error amplifier output, this pin is made available for loop compensation.
2	V _{FB}	Voltage Feedback, the inverting input of the Error Amplifier. It is normally connected to the switching power supply output through a resistor divider.
3	I _{SENSE}	A voltage proportional to inductor current is connected to this input. The PWM uses this information to terminate the output switch conduction.
4	R _T /C _T	The Oscillator frequency and maximum output duty cycle are programmed by connecting resistor R _T to Vref and capacitor C _T to ground. Operation to 1 MHz is possible.
5	GND	Power ground.
6	Output	This output directly drives the gate of a power MOSFET. Peak currents up to 1A are sourced and sunk by this pin. The output switches at one-half the oscillator frequency.
7	V _{CC}	Positive supply.
8	V _{REF}	Reference output, provides charging current for capacitor C _T though resistor R _T .

3. Comparator gain is defined as: $A_V = \frac{\Delta V \text{ Output Compensation}}{\Delta V \text{ Current Sense Input}}$

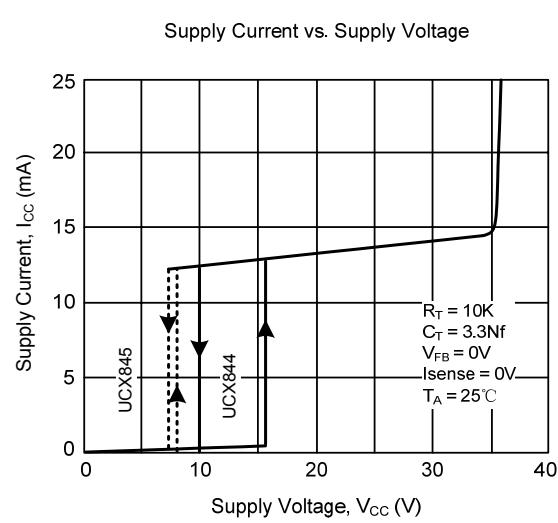

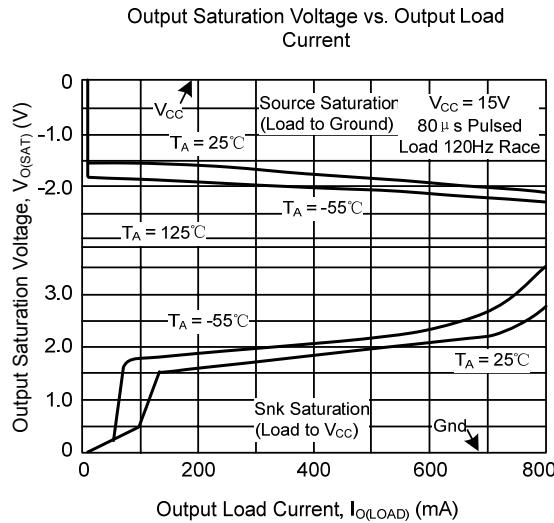

4. Adjust V_{CC} above the startup threshold before setting to 15V.
