General terms and conditions...... F-7

Sensing objects can be detected at a constant distance using the triple beam sensing method

Hardly affected by color

Adjustable range reflective type sensor can detect white or black object at the same distance. Therefore, the sensor can even detect individual objects that are mixed with black objects or objects of various colors that were hard for the diffuse reflective type sensor to detect.

(However, when the background is specular, it may be necessary to change the angle of the sensor.

ENVIRONMENTAL RESISTANCE

Insusceptible to contamination on lens

Adjustable range reflective type sensor detects the distance by the angle, not by the light receiving intensity. Even if the lens surface is soiled by dust or any powdery material, there is little variation of sensing range. In addition, the sensor stably detects approaching objects at a fixed distance because the distance is sensed by the angle of received light.

MOUNTING / SIZE

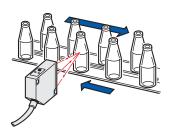

Compact and slim size

A small size of W32 × H32 × D12.6 mm W1.260 × H1.260 × D0.496 in has been achieved for the 40 mm 1.575 in / 200 mm 7.874 in sensing range type due to the built-in amplifier. In addition, you can mount the sensor both vertically and horizontally by diagonal mounting.

Hardly affected by background

Sensor selection guide...... P.271~

Adjustable range reflective type sensor dose not detect objects beyond the set range. For this reason, malfunction does not occur even if there are moving machines or people passing by in the background.

VARIETIES

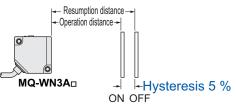

Visible light type and low hysteresis type are available

Visible light type

Beam axis alignment can be performed by looking at the spot light.

Low hysteresis type

Hysteresis between the ON and OFF status has been reduced by half (compared to conventional model). Detection precision has been further improved!

APPLICATIONS

The sensor detects objects that are being conveyed with almost no influence from background objects.

Detecting the remaining amount of roll sheets

Even if roll sheet colors are changed, the sensor

can detect them at almost the same distance.

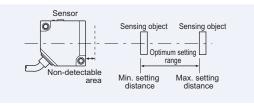

Glossary (Performance overview of the triple beam adjustable range reflective type)

Sensing distance (rated)

• For the triple beam adjustable range reflective type, the maximum distance to operate stably with a standard sensing object is shown.

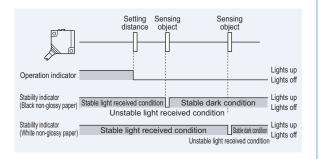

Setting range (optimum)

• For the triple beam adjustable range reflective type, the range between the maximum and minimum setting distance to operate stably with a standard sensing object is shown. When used beyond this range, there will be a non-detectable area near the sensor. There will also be insufficient light intensity on the far side of the sensor. This will result in unstable sensing. So when setting the sensor, use it within the optimum setting range.

Stability Indicator

• The MQ-W series uses PSD for light receiving elements and since sensing is based on the position of the entering beam and not its intensity, the output corresponds to distance. The stability indicator displays the marginal degree of the incident light intensity. So take note that the distance by which the indicator lights on/off varies depending on the reflectance of the sensing object, as shown in the diagram below. Also, do not use the sensor when the stability indicator lights off (Unstable light received condition).

Setting

Correlation between material and sensing range

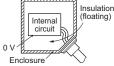

These bars indicate the sensing range with the respective objects when the distance adjuster is set to a sensing range of 700 mm 27.559 in, 400 mm 15.748 in and 200 mm 7.874 in long, respectively, with white non-glossy paper. Sensing object size: 35 × 60 mm 1.378 × 2.362 in.

PRECAUTIONS FOR PROPER USE

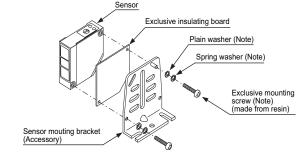

- Never use this product as a sensing device for personnel protection.
- In case of using sensing devices for
- personnel protection, use products which meet laws and standards, such as OSHA, ANSI or IEC etc., for personnel protection applicable in each region or country.

Case grounding method and insulation mounting bracket

 The MQ-W series has an internal circuit that is completely insulated from the enclosure (floating method).

 An exclusive insulation mounting bracket is available in order to improve the anti-noise quality in case there are devices that produce high-frequency noise close to the sensor and the place where the sensor is mounted is an electric conductor (such as metal). Please contact our office for details.

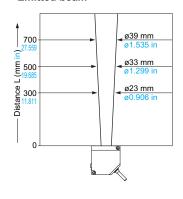

Note: Attached with the exclusive insulating board.

Correlation between sensing object size and sensing range

These curves show the characteristics with the maximum sensing range set to 700 mm 27.559 in, 400 mm 15.748 in and 200 mm 7.874 in. with white non-glossy paper (75 × 75 mm 2.953 × 2.953 in).

Emitted beam

Refer to p.1458~ for general precautions.

- Performing direct-grounding between the enclosure and circuit 0 V will improve the anti-noise quality.
- · Contact our office if you would like to special-order the direct-grounding type that has the enclosure and circuit 0 V connected beforehand.

Others

 Do not use during the initial transient time (50 ms) after the power supply is switched on.
