## Smart High-Side Power Switch

RoHS

## 1 Overview

## Application

- All types of resistive and capacitive loads
- Suitable for inductive loads in conjunction with an effective, peripheral free wheeling circuit
- Replaces electromechanical relays and fuses
- Most suitable for applications with high current loads, such as heating system, main switch for power distribution, start-stop power supply switch
- PWM application with low frequencies

PG-TO263-7-8

## Features

- One channel device
- Low Stand-by current
- Wide input voltage range (can be driven by logic levels 3.3 V and 5 V as well as directly by $V_{\mathrm{S}}$ )
- Electrostatic discharge protection (ESD)
- Optimized Electromagnetic Compatibility (EMC)
- Logic ground independent from load ground
- Very low leakage current on OUT pin
- Compatible to cranking pulse requirement (test pulse 4 of ISO7637 and cold start pulse in LV124)
- Embedded diagnostic functions
- Embedded protection functions
- Green Product (RoHS compliant)
- AEC Qualified

## Description

The BTS50015-1TAA is a $1.5 \mathrm{~m} \Omega$ single channel Smart High-Side Power Switch, embedded in a PG-TO-263-7-8 package, providing protective functions and diagnosis. It contains Infineon ${ }^{\circledR}$ Reversave. The power transistor is built by a N-channel power MOSFET with charge pump. It is specially designed to drive high current loads up to 80A, for applications like switched battery couplings, power distribution switches, heaters, glow plugs, in the harsh automotive environment.

| Type | Package | Marking |
| :--- | :--- | :--- |
| BTS50015-1TAA | PG-TO-263-7-8 | S50015A |

## Overview

## Table 1 Product Summary

| Parameter | Symbol | Values |
| :--- | :--- | :--- |
| Operating voltage range | $V_{\mathrm{S}(\mathrm{OP})}$ | $8 \mathrm{~V} \ldots 18 \mathrm{~V}$ |
| Extended supply voltage contain dynamic <br> undervoltage capability | $V_{\mathrm{S}(\mathrm{DYN})}$ | $3.2 \mathrm{~V} \ldots 28 \mathrm{~V}$ |
| Maximum on-state resistance at $T_{\mathrm{j}}=150^{\circ} \mathrm{C}$ | $R_{\mathrm{DS}(\mathrm{ON})}$ | $3 \mathrm{~m} \Omega$ |
| Minimum nominal load current | $I_{\mathrm{L}(\mathrm{nom})}$ | 33 A |
| Typical current sense differential ratio | $\mathrm{dk}_{\text {lLIS }}$ | 51500 |
| Minimum short circuit current threshold | $I_{\mathrm{L}(\mathrm{OVL})}$ | 135 A |
| Maximum stand-by current for the whole device <br> with load at $T_{\mathrm{A}}=T_{\mathrm{J}}=85^{\circ} \mathrm{C}$ | $I_{\mathrm{S}(\mathrm{OFF})}$ | $18 \mu \mathrm{~A}$ |
| Maximum reverse battery voltage at $T_{\mathrm{A}}=25^{\circ} \mathrm{C}$ for <br> 2 min | $-V_{\mathrm{S}(\mathrm{REV})}$ | 16 V |

## Embedded Diagnostic Functions

- Proportional load current sense
- Short circuit / Overtemperature detection
- Latched status signal after short circuit or overtemperature detection

## Embedded Protection Functions

- Infineon ${ }^{\circledR}$ Reversave: Reverse battery protection by self turn ON of power MOSFET
- Infineon ${ }^{\circledR}$ Inversave: Inverse operation robustness capability
- Secure load turn-OFF while device loss of GND connection
- Overtemperature protection with latch
- Short circuit protection with latch
- Overvoltage protection with external components
- Enhanced short circuit operation

## 2 Block Diagram

| Junction Temperature | $T_{J}$ | -40 | - | 150 | ${ }^{\circ} \mathrm{C}$ | - | 4.1.16 |
| Dynamic temperature increase while switching | $\Delta T_{J}$ | - | - | 60 | K | See Chapter 5.3 | 4.1.17 |
| Storage Temperature | $T_{\text {STG }}$ | -55 | - | 150 | ${ }^{\circ} \mathrm{C}$ | - | 4.1.18 |
| ESD Susceptibility |  |  |  |  |  |  |  |
| ESD susceptibility (all pins) | $V_{\text {ESD }}$ | -2 | - | 2 | kV | $\mathrm{HBM}^{8)}$ | 4.1.19 |
| ESD susceptibility OUT Pin vs. GND / $V_{S}$ | $V_{\text {ESD }}$ | -4 | - | 4 | kV | $\mathrm{HBM}^{8)}$ | 4.1 .20 |

1) Not subject to production test, specified by design.
2) The device is mounted on a FR4 $2 s 2 p$ board according to Jedec JESD51-2,-5,-7 at natural convection.
3) $V_{\mathrm{S}(\mathrm{LD})}$ is setup without DUT connected to the generator per ISO 7637-1.
4) In accordance to AEC Q100-012
5) In accordance to AEC Q100-012. Test aborted after 100,000 cycles. Short circuit conditions deviating from AEC Q100-012 may influence the specified short circuit cycle number in the datasheet.
6) The total reverse current (sum of $I_{\mathrm{GND}}, I_{\mathrm{IS}}$ and $-I_{\mathrm{IN}}$ ) is limited by $-V_{\mathrm{S}(\mathrm{REV}) \text { max }}$ and $R_{\mathrm{VS}}$.
7) $T_{\mathrm{C}} \leq 125^{\circ} \mathrm{C}$
8) ESD susceptibility, HBM according to ANSI/ESDA/JEDEC JS-001

## Notes

1. Stresses above the ones listed here may cause permanent damage to the device. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.
2. Integrated protection functions are designed to prevent IC destruction under fault conditions described in the data sheet. Fault conditions are considered as "outside" normal operating range. Protection functions are not designed for continuous repetitive operation.

Figure 4 Maximum Single Pulse Current vs. Pulse Time, $T_{J} \leq 150^{\circ} \mathrm{C}, T_{\text {amb }}=85^{\circ} \mathrm{C}$
Above diagram shows the maximum single pulse current that can be driven for a given pulse time $t_{\text {pulse }}$. The maximum reachable current may be smaller depending on the current limitation level. Pulse time may be limited due to thermal protection of the device.

## General Product Characteristics

### 4.2 Functional Range

Table 3 Functional Range

| Parameter | Symbol | Values |  |  | Unit | Note I <br> Test Condition | Number |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Min. | Typ. | Max. |  |  |  |
| Nominal operating voltage | $V_{\text {S(OP) }}$ | 8 | - | 18 | V | - | 4.2.1 |
| Extended operating voltage | $V_{\text {S(OP_EXT) }}$ | 5.3 | - | 28 | V | $\begin{aligned} & { }^{1)} V_{\text {IN }} \geq 2.2 \mathrm{~V} \\ & I_{\mathrm{L}} \leq I_{\mathrm{L}(\mathrm{NOM})} \\ & T_{\mathrm{J}} \leq 25^{\circ} \mathrm{C} \\ & \text { Parameter } \\ & \text { deviations possible } \end{aligned}$ | 4.2.2 |
|  |  | 5.5 | - | 28 | V | $\begin{aligned} & { }^{1)} V_{\mathrm{IN}} \geq 2.2 \mathrm{~V} \\ & I_{\mathrm{L}} \leq I_{\mathrm{L}(\mathrm{NOM})} \\ & T_{\mathrm{J}}=150^{\circ} \mathrm{C} \\ & \text { Parameter } \\ & \text { deviations possible } \end{aligned}$ |  |
| Extended operating voltage contain short dynamic undervoltage capability | $V_{\text {S(DYN })}$ | $3.2{ }^{2)}$ | - | 28 | V | ${ }^{1)} \mathrm{acc}$. to ISO7637 | 4.2.3 |
| Undervoltage turn OFF voltage | $V_{\text {S(UV_OFF) }}$ | - | - | 4.5 | V | $\begin{aligned} & { }^{1)} V_{\text {IN }} \geq 2.2 \mathrm{~V} \\ & R_{\mathrm{L}}=270 \Omega \\ & V_{\mathrm{S}} \text { decreasing } \\ & \text { See Figure } 19 \end{aligned}$ | 4.2.4 |
| Undervoltage shutdown hysteresis | $V_{\text {S(UV)_HYS }}$ | - | $500^{1)}$ | - | mV | $R_{\mathrm{L}}=270 \Omega$ <br> See Figure 19 | 4.2 .6 |
| Slewrate at OUT | $\left\|\mathrm{d} V_{\text {DS }} / d t\right\|$ | - | - | 101) | V/ $\mu \mathrm{S}$ | $\left\|V_{D S}\right\|<3 V$ <br> See Chapter 5.1.4 | 4.2.7 |
| Drain to source voltage in OFF condition | $V_{\text {DS_OFF }}$ | - | - | 28 | V | ${ }^{1} \mathrm{~V} \mathrm{VIN} \leq 0.8 \mathrm{~V}$ | 4.2.8 |

1) Not subject to production test. Specified by design
2) $T_{\mathrm{A}}=25^{\circ} \mathrm{C} ; R_{\mathrm{L}}=0.5 \Omega$; pulse duration 6 ms ; cranking capability is depending on load and must be verified under application conditions

Note: Within the functional or operating range, the IC operates as described in the circuit description. The electrical characteristics are specified within the conditions given in the Electrical Characteristics table.

### 4.3 Thermal Resistance

Note: This thermal data was generated in accordance with JEDEC JESD51 standards. For more information, go to www.jedec.org.

Table 4 Thermal Resistance

| Parameter | Symbol | Values |  |  | Unit | Note / <br> Test Condition | Number |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
|  |  | Min. | Typ. | Max. |  |  | 4.3 .1 |
| Junction to Case | $R_{\text {thJc }}$ | - | - | 0.5 | K/W | ${ }^{1)}$ | 4.3 .2 |
| Junction to Ambient | $R_{\text {thJA(2s2p })}$ | - | 20 | - | K/W | $\left.{ }^{1) 2}\right)$ | 4.3 .3 |
| Junction to Ambient | $R_{\text {thJA }}$ | - | 70 | - | K/W | ${ }^{1) 3)}$ |  |

1) Not subject to production test, specified by design.
2)Specified $R_{\text {thJA }}$ value is according to Jedec JESD51-2,-5,-7 at natural convection on FR4 2 s 2 p board; The Product (Chip+Package) was simulated on a $76.2 \times 114.3 \times 1.5 \mathrm{~mm}$ board with 2 inner copper layers ( $2 \times 70 \mu \mathrm{~m} \mathrm{Cu}, 2 \times 35 \mu \mathrm{~m} \mathrm{Cu}$ ). Where applicable a thermal via array under the exposed pad contacted the first inner copper layer. $T_{\mathrm{A}}=25^{\circ} \mathrm{C}$. Device is dissipating 2 W power.
3)Specified $R_{\mathrm{thJA}}$ value is according to Jedec JESD51-2,-5,-7 at natural convection on FR4 1s0p board; the Product $/$ Chip+Package) was simulated on a $76.2 \times 114.3 \times 1.5 \mathrm{~mm}$ board with only one top copper layer $1 \times 70 \mu \mathrm{~m} . T_{\mathrm{A}}=25^{\circ} \mathrm{C}$. Device is dissipating 2 W power.

Figure 5 is showing the typical thermal impedance of BTS50015-1TAA mounted according to JEDEC JESD51-$2,-5,-7$ at natural convection on FR4 1s0p and $2 s 2 p$ boards.

Figure $5 \quad$ Typical Transient Thermal Impedance $\mathbf{Z}_{\text {th( }(\mathrm{AA})}=\mathrm{f}($ time $)$ for Different PCB Conditions

## 5 Functional Description

## $5.1 \quad$ Power Stage

The power stage is built by a N -channel power MOSFET (DMOS) with charge pump.

### 5.1.1 Output ON-State Resistance

The ON-state resistance $R_{\mathrm{DS}(O \mathrm{~N})}$ depends on the supply voltage as well as the junction temperature $T_{\mathrm{J}}$. Figure 31 shows the dependencies in terms of temperature and supply voltage, for the typical ON-state resistance. The behavior in reverse polarity is described in Chapter 5.3.5.
A HIGH signal (see Chapter 5.2) at the input pin causes the power DMOS to switch ON with a dedicated slope, which is optimized in terms of EMC emission.

### 5.1.2 Switching a Resistive Load

Figure 6 shows the typical timing when switching a resistive load. The power stage has a defined switching behavior. Defined slew rates results in lowest EMC emission at minimum switching losses.

Figure 6 Switching a Resistive Load:Timing
The connection to the load as well as the load itself (if not purely resistive) bring an inductive component. For that reason the drain to source voltage of the BTS50015-1TAA during switch off can differ compared to the pure resistive load condition (see Figure 7). It must be assured that under these conditions the drain to source voltage does not exceed the $V_{D S(C L) m i n}$.
If $\mathrm{V}_{\mathrm{DS}(\mathrm{CL}) \text { min }}$ is exceeded, a free wheeling path should be implemented following the recommendation provided in the next chapter.

Figure 7 Effect of the wire inductance

### 5.1.3 Switching an Inductive Load

When switching OFF inductive loads with high side switches, the voltage $V_{\text {OUT }}$ is driven below ground potential, due to the fact that the inductance intends to continue driving the current. To prevent the destruction of the device due to high voltages, the device implements an overvoltage protection, which clamps the voltage between $\mathrm{V}_{\mathrm{S}}$ and $V_{\text {OUT }}$ at $V_{D S(C L)}$ (see Figure 8).
Nevertheless it is not recommended to operate the device repetitively under this condition. Therefore, when driving inductive loads, a free wheeling diode must be always placed.

Figure 8 Overvoltage Clamp

Figure 9 Switching an Inductance with or without free wheeling diode

It is important to verify the effectiveness of the freewheeling solution (see Figure 9), which means the selection of the proper diode and of an appropriate free wheeling path. With regard to the choice of the free wheeling diode, low threshold and fast response are key parameter to achieve an effective result.
Moreover the diode should be placed in order to have the shortest wire connection with the load (see Figure 10).

Recommended free wheeling path

Figure 10 Optimization of the free wheeling path

### 5.1.4 Inverse Current Capability

In case of inverse current, meaning a voltage $V_{\mathrm{OUT}(\mathrm{INV})}$ at the output higher than the supply voltage $V_{\mathrm{S}}$, a current $I_{\mathrm{L}(\mathrm{INV})}$ will flow from output to $V_{\mathrm{S}}$ pin via the body diode of the power transistor (please refer to Figure 11). In case the IN pin is HIGH, the power DMOS is already activated and keeps ON. In case, the input goes from "L" to "H", the DMOS will be activated. Under inverse condition, the device is not overtemperature / overload protected. The IS pin is high impedance. Due to the limited speed of INV comparator, the output voltage slope needs to be limited.

Figure 11 Inverse Current Circuitry

Figure 12 Inverse Behavior - Timing Diagram

### 5.1.5 PWM Switching

For PWM switching application, a $t_{\text {IN(RESETDELAY) }}$ parameter should be respected by defining the maximum PWM frequency (see Figure 22). The average power over time must be below the specified value (see paramater 4.1.15) and is defined as (see Figure 13):
$P_{\mathrm{TOT}}=\left(\right.$ switching_ON_energy + switching_OFF_energy $+I_{\mathrm{L}}{ }^{2}{ }^{*} R_{\mathrm{DS}(\mathrm{ON})}{ }^{*} t_{\mathrm{DC}}$ ) / period
For system with PWM switching, the maximum retry cycle ( $f_{\text {fault }}$ ) under fault condition should not be exceeded.

Figure 13 Switching in PWM

### 5.2 Input Pins

### 5.2.1 Input Circuitry

The input circuitry is compatible with 3.3 V and 5 V microcontrollers or can be directly driven by $V_{\mathrm{S}}$. The concept of the input pin is to react to voltage threshold. With the Schmitt trigger, the output is either ON or OFF. Figure 14 shows the electrical equivalent input circuitry.

Figure 14 Input Pin Circuitry

### 5.2.2 Input Pin Voltage

The IN uses a comparator with hysteresis. The switching ON / OFF takes place in a defined region, set by the threshold $V_{\operatorname{IN}(\mathrm{L})}$ Max and $V_{\operatorname{IN(H)}}$ Min. The exact value where ON and OFF take place depends on the process, as well as the temperature. To avoid cross talk and parasitic turn ON and OFF, an hysteresis is implemented. This ensures immunity to noise.

### 5.3 Protection Functions

The device provides embedded protective functions. Integrated protection functions are designed to prevent the destruction of the IC from fault conditions described in the datasheet. Fault conditions are considered as "outside" normal operating range. Protection functions are designed neither for continuous nor for repetitive operation.
Figure 15 describes the typical functionality of the diagnosis and protection block.

Figure 15 Diagram of Diagnosis \& Protection Block

### 5.3.1 Loss of Ground Protection

In case of loss of module or device ground, where the load remains connected to ground, the device protects itself by automatically turning OFF (when it was previously ON) or remains OFF, regardless of the voltage applied on IN pin. It is recommended to use input resistors between the microcontroller and the BTS50015-1TAA to ensure switching OFF of channel. In case of loss of module or device ground, a current ( $l_{\mathrm{OUT}(\mathrm{GND})}$ ) can flow out of the DMOS. Figure 16 sketches the situation.

Figure 16 Loss of Ground Protection with External Components

### 5.3.2 Protection during Loss of Load or Loss of $V_{S}$ Condition

In case of loss of load with charged primary inductances the maximum supply voltage has to be limited. It is recommended to use a Z-diode, a varistor or $V_{S}$ clamping power switches with connected loads in parallel. The voltage must be limited according to the minimum value of the parameter 6.1.33 indicated in Table 6.
In case of loss of $V_{S}$ connection, the inductance of the wire and/or of the load should be taken into account and should be demagnetized by providing a proper current path. It is recommended to protect the device using a zener diode together with $\mathrm{a}\left(V_{\mathrm{Z} 1}+V_{\mathrm{D} 1}<16 \mathrm{~V}\right)$, as shown in Figure 17.
For a proper restart of the device after loss of $V_{S}$, the input voltage must be applied delayed to the supply voltage. This can be realized by an capacitor between IN and GND (see Figure 51).
For higher clamp voltages, currents through all pins have to be limited according to the maximum ratings. Please see Figure 17 and Figure 18 for details.

Figure 17 Loss of $V_{S}$

Figure 18 Loss of Load

### 5.3.3 Undervoltage Behavior

If the supply voltage is in the area below $V_{\text {S(UV_OFF) }}$, the device is OFF (turns OFF). As soon as the supply voltage is above $V_{\text {S(OP_EXT)_min }}$, the device will switch ON again. Figure 19 sketches the undervoltage behavior.

Figure 19 Undervoltage Behavior

### 5.3.4 Overvoltage Protection

In case $\mathrm{V}_{\mathrm{S}(\mathrm{SC}) \text { _max }}<V_{\mathrm{S}}<\mathrm{V}_{\mathrm{DS}(\mathrm{CL})}$, the device will switch ON/OFF as in nominal voltage range. Parameters may deviate from the specified limits and the lifetime is reduced.
The BTS50015-1TAA provides an overvoltage clamp functionality, which suppresses non nominal overvoltage transients by actively clamping the voltage across the power stage (see Table 6, parameters 6.1.11). The clamping voltage $\mathrm{V}_{\mathrm{DS}(\mathrm{CL})}$ is depending on the junction temperature $\mathrm{T}_{\mathrm{j}}$ and load current $I_{\mathrm{L}}$ (see Figure 20 for details).
A repetitive operation under clamping condition must be avoided.

Figure 20 Overvoltage Protection with External Components

### 5.3.5 Reverse Polarity Protection

In case of reverse polarity, the intrinsic body diode of the power DMOS causes power dissipation. To limit the risk of overtemperature, the device provides Infineon ${ }^{\circledR}$ Reversave function. The power in this intrinsic body diode is limited by turning the DMOS ON. The DMOS resistance is then equal to $R_{\text {DS(ON)_REV }}$.
Additonally, the current into the logic has to be limited. The device includes a $R_{\mathrm{VS}}$ resistor which limits the current in the diodes. To avoid overcurrent in the $R_{\text {VS }}$ resistor, it is nevertheless recommended to use a $R_{\text {IN }}$ resistor. Please refer to maximum current described in Chapter 4.1. Figure 21 shows a typical application. $R_{\text {IS }}$ is used to limit the current in the sense transistor which behaves as a diode.

The recommended typical values for $R_{\text {IN }}$ is $4.7 \mathrm{k} \Omega$ and for $R_{\text {SENSE }} 1 \mathrm{k} \Omega$.

Figure 21 Reverse Polarity Protection with External Components

### 5.3.6 Overload Protection

In case of overload, high inrush current or short circuit to ground, the BTS50015-1TAA offers several protection mechanisms. Any protective switch OFF latches the output. To restart the device, it is necessary to set IN=LOW for $t>t_{\text {IN(RESETDELAY) }}$. This behavior is known as latch behavior. Figure $\mathbf{2 2}$ gives a sketch of the situation.

### 5.3.6.1 Activation of the Switch into Short Circuit (Short circuit Type 1)

When the switch is activated into short circuit, the current will raise until reaching the $I_{\text {L(TRIP) }}$ value. After $t_{\text {OFF(TRIP) }}$, the device will turn OFF and latches until the IN pin is set to low for $t>t_{\operatorname{IN(RESETDELAY)}}$. An undervoltage shutdown will not reset the latched fault overcurrent. For overload (short circuit or overtemperature), the maximum retry cycle $\left(f_{\text {fault }}\right)$ under fault condition must be considered.

### 5.3.6.2 Short Circuit Appearance when the Device is already ON (Short circuit Type 2)

When the device is in ON state and a short circuit to ground appears at the output (SC2) with a overcurrent higher than $I_{\text {L(TRIP) }}$ for a time longer than $t_{\text {OFF(TRIP) }}$, the device automatically turns OFF and latches until the IN pin is set to low for $t>t_{\mathrm{IN}(\text { RESETDELAY })}$. An undervoltage shutdown will not reset the latched fault overcurrent.

### 5.3.7 Temperature Limitation in the Power DMOS

The BTS50015-1TAA incorporates an absolute ( $T_{\text {J(TRIP) }}$ ) temperature sensor. Activation of the sensor will cause an overheated channel to switch OFF to prevent destruction. The device restarts when the IN pin is toggled and the temperature has decreased below $T_{\mathrm{J}(\mathrm{TRIP})}-\Delta T_{\mathrm{J}(\mathrm{TRIP})}$. An undervoltage shutdown may not reset the fault over temperature.

Figure 22 Overload Protection

The current sense exact signal timing can be found in the Chapter 5.4. It is represented here only for device's behavior understanding.

In order to allow the device to detect overtemperature conditions and react effectively, it is recommended to limit the power dissipation below $P_{\text {TOT }}$ (parameter 4.1.15).

### 5.4 Diagnostic Functions

For diagnosis purposes, the BTS50015-1TAA provides a combination of digital and analog signal at pin IS.

### 5.4.1 IS Pin

The BTS50015-1TAA provides an enhanced current sense signal called $I_{\text {IS }}$ at pin IS. As long as no "hard" failure mode occurs (short circuit to GND / overcurrent / overtemperature) and the condition $V_{\text {IS }} \leq V_{\text {OUT }}-5 \mathrm{~V}$ is fulfilled, a proportional signal to the load current (ratio $k_{\text {ILIS }}=I_{\mathrm{L}} / I_{S}$ ) is provided. The complete IS pin and diagnostic mechanism is described in Figure 23. The accuracy of the sense current depends on temperature and load current. In case of failure, a fixed $I_{\mathrm{IS}(\mathrm{FAULT})}$ is provided. In order to enable the fault current reporting, the condition $V_{S}-V_{\text {OUT }}>2 \mathrm{~V}$ must be fulfilled. In order to get the fault current in the specified range, the condition $V_{S}-V_{\text {IS }} \geq 5 \mathrm{~V}$ must be fulfilled.

Figure 23 Diagnostic Block Diagram

### 5.4.2 SENSE Signal in Different Operation Mode

Table 5 Sense Signal, Function of Operation Mode ${ }^{1)}$

| Operation mode | Input Level | Output Level $V_{\text {OUT }}$ | Diagnostic Output (IS) ${ }^{\text {2 }}$ |
| :---: | :---: | :---: | :---: |
| Normal operation | LOW (OFF) | ~ GND | $I_{\text {IS(OFF) }}$ |
| Short circuit to GND |  | GND | Z |
| Overtemperature |  | Z | Z |
| Short circuit to VS |  | $V_{S}$ | Z |
| Open Load |  | Z | Z |
| Inverse current |  | $>V_{S}$ | Z |
| Normal operation | HIGH (ON) | $\sim V_{\mathrm{S}}$ | $I_{\text {IS }}=\left(I_{\text {L }} / \mathrm{d} k_{\text {ILIS }}\right) \pm I_{\text {IS }}$ |
| Overcurrent condition |  | $<V_{S}$ | $I_{\text {IS }}=\left(I_{\text {L }} / \mathrm{d} k_{\text {ILIS }}\right) \pm I_{\text {IS }} \ldots \ldots I_{\text {IS(FAULT }}$ |
| Short circuit to GND |  | ~ GND | $I_{\text {IS(FAULT) }}$ |
| Overtemperature $T_{\text {J(TRIP) }}$ event |  | Z | $I_{\text {IS(FAULT) }}$ |
| Short circuit to VS |  | $V_{S}$ | $I_{\text {IS }}=0 \ldots I_{\text {L }} / \mathrm{d} k_{\text {ILIS }} \pm I_{\text {IS }}$ |
| Open Load |  | $\sim V_{S}$ | $I_{\text {ISo }}$ |
| Inverse current |  | $>V_{S}$ | Z |

2) See Chapter 5.4.3 for Current Sense Range and Improved Current Sense Accuracy

### 5.4.3 SENSE Signal in the Nominal Current Range

Figure 24 and Figure 25 show the current sense as function of the load current in the power DMOS. Usually, a pull-down resistor $R_{\text {IS }}$ is connected to the current sense pin IS. A typical value is $1 \mathrm{k} \Omega$. The dotted curve represents the typical sense current, assuming a typical $d k_{\text {ILIS }}$ factor value. The range between the two solid curves shows the sense accuracy the device is able to provide, at a defined current.

$$
\begin{equation*}
I_{I S}=\frac{I_{L}}{{d k_{I L I S}} \pm I_{I S 0} \quad \text { with }\left(I_{I S} \geq 0\right), ~} \tag{1}
\end{equation*}
$$

Where the definition of $\mathrm{d} k_{\text {ILIS }}$ is:

$$
\begin{equation*}
\mathrm{dk}_{\mathrm{ILIS}}=\frac{\mathrm{I}_{\mathrm{L} 4}-I_{\mathrm{L} 1}}{I_{\mathrm{IS} 4}-I_{\mathrm{IS} 1}} \tag{2}
\end{equation*}
$$

Figure 24 Current Sense for Nominal and Overload Condition

### 5.4.3.1 SENSE Signal Variation and calibration

In some application, an enhanced accuracy is required around the device nominal current range $I_{\mathrm{L}(\mathrm{NOM})}$. To achieve this accuracy requirement, a calibration on the application is possible. After two points calibration, the BTS50015-1TAA will have a limited $I_{\text {IS }}$ value spread at different load currents and temperature conditions. The $I_{\text {IS }}$
variation can be described with the parameters $\Delta\left(\mathrm{d} k_{\text {ILIS(cal) }}\right)$ and the $\alpha_{\text {ISO }}$. The blue solid line in Figure 25 is the current sense ratio after the two point calibration. The slope of this line is defined as follow:

$$
\begin{equation*}
\frac{1}{\mathrm{dk}_{\mathrm{KILIS}(\text { cal })}}=\frac{\mathrm{I}_{\mathrm{S}(\text { cal }) 2}-\mathrm{I}_{\mathrm{S}(\text { cal }) 1}}{\mathrm{I}_{\mathrm{L}(\text { cal }) 2}-\mathrm{I}_{\mathrm{L}(\text { cal }) 1}} \tag{3}
\end{equation*}
$$

The bluish in area in Figure 25 is the range where the current sense ratio can vary after performing the calibration. The accuracy of the load current sensing is improved and, given a sense current value $\mathrm{I}_{\mathrm{IS}}$ (measured in the application), the load current can be calculated as follow:

$$
\begin{equation*}
\mathrm{I}_{\mathrm{L}}=\mathrm{dk}_{\mathrm{ILIS}(\mathrm{cal})} \cdot\left(1+\frac{\Delta\left(\mathrm{dk}_{\mathrm{ILIS}(\mathrm{cal})}\right)}{100}\right) \cdot\left(\mathrm{I}_{\mathrm{IS}}-\frac{\mathrm{I}_{\mathrm{IS} 0(\mathrm{cal})}}{1+\alpha_{\mathrm{IS} 0}\left(\mathrm{~T}_{\mathrm{x}}-\mathrm{T}_{\mathrm{caI}}\right)}\right) \tag{4}
\end{equation*}
$$

where $\mathrm{d} k_{\text {ILIS(cal) }}$ is the current sense ratio measured after two-points calibration (defined in Equation (3)), $\mathrm{I}_{\text {ISo(cal) }}$ is the current sense offset (calculated after two points calibration, see Equation (5)), $\mathrm{T}_{\mathrm{x}}$ is the operating temperature, and $T_{\text {cal }}$ is temperature at which the calibration is performed $\left(25^{\circ} \mathrm{C}\right)$. The Equation (4) actually provides two values for load current, considering that $\Delta\left(\mathrm{d} k_{\text {ILIS(cal) }}\right)$ can be both positive and negative (see parameter 6.1.47 in Table 6 ).

$$
\begin{equation*}
\mathrm{I}_{\mathrm{IS} 0(\text { cal })}=\mathrm{I}_{\mathrm{S}(\text { cal }) 1}-\frac{\mathrm{I}_{\mathrm{L}(\text { cal }) 1}}{\mathrm{dk}_{\mathrm{ILIS}(\text { cal })}}=\mathrm{I}_{\mathrm{S}(\text { cal }) 2}-\frac{\mathrm{I}_{\mathrm{L}(\text { cal }) 2}}{\mathrm{dk}_{\mathrm{LIIS}(\text { cal })}} \tag{5}
\end{equation*}
$$

Figure 25 Improved Current Sense Accuracy after 2-Point Calibration

### 5.4.3.2 SENSE Signal Timing

Figure 26 shows the timing during settling and disabling of the sense.

Figure 26 Fault Acknowledgement

### 5.4.3.3 SENSE Signal in Case of Short Circuit to $\boldsymbol{V}_{\mathbf{S}}$

In case of a short circuit between OUT and VS pin, a major part of the load current will flow through the short circuit. As a result, a lower current compared to the nominal operation will flow through the DMOS of the BTS50015-1TAA, which can be recognized at the current sense signal.

### 5.4.3.4 SENSE Signal in Case of Over Load

An over load condition is defined by a current flowing out of the DMOS reaching the current over load $I_{\mathrm{CL}}$ or the junction temperature reaches the thermal shutdown temperature $T_{\mathrm{J}(\mathrm{TRIP})}$. Please refer to Chapter 5.3.6 for details. In that case, the SENSE signal will be in the range of $I_{\text {IS(FAULT) }}$ when the IN pin stays HIGH.
This is a device with latch function. The state of the device will remain and the sense signal will remain on $I_{\text {IS(FAULT) }}$ until a reset signal comes from the IN pin. For example, when a thermal shutdown happened, even the over temperature condition was disappeared, the DMOS can only be reactivated when a reset signal is send to the IN pin.

## 6 Electrical characteristics BTS50015-1TAA

### 6.1 Electrical Characteristics Table

## Table 6 Electrical Characteristics: BTS50015-1TAA

$V_{\mathrm{S}}=8 \mathrm{~V}$ to $18 \mathrm{~V}, T_{\mathrm{j}}=-40^{\circ} \mathrm{C}$ to $+150^{\circ} \mathrm{C}$ (unless otherwise specified)
For a given temperature or voltage range, typical values are specified at $V_{\mathrm{S}}=13.5 \mathrm{~V}, T_{\mathrm{J}}=25^{\circ} \mathrm{C}$

| Current sense ratio spread over temperature and repetitive pulse operation lafter 2-points calibration | $\Delta\left(d k_{\text {ILIS(call }}\right)$ | - | $\pm 8$ | - | \% | ${ }^{1)}$ See Figure 25 | 6.1 .47 |
| Temperature coefficient for $\mathrm{I}_{\text {ISO(cal) }}$ | $\alpha_{\text {ISO }}$ | - | 3.8 | - | \%/K | ${ }^{1)}$ see <br> Equation (4) and Equation (5) | 6.1 .54 |

Diagnostic Function: Diagnostic timing in normal condition

| Current sense propagation time until $90 \%$ of $I_{\text {IS }}$ stable after positive input slope on IN pin | $t_{\text {plS(ON)_90 }}$ | 0 | - | 700 | $\mu \mathrm{s}$ | $\begin{aligned} & V_{\mathrm{IN}} \geq 2.2 \mathrm{~V} \\ & V_{\mathrm{S}}=13.5 \mathrm{~V} \\ & R_{\mathrm{L}}=0.5 \Omega \end{aligned}$ <br> See Figure 26 | 6.1.48 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Current sense settling time to $I_{\text {IS }}$ stable after positive input slope on IN pin | $t_{\text {sis(ON) }}$ | - | - | 3000 | $\mu \mathrm{S}$ | $\begin{aligned} & V_{\mathrm{IN}} \geq 2.2 \mathrm{~V} \\ & V_{\mathrm{S}}=13.5 \mathrm{~V} \\ & R_{\mathrm{L}}=0.5 \Omega \end{aligned}$ <br> See Figure 26 | 6.1.49 |
| $I_{\text {IS }}$ leakage current when IN disabled | $I_{\text {IS(OFF) }}$ | 0 | 0.05 | 1 | $\mu \mathrm{A}$ | $\begin{aligned} & V_{\mathrm{IN}} \leq 0.8 \mathrm{~V} \\ & R_{\mathrm{IS}}=1 \mathrm{k} \Omega \end{aligned}$ | 6.1 .50 |
| Current sense propagation time after load jump during ON condition | $t_{\text {sIS(ON)_J }}$ | - | 350 | - | $\mu \mathrm{S}$ | $\begin{aligned} & { }^{1)} V_{\text {IN }} \geq 2.2 \mathrm{~V} \\ & d I_{\mathrm{L}} / d t=0.4 \mathrm{~A} / \mu \mathrm{s} \end{aligned}$ | 6.1 .51 |

Diagnostic Function: Diagnostic timing in overload condition

| Current sense propagation time for short circuit detection | $t_{\text {plS(FAULT) }}$ | 0 | - | 100 | $\mu \mathrm{s}$ | ${ }^{1)} V_{\text {IN }} \geq 2.2 \mathrm{~V}$ from $V_{\text {OUT }}=V_{\mathrm{S}}-3 \mathrm{~V}$ to $I_{\text {IS(FAULT)_min }}$ See Figure 26 | 6.1 .52 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Delay time to reset fault signal at IS pin after turning OFF $V_{\text {IN }}$ | $t_{\text {IN(RESETDELAY) }}$ | 250 | 1000 | 1500 | $\mu \mathrm{S}$ | 1) | 6.1 .53 |

Timing: Inverse Behavior

| Propagation time from <br> $V_{\text {OUT }}>V_{S}$ to fault disable | $t_{\text {p,INV,noFAULT }}$ | - | 4 | - | $\mu \mathrm{s}$ | ${ }^{1}$ See Figure 12 | 6.1 .55 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| Propagation time from <br> $V_{\text {OUT }}<V_{S}$ to fault enable | $t_{\text {p,noINV,FAULT }}$ | - | 10 | - | $\mu \mathrm{s}$ | ${ }^{1}$ See Figure 12 | 6.1 .56 |

1) Not subject to production test, specified by design
2) Value is calculated from the parameters typ. $R_{\mathrm{th} J \mathrm{~A}(2 \mathrm{~s} 2 \mathrm{p})}$, with 65 K temperature increase, typ. and max. $R_{\mathrm{DS}(\mathrm{ON})}$
3) All pins are disconnected except $V_{\mathrm{S}}$ and OUT

### 6.2 General Product Characteristics

## Typical Performance Characteristics

Figure 27 Standby Current for Whole Device with
Load, $I_{\text {S(OFF) }}=f\left(V_{S}, T_{J}\right)$

Figure 29 GND Leakage Current
$I_{\text {GND (OFF) }}=\mathbf{f}\left(V_{\mathrm{S}}, T_{\mathrm{J}}\right)$

$V_{\mathrm{S}}=13.5 \mathrm{~V}$

## $7 \quad$ Package Outlines

1) Typical

Metal surface min. $X=7.25, Y=6.9$
All metal surfaces tin plated, except area of cut.
Figure 50 PG-TO-263-7-8 (RoHS-Compliant)

## Green Product (RoHS compliant)

To meet the world-wide customer requirements for environmentally friendly products and to be compliant with government regulations the device is available as a green product. Green products are RoHS-Compliant (i.e Pb-free finish on leads and suitable for Pb-free soldering according to IPC/JEDEC J-STD-020).

For further information on alternative packages, please visit our website:
http://www.infineon.com/packages.

## 8 Application Information

Note: The following information is given as a hint for the implementation of the device only and shall not be regarded as a description or warranty of a certain functionality, condition or quality of the device.

Figure 51 Application Diagram with BTS50015-1TAA
Note: This is a very simplified example of an application circuit. The function must be verified in the real application.
Note: This application circuit is valid only if the device does not enter the clamping mode, otherwise the recommendation in Figure 52 are valid.

Table $7 \quad$ Bill of material

| Reference | Value | Purpose |
| :--- | :--- | :--- |
| $R_{\mathrm{IN}}$ | $4.7 \mathrm{k} \Omega$ | Protection of the microcontroller during overvoltage, reverse polarity <br> allows BTS50015-1TAA channels OFF during loss of ground |
| $R_{\mathrm{IS}}$ | $1 \mathrm{k} \Omega$ | Sense resistor |
| $R_{\mathrm{SENSE}}$ | $4.7 \mathrm{k} \Omega$ | Protection of the microcontroller during overvoltage <br> Protection of the BTS50015-1TAA during reverse polarity |
| $Z_{\mathrm{a}}$ | Zener diode | Protection of the BTS50015-1TAA during loss of load with primary charged <br> inductance, see Chapter 5.3.2 |
| $Z_{\mathrm{b}}$ | Zener diode | Protection of the BTS50015-1TAA during loss of battery or against huge <br> negative pulse at OUT (like ISO pulse 1), see Chapter 5.3.2 |
| $C_{\text {SENSE }}$ | 10 nF | Sense signal filtering |
| $C_{\mathrm{VS} 1}$ | 100 nF | Improved EMC behavior (in layout, pls. place close to the pins) |

Table $7 \quad$ Bill of material

| Reference | Value | Purpose |
| :--- | :--- | :--- |
| $C_{\text {VS2 }}$ | $10 \mu \mathrm{~F}$ to $22 \mu \mathrm{~F}$ | Suppression of transient over voltages exceeding 4.2 .8 |
| $C_{\text {OUT }}$ | 10 nF | Improved EMC behavior (in layout, pls. place close to the pins) |
| $C_{\text {IN }}$ | 150 nF | BTS50015-1TAA tends to latched switch-off due to short negative transients <br> on supply pin; $C_{\text {IN }}$ automatically resets the device |

Figure 52 Application Diagram with BTS50015-1TAA
Note: This is a very simplified example of an application circuit. The function must be verified in the real application.
Note: This application circuit is valid also every time the device enters the clamping mode, although it is not driving a pure inductive load.

Table 8 Bill of material

| Reference | Value | Purpose |
| :--- | :--- | :--- |
| $R_{\mathrm{IN}}$ | $4.7 \mathrm{k} \Omega$ | Protection of the microcontroller during overvoltage, reverse polarity <br> allows BTS50015-1TAA channels OFF during loss of ground |
| $R_{\mathrm{IS}}$ | $1 \mathrm{k} \Omega$ | Sense resistor |
| $R_{\mathrm{SENSE}}$ | $4.7 \mathrm{k} \Omega$ | Protection of the microcontroller during overvoltage <br> Protection of the BTS50015-1TAA during reverse polarity |
| $Z_{\mathrm{a}}$ | Zener diode | Protection of the BTS50015-1TAA during loss of load with primary <br> charged inductance, see Chapter 5.3.2 |

## Application Information

Table 8 Bill of material

| Reference | Value | Purpose |
| :--- | :--- | :--- |
| $Z_{\mathrm{b}}$ | Zener diode | Protection of the BTS50015-1TAA during loss of battery or against <br> negative huge pulses at OUT (like ISO pulse 1), see Chapter 5.3.2 |
| Z1 | Schottky diode <br> Zener Transient Suppressor | Protection of the BTS50015-1TAA when driving an inductive load. $\mathrm{Z2}$ <br> is added in option A to demagnetize more quickly the inductance <br> associated with the cable. Only one of the two possible options A and <br> B should be implemented |
| $T 1$ | n-channel MOSFET | Optional. It can be added to block reverse current in protection diodes. |

### 8.1 Further Application Information

- Please contact us for information regarding the pin FMEA

## 9 Revision History

| Revision | Date | Changes |
| :---: | :---: | :---: |
| 1.3 | 2014-06-03 | Chapter 1, section "Application" slightly modified |
|  |  | Table 1, symbol $\Delta \mathrm{k}_{\text {ILIS }}$ changed into $\mathrm{dk}_{\text {lIIS }}$ |
|  |  | Page 4, Embedded Protection Functions slightly changed |
|  |  | Figure 1 slightly changed |
|  |  | Table 2 on Page 8, min value of the parameter 4.1.8 under condition $t \leq 2 m i n$ added Table 2 on page 10, parameter 4.1.12 removed |
|  |  | Figure 5 (Maximum Energy dissipation for inductive switch OFF, $\mathrm{E}_{\mathrm{A}}$ vs Load Current) removed |
|  |  | Table 3 on Page 11, absolute value added at parameter 4.2.7 |
|  |  | Table 3 on Page 11, parameter 4.2.8 added |
|  |  | Table 4 on Page 12, footnote 2 and 3 slightly modified |
|  |  | Chapter 5.1.2 modified and Note removed |
|  |  | Chapters 5.1.3.1 and 5.1.3.2 removed |
|  |  | Chapter 5.1 .3 modified |
|  |  | Figure 8 slightly modified |
|  |  | Figure 8, caption modified |
|  |  | Figure 9 added |
|  |  | Figure 10 (old) removed |
|  |  | Figure 10 added |
|  |  | Figure 15 slightly modified |
|  |  | Figure 16 slightly modified |
|  |  | Chapter 5.3 .2 slightly changed |
|  |  | Chapter 5.3 .4 modified |
|  |  | Figure 20 slightly modified |
|  |  | Figure 21 slightly modified |
|  |  | Chapter 5.3.7 a sentence added |
|  |  | Figure 23 slightly modified |
|  |  | Table 5 on Page 24, diagnostic output of "Normal Operation", "Overcurrent Condition" and "Short Circuit to VS" modified |
|  |  | Equation 3 replaced by Equation (1) |
|  |  | Equation 4 replaced by Equation (2) |
|  |  | Figure 24 changed |
|  |  | Chapter 5.4.3.1 modified |
|  |  | Former Equation (5) removed |
|  |  | Equation (3) added |
|  |  | Equation (5) added |
|  |  | Former Equation (6) replaced with Equation (4) |
|  |  | Figure 25 changed |
|  |  | Table 6 on Page 28, parameter 6.1.2, footnote added |
|  |  | Table 6 parameter 6.1.41, description changed from "Current Sense Ratio" to "Current Sense Differential Ratio" |
|  |  | Table 6, parameter 6.1.41, symbol modified |
|  |  | Table 6, parameter 6.1.42, one row added, differentiating the parameter according to the temperature range |
|  |  | Table 6, parameter 6.1.43, min value added |
|  |  | Table 6, parameter 6.1.43, max value modified |
|  |  | Table 6, parameter 6.1.44, min value modified |

| Revision | Date | Changes |
| :--- | :--- | :--- |
|  |  | Table 6, parameter 6.1.44, max value modified <br> Table 6, parameter 6.1.45, min value modified |
|  |  | Table 6, parameter 6.1.45, typ value modified <br> Table 6, parameter 6.1.45, max value modified |
|  |  | Table 6, parameter 6.1.46, min value modified <br> Table 6, parameter 6.1.46, max value modified |
|  |  | Table 6, parameter 6.1.47, parameter description modified <br> Table 6, parameter 6.1.47, parameter symbol changed <br> Table 6, parameter 6.1.47, $\pm$ symbol added before the typ value <br> Table 6, parameter 6.1.54, parameter description modified |
|  |  | Table 6, parameter 6.1.54, parameter symbol modified <br> Table 6, parameter 6.1.54, typ value changed <br> Table 6, parameter 6.1.54, parameter unit changed |
| 1.2 | $2012-11-12$ | Note added below Figure 8 in 5.1.2 <br> Note added below Figure 51in Chapter 8 <br> Note added below Figure 52in Chapter 8 |

## Revision History

| Revision | Date | Changes |
| :---: | :---: | :---: |
| 1.1 | 2012-06-14 | Page 4, in the first bullet point, "inductive" deleted <br> Table 1 on Page 5, eighth row, " $T_{A}=85^{\circ} \mathrm{C}$ " changed into " $T_{\mathrm{A}}=T_{J}=85^{\circ} \mathrm{C}$ " <br> Table1, Page 5, ninth row, " $T_{\mathrm{A}}=85^{\circ} \mathrm{C}$ " changed into " $T_{\mathrm{A}}=25^{\circ} \mathrm{C}$ " <br> Table 2 on page 10: parameter 4.1.13 removed <br> Table 2 on page 10: parameter 4.1.14 removed <br> Table 2 on page 10: parameter name 4.1.15 corrected (typing error present in previous release) <br> Page 10, footnote 8) removed (refer to Rev. 1.0) <br> Figure 4modified <br> Figure 5, $E_{A R}$ curve removed <br> Page 12, figure 6 removed (refer to Rev. 1.0) <br> Chapter 5.1.3.2,page 16, last sentence added ("If the application requires the inductive load to be switched on/off repetitively, the recommendation in Chapter 8must be followed") <br> Figure 15modified <br> Chapter 5.3.2, page 20, third and fourth sentences modified, from "In case of loss of $V_{\mathrm{S}}$ " to "...as shown in Figure 17". <br> Figure 17 modified <br> Figure 18modified <br> Chapter 5.3.4, page 21, third row, parameter $E_{A R}$ deleted <br> Table 6 on page 30, parameter 6.1.23, value indicated as minimum is actually maximum <br> Table 6 on page 30, parameter 6.1.24, value indicated as maximum is actually minimum <br> Table 6 on page 31, word "maximum" deleted from description of the parameter 6.1.40, <br> Figure 29 on page 33, unit of measurement ("mA") added on y-axis <br> Figure 51, modified <br> Figure 51, "driving R/C loads" added in the caption <br> Table 7 on page 40, fifth row deleted (refer to Rev. 1.0) <br> Table 7 on page 40, two rows added (describing $Z_{a}$ and $Z_{b}$ ) <br> Figure 52, added <br> Page 41 note "This represents only a recommendation for driving inductive loads. The function must be verified in the real application." added <br> Table 8 on page 41, added |
| 1.0 | 2011-10-25 | Datasheet release |

With respect to any examples or hints given herein, any typical values stated herein and/or any information regarding the application of the device, Infineon Technologies hereby disclaims any and all warranties and liabilities of any kind, including without limitation, warranties of non-infringement of intellectual property rights of any third party.

## Information

For further information on technology, delivery terms and conditions and prices, please contact the nearest Infineon Technologies Office (www.infineon.com).

## Warnings

Due to technical requirements, components may contain dangerous substances. For information on the types in question, please contact the nearest Infineon Technologies Office.
Infineon Technologies components may be used in life-support devices or systems only with the express written approval of Infineon Technologies, if a failure of such components can reasonably be expected to cause the failure of that life-support device or system or to affect the safety or effectiveness of that device or system. Life support devices or systems are intended to be implanted in the human body or to support and/or maintain and sustain and/or protect human life. If they fail, it is reasonable to assume that the health of the user or other persons may be endangered.
