## ARINC 429 Bus Interface Line Driver Circuit

The HS-3182 is a monolithic dielectric ally isolated bipolar differential line driver designed to meet the specifications of ARINC 429. This device is intended to be used with a companion chip, HS-3282 CMOS ARINC Bus Interface Circuit, which provides the data formatting and processor interface function.

All logic inputs are TTL and CMOS compatible. In addition to the DATA (A) and DATA (B) inputs, there are also inputs for CLOCK and SYNC signals which are AND'd with the DATA inputs. This feature enhances system performance and allows the HS-3182 to be used with devices other than the HS-3182.

Three power supplies are necessary to operate the HS-3182: $+\mathrm{V}=+15 \mathrm{~V} \pm 10 \%,-\mathrm{V}=-15 \mathrm{~V} \pm 10 \%$, and $\mathrm{V} 1=5 \mathrm{~V} \pm 5 \%$. $\mathrm{V}_{\mathrm{REF}}$ is used to program the differential output voltage swing such that $\mathrm{V}_{\text {OUT }}$ (DIFF) $= \pm 2 \mathrm{VREF}$. Typically, $\mathrm{V}_{\text {REF }}=\mathrm{V} 1=5 \mathrm{~V} \pm 5 \%$, but a separate power supply may be used for VREF which should not exceed 6 V .

The driver output impedance is $75 \Omega \pm 20 \%$ at $+25^{\circ} \mathrm{C}$. Driver output rise and fall times are independently programmed through the use of two external capacitors connected to the CA and $C B$ inputs. Typical capacitor values are $\mathrm{CA}=\mathrm{CB}=75 \mathrm{pF}$ for high-speed operation (100kBPS), and CA $=\mathrm{CB}=300 \mathrm{pF}$ for low-speed operation ( 12 kBPS to 14.5 kBPS ). The outputs are protected against overvoltage and short circuit as shown in the Block Diagram. The HS-3182 is designed to operate over an ambient temperature range of $-55^{\circ} \mathrm{C}$ to $+125^{\circ} \mathrm{C}$, or $-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$.

## Features

- RoHS/Pb-free Available for SBDIP Package (100\% Gold Termination Finish)
- TTL and CMOS Compatible Inputs
- Adjustable Rise and Fall Times via Two External Capacitors
- Programmable Output Differential Voltage via $\mathrm{V}_{\text {REF }}$ Input
- Operates at Data Rates Up to 100k Bits/s
- Output Short Circuit Proof and Contains Overvoltage Protection
- Outputs are Inhibited (0V) If DATA (A) and DATA (B) Inputs are Both in the "Logic One" State
- DATA (A) and DATA (B) Signals are "AND'd" with Clock and Sync Signals
- Full Military Temperature Range

## Typical Application

NOTE: The rise and fall time of the outputs are set to ARINC specified values by $C_{A}$ and $C_{B}$. Typical $C_{A}=C_{B}=75 p F$ for high speed and 300 pF for low speed operation. The output HI and low levels are set to ARINC specifications by $\mathrm{V}_{\mathrm{REF}}$.

## Die Characteristics

Number of Transistors or Gates . . . . . . . . . . . . . . . . . . . . . . . . . . 133

CAUTION: Do not operate at or near the maximum ratings listed for extended periods of time. Exposure to such conditions may adversely impact product reliability and result in failures not covered by warranty.

NOTES:

1. $\theta_{\mathrm{JA}}$ is measured with the component mounted on a low effective thermal conductivity test board in free air. See Tech Brief TB379 for details.
2. $\theta_{\mathrm{JC}}$, the "case temp" location is the center of the package underside.
3. Heat sink may be required for 100 k bits $/ \mathrm{s}$ at $+125^{\circ} \mathrm{C}$ and output short circuit at $+125^{\circ} \mathrm{C}$.
4. The fuses used for output overvoltage protection may be blown by a fault at each output of greater than $\pm 6.5 \mathrm{~V}$ relative to GND.

DC Electrical Specifications Parameters with MIN and/or MAX limits are $100 \%$ tested at $+25^{\circ} \mathrm{C}$, unless otherwise specified. Temperature limits established by characterization and are not production tested.

## Driver Waveforms

NOTES:
$\mathrm{t}_{\mathrm{R}}$ measured $50 \%$ to $90 \% \times 2$
$\mathrm{t}_{\mathrm{F}}$ measured $50 \%$ to $10 \% \times 2$
$\mathrm{V}_{\mathrm{IH}}=5 \mathrm{~V} \quad \mathrm{~V}_{\mathrm{OL}}=-4.75 \mathrm{~V}$ to -5.25 V
$\mathrm{V}_{\mathrm{IL}}=0 \mathrm{~V} \quad \mathrm{~V}_{\mathrm{OH}}=4.75 \mathrm{~V}$ to 5.25 V

When the Data (A) input is in the Logic One state and the Data (B) input is in the Logic Zero state, $A_{\text {OUT }}$ is equal to $\mathrm{V}_{\text {REF }}$ and $\mathrm{B}_{\text {OUT }}$ is equal to $-\mathrm{V}_{\text {REFF }}$. This constitutes the Output High state. Data ( A ) and Data (B) both in the Logic Zero state causes both AOUt and BOUT to be equal to $0 V$ which designates the output Null state. Data (A) in the Logic Zero state and Data (B) in the Logic One state causes $A_{\text {OUt }}$ to be equal to $-V_{\text {REF }}$ and $B_{\text {OUT }}$ to be equal to $V_{\text {REF }}$ which is the Output Low state.

NOTES:

1. Metallized castellations shall be connected to plane 1 terminals and extend toward plane 2 across at least two layers of ceramic or completely across all of the ceramic layers to make electrical connection with the optional plane 2 terminals.
2. Unless otherwise specified, a minimum clearance of 0.015 inch $(0.38 \mathrm{~mm})$ shall be maintained between all metallized features (e.g., lid, castellations, terminals, thermal pads, etc.)
3. Symbol "N" is the maximum number of terminals. Symbols "ND" and "NE" are the number of terminals along the sides of length "D" and "E", respectively.
4. The required plane 1 terminals and optional plane 2 terminals (if used) shall be electrically connected.
5. The corner shape (square, notch, radius, etc.) may vary at the manufacturer's option, from that shown on the drawing.
6. Chip carriers shall be constructed of a minimum of two ceramic layers.
7. Dimension " A " controls the overall package thickness. The maximum " $A$ " dimension is package height before being solder dipped.
8. Dimensioning and tolerancing per ANSI Y14.5M-1982.
9. Controlling dimension: $\operatorname{INCH}$.
