4 Application hints

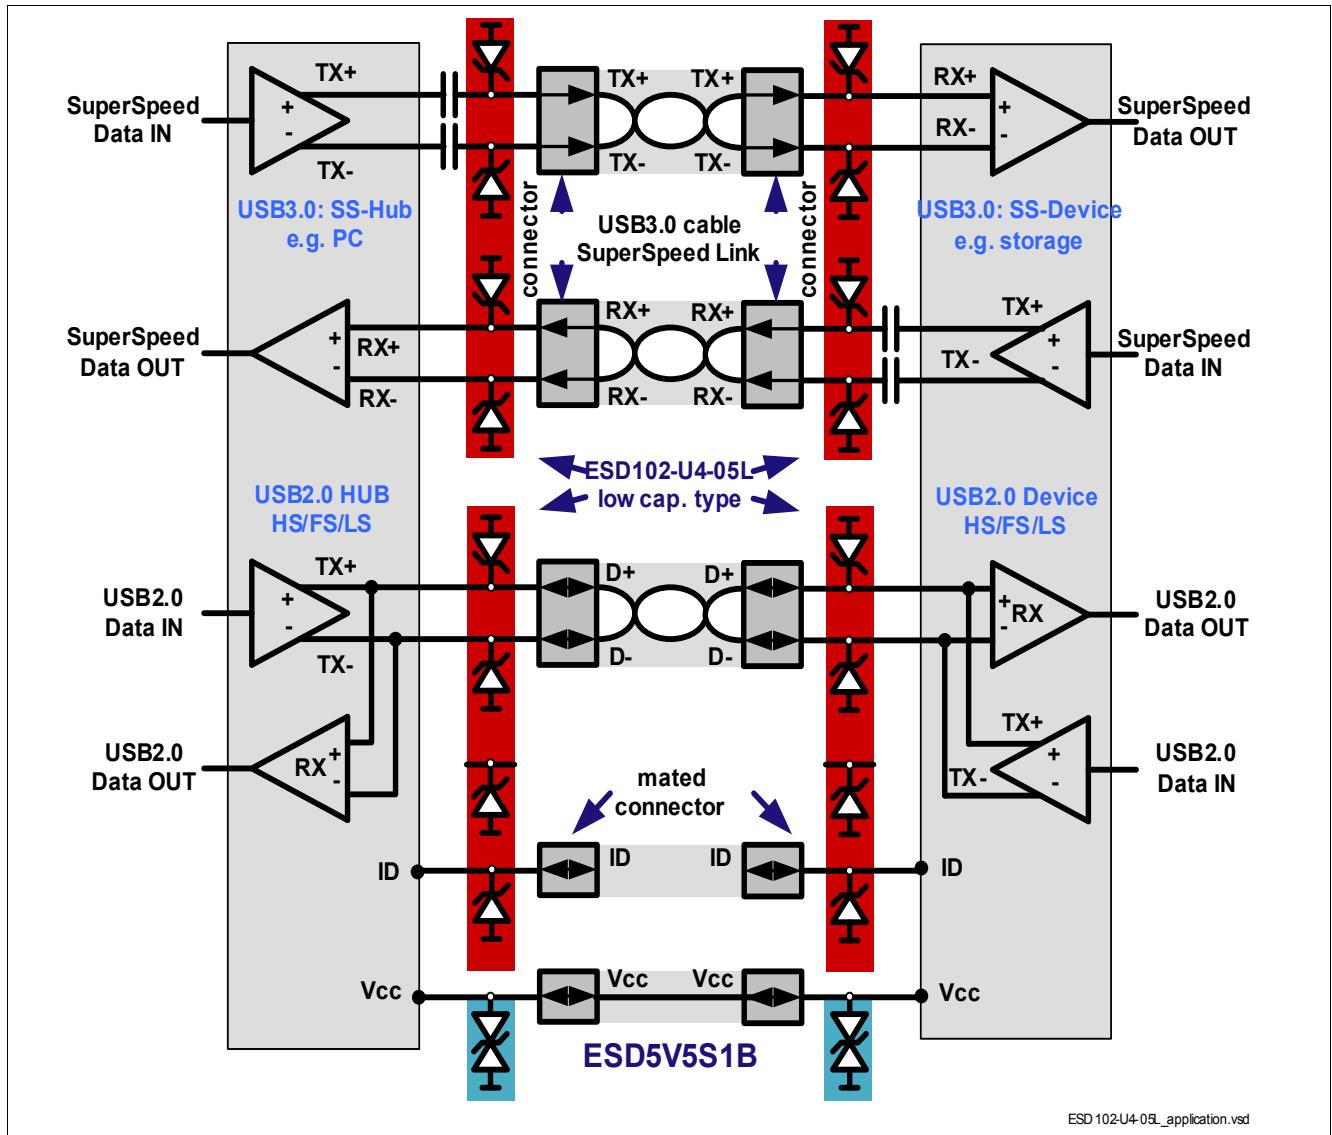

Figure 13 Application

High speed low voltage differential signaling (LVDS) is using a coupled line-pair, called 'lane' for data transmission. In this data transmission systems load and source impedance as well the characteristic differential line impedance is well defined in the range of 90... 100 Ω for USB2.0/ USB3.0, MIPI, HDMI Thunderbolt.

The USB3.0 link provides a full duplex SuperSpeed link (dedicated TX and RX lanes, up to 5 Gb/s) and a USB2.0 link to maintain compatibility. In addition there is a ID pin for identification, the Vcc pin for 5 V supply.

To protect from ESD damage, suited ESD protection diodes should be placed close to the connector.

For the differential high-speed lines the TVS diodes must not have an impact to insertion loss even not for the third harmonic of the data signal. Signal integrity must not be affected by the ESD diode capacitance, The use of ultra low capacitance ESD diode for the data line is mandatory. For the ID and the Vcc pin device capacitance is not critical. To handle the 5 V Vcc line, a 5 V (or even higher) ESD diode is required.
