

CS4207 HD Audio CODEC Development Platform

Features

- ◆ Demonstrates Recommended Layout and Grounding Arrangements
- ◆ Analog I/O Use Standard 1/8" (3.5 mm) or 1/4" (6.35 mm) Jacks With Presence Detection
- ◆ Analog Inputs (Passive)
 - Single-ended and Differential MIC Inputs
 - Single-ended Stereo Line-level Input
- ◆ Analog Outputs (Passive)
 - Stereo Headphone Output with Test Loads
 - Single-ended and Differential Line Outputs
- ◆ Digital I/O
 - Optical S/PDIF I/O Jacks
 - Digital MIC Input Headers
 - HD Audio Bus Headers
 - CS4207 GPIO Header
- ◆ Powered by HDA Bus Connection to PC
 - Optionally Powered by Bench Supply or PC Peripheral Power Supply Cable (Molex)
- ◆ Configured by Hardware Jumpers
 - Power Supply Sources, Analog I/O Settings
- ◆ Current Sense Resistors for CS4207 Supplies

Description

The CDB4207 is a flexible development platform designed for easy evaluation of the CS4207 HD Audio CODEC. Evaluation requires a PC with an HD Audio Bus connector and an analog or digital audio signal source for recording. Analog I/O is provided via 1/8" or 1/4" jacks. S/PDIF I/O is provided via optical connectors. Two identical HD Audio Bus headers are provided for connection to a PC.

The CDB4207 is configured via hardware jumper settings to set up the analog I/O circuitry and select a source for each CS4207 power supply rail. The analog inputs and outputs support several signal types for compatibility with a variety of signal sources and analyzers. The CS4207 can be powered from the HD Audio Bus header, a PC peripheral power supply cable, or external power supplies. Current sense resistors are included for easy power calculations during system development.

1. HARDWARE SYSTEM OVERVIEW

The CDB4207 allows for easy and complete evaluation of the CS4207 HD Audio CODEC. Use of the CDB4207 requires only a PC with an available HD Audio Bus header. If desired the CDB4207 can be powered solely from the connected PC. The CDB4207 supports microphone and line-level analog input signals, line-level and headphone analog output signals, digital microphone input signals, and optical S/PDIF input and output signals.

1.1 CS4207

A description of the CS4207 HD Audio CODEC is included in the CS4207 datasheet. See [Figure 2 on page 11](#) for the CS4207 circuit schematic.

1.2 Analog Inputs

The analog input circuitry on the CDB4207 allows for all possible input configurations of the CS4207 to be tested. Microphone and line-level inputs are connected to the CS4207 using standard 1/8" (3.5 mm) or 1/4" (6.35 mm) jacks. All input configurations are passive and use the recommended DC-blocking capacitors and anti-aliasing filter capacitors.

The CDB4207 supports the following microphone input types: stereo fully-differential signals (J50 and J56), stereo single-ended/pseudo-differential signals (J42), and mono single-ended/pseudo-differential signals with phantom power (J28, into left channel of CS4207). Jumpers J46 and J52 connect the inverting microphone input pins of the CS4207 to either the negative signals of the differential input jacks or ground (for single-ended/pseudo-differential input types). Jumpers J33 and J37 configure the microphone input anti-aliasing capacitor for common-mode or differential filtering. Optionally, an external load may be applied to the MICBIAS pin of the CS4207 using J27. Current sensing for the MICBIAS supply is accomplished by unshunting J36 and measuring the voltage across R33. The CDB4207 supports stereo single-ended/pseudo-differential line-level input signals (J68).

The sleeve connection of the MIC and line input jacks is used for their respective signal's return path. The sleeve should thus be connected to the negative inputs of the CS4207's MIC and/or line input pins when configured in pseudo-differential mode. J43 and J60 are provided to connect the sleeve to board ground. The jumpers should be shunted when the MIC and/or line input source is floating and must use the board ground for its ground reference. To avoid ground loop issues, the jumpers should not be shunted if the MIC and/or line input source has its own external ground reference.

The microphone input jack presence detect signal is triggered by inserting a plug into either J42 or J28 or shunting J40. The line-level input jack presence detect signal is triggered by inserting a plug into J68 or shunting J61.

See [Figure 3 on page 12](#) for the analog input circuit schematic and [Section 3 on page 7](#) for the analog input connections and jumper selections. There is no on-board signal attenuation; see CS4207 datasheet for full-scale input amplitudes.

1.3 Analog Outputs

The analog output circuitry on the CDB4207 allows for full evaluation of the CS4207's analog outputs. Headphone and line-level outputs are connected to the CS4207 using standard 1/8" (3.5 mm) or 1/4" (6.35 mm) jacks. All output paths are passive. The headphone outputs use the recommended anti-peaking filters. The line-level outputs use the recommended DC-blocking capacitors (single-ended only) and low pass filters.

The headphone outputs are stereo single-ended/pseudo-differential signals available at J48. Optionally, a test load of 32 Ω or 16 Ω can be connected to each channel by using J47. The line-level outputs can be configured as stereo single-ended or fully-differential signals. For lineout 1, the single-ended or full-differential output option is selected using J59 and J51. The stereo single-ended output is available at J70. The

stereo full-differential outputs are available at J66 and J53. For lineout 2, the single-ended or full-differential output option is selected using J54 and J55. The stereo single-ended output is available at J69. The stereo full-differential outputs are available at J64 and J65.

The headphone output jack presence detect signal is triggered by inserting a plug into J48 or shunting J49. The lineout 1 jack presence detect signal is triggered by inserting a plug into J70 or shunting J67. Since the CS4207 can only support four jack detect signals on the SENSE_A pin (MIC input, line input, headphone output, and lineout 1), the lineout 2 jack presence detect signal uses the CS4207's GPIO pins. The detect signal can be connected to GPIO2 or GPIO3 using J35. The signal is triggered by inserting a plug into J69.

See [Figure 4 on page 13](#) for the analog output circuit schematic and [Section 3 on page 7](#) for the analog output connections and jumper selections. There is no on-board signal attenuation; see CS4207 datasheet for full-scale output amplitudes.

1.4 Digital Microphone Inputs

The two stereo digital microphone inputs use 4-pin headers for connection to the CS4207. Digital MIC 1 uses headers J29 and J30 while digital MIC 2 uses headers J31 and J32. Pin 1 of each header is connected to DMIC_SCL, the digital microphone clock signal from the CS4207. Pin 2 of each header is the data input signal to the CS4207. The data signals are multiplexed for each header pair (J29/J30 and J31/J32) to support stereo signals. Pin 3 of each header is fixed to a 3.3 V supply from an on-board regulator. Pin 4 of each header is fixed to ground.

See [Figure 5 on page 14](#) for the digital microphone circuit schematic and [Section 3 on page 7](#) for the digital microphone connections.

1.5 S/PDIF I/O

All S/PDIF I/O signals on the CDB4207 use optical connectors. The S/PDIF input signal to the CS4207 is supplied at J39. The S/PDIF output 1 signal from the CS4207 is available at J26. The S/PDIF output 2 signal from the CS4207 is available at J71. Since the S/PDIF output 2 signal from the CS4207 uses a multi-purpose pin, it can be disconnected from J71 by unshunting J16.

See [Figure 5 on page 14](#) for the S/PDIF I/O circuit schematic and [Section 3 on page 7](#) for the S/PDIF I/O connections and jumper selections.

1.6 GPIO Header

The CS4207's four GPIO pins are available at header J34. The GPIO signals are located in the middle column of the header. A 10 k Ω pull-down or pull-up resistor can be applied to each GPIO signal by shunting the middle column to column 1 or 3, respectively.

See [Figure 5 on page 14](#) for the GPIO header circuit schematic and [Section 3 on page 7](#) for the GPIO header connections and jumper selections.

1.7 HD Audio Bus Headers

The CDB4207 has duplicate HD Audio Bus headers for connection to a PC (J1 and J9). These headers allow for easy daisy chaining between CDB4207s for systems with multiple HD Audio CODECs. See [Table 1](#) for header pinout. The headers are keyed for a standard 16-pin ribbon cable. The header cable should only be connected or disconnected while the PC power is turned off. An alternate HD Audio Bus header for the digital I/O signals only is available at J20. The CS4207 will be connected to the serial digital input (SDI) line of the HD Audio Controller selected by header J21. See [Figure 5 on page 14](#) for the HD Audio Bus header circuit schematic and [Section 3 on page 7](#) for the HD Audio Bus header connections and jumper selections.

Table 1. CDB4207 HD Audio Bus Header Pinout (J1 and J9)

| Pin | Signal |
|-----|--------------------------------------|
| 1 | BCLK |
| 2 | GND |
| 3 | RST# |
| 4 | DVDD_IO (to J12 VL_HD header) |

| 10 | +12V |
| 11 | SDI1 |
| 12 | Key (no connection) |
| 13 | SDI2 |
| 14 | 3.3V_DUAL (to D12 indicator LED) |
| 15 | SDI3 |
| 16 | GND |

1.8 Power Supply Circuitry

The CDB4207 has several options for powering the CS4207 and auxiliary circuits. The main board power supply can be used to power the entire board through on-board regulators. The main board power supply can be provided by pin 10 of the HD Audio Bus header J1/J9, the PC peripheral power supply connector J14, or an external bench supply using J8 and J7. The three options are separated via Schottky diodes, thus the applied source with the largest voltage will be used. To use only this single power source, the CS4207 supply source selection headers (J10, J11, J12, J13, and J15) should be shunted in the 'REG' positions. Alternatively each CS4207 supply can be sourced directly from external bench supplies via banana jacks by shunting the 'EXT' position. In this case the main board power supply is still required to regulate a +3.3 V supply for the S/PDIF optical jacks, the digital microphone power, and the GPIO pull-up resistors.

For the VL_HD supply 'REG' setting, J19 selects whether the supply is +3.3 V (unshunted) or +1.5 V (shunted). For the VD supply 'REG' setting, J18 selects whether the supply is +1.8 V (unshunted) or +1.5 V (shunted). For the VA supply 'REG' setting, J17 selects whether the supply is +5 V (unshunted), +4.7 V (1-2 shunted), +3.3 V (3-4 shunted), or +3.1V (5-6 shunted). In addition to the regulator and external options, the CS4207's VL_IF and VL_HD supplies can be powered directly from 3.3V_DVDD_CORE and DVDD_IO on J1/J9 ('HDA'), respectively, and the VA_HP supply can be powered directly from 3.3V_DVDD_CORE on J1/J9 ('3.3 V HDA') or +5 V on J14 ('5.0 V HDD').

Note that the VL_HD supply voltage must match the chipset voltage used by the connected PC. This condition is guaranteed when the 'HDA' setting on J12 is selected instead of 'REG' or 'EXT'.

There are nine power supply indicator LEDs on the CDB4207. Each LED will be lit whenever the associated supply is turned on. See [Figure 6 on page 15](#) for the power supply circuit schematic and [Section 3 on page 7](#) for the power supply connections, jumper selections, and indicator LEDs.

1.9 Grounding and Power Supply Decoupling

As with any high-performance converter, the CS4207 requires careful attention to power supply and grounding arrangements to optimize performance. [Figure 2](#) details the connections to the CS4207 and [Figures 7, 8, 9, 10, and 11](#) show the component placement and the board layout. The decoupling capacitors are located as close as possible to the CS4207.

2. QUICK-START GUIDE

The following figure is a quick-start guide made for user convenience. The guide configures the board to be powered solely from the HD Audio Bus header. The user may choose to ignore steps 3, 4, or 6 through 9 depending on the desired I/O measurements required. See [Table 3](#) for board jumper settings and their factory default settings.

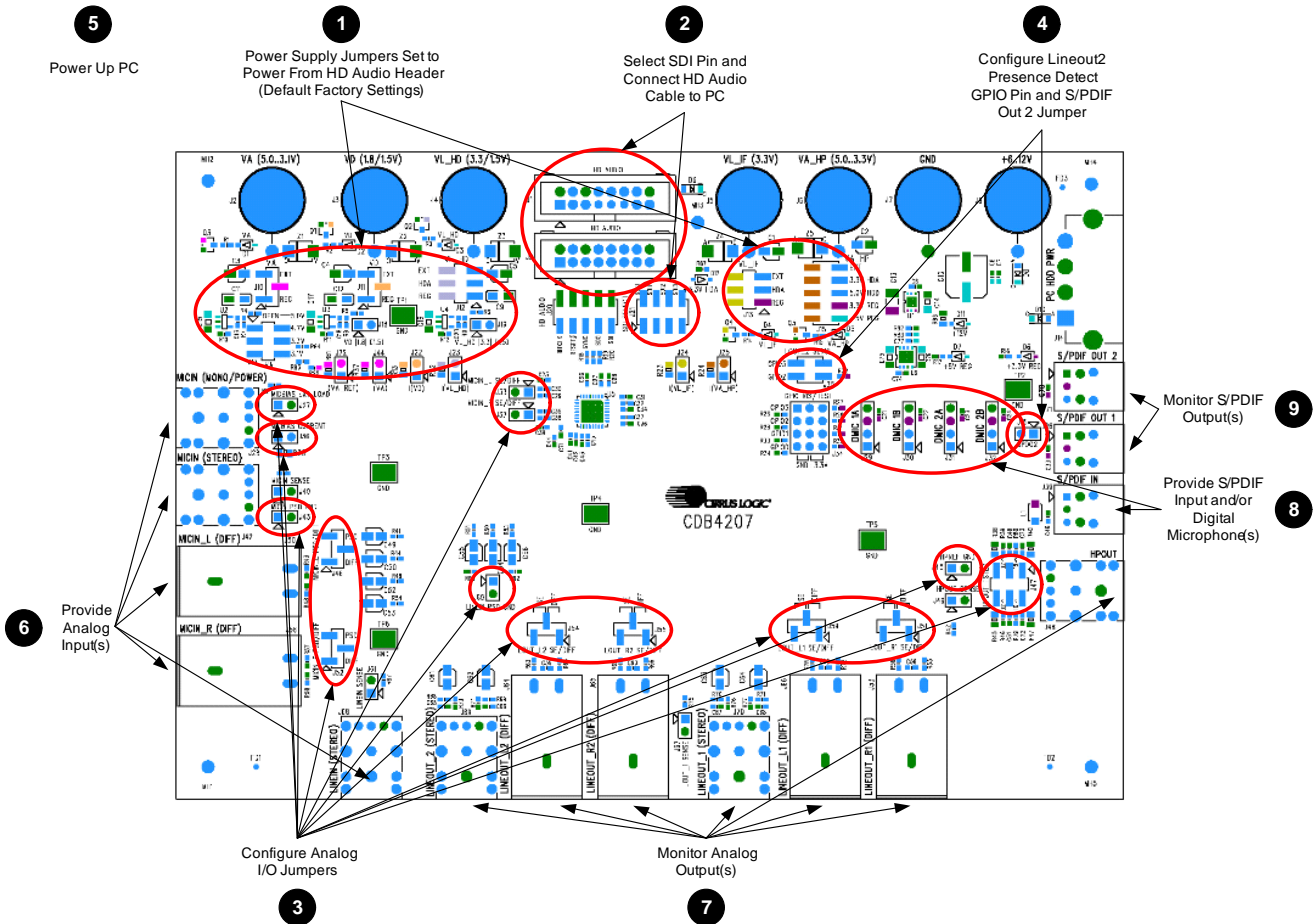

Figure 1. CDB4207 Quick-Start Guide

3. SYSTEM CONNECTIONS AND JUMPER SETTINGS

Table 2 below serves as a quick reference to all user interface elements, Table 3 outlines the various jumper settings on the board, and Table 4 lists the indicator LEDs.

Table 2. System Connections

| Reference Designator | Silkscreen Label | Input / Output | Description |
|----------------------|--------------------|----------------|--|
| J50 | MICIN_L (DIFF) | Input | 1/4" jack, stereo differential microphone input, left channel |
| J56 | MICIN_R (DIFF) | Input | 1/4" jack, stereo differential microphone input, right channel |
| J42 | MICIN (STEREO) | Input | 1/8" jack, stereo single-ended microphone input with jack sense |
| J28 | MICIN (MONO/POWER) | Input | 1/8" jack, mono single-ended microphone input with phantom power, jack sense, and optional test load |
| J68 | LINEIN (STEREO) | Input | 1/8" jack, stereo single-ended line-level input with jack sense |
| J48 | HPOUT | Output | 1/8" jack, stereo single-ended headphone output with jack sense |
