### **Flash Code Protection**

Cypress products meet the specifications contained in their particular Cypress PSoC Data Sheets. Cypress believes that its family of PSoC products is one of the most secure families of its kind on the market today, regardless of how they are used. There may be methods, unknown to Cypress, that can breach the code protection features. Any of these methods, to our knowledge, would be dishonest and possibly illegal. Neither Cypress nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as 'unbreakable'.

Cypress is willing to work with the customer who is concerned about the integrity of their code. Code protection is constantly evolving. We at Cypress are committed to continuously improving the code protection features of our products.

# Safety Information

# **Regulatory Compliance**

The CY8CKIT-049-4xxx Prototyping Kit is intended for use as a development platform for hardware or software in a laboratory environment. The board is an open system design, which does not include a shielded enclosure. This may cause interference to other electrical or electronic devices in close proximity. In a domestic environment, this product may cause radio interference. In such cases, you may be required to take adequate preventive measures. In addition, this board should not be used near any medical equipment or RF devices.

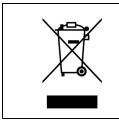

Attaching additional wiring to this product or modifying the product operation from the factory default may affect its performance and cause interference with other apparatus in the immediate vicinity. If such interference is detected, suitable mitigating measures should be taken.

The CY8CKIT-049-4xxx Prototyping Kit, as shipped from the factory, has been verified to meet with requirements of CE as a Class A product.

The CY8CKIT-049-4xxx contains electrostatic discharge (ESD) sensitive devices. Electrostatic charges readily accumulate on the human body and any equipment, and can discharge without detection. Permanent damage may occur on devices subjected to high-energy discharges. Proper ESD precautions are recommended to avoid performance degradation or loss of functionality. Store unused CY8CKIT-049-4xxx boards in the protective shipping package.

### End-of-Life/Product Recycling

This kit has an end-of life five years from the date of manufacture mentioned on the back of the box. Contact your nearest recycler for discarding the kit.

# **General Safety Instructions**

### **ESD** Protection

ESD can damage boards and associated components. Cypress recommends that you perform procedures only at an ESD workstation. If such a workstation is not available, use appropriate ESD protection by wearing an antistatic wrist strap attached to the chassis ground (any unpainted metal surface) on your board when handling parts.

## Handling Boards

CY8CKIT-049-4xxx boards are sensitive to ESD. Hold the board only by its edges. After removing the board from its box, place it on a grounded, static-free surface. Use a conductive foam pad if available. Do not slide board over any surface.

Thank you for your interest in the PSoC<sup>®</sup> 4 CY8CKIT-049-4xxx family of prototyping kits. The prototyping kit is designed as an easy-to-use and inexpensive prototyping platform for users wishing to rapidly develop products using the PSoC 4 families and use the unique flexibility of the PSoC 4 architecture. Designed for flexibility, these kits offer an open footprint breakout board to maximize the end utility of the PSoC 4 device. These kits provide a low-cost alternative to device samples while providing a platform to easily develop and integrate the PSoC 4 device into your end system. In addition, the board includes the following features:

- Onboard CMOD capacitors to enable CapSense<sup>®</sup> development
- A bypass capacitor to ensure the high quality ADC conversions
- An LED to provide feedback
- A push button to provide a simple user input and trigger the bootloader programming mode
- The CY8CKIT-049-41xx PSoC 4 Prototyping kit has CY8C4125AXI-483 device on-board and CY8CKIT-049-42xx PSoC 4 Prototyping kit has CY8C4245AXI-483 device on-board

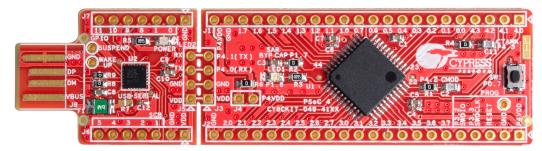

The CY8CKIT-049-4xxx development kit also supports the Cypress USB-Serial CY7C65211 Full-Speed USB controller that enables PC connectivity and serial interfaces, such as USB-UART, USB-I2C, USB-SPI, and USB-GPIO. The development kit includes a Cypress USB-Serial controller used to bootload the target PSoC 4 device. The PSoC 4 prototyping board is breakable, allowing you to separate the USB-Serial board from the PSoC 4 board.

This kit supports either 5 V or 3.3 V power supply voltages. The device can be programmed using the bootloader or the Cypress MiniProg3 programmer. The PSoC 4 Prototyping Kit supports boards based on the 4100 and 4200 device families, delivering a programmable platform for a wide range of embedded applications at a very low cost. The PSoC 4 is a scalable and reconfigurable platform architecture for a family of mixed-signal programmable embedded system controllers with an ARM<sup>®</sup> Cortex<sup>™</sup>-M0 CPU. It combines programmable and reconfigurable analog and digital blocks with flexible automatic routing.

# 1.1 Kit Contents

This kit contains only the PSoC 4 Prototyping Kit, either the 4100 or 4200 series device.

Figure 1-1. PSoC 4 CY8CKIT-049-4xxx Prototyping Kit

# 1.2 Getting Started

This user guide helps you to get acquainted with the PSoC 4 Prototyping Kit. The Software Installation chapter on page 13 describes the installation of the PSoC Creator software. The Kit Operation chapter on page 17 explains how to program the kit using a bootloader or a MiniProg3. The Hardware chapter on page 27 details the hardware operation of the kit. The Code Examples chapter on page 37 and USB-Serial Configuration chapter on page 55 walk you through making projects and configuring the USB-Serial device on the kit. The Appendix on page 65 provides the schematics, pin assignment, and bill of materials (BOM).

# 1.3 Additional Learning Resources

Cypress provides a wealth of data at www.cypress.com to help you to select the right PSoC device for your design, and to help you to quickly and effectively integrate the device into your design. For a comprehensive list of resources, see KBA86521, How to Design with PSoC 3, PSoC 4, and PSoC 5LP. The following is an abbreviated list for PSoC 4:

- Overview: PSoC Portfolio, PSoC Roadmap
- Product Selectors: PSoC 1, PSoC 3, PSoC 4, or PSoC 5LP. In addition, PSoC Creator includes a device selection tool.
- Datasheets: Describe and provide electrical specifications for the PSoC 4000, PSoC 4100, and PSoC 4200 device families.
- CapSense Design Guide: Learn how to design capacitive touch-sensing applications with the PSoC 4 family of devices.
- Application Notes and Code Examples: Cover a broad range of topics, from basic to advanced level. Many of the application notes include code examples. Visit the PSoC 3/4/5 Code Examples webpage for a list of all available PSoC Creator code examples. For accessing code examples from within PSoC Creator see PSoC Creator Code Examples on page 10. These code examples available across PSoC Creator, Application notes and kits for the most part will NOT be bootloadable. However, with a very small modification you can port them to a bootloadable project and use them with the CY8CKIT-049. Refer to Converting a Non-bootloadable Project to a Bootloadable Project on page 42 for details.
- Technical Reference Manuals (TRM): Provide detailed descriptions of the architecture and registers in each PSoC 4 device family.
- Development Kits:
  - □ CY8CKIT-042 and CY8CKIT-040, PSoC 4 Pioneer Kits, are easy-to-use and inexpensive development platforms. These kits include connectors for Arduino<sup>™</sup> compatible shields and Digilent<sup>®</sup> Pmod<sup>™</sup> daughter cards.
  - □ CY8CKIT-049 is a very low-cost prototyping platform for sampling PSoC 4 devices.
- CY8CKIT-001 is a common development platform for all PSoC family devices.
- The MiniProg3 device provides an interface for flash programming and debug.
- Knowledge Base Articles (KBA): Provide design and application tips from experts on the devices/kits. For instance, KBA93541, explains how to use CY8CKIT-049 to program another PSoC 4.

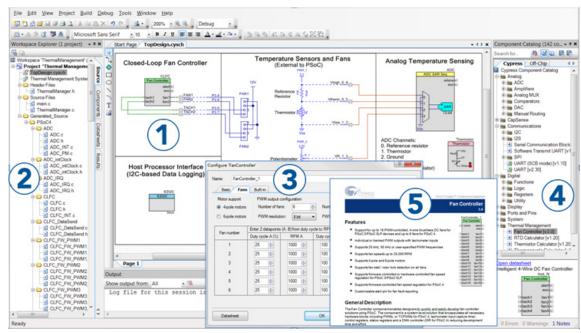

# 1.3.1 PSoC Creator

PSoC Creator is a free Windows-based Integrated Design Environment (IDE). It enables concurrent hardware and firmware design of systems based on PSoC 3, PSoC 4, and PSoC 5LP. See Figure 1-2 – with PSoC Creator, you can:

- 1. Drag and drop Components to build your hardware system design in the main design workspace
- 2. Codesign your application firmware with the PSoC hardware
- 3. Configure Components using configuration tools
- 4. Explore the library of 100+ Components
- 5. Review Component datasheets

Figure 1-2. PSoC Creator Features

Visit PSoC Creator training page for video tutorials on learning and using PSoC Creator.

## 1.3.2 PSoC Creator Code Examples

PSoC Creator includes a large number of code example projects. These projects are available from the PSoC Creator Start Page, as Figure 1-3 shows.

Example projects can speed up your design process by starting you off with a complete design, instead of a blank page. The example projects also show how PSoC Creator Components can be used for various applications. Code examples and datasheets are included, as Figure 1-4 on page 11 shows.

In the Find Example Project dialog shown in Figure 1-4 on page 11, you have several options:

- Filter for examples based on architecture or device family, i.e., PSoC 3, PSoC 4 or PSoC 5LP; category; or keyword
- Select from the menu of examples offered based on the Filter Options
- Review the datasheet for the selection (on the **Documentation** tab)
- Review the code example for the selection. You can copy and paste code from this window to your project, which can help speed up code development, or
- Create a new project (and a new workspace if needed) based on the selection. This can speed up your design process by starting you off with a complete, basic design. You can then adapt that design to your application.

### 1.3.3 PSoC Creator Help

Visit the PSoC Creator home page to download the latest version of PSoC Creator. Then, launch PSoC Creator and navigate to the following items:

- Quick Start Guide: Choose Help > Documentation > Quick Start Guide. This guide gives you the basics for developing PSoC Creator projects.
- Simple Component example projects: Choose File > Open > Example projects. These example projects demonstrate how to configure and use PSoC Creator Components.
- Starter designs: Choose File > New > Project > PSoC 4 Starter Designs. These starter designs demonstrate the unique features of PSoC 4.
- System Reference Guide: Choose Help > System Reference > System Reference Guide. This guide lists and describes the system functions provided by PSoC Creator.
- Component datasheets: Right-click a Component and select "Open Datasheet." Visit the PSoC 4 Component Datasheets page for a list of all PSoC 4 Component datasheets.
- Document Manager: PSoC Creator provides a document manager to help you to easily find and review document resources. To open the document manager, choose the menu item Help > Document Manager.

## 1.3.4 Technical Support

If you have any questions, our technical support team is happy to assist you. You can create a support request on the Cypress Technical Support page.

If you are in the United States, you can talk to our technical support team by calling our toll-free number: +1-800-541-4736. Select option 2 at the prompt.

You can also use the following support resources if you need quick assistance.

- Self-help
- Local Sales Office Locations

# 1.4 Document Conventions

Table 1-1. Document Conventions for Guides

Convention	Usage
Courier New	Displays file locations, user entered text, and source code: C:\cd\icc\
Italics	Displays file names and reference documentation: Read about the <i>sourcefile.hex</i> file in the <i>PSoC Creator User Guide</i> .
[Bracketed, Bold]	Displays keyboard commands in procedures: [Enter] or [Ctrl] [C]
File > Open	Represents menu paths: File > Open > New Project
Bold	Displays commands, menu paths, and icon names in procedures: Click the <b>File</b> icon and then click <b>Open</b> .
Times New Roman	Displays an equation: 2+2=4
Text in gray boxes	Describes Cautions or unique functionality of the product.

# 2. Software Installation

# 2.1 Before You Begin

All Cypress software installations require administrator privileges, but these are not required to run the software after it is installed. Close any other Cypress software that is currently running before installing the kit software.

Note: The kit contents are installed in the C:\Program Files\Cypress folder by default. If the

Code examples are being run from the default install location, administrator privileges are required. If you do not have administrator privileges, copy the Firmware folder from the default install location to any other location on your PC and access the files

# 2.2 CY8CKIT-049-41xx/CY8CKIT-049-42xx Software

The kit requires Cypress' proprietary software, such as PSoC Creator, PSoC Programmer and the USB-Serial Configuration Utility, and generic software such as .NET Framework, Windows Installer, and Internet Explorer. The kit software is available on the kit web page in three formats:

Install Package	File Format	Usage
CY8CKIT-049-41xx_Kit ISO/ CY8CKIT-049-42xx_Kit ISO	ISO	This package can be used if the PC does not have any Cypress or non-Cypress prerequisite software installed. It first installs the prerequisites and then the kit content (firmware, hardware, and documentation files) in the specified location.
CY8CKIT-049-41xx_Kit Setup/ CY8CKIT-049-42xx_Kit Setup	EXE	This package can be used if the PC does not have any Cypress prerequisite software installed. If any non-Cypress prerequisites are found to be missing during installation, the installer provides links to download and install them and then installs the kit content (firmware, hardware, and documentation files) in the specified location.
CY8CKIT-049-41xx_Kit Only/ CY8CKIT-049-42xx_Kit Only	EXE	This package can be used if the PC has all the Cypress and non-Cypress prerequisites installed. It installs only the kit content (firmware, hardware, and documentation files) in the specified location. If any of the prerequisites are found missing during the installation process, the installer prompts you to install all the required software before attempting to install the kit. The installer redirects to the kit web page to download and install any missing Cypress software. Similarly, it provides links to download and install the missing non- Cypress prerequisites.

Table 2-1. Kit Software Formats

**Note:** The USB-Serial Configuration Utility requires Visual C++. If Visual C++ is not installed in the PC, the installer provides link to install the Visual C++ Redistributable package in the PC.

**Note:** Adobe Reader is required to view kit documents. If Adobe Reader is not installed on your PC, the installer provides the link to download and install it.

**Note:** PSoC Creator is provided with a free Keil C licence that has to be registered within 30 days of installing PSoC Creator. To register your Keil license, you will require an internet connection. Please read http://www.cypress.com/?id=4&rID=38519 for more details. Please read http://www.cypress.com/?id=4&rID=44355 if PSoC Creator needs to be used on a PC that does not have internet connection. The product ID for the Keil compiler is IKA1P-M6Q0E-8W7ST.

# 2.3 Install Software

- 1. Run cyautorun.exe in the kit ISO to start the installation process.
- 2. Click **Install CY8CKIT-049-41xx** to start CY8CKIT-049-41xx PSoC 4 Prototyping kit installation. Click **Install CY8CKIT-049-42xx** to start CY8CKIT-049-42xx PSoC 4 Prototyping kit installation.
- 3. Select the folder to install the kit files. Choose the directory and click **Next**. The installation directory is referred to as *<Install\_Directory>* in this document.
- 4. When you click **Next**, the kit installer automatically installs the required software, if it is not present on your computer.
- 5. Select the installation type in the **Product Installation Overview** window. The drop-down menu contains three options: **Typical** (installs all the required features), **Custom** (lets you choose the features to be installed), and **Complete** (installs all the contents). Click **Next** after you select the installation type.

Note: It is recommended that you choose the Complete installation type.

- 6. Read and Accept the End-User License Agreement and click **Next** to proceed with the installation.
- 7. When the installation begins, a list of packages appears on the installation page. A green check mark appears adjacent to every package after successful installation.
- 8. After installing all the packages, the CyInstaller finish page opens up. Please provide the requested contact information or uncheck the "Continue Without Contact Information" checkbox and click on **Finish** button to complete the kit installation.

After the installation is complete, the kit contents are available at the following location:

- 1. For CY8CKIT-049-41xx: <Install\_Directory>\ CY8CKIT-049-41xx \<version>
- 2. For CY8CKIT-049-42xx: <Install\_Directory>\ CY8CKIT-049-42xx \<version>

# 2.4 Install Hardware

There is no additional hardware installation required for this kit.

# 2.5 Uninstall Software

To uninstall the software, do one of the following:

- Go to Start > All Programs > Cypress > Cypress Update Manager > Cypress Update Manager, and then select the Uninstall button corresponding to the kit software.
- Go to Start > Control Panel > Programs and Features, and then select the Uninstall/Change button corresponding to the kit software.

W

#### Open the "PSoC 4 Code" Code Example in PSoC Creator 2.6

Note: The code examples require administrator privileges if they are run directly from the default install location (C:\Program Files\Cypress). If you do not have administrator privileges, copy the Firmware folder from the default install location to any other location on your PC and use the files.

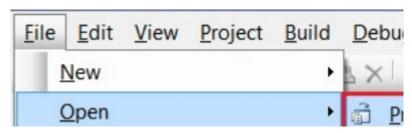

1. Launch the PSoC Creator software from the Start menu.

### Figure 2-1. PSoC Creator Start Page

2. Open the SCB\_Bootloader.cywrk workspace by choosing File > Open > Project/Workspace and navigating to the directory in which your project is present.

Figure 2-2. Open Project/Workspace

The workspace includes two sample projects linked in the Workspace Explorer. Subsequent chapters of this user guide show how to build, program, and understand the code examples supplied with this kit.

Software Installation

The PSoC 4 Prototyping Kit is simplistic in design and focuses on providing you with complete access to develop applications using the PSoC 4 device family. The development kit supports a number of onboard functions such as an LED, push button, through-hole connections, USB-Serial connectivity to the PC, and a breakable board design to separate the two target boards.

Figure 3-1. PSoC 4 Prototyping Kit

Kit Operation

3.

#### 3.1 **Connecting the PSoC 4 Prototyping Kit to a Computer**

To use the PSoC 4 Prototyping Kit, you need to connect the kit to a target PC. The kit is designed to be connected to the computer through USB. The USB connector will provide power to the target boards and enable serial communication. CY8CKIT-049-4xxx implements a PCB-based USB connector that makes connections to the USB port when plugged in. The amber LED turns on when the board is plugged into the port to indicate power.

Figure 3-2. Connecting the PSoC 4 Prototyping Kit to a Computer

Figure 3-3. PSoC 4 Prototyping Kit Connected to the Computer

# 3.2 CY8CKIT-049-4xxx USB COM Port

When you connect the CY8CKIT-049-4xxx to the PC over a USB interface, it enumerates as a COM port device under the Device Manager window on the Windows OS. Often, the COM port number will be higher than any existing COM port value. For example, in the following image the CY8CKIT-049-4xxx enumerates as **COM37**.

Figure 3-4. CY8CKIT-049-4xxx USB COM Port in Device Manager

When connecting your CY8CKIT-049-4xxx to a computer for the first time or to any new USB port, it may take a moment to enumerate because the computer will complete an online check for the latest drivers.

Figure 3-5. Automatic Driver Software Installation for CY8CKIT-049-4xxx

Driver Software Installation		x

U Driver Software Installation		<b>×</b>
Your device is ready to use		
USB Composite Device USB-Serial (Single Channel) Vendor MFG USB-Serial Adapter	Ready to use Ready to use Ready to use	

**Note:** The baud rate settings do not apply to the virtual COM port as the data transmission is taking place using the Full-Speed USB bus at 12 Mbps. However, because of the virtual COM port driver that sits between the PC and the USB-Serial device, the operating system will see the device as a normal serial port and you will be able to set the baud rate. However, these settings may be ignored.

# 3.3 **Programming a CY8CKIT-049-4xxx Project Using the Bootloader**

The following example shows how to bootload (program) a project into the PSoC 4 with the USB-Serial device, using the Bootloader Host. To use this method, the PSoC 4 device must contain the bootloader and the project must be configured as bootloadable. This is the default programming method for new users.

The following steps use the code example included in the kit installer.

1. Launch PSoC Creator from the Start menu.

- 2. Open the SCB\_Bootloader.cywrk workspace from Examples and Kits > Kits. Select CY8CKIT-049-41xx folder for CY8CKIT-049-41xx PSoC 4 Prototyping Kit and CY8CKIT-049-42xx folder for CY8CKIT-049-42xx PSoC 4 Prototyping Kit.
- 3. Select the folder where you want to save the project and click **OK**.

Figure 3-8. Set the Code Example as Active Project

The bootloadable project must be associated with the bootloader project's HEX and ELF files. This will ensure that the firmware code mapping aligns with the code on the target device.

 Under the 'Bootloadable Blinking LED' code example, double-click the 'TopDesign.cysch' file to open the schematic view. Select the tab for the Bootloadable Project schematic page if it is not already selected.

7. In the schematic view, right-click the Bootloadable component and select Configure.

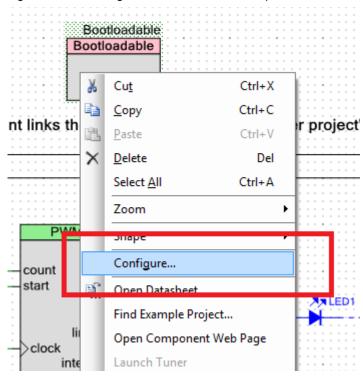

Figure 3-10. Configure the Bootloader Component

8. In the configuration window, select the **Dependencies** tab and click the **Browse** button to point to the HEX and ELF files present in the 'Dependencies' folder under project directory; click OK. The file paths (assuming the CY8CKIT-040-42xx) will appear as follows:

<Project Directory>\SCB Bootloader\UART Bootloader.cydsn\CortexM0\ ARM GCC 484\Debug\UART Bootloader.hex

<project Directory>\SCB Bootloader\UART Bootloader.cydsn\CortexM0\ ARM GCC 484\Debug\UART Bootloader.elf

Figure 3-11. Configure Dependencies for Bootloader Component

Configure 'Bootloadable'	2	x
Name: Bootloadable		
General Dependencies Built-in	<	1 Þ
Bootloadable projects require a reference to the associated Bootloader project's HEX files. The HEX files extension is *.hex. The ELF files extension depends on IDE and ca *.elf, *.out, *.axf, or other.

10. Connect the CY8CKIT-049-4xxx prototyping board to the PC. When connecting the kit to the port, depress the **SW1** button as it is plugged in.

You will notice that the blue LED begins to blink rapidly; this indicates that the PSoC 4 is in 'Bootloader Mode' and is ready to be loaded with the latest firmware. This must be done each time you bootload the PSoC 4.

11. Select **Tools > Bootloader Host** to open the Bootloader Host tool.

Figure 3-13. Launch Bootloader Host Tool

The Bootloader Host tool opens.

Figure 3-14. Bootloader Host Tool

🛓 Bootloader Host

Ports:	Filters	Port Config	uration UART -
USB Serial Port (COM2)		Baud Data Bits Stop Bits Parity	115200       8       One       None

12. Click **Filters** and select the **Show UART Devices** option from the Port Filters window and click **OK**. This lists all COM devices connected to the computer.

**Note:** The PID of the Bootloader is F13B. You may enter this PID in the Port filters window to list only the Kit Bootloader.

Figure 3-15. Port Filters

Port Filter	s x
Show	I2C Devices SPI Devices UART Devices USB Devices
VID:	0x04B4
PID:	0xF13B
Cano	xel OK

The Bootloader Host tool will now display all of the available UART based COM ports.

 Click the COM port from the list of available ports and enter the UART configuration such as Baud Rate, Data Bits, Stop Bits, and Parity for the USB-UART configuration on the USB-Serial device.

The values for the UART are: 115200 baud rate, 8 data bits, 1 stop bit, and no parity.

14. Click **File > Open** and navigate to the *Bootloadable\_Blinking\_LED.cyacd* file generated in the CortexM0 folder in your project directory, and click **Open**.

Figure 3-16. Opening the Generated File

File:	File: 3der_42XX\Bootloadable Blinking LED.cydsn\CortexM0\ARM_GCC_473\Debug\Bootloadable Blinking LED.cyacd		
Ports:	Filters Port Configuration UART Port Information		

15. Click the **Program** button to flash the part with your new application code.

The status window provides output message and a status bar indicates the programming progress. When bootloading is complete, your application executes with the latest version of the application code.

Figure 3-17. Program the Device With Application Code

See application note AN73854 for additional details on bootloading.

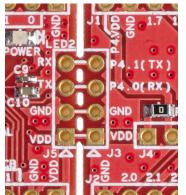

# 3.4 USB-UART Default Settings

The default configuration of the USB-Serial device on the CY8CKIT-049-4xxx prototyping kit is the USB-UART mode. The CY8CKIT-049-4xxx also enables a default UART connection between the USB-Serial device and the PSoC 4. This connection is indicated by two parallel 4-pin headers in the middle of the board. The default pin connections are shown in Table 3-2.

Table 3-1. Pin Mapping for USB-Serial Port and PSoC 4 UART

USB-Serial UART	PSoC 4 UART
ТХ	P4.0 (RX)
RX	P4.1 (TX)
GND	GND
VDD	VDD

Figure 3-18. UART Pin Connections on CY8CKIT-049-4xxx

The USB-Serial device provides the PSoC 4 device with an interface to a PC. The USB-Serial device enumerates as a COM port to allow any terminal software to be used to communicate with the PSoC 4. To use the USB-UART functionality in the COM terminal software, select the corresponding COM port. Note that if the USB-Serial device board is separated from the PSoC 4 board, you will still be able to use the USB-Serial device to communicate with any UART device using the 4-pin header.

The USB-Serial device is by default configured as a USB-UART device with the following specifications. The USB-UART settings can also be configured from the Cypress USB-Serial Configuration Utility. The default setting are as shown in bold in the table below.

Parameter	Supported Values	
Baud Rate	100, 200, 300, 600, 1200, 2400, 4800, 9600, 14400, 19200, 38400, 56000, 57600, <b>115200</b> , 230400, 460800, 921600, 1000000, 3000000	
Туре	<b>2 pin</b> , 4 pin, 6 pin	
Data Bits	7 bits, 8 bits	
Stop Bits	1 bit, 2 bits	
Parity	None, Odd, Even, Mark, Space	
Drop Packets on RX error	Disabled, Enabled	
Disable CTS and DSR pull-up during suspend	Disabled, Enabled	

Table 3-2. USB-UART settings as seen in Cypress USB-Serial Configuration Utility

# 4. Hardware

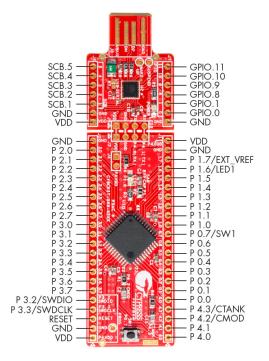

# 4.1 Board Details

The PSoC 4 Prototyping Kit consists of the following blocks:

- PSoC 4 device
- PSoC 4 header ports J1 and J2
- USB-Serial device
- USB-Serial header ports J5 and J6 (GPIO)
- UART connection J3 and J4 (SCB and GPIO)
- PCB USB connector
- One amber LED (Power)
- One blue LED (User)
- Push button
- External reference capacitor (ADC Bypass)
- CapSense and shield capacitors (CMOD and CTANK)
- Programming connector
- Perforated 'snappable' board design

Figure 4-1. CY8CKIT-049-4xxx Pin Details

# 4.2 Theory of Operation

PSoC 4 is a new generation of programmable system-on-chip device from Cypress for embedded applications. It combines programmable analog, programmable digital logic, programmable I/O, and a high-performance ARM Cortex-M0 core. With PSoC 4, you can create the combination of peripherals required to meet your application's specifications.

The PSoC 4 Prototyping Kit features an onboard USB-Serial device, which communicates to a PC through USB to provide serial communication support and serial port debugging.

The PSoC 4 Prototyping Kit has a user LED and a power status LED. This kit includes a button that connects to the PSoC 4 device, which can be used to develop applications. This button is also used to enable the onboard bootloader. The PSoC 4 pins are brought out onto headers J1 to J2 on the kit and support 100-mil breadboard spacing.

The PSoC 4 Prototyping Kit can be powered from USB or an external power supply. The input voltage is either 5 V from USB or a variable supply from an external source.

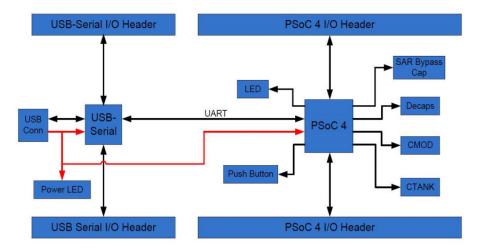

Figure 4-2. CY8CKIT-049-4xxx Functional Block Diagram

# 4.3 Functional Description

### 4.3.1 Power Supply System

The power supply system on this board is dependent on the source of the power. For most applications, you can use the 5 V supply from the USB connection to power the system. You can also connect an external power supply to the board for low-voltage applications. The kit supports the following connections:

- 5 V from the PCB USB
- 1.8-5 V from a regulated supply connected to VDD

It is important to understand that this prototyping kit does not have any onboard ESD protection circuitry. Therefore, the power source for the CY8CKIT-049-4xxx must be of a high quality to ensure that the board is protected from any over-current conditions and swapped-power connections.

### 4.3.1.1 Measure PSoC 4 Current Consumption

You can measure the current consumption of the PSoC 4 device by using one of these methods:

Method 1:

- 1. Separate the USB-Serial board by 'snapping' the perforated edge between the two boards.
- 2. Power the remaining prototyping board via any of the VDD terminals.
- 3. Place an ammeter in series with the VDD connection to measure the current consumption.

Method 2:

- 1. Remove the resistor R6 and install a 2-pin jumper in the supplied holes of J4.
- 2. Connect an ammeter across the 2-pin jumper to measure the current to the PSoC 4 device.

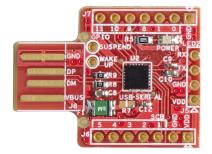

This method can be used either with USB power or with power supplied to one of the VDD pins.

## 4.3.2 Board Separation (Snapping)

CY8CKIT-049-4xxx supports both the PSoC 4 and USB-Serial boards. To separate the two boards for testing or development, break the two boards apart at the built-in perforated edge.

The easiest method of separating the two boards is to place the kit on the edge of a table, where the edge of the table is directly below the perforated edge and the smaller USB-Serial device is off the table edge. Press gently on the USB-Serial board and snap the two boards apart. If any material is removed from the edge of the boards, use sheers to clean up the edge of the kit.

Figure 4-3. CY8CKIT-049-4xxx Broken as Two Parts

## 4.3.3 Header Connections

The CY8CKIT-049-4xxx Prototyping Kit supports a number of unpopulated headers on both the USB-Serial and the PSoC 4 boards.

## 4.3.3.1 Functionality of the J1 and J2 Headers (PSoC 4)

The main PSoC 4 board contains two dual-inline headers (J1 and J2). These headers are both 1×22-pin headers and include all of the I/O available on the PSoC 4 devices. These headers support all of the available ports, GND, VDD, and connections to passive elements and user-input devices.

The J1 and J2 headers support 100-mil spacing, so you can solder the male connectors to connect the CY8CKIT-049-4xxx to any development breadboard.

Figure 4-4. J1 and J2 Headers

J2_22	GND	Ground

Table 4-2. J2 Header Pin Details

#### Functionality of J3 and J5 Headers (PSoC 4 to USB-Serial) 4.3.3.2

Both the USB-Serial and the PSoC 4 prototyping boards each contain a 1×4-pin header. This header provides a physical connection between the two devices. Specifically, the connection includes the UART (RX and TX), VDD, and GND connections between the two devices. When the boards are separated, this physical connection is broken.

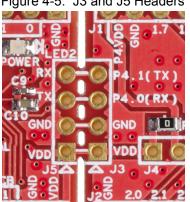

Figure 4-5. J3 and J5 Headers

### 4.3.3.3 Functionality of J6 and J7 Headers (USB-Serial)

The USB-Serial board contains two dual-inline headers (J6 and J7). These headers are both 1x7-pin headers and include all of the GPIO and SCB connections. These headers support all of the available ports, GND, VDD, and connections to passive elements and user-input devices.

The J6 and J7 headers support 100-mil spacing, so you can solder the male connectors to connect the USB-Serial board to any development breadboard.

J7_06	GPIO.10	GPIO
J7_07	GPIO.11	GPIO

# 4.3.4 User and Passive Inputs

### 4.3.4.1 Push Button

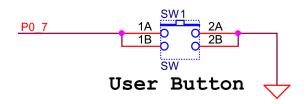

The main PSoC 4 board contains a single push button connected to the P0.7 pin on the PSoC 4 device. This button can be used for general user inputs and for triggering the bootloader for programming.

Figure 4-8. Push Button on the Board

### 4.3.4.2 CY8CKIT-049-4xxx LEDs

CY8CKIT-049-4xxx contains two LEDs: the amber LED, which indicates the board is power applied and the blue LED that is directly connected to the PSoC 4 device through the pin P1.6. The blue LED is also used to indicate the bootloader mode by rapidly blinking. The power LED is on the USB-Serial board; if the boards are separated, the PSoC 4 section does not consume current through the power LED.

Figure 4-10. Power LED

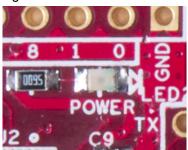

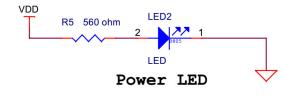

Figure 4-11. User LED

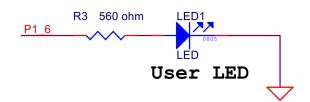

Figure 4-12. Power LED Connection

### Figure 4-13. User LED Connection

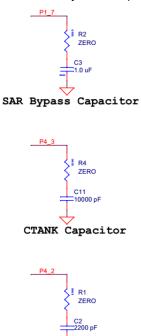

### 4.3.4.3 System Capacitors

The three capacitors on the CY8CKIT-049-4xxx prototyping kit enable proper development of ADC and CapSense code examples. These capacitors are the following:

- A SAR ADC bypass capacitor: Required for proper sampling at high frequencies,
- Two CapSense capacitors (CMOD and CTANK): Required for proper CapSense functionality.

Figure 4-14. System Capacitors Circuit Diagram

CMOD Capacitor

Hardware

This section describes how to use the code example included with the kit and how to develop custom bootloadable code examples for new applications.

For a list of all code examples available with PSoC Creator, visit the PSoC 3/4/5 Code Examples page. This page lists all the PSoC Creator based code examples available across PSoC Creator, Application notes and kits. Most of these examples CANNOT be directly used with the kit. Refer to Converting a Non-bootloadable Project to a Bootloadable Project on page 42 for details on how to port these projects to use with CY8CKIT-049.

For PSoC Creator related training and video tutorials, visit PSoC Creator training page.

## 5.1 Bootloader Base Code Example

The CY8CKIT-049-4xxx prototyping board is pre-programmed with a simple blinking LED code example. This code example uses a PWM to slowly blink an LED. Included in the application project is the Bootloader Base project. The Bootloader code is detailed in the UART\_Bootloader project available on the kit web page.

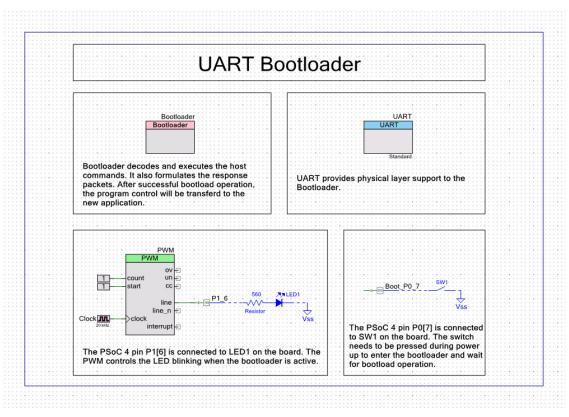

In the bootloader example, the device rapidly blinks an LED when the bootloader is active, provides UART communication support for bootloading, and reads the state of the switch (SW1). You can observe the state of the board by noticing the rate at which the LED blinks. The bootloader is activated when you plug in the CY8CKIT-049-4xxx while pressing the SW1 button. The bootloader reads the state of this button during power-up. If the button is not pressed, the bootloader jumps to the user's application code. If the button is pressed, then the bootloader waits for a new application to be transferred. While the bootloader waits for the new application, it rapidly blinks the onboard blue LED.

Note that the bootloader project is fully customizable, so you can use different methods for entering the bootloader mode, and different feedback mechanisms. For example, you can change the project so that it waits at power-up for a specified amount of time for a new application to be loaded rather than through the use of a button press. All resources of the PSoC are available for use by the bootloader project.

For details on UART bootloader in PSoC 4, please refer AN68272 - PSoC<sup>®</sup> 3, PSoC 4 and PSoC 5LP UART Bootloader. The landing page of the application note also includes a video providing an overview of a UART bootloader.

The Bootloader Base Project includes the source code in the *main.c* and the *UART\_Btld.c* files, which support bootloading the PSoC 4 device. The source code is available for reference, but is not necessary to create bootloadable applications.

# 5.2 Bootloadable Code Example

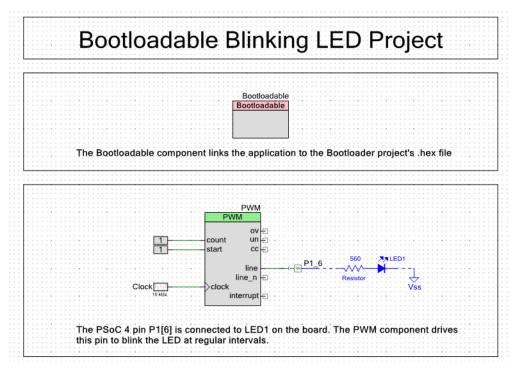

The example in Programming a CY8CKIT-049-4xxx Project Using the Bootloader on page 19 showed how to bootload the application code for a blinking LED project into the device using the USB-Serial controller.

In the bootloadable code example, the following components are used:

- Bootloadable
- PWM
- Clock
- Digital Output Pin
- Digital Constants (logic HIGH/LOW)
- Off-Chip Components (external resistor, LED, and Vss)

In this code example, the PWM component is used to drive an output on a pin connected to the user LED. The bootloadable component is placed to ensure that your application code is correctly mapped to the target PSoC 4 bootloader flash-space mapping.

#### Figure 5-2. Bootloadable Blinking LED Project

## 5.3 Creating a New Bootloadable Project

To create a new bootloadable project, do the following:

- 1. On the Start Page of PSoC Creator, click Create New Project.
- 2. On the New Project window, select an PSoC 4100/PSoC 4200 Design.
- 3. Enter a name for the project and select a workspace. You can either add the new project to an existing workspace or create a new one.
- 4. Set the device to the PSoC 4 device on your CY8CKIT-049-4xxx. For example, the CY8CKIT-049-42XX kit requires the CY8C4245AXI-483 device.
- 5. Click the + button next to Advanced, set the Application Type as Bootloadable.

#### 6. Click OK.

 After the project builds without errors, follow the steps shown in Programming a CY8CKIT-049-4xxx Project Using the Bootloader on page 19 to bootload the new code into the target using the Bootloader Host application.

This example does not have any source code, but is a base code example. Follow the steps in the next examples to add functionality to this base project.

## 5.4 Converting a Non-bootloadable Project to a Bootloadable Project

As part of PSoC Creator application notes and kits available at www.cypress.com, Cypress provides many code examples that you can work with. Most of these code examples do not include a boot-loader in the project and are not directly usable with the CY8CKIT-049 kit. However, with a very small modification to the project, they can be easily made to work with the CY8CKIT-049 kit. The following section describes how to port a code example that is not bootloadable into a bootloadable example. We will take a simple PSoC Creator code example, **PWMExample**, for this purpose. You can follow the same steps to port any non-bootloadable project to a bootloadable project.

### 5.4.1 PWMExample

This example explains how to get the **PWMExample** project from the PSoC Creator code examples list into your workspace and target the CY8CKIT-049-4xxx development kits.

1. In PSoC Creator, click Find Example Project... under Start Page > Examples and Kits.

20. Click the **Program** button. When the firmware is programmed, observe that the LED moves from low intensity to higher intensity in steps of 100. You can change the BRIGHTNESS\_DECREASE macro to modify the step size.

Figure 5-23. Program Button in Bootloader Host

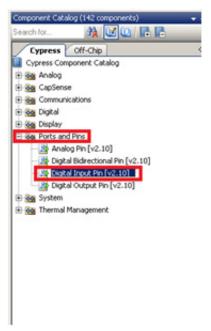

## 5.4.2 Entering Bootloader Mode from the Bootloadable Application

To program the PSoC 4 device on the CY8CKIT-049 kit, you need to enter the bootloader mode through which you can load the desired application via the Bootloader Host utility and the USB-Serial bridge. The default bootloader in the onboard PSoC 4 enters the bootloader mode when the SW1 button is pressed during board/device power up. This method of entering the bootloader can be time consuming and you may not prefer removing the board from the PC each time you want to program it. You can also enter the bootloader mode using the Bootloadele component present in the application project. When you want to enter bootloader mode, say when a button is pressed for a predefined duration or a command is sent via UART, all you need to do is detect the condition to enter bootloader mode from the bootloadable application and call the "Bootloadable\_Load()" API when the condition is met. Let us use the example in PWMExample on page 43 and modify the project to enter bootloader mode from the bootloadable application when SW1 is pressed for more than 2 seconds.

Follow these steps to modify the project in PWMExample on page 43 to enter bootloader mode from the application.

1. Open **TopDesign.cysch** of the project; drag and drop a **Digital Input Pin** component into the schematic view.

Figure 5-24. Digital Input Pin Component in Component Catalog

2. Double-click the placed component and configure the parameters as shown in Figure 5-25 and click **OK**.

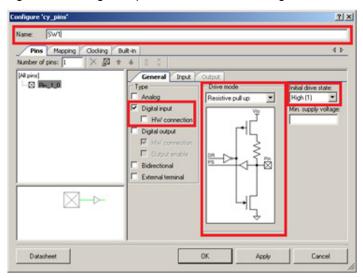

Figure 5-25. Digital Input Pin Parameter Configuration

3. In the *PWMExample01.cydwr* file, select **P0[7]** as the pin connection for SW1.

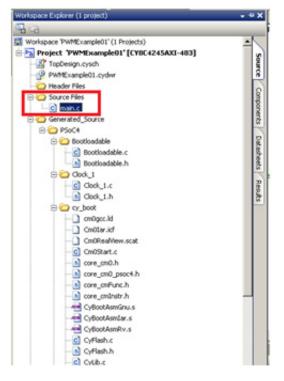

Figure 5-26. 'cydwr' Pin Settings

Start Page *TopDesign.cysch	-100	MExample0Lcydwr matur

	- 10		nes a Distance					
	198		AND IN COLUMN					
	1.88							

4. Open main.c file from the Workspace Explorer.

Figure 5-27. Opening main.c

5. Add the following code inside the infinite "for" loop. Note that you need to define a variable 'uint8 swCounter' in the beginning of the main loop.

```
for(;;)
    {
        /* Reset the software counter if SW1 is not pressed (Pulled high)
*/
if(SW1 Read())
{
swCounter = 0;
}
else
{
/* Increment the counter if SW1 is pressed (Shorted to GND) */
swCounter++;
}
/* Provide a 10 ms delay to make the counter approximately periodic every
10 ms */
CyDelay(10);
/* Check if the software counter has passed 2 s (200 * 10 ms)
==> Since the software counter is incremented only when SW1 is
==> pressed, SW1 is pressed for more than 2 seconds
==> Enter bootloader mode */
if(swCounter > 200)
{
Bootloadable Load();
}
    }
```

- 6. Build the project using **Build > Build PWMExample01**.
- 7. Program the PSoC 4 device as described from Step 15 in PWMExample on page 43.
- 8. When the new application is loaded, the output of the project will remain the same as in PWMExample on page 43. If you press and hold SW1 for 2 seconds without unplugging the device from the PC, the device will enter bootloader mode (the LED will blink). To exit the bootloader mode, unplug and re-plug the board from the USB port.

# 6. USB-Serial Configuration

The CY8CKIT-049-4xxx Prototyping Kits support the CY7C6521x family of USB controller products. The CY7C6521x devices are a family of full-speed USB-Serial bridge controllers. These bridge controllers offer configurable serial channels for UART, I2C, SPI, or GPIO interfaces, with the industry's lowest power consumption in the stand-by mode (5  $\mu$ A).

USB-Serial bridge controllers integrate the CapSense capacitive-touch sensing technology and USB-IF Battery Charging specification version 1.2. These controllers are ideal for applications such as portable medical devices (such as blood-glucose meters), point-of-sales terminals, serial cables (including USB-to-UART and RS-232 cables) and other applications requiring USB connectivity.

CY8CKIT-049-4xxx development kits use the USB-Serial device to provide connectivity to a PC and to perform USB-UART bootload programming. The following sections provide instructions on how to use and configure the USB-Serial device on the CY8CKIT-049-4xxx kits.

## 6.1 USB-Serial Resources

Use the following links to access a wide variety of content that includes custom software, utilities, datasheets, and knowledge base articles.

- USB-Serial landing page: www.cypress.com/go/usbserial
- Software and drivers: USB-Serial Software Development Kit (SDK)
- Datasheets: CY7C6521x Device Families
- Additional information: Knowledge Base Articles

# 6.2 USB-Serial Configuration Utility

Cypress USB-Serial Configuration Utility is an application included in the USB-Serial software development kit (SDK) installation. This utility is used to configure the USB-Serial device configuration, and helps use additional capabilities of USB-Serial device such as USB-UART configurations, USB-GPIO controls, and custom development using the USB-I2C and USB-SPI protocols.

After you install the USB-Serial SDK, click Start > All Programs > Cypress > Cypress USB Serial > Cypress USB-Serial Configuration Utility to launch the USB-Serial Configuration Utility.

**Note:** For Windows 8 or higher OS, launch Cypress USB-Serial Configuration Utility by doubleclicking on <Install\_Directory>\USB-Serial SDK\<version>\bin\USB Serial Configuration Utility.exe.

Figure 6-1. USB-Serial Configuration Utility

5. Select the new tab and begin configuring the device.

#### 6.2.2 Configuring a Serial Port

The USB-Serial device acts as a USB-UART bridge for the CY8CKIT-049-4xxx development kit. You can use the Configuration Utility to read the default settings and configure new UART settings.

- 1. After connecting to the USB-Serial device, click the CY7C65211-24LTXI tab.
- 2. Select the **SCB** tab under the **CY7C65211-24LTXI** tab to see the default UART settings on the USB-Serial device.

Disable CTS and CTS	☑ Disable CTS and DSR pull-up during suspend		
	OK Cancel		

## 6.2.3 Configuring GPIOs

The USB-Serial device included in the CY8CKIT-049-4xxx Prototyping Kit also supports GPIO controls through the J6 header. Each of the serial protocols requires a different number of GPIO pins. Based on your serial configuration, the number of available GPIOs will change. The Configuration Utility will only display the available GPIOs based on your serial configuration. For more information on the serial configuration and the respective GPIO consumption, refer to the USB-Serial device datasheet.

1. Plug CY8CKIT-049-4xxx into a USB port on the PC, and connect to the USB-Serial device using the Configuration Utility.

2. Navigate to the CapSense/BCD/GPIO tab.

#### Figure 6-11. Device GPIO

😙 Cypress USB-Serial Configuration Utility

Start Page Select Target CY7C65211-24LTXI
USB SCB CapSense®/BCD/GPI0
Enable / Disable CapSense®: Configure
Validate CapSense®: Launch
Battery Charge Detect (BCD): Configure
Unused GPIOs' drive mode: Configure
1
Program Disconnect
USB-Serial devices attached #: 1

3. Click **Configure** on the **Unused GPIOs** drive mode. This launches the GPIO configuration window.

This example shows how to change the output mode of the GPIO 08 pin to drive an output. You can connect the pin to the PSoC 4, an LED, or any external circuitry.

4. Click the Select Drive Mode drop-down menu for the GPIO 08 pin.

Figure 6-12. Configuring GPIO Drive Mode

😙 Configure GPIO Drive	e Mode
Select drive mode of unus	ed GPIOs:
Unused GPIOs	Select Drive Mode
GPIO 02	Tristate 💌
GPIO 03	Tristate 💌
GPIO 04	Tristate 💌 🗉
GPIO 07	Tristate 💌
GPIO 08	Tristate 🔹
GPIO 09	Tristate Drive 1
0010-40	Drive 0 Input OK Cancel

- 5. Select Drive 1 from the available options and click OK. This example makes the pin HIGH.
- 6. Program the new configuration into the device and cycle the port to see the new configuration applied. For example, if the GPIO 08 pin is connected to an LED, you will see that the LED is on.

## 6.2.4 Additional Features of the USB-Serial Device

Apart from the UART and the GPIO features described in earlier sections, the USB-Serial device included in the CY8CKIT-049-4xxx provides several other features, such as the following:

- USB-I2C (Master/Slave)
- USB-SPI (Master/Slave)
- Cypress CapSense (up to eight buttons)
- Battery Charging Detect (BCD)

For more information on these features, refer to the device datasheet and the USB-Serial Configuration Utility user guide. (Select **Help > Help Topics**).

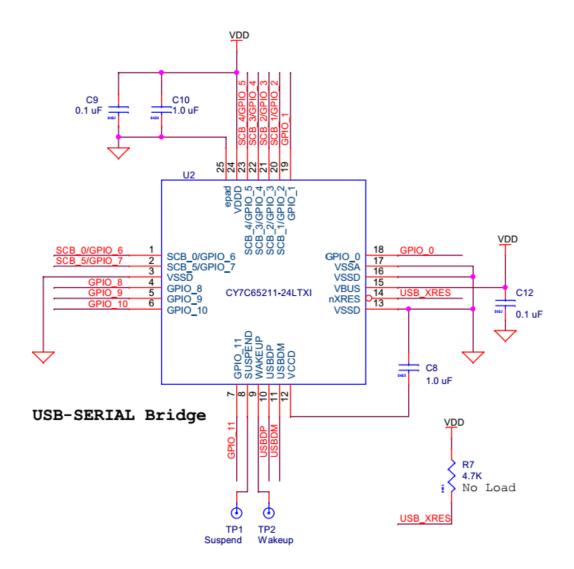

**Note:** USB-UART works in the USB Communication Device Class (CDC), while all other configuration controls such as GPIO, SPI, and I2C use the Cypress vendor driver on the PC. Therefore, COM port tools such as PuTTY or HyperTerminal will only work for the UART bridge. You can use the C++ APIs to create scripts and tools included with the USB-Serial SDK to evaluate and control the other bridge options. **USB-Serial Configuration**

## A.2 Programming a CY8CKIT-049-4xxx Project Using MiniProg3

To use MiniProg3 for programming, connect wires or a 5-pin 100-mil spaced header to the programming header on the CY8CKIT-049-4xxx board. The programming header is a 5-pin header indicated on the silkscreen and is labeled '**PROG**'. The suggested part numbers are

Molex 22-05-3051 (right angled male header) and Molex 22-23-2051 (straight header). The suggested part numbers for 5 pin headers are 5-pin Molex-KK right-angle male header (Part number# 22-05-3051) or 5-pin Molex-KK vertical male header (Part number# 22-23-3051).

Please see images below for orientation of the header. The CY8CKIT-049 supports both power cycle and reset programming modes.

Figure A-3. Connecting CY8CKIT-049-4xxx to MiniProg3 using right angled header

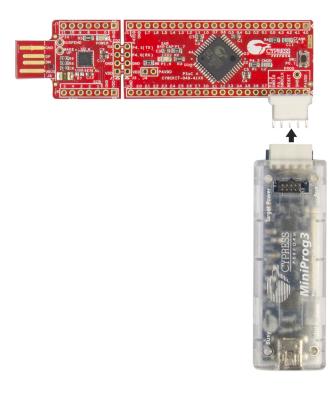

Figure A-4. Connecting CY8CKIT-049-4xxx to MiniProg3 using straight header

**Note:** CY8CKIT-002 MiniProg3 is not part of the PSoC 4 Prototyping Kit contents and can be purchased from the Cypress Online Store.

The following images show the pinout for MiniProg3 and the connections on CY8CKIT-049-4xxx.

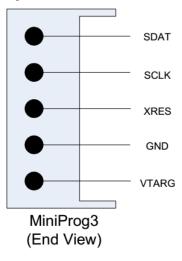

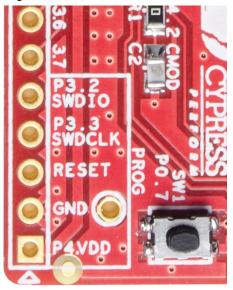

Figure A-6. CY8CKIT-049-4xxx Connections for MiniProg3

The code examples described in this section show how to bootload new projects into PSoC 4 and create bootloader and bootloadable projects. To access the kit examples, download the examples from the kit web page.

The initial example shows how to program the kit with just a bootloader using MiniProg3. Note that the kit is pre-programmed with a project containing a bootloader, so this step is not necessary to change the application firmware.

1. Launch PSoC Creator from the Start menu.

Figure A-7. PSoC Creator Start Page

2. Open the SCB\_Bootloader.cywrk workspace by choosing File > Open > Project/Workspace and navigating to the directory in which your project is present.

 Eile

Figure A-11. Programming the CY8CKIT-049-4xxx

The Select Debug Target window opens.

Figure A-12. Debug Target Window

Select Debug Target	? <mark>×</mark>
😴 🕂 MiniProg3/1216DD000BB3	MiniProg3/1216DD000BB3
	POWER = 0 VOLTAGE_ADC = 40 FREQUENCY = 1600000 CONNECTOR = 5 PROTOCOL = SWD
	MiniProg3 version 2.05 [3.08/2.07]
Show all targets	Port Setting Port Acquire
	ОК

7. Click Port Settings, set the connector to 5 pin, and then click OK.

8. Click Port Acquire to detect the target device, click Connect, and then click OK.

PSoC Creator programs the target. When programming is complete, the PSoC 4 will contain the bootloader but not any application code.

To bootload any application code, refer:

"Programming a CY8CKIT-049-4xxx Project Using the Bootloader" on page 19.
