Application Information

CY2DP1502 can be used with a single ended CMOS input by biasing the Complementary Input Clock (INx#). “True” input pins (INx) of differential input pair can be fed with a single ended CMOS input signal. The “complementary” input pin (INx#) of the same differential input pair can be biased with Vref.

Figure 9 shows the schematic which can be used to give single ended CMOS input to the CY2DP1502.

The reference voltage $V_{ref} = VDD/2$ is generated by the bias resistors R1, R2 and capacitor C0. This bias circuit should be located as close as possible to the input pin. The ratio of R1 and R2 might need to be adjusted to position the Vref in the center of the input voltage swing. For example, if the input clock swing is 2.5 V and $VDD = 3.3$ V, V_{ref} should be 1.25 V and $R2/R1 = 0.609$.
