Description

The IRM-2638T device is miniature type infrared remote control system receiver which has been developed and designed by utilizing the most updated IC technology.

The PIN diode and preamplifier are assembled onto a lead frame and molded into a black epoxy package which operates as an IR filter. The demodulated output signal can directly be decoded by a microprocessor..

Applications

- Light detecting portion of remote control
- AV instruments such as Audio, TV, VCR, CD, MD, etc.
- Home appliances such as Air-conditioner, Fan, etc.
- The other equipments with wireless remote control.
- CATV set top boxes
- Multi-media Equipment

Application Circuit

RC Filter should be connected closely between Vcc pin and GND pin.

2. The ray receiving surface at a vertex and relation to the ray axis in the range of θ=0° and θ=45°.
3. A range from 30cm to the arrival distance. Average value of 50 pulses.

Test method

The specified electro-optical characteristics is satisfied under the following Conditions at the controllable distance.

1. Measurement place

A place that is nothing of extreme light reflected in the room.

2. External light

Project the light of ordinary white fluorescent lamps which are not high Frequency lamps and must be less then 10 Lux at the module surface.
($E_e \leq 10 \text{Lux}$)

3. Standard transmitter

A transmitter whose output is so adjusted as to $V_o=400\text{mVp-p}$ and the output Wave form shown in Fig.-1. According to the measurement method shown in Fig.-2 the standard transmitter is specified. However, the infrared photodiode to be used for the transmitter should be $\lambda_p=940\text{nm}, \Delta\lambda=50\text{nm}$. Also, photodiode is used of PD438B ($V_r=5\text{V}$). (Standard light / Light source temperature 2856 °K).

The Notice of Application:

Transmission of remote control signal consist of four parts: Encode Part, IR Transmitter Source, IRM device, Decode Part

1. When IRM-2638T code select frequency, it need to well understand the center system of encode part.
2. Strong or weak light of IR Transmitter can affect distance of transmission.
3. When using IRM-2638T device, it requires the composition of code pattern to reach the demand as follows:

Minimum t_{burst} (number of pulses per burst)	Minimum t_{burst_gap} (number of pulses between two burst)	Minimum t_{pause}
10 pulses	14 pulses	25 msec

4. It needs to ensure the translation range of decode part if it is applied to the pulse-width range.

If the above items hardly assure of its application, it'll cause NG(no good) message from the edge of signal.
