

GENERAL DESCRIPTION

The SP510 is a highly integrated physical layer solution that is configurable to support multiple serial standards. It incorporates eight (8) drivers and eight (8) receivers, configurable for either differential (V.11 or V.35) or single ended (V.28 and V.10) signaling. The device architecture is designed to support the data and clock signals used in HDLC or SDLC serial ports as either a DTE or DCE. SP510 enables a Serial Communications Controller (SCC) to implement a variety of serial port types including V.24, V.25, V.36, EIA-530, EIA-530-A, X.21, RS-232.

Operating configuration is in-system programmable using the mode-select pins. The V.11 and V.35 modes contain built in bus termination that may be switched in or out using the TERM_OFF pin.

SP510 is ideal for space constrained applications. It requires only a single 5V supply for full operation. The VL pin determines the receiver output voltage (VOH). For single supply operation at 5V the VL pin may be connected to VCC. Fully compliant V.28 and V.10 driver output voltages are generated using onboard charge pumps. Special power sequencing is not required during system startup. Charge pump outputs are internally regulated to minimize power consumption. The SP510 requires only four 1µF capacitors for complete functionality. The device may be put into a 200µA low power shutdown mode when not in active use.

All receivers have fail-safe protection to put outputs into a known state when inputs are open, terminated but open or shorted.

TYPICAL APPLICATIONS

- Data Communication Networks
- Telecommunication Equipment
- Secured Data Communication
- CSU and DSU
- Data Routers
- Network Switches
- WAN Access Equipment
- VoIP-PBX Gateways

ORDERING INFORMATION

PART NUMBER	PACKAGE	OPERATING TEMPERATURE RANGE	DEVICE STATUS
SP510EM-L	100-pin LQFP	-40°C to +85°C	Active
SP510CM-L	100-pin LQFP	0°C to +70°C	Active

FEATURES

- 52Mbps Differential Transmission Rates
- Adjustable Logic Level Pin (Down to 1.65V)
- +/-15kV ESD Tolerance for Analog I/O's
- Internal Transceiver Termination Resistors for V.11/V.35
- Interface Modes:
 - RS-232 (V.28)
 - EIA-530 (V.10 & V.11)
 - X.21 (V.11)
 - EIA-530A (V.10 & V.11)
 - RS-449/V.36
- Software Selectable Protocols with 3-Bit Word
- Eight Drivers and Eight Receivers
- V.35/V.11 Receiver Termination Network Disable Option
- Internal Line or Digital Loopback Testing
- Adheres to NET1/NET2 and TBR2 Requirements
- Easy Flow-Through Pinout
- Single +5V Supply Voltage
- Individual Driver/Receiver Enable/Disable Controls
- Operates in DTE or DCE Mode

Thermal Considerations

High speed devices like the SP510 dissipate heat during normal operation. Actual power dissipation is a function of the switching frequency and loading. For maximum system performance and reliability designers should ensure sufficient air flow. Other commonly used methods for managing heat include heat sinks for higher powered devices, forced air flow (fans) and lower density board stuffing.

PCB Design

The use of multi layer printed circuit boards is recommended to provide both a better ground plane and a thermal path for heat dissipation. If possible, the ground plane should face the bottom of the package to form the thermal conduction plane. Two-sided printed circuit boards may be used where board dimensions and package count are small, but multi-layer boards allow for improved signal routing as well as improved signal integrity. A multi layer board allows the use of microstrip line techniques to provide for high speed signal interconnections. On multi-layer boards route the high speed signal lines on the inner layers.
