Product Description

## 1 Product Description

### 1.1 Overview

The IC is a very low power consumption single chip FSK/ASK Superheterodyne Receiver (SHR) for the frequency bands 810 to 870 MHz and 400 to 440 MHz . The IC offers a high level of integration and needs only a few external components. The device contains a low noise amplifier (LNA), a double balanced mixer, a fully integrated VCO, a PLL synthesiser, a crystal oscillator, a limiter with RSSI generator, a PLL FSK demodulator, a data filter, an advanced data comparator (slicer) with selection between two threshold modes and a peak detector. Additionally there is a power down feature to save current and extend battery life, and two selectable alternatives of generating the data slicer threshold.

## $1.2 \quad$ Features

- Low supply current ( $\mathrm{Is}=5.7 / 5.9 \mathrm{~mA}$ typ. in FSK mode, $\mathrm{Is}=5.0 / 5.2 \mathrm{~mA}$ typ. in ASK mode for $434 / 868 \mathrm{MHz}$ )
- Supply voltage range $5 \mathrm{~V} \pm 10 \%$
- Power down mode with very low supply current (50nA typ.)
- FSK and ASK demodulation capability
- Fully integrated VCO and PLL Synthesiser
- ASK sensitivity better than -106 dBm over specified temperature range (- 40 to $+105^{\circ} \mathrm{C}$ )
- FSK sensitivity better than -100 dBm over specified temperature range (- 40 to $+105^{\circ} \mathrm{C}$ )
- Selectable frequency ranges $810-870 \mathrm{MHz}$ and $400-440 \mathrm{MHz}$
- Limiter with RSSI generation, operating at 10.7 MHz
- 2nd order low pass data filter with external capacitors
- Data slicer with selection between two threshold modes (see Section 2.4.8)

### 1.3 Application

- Keyless Entry Systems
- Remote Control Systems
- Alarm Systems
- Low Bitrate Communication Systems

### 2.3 Functional Block Diagram

Figure 2 Block Diagram

### 2.4 Functional Block Description

### 2.4.1 Low Noise Amplifier (LNA)

The LNA is an on-chip cascode amplifier with a voltage gain of 15 to 20 dB . The gain figure is determined by the external matching networks situated ahead of LNA and between the LNA output LNO (Pin 6) and the Mixer Inputs MI and MIX (Pins 8 and 9). The noise figure of the LNA is approximately 3 dB , the current consumption is $500 \mu \mathrm{~A}$. The gain can be reduced by approximately 18 dB . The switching point of this AGC action can be determined externally by applying a threshold voltage at the THRES pin (Pin 23). This voltage is compared internally with the received signal (RSSI) level generated by the limiter circuitry. In case that the RSSI level is higher than the threshold voltage the LNA gain is reduced and vice versa. The threshold voltage can be generated by attaching a voltage divider between the 3VOUT pin (Pin 24) which provides a temperature stable 3V output generated from the internal bandgap voltage and the THRES pin as described in Section 3.1. The time constant of the AGC action can be determined by connecting a capacitor to the TAGC pin (Pin 4) and should be chosen along with the appropriate threshold voltage according to the intended operating case and interference scenario to be expected during operation. The optimum choice of AGC time constant and the threshold voltage is described in Section 3.1.

Functional Description

### 2.4.2 Mixer

The Double Balanced Mixer downconverts the input frequency (RF) in the range of 400$440 \mathrm{MHz} / 810-870 \mathrm{MHz}$ to the intermediate frequency (IF) at 10.7 MHz with a vol-tage gain of approximately 21 dB by utilising either high- or low-side injection of the local oscillator signal. In case the mixer is interfaced only single-ended, the unused mixer input has to be tied to ground via a capacitor. The mixer is followed by a low pass filter with a corner frequency of 20 MHz in order to suppress RF signals to appear at the IF output (IFO pin). The IF output is internally consisting of an emitter follower that has a source impedance of approximately $330 \Omega$ to facilitate interfacing the pin directly to a standard 10.7 MHz ceramic filter without additional matching circuitry.

### 2.4.3 PLL Synthesizer

The Phase Locked Loop synthesizer consists of a VCO, an asynchronous divider chain, a phase detector with charge pump and a loop filter and is fully implemented on-chip. The VCO is including spiral inductors and varactor diodes. The tuning range of the VCO guarantee over production spread and the specified temperature range is 820 and 860 MHz . The oscillator signal is fed both to the synthesiser divider chain and to the downconverting mixer. In case of operation in the 400 to 440 MHz range the signal is divided by two before it is fed to the Mixer. Depending on whether high- or low-side injection of the local oscillator is used, the receiving frequency ranges are 810 to 840 MHz and 840 to 870 MHz or 400 to 420 MHz and 420 to 440 MHz - see also Section 3.4. To be able to switch between two different frequency channels a divider ratio of either 32 or 32.25 can be selected via the FSEL-Pin.

Table 2 FSEL-Pin Operating States

| FSEL | RF |
| :--- | :--- |
| Open | $400-440 \mathrm{MHz}$ |
| GND | $810-870 \mathrm{MHz}$ |

### 2.4.4 Crystal Oscillator

The calculation of the value of the necessary crystal load capacitance is shown in Section 3.3, the crystal frequency calculation is explained in Section 3.4.

### 2.4.5 Limiter

The Limiter is an AC coupled multistage amplifier with a cumulative gain of approximately 80 dB that has a bandpass-characteristic centred around 10.7 MHz . It has a typical input impedance of $330 \Omega$ to allow for easy interfacing to a 10.7 MHz ceramic IF filter. The limiter circuit also acts as a Receive Signal Strength Indicator (RSSI) generator which produces a DC voltage that is directly proportional to the input

## Functional Description

signal level as can be seen in Figure 4. This signal is used to demodulate ASKmodulated receive signals in the subsequent baseband circuitry. The RSSI output is applied to the modulation format switch, to the Peak Detector input and to the AGC circuitry.
In order to demodulate ASK signals the MSEL pin has to be in its 'High'-state as described in the next chapter.

### 2.4.6 FSK Demodulator

To demodulate frequency shift keyed (FSK) signals a PLL circuit is used that is contained fully on chip. The Limiter output differential signal is fed to the linear phase detector as is the output of the 10.7 MHz center frequency VCO. The demodulator gain is typically $200 \mu \mathrm{~V} / \mathrm{kHz}$. The passive loop filter output that is comprised fully on chip is fed to both the VCO and the modulation format switch described in more detail below. This signal is representing the demodulated signal with low frequencies applied to the demodulator demodulated to logic zero and high frequencies demodulated to logic ones. However this is only valid in case the local oscillator is low-side injected to the mixer which is applicable to receive frequencies above 840 or 420 MHz . In case of receive frequencies below 840 or 420 MHz high frequencies are demodulated as logical zeroes due to a sign inversion in the downconversion mixing process as the L0 is high-side injected to the mixer. See also Section 3.4.

The modulation format switch is actually a switchable amplifier with an AC gain of 11 that is controlled by the MSEL pin (Pin 15) as shown in the following table. This gain was chosen to facilitate detection in the subsequent circuits. The DC gain is 1 in order not to saturate the subsequent Data Filter wih the DC offset produced by the demodulator in case of large frequency offsets of the IF signal. The resulting frequency characteristic and details on the principle of operation of the switch are described in Section 3.6.

## Table 3 MSEL Pin Operating States

| MSEL | Modulation Format |
| :--- | :--- |
| Open | ASK |
| Shorted to ground | FSK |

The demodulator circuit is switched off in case of reception of ASK signals.

### 2.4.7 Data Filter

The data filter comprises an OP-Amp with a bandwidth of 100 kHz used as a voltage follower and two $100 \mathrm{k} \Omega$ on-chip resistors. Along with two external capacitors a 2nd order

## Functional Description

Sallen-Key low pass filter is formed. The selection of the capacitor values is described in Section 3.2.

### 2.4.8 Data Slicer

The data slicer is a fast comparator with a bandwidth of 100 kHz . This allows for a maximum receive data rate of up to 100 kBaud . The maximum achievable data rate also depends on the IF Filter bandwidth and the local oscillator tolerance values. Both inputs are accessible. The output delivers a digital data signal (CMOS-like levels) for subsequent circuits. A self-adjusting slicer-threshold on pin 20 its generated by a RCterm. In ASK-mode alternatively a scaled value of the voltage at the PDO-output (approx. 87\%) can be used as the slicer-threshold as shown in Table 4. The data slicer threshold generation alternatives are described in more detail in Section 3.5.

Table 4 SSEL Pin Operating States

| SSEL | MSEL | Selected Slicing Level (SL) |
| :--- | :--- | :--- |
| $X$ | Low | external SL on Pin 20 (RC-term, e.g.) |
| High | High | external SL on Pin 20 (RC-term, e.g.) |
| Low | High | $87 \%$ of PDO-output (approx.) |

### 2.4.9 Peak Detector

The peak detector generates a DC voltage which is proportional to the peak value of the receive data signal. A capacitor is necessary. The input is connected to the output of the RSSI-output of the Limiter, the output is connected to the PDO pin (Pin 26). This output can be used as an indicator for the received signal strength to use in wake-up circuits and as a reference for the data slicer in ASK mode. Note that the RSSI level is also output in case of FSK mode.

### 2.4.10 Bandgap Reference Circuitry

A Bandgap Reference Circuit provides a temperature stable reference voltage for the device. A power down mode is available to switch off all subcircuits which is controlled by the PWDN pin (Pin 27) as shown in the following table. The supply current drawn in this case is typically 50 nA .

## Table 5 PDWN Pin Operating States

| PDWN | Operating State |
| :--- | :--- |

| Tied to Vs | Receiver On |

TDA 5220
technologies
Applications

## 3 Applications

### 3.1 Application Circuit

Figure 3 LNA Automatic Gain Control Circuity
The LNA automatic gain control circuitry consists of an operational transimpedance amplifier that is used to compare the received signal strength signal (RSSI) generated by the Limiter with an externally provided threshold voltage $\mathrm{U}_{\text {thres }}$. As shown in the following figure the threshold voltage can have any value between approximately 0.8 and 2.8V to provide a switching point within the receive signal dynamic range.

This voltage $U_{\text {thres }}$ is applied to the THRES pin (Pin 23) The threshold voltage can be generated by attaching a voltage divider between the 3VOUT pin
(Pin 24) which provides a temperature stable 3V output generated from the internal bandgap voltage and the THRES pin. If the RSSI level generated by the Limiter is higher than $U_{\text {thres }}$, the OTA generates a positive current $I_{\text {load }}$. This yields a voltage rise on the TAGC pin (Pin 4). Otherwise, the OTA generates a negative current. These currents do not have the same values in order to achieve a fast-attack and slow-release action of the

TDA 5220
technologies

## Applications

AGC and are used to charge an external capacitor which finally generates the LNA gain control voltage.

Figure 4 RSSI Level and Permissive AGC Threshold Levels
The switching point should be chosen according to the intended operating scenario. The determination of the optimum point is described in the accompanying Application Note, a threshold voltage level of 1.8 V is apparently a viable choice. It should be noted that the output of the 3VOUT pin is capable of driving up to $50 \mu \mathrm{~A}$, but that the THRES pin input current is only in the region of 40nA. As the current drawn out of the 3VOUT pin is directly related to the receiver power consumption, the power divider resistors should have high impedance values. The sum of R1 and R2 has to be $600 \mathrm{k} \Omega$ in order to yield 3 V at the 3VOUT pin. R1 can thus be chosen as $240 \mathrm{k} \Omega$, R2 as $360 \mathrm{k} \Omega$ to yield an overall 3VOUT output current of $5 \mu \mathrm{~A}^{1)}$ and a threshold voltage of 1.8 V
Note: If the LNA gain shall be kept in either high or low gain mode this has to be accomplished by tying the THRES pin to a fixed voltage. In order to achieve high gain mode operation, a voltage higher than 2.8 V shall be applied to the THRES pin, such as a short to the 3VOLT pin. In order to achieve low gain mode operation THRES has to be connected to GND.
As stated above the capacitor connected to the TAGC pin is generating the gain control voltage of the LNA due to the charging and discharging currents of the OTA and thus is also responsible for the AGC time constant. As the charging and discharging currents are not equal two different time constants will result. The time constant corresponding to the charging process of the capacitor shall be chosen according to the data rate. According to measurements performed at Infineon the capacitor value should be greater than 47 nF .

[^0]
## Applications

### 3.2 Data Filter Design

Utilising the on-board voltage follower and the two $100 \mathrm{k} \Omega$ on-chip resistors a 2 nd order Sallen-Key low pass data filter can be constructed by adding 2 external capacitors between pins 19 (SLP) and 22 (FFB) and to pin 21 (OPP) as depicted in the following figure and described in the following formulas ${ }^{1)}$.

Figure 5 Data Filter Design
with $R_{\text {F1int }}=R_{\text {F2int }}=R$

$$
C 14=\frac{2 Q \sqrt{b}}{R 2 \pi f_{3 d B}} \quad C 12=\frac{\sqrt{b}}{4 Q R \pi f_{3 d B}}
$$

with

$$
Q=\frac{\sqrt{b}}{a}
$$

$Q$ is the qualify factor of the poles where, in case of a Bessel filter $a=1.3617, b=0.618$ and thus $\mathrm{Q}=0.577$
and in case of a Butter worth filter $\mathrm{a}=1.414, \mathrm{~b}=1$
and thus $\mathrm{Q}=0.71$

Example: Butter worth filter with $f_{3 d B}=5 k H z$ and $R=100 \mathrm{k} \Omega$ :
C14=450pF, C12=225pF

[^1]
### 3.3 Crystal Load Capacitance Calculation

The value of the capacitor necessary to achieve that the crystal oscillator is operating at the intended frequency is determined by the reactive part of the negative resistance of the oscillator circuit as shown in Section 4.1.3 and by the crystal specifications given by the crystal manufacturer.

Figure 6 Determination of Series Capacitance Vale for the Quartz Oscillator
The required series capacitor for a crystal with specified load capacitance $C_{L}$ can be calculated as

$$
C_{S}=\frac{1}{\frac{1}{C_{L}}+2 \pi f X_{L}}
$$

$C_{L}$ is the nominal load capacitance specified by the crystal manufacturer.

Example:
13.4 MHz: $\mathrm{C}_{\mathrm{L}}=12 \mathrm{pF} \quad \mathrm{X}_{\mathrm{L}}=1010 \Omega \quad \mathrm{C}_{\mathrm{S}}=5.9 \mathrm{pF}$

This value may be obtained by putting two capacitors in series to the crystal, such as 22 pF and 8.2 pF for 13.4 MHz .
But please note that the calculated $\mathrm{C}_{\mathrm{S}}$-value includes all parasitic.

### 3.4 Crystal Frequency Calculation

As described in Section 2.4.3 the operating range of the on-chip VCO is wide enough to guarantee a receive frequency range between 810 and 870 MHz or between 400 and 440 MHz . The VCO signal is divided by 2 before applied to the mixer in case of operation at 434 MHz . This local oscillator signal can be used to downconvert the RF signals both

## Applications

with high- or low-side injection at the mixer. High-side injection of the local oscillator has to be used for receive frequencies between 810 and 840 MHz or beteween 400 and 420 MHz . In this case the local oscillator frequency is calculated by adding the IF frequency ( 10.7 MHz ) to the RF frequency. Thus the higher frequency of a FSKmodulated signal is demodulated as a logical zero (low).
Low-side injection has to be used for receive frequencies above 840 MHz or above 420 MHz . The local oscillator frequency is calculated by subtracting the IF frequency (10.7 MHz) from the RF frequency then. In this case no sign-inversion occurs and the higher frequency of a FSK-modulated signal is demodulated as a logical one (high). The overall division ratios in the PLL are 32 or 64 depending on whether the FSEL-pin is left open or tied to ground.
Therefore the crystal frequency may be calculated by using the following formula:

$$
f_{Q U}=\frac{f_{R F} \pm 10.7}{r}
$$

with $\quad f_{\mathrm{RF}}$ receive frequency
$f_{\text {Lo }}$ local oscillator (PLL) frequency ( $f_{\mathrm{RF}} \pm 10.7$ )
$f_{\mathrm{QU}}$ quartz crystal oscillator frequency
$r$ ratio of local oscillator (PLL) frequency and crystal frequency as shown in the subsequent table

Table 6 Dependence of PLL Overall Division Ratio on FSEL

| FSEL | Ratio $\mathbf{r}=\left(\mathbf{f}_{\mathrm{LO}} / \mathbf{f}_{\mathbf{Q U}}\right)$ |
| :--- | :--- |
| open | 32 |
| GND | 64 |

This yields the following examples:
FSEL is "Low":

$$
f_{Q U}=\frac{868.4 \mathrm{MHz}-10.7 \mathrm{MHz}}{64}=13.4015625 \mathrm{MHz}
$$

FSEL is „High":

$$
f_{Q U}=\frac{434.2 \mathrm{MHz}-10.7 \mathrm{MHz}}{32}=13.234375 \mathrm{MHz}
$$

Applications

### 3.5 Data Slicer Threshold Generation

The threshold of the data slicer can be generated using an external R-C integrator as shown in Figure 7.

The time constant $T_{A}$ of this circuit including also the internal resistors $R_{\text {F3int }}$ and $R_{\text {F4int }}$ (see Figure 9) has to be significantly larger than the longest period of no signal change $T_{L}$ within the data sequence.
In order to keep distortion low, the minimum value for R is $20 \mathrm{k} \Omega$.
$\mathrm{T}_{\mathrm{A}}$ has to be calculated as

$$
T_{A}=\frac{R 1 \cdot\left(R_{F 3 \mathrm{int}}+R_{F 4 \mathrm{int}}\right)}{R 1+R_{F 3 \mathrm{int}}+R_{F 4 \mathrm{int}}} \cdot C 13 \quad=R 1 I I\left(R_{F 3 \mathrm{int}}+R_{F 4 \mathrm{int}}\right) \cdot C 13 \quad \ldots \text { for ASK }
$$

and

$$
T_{A}=\frac{R 1 \cdot R_{F 4 \mathrm{int}}}{R 1+R_{F 3 \mathrm{int}}+R_{F 4 \mathrm{int}}} \cdot C 13 \quad=\frac{R 1 I I\left(R_{F 3 \mathrm{int}}+R_{F 4 \mathrm{int}}\right)}{v} \cdot C 13 \quad \ldots \text { for } F S K
$$

$R 1, R_{F 3 \text { int }}, R_{F 4 \text { int }}$ and $C 13$ see also Figure 7 and .Figure 9

Figure 7 Data Slicer Threshold Generation with External R-C Integrator
In case of ASK operation another possibility for threshold generation is to use the peak detector in connection with an internal resistive divider and one capacitor as shown in the following Figure 8. For selecting the peak detector as reference for the slicing level a logic low as to be applied on the SSEL pin.
In case of MSEL is high (or open), which means that ASK-Mode is selected, a logic low on the SSEL pin yields a logic high on the AND-output and thus the peak-detector is selected (see Figure 9).
In case of FSK the MSEL-pin and furthermore the one input of the AND-gate is low, so the peak detector can not be selected.
The capacitor value is depending on the coding scheme and the protocol used.

TDA 5220
technologies
Applications

Figure 8 Data Slicer Threshold Generation Utilising the Peak Detector

### 3.6 ASK/FSK-Data Path Functional Description

The TDA5220 is containing an ASK/FSK switch which can be controlled via Pin 15 (MSEL). This switch is actually consisting of 2 operational amplifiers that are having a gain of 1 in case of the ASK amplifier and a gain of 11 in case of the FSK amplifier in order to achieve an appropriate demodulation gain characteristic. In order to compensate for the DC-offset generated especially in case of the FSK PLL demodulator there is a feedback connection between the threshold voltage of the bit slicer comparator (Pin 20) to the negative input of the FSK switch amplifier.

In ASK-mode alternatively to the voltage at Pin 20 (SLN) a value of approx. $87 \%$ of the peak-detector output-voltage at Pin 26 (PDO) can be used as the slicer-reference level. The slicing reference level is generated by an internal voltage divider $\left(\mathrm{R}_{\mathrm{T} \text { int, }}, \mathrm{R}_{\mathrm{T} \text { 2int }}\right)$, which is applied on the peak detector output.
The selection between these modes is controlled by Pin 16 (SSEL), as described in Section 3.5.
This is shown in the following Figure 9.

TDA 5220
technologies
Applications

Figure 9 ASK/FSK mode datapath

## $3.7 \quad$ FSK Mode

The FSK datapath has a bandpass characterisitc due to the feedback shown above (highpass) and the data filter (lowpass). The lower cutoff frequency f2 is determined by the external RC-combination. The upper cutoff frequency f 3 is determined by the data filter bandwidth.

The demodulation gain of the FSK PLL demodulator is $200 \mu \mathrm{~V} / \mathrm{kHz}$. This gain is increased by the gain $v$ of the FSK switch, which is 11 . Therefore the resulting dynamic gain of this circuit is $2.2 \mathrm{mV} / \mathrm{kHz}$ within the bandpass. The gain for the DC content of FSK signal remains at $200 \mu \mathrm{~V} / \mathrm{kHz}$. The cut-off frequencies of the bandpass have to be chosen such that the spectrum of the data signal is influenced in an acceptable amount.
In case that the user data is containing long sequences of logical zeroes the effect of the drift-off of the bit slicer threshold voltage can be lowered if the offset voltage inherent at the negative input of the slicer comparator (Pin20) is used. The comparator has no hysteresis built in.

This offset voltage is generated by the bias current of the negative input of the comparator (i.e. 20nA) running over the external resistor R. This voltage raises the voltage appearing at pin 20 (e.g. 1 mV with $R=100 \mathrm{k} \Omega$ ). In order to obtain benefit of this

TDA 5220

Applications
asymmetrical offset for the demodulation of long zeros the lower of the two FSK frequencies should be chosen in the transmitter as the zero-symbol frequency.
In the following figure the shape of the above mentioned bandpass is shown.

Figure 10 Frequency characteristic in case of FSK mode
The cutoff frequencies are calculated with the following formulas:

$$
\begin{gathered}
f_{1}=\frac{1}{2 \pi \frac{R 1 \times 330 k \Omega}{R 1+330 k \Omega} \times C 13} \\
f_{2}=v \times f_{1}=11 \times f_{1}
\end{gathered}
$$

$$
f_{3}=f_{3 d B}
$$

$f_{3}$ is the $3 d B$ cutoff frequency of the data filter - see Section 3.2.

## Example:

$\mathrm{R} 1=100 \mathrm{k} \Omega, \mathrm{C} 13=47 \mathrm{nF}$
This leads tof ${ }_{1}=44 \mathrm{~Hz}$ and $\mathrm{f}_{2}=485 \mathrm{~Hz}$

### 3.8 ASK Mode

In case the receiver is operated in ASK mode the datapath frequency charactersitic is dominated by the data filter alone, thus it is lowpass shaped.The cutoff frequency is determined by the external capacitors $\mathrm{C}_{12}$ and $\mathrm{C}_{14}$ and the internal 100k resistors as described in Section 3.2

Figure 11 Frequency characteristic in case of ASK mode

### 3.9 Principle of the Precharge Circuit

In case the data slicer threshold shall be generated with an external RC network as described in Section 3.5 it is necessary to use large values for the capacitor $C$ attached to the SLN pin (pin 20) in order to achieve long time constants. This results also from the fact that the choice of the value for R1 connected between the SLP and SLN pins (pins 19 and 20) is limited by the $330 \mathrm{k} \Omega$ resistor appearing in parallel to R1 as can be seen in Figure 9. Apart from this a resistor value of $100 \mathrm{k} \Omega$ leads to a voltage offset of 1 mv at the comparator input. The resulting startup time constant $\tau_{1}$ can be calculated with:

$$
\tau_{1}=(R 1 \| 330 k \Omega) \times C 13
$$

In case R 1 is chosen to be $100 \mathrm{k} \Omega$ and C 13 is chosen as 47 nF this leads to

$$
\tau_{1}=(100 k \Omega \| 330 k \Omega) \times 47 n F=77 \mathrm{k} \Omega \times 47 n F=3.6 \mathrm{~ms}
$$

When the device is turned on this time constant dominates the time necessary for the device to be able to demodulate data properly. In the powerdown mode the capacitor is only discharged by leakage currents.

TDA 5220
technologies
Applications
In order to reduce the turn-on time in the presence of large values of C a precharge circuit was included in the TDA5220 as shown in the following figure.

Figure 12 Principle of the precharge circuit
This circuit charges the capacitor C 13 with an inrush current $\mathrm{I}_{\text {oad }}$ of typically $220 \mu \mathrm{~A}$ for a duration of $T_{2}$ until the voltage $U_{c}$ appearing on the capacitor is equal to the voltage $U_{s}$ at the input of the data filter. This voltage is limited to 2.5 V . As soon as these voltages are equal or the duration $\mathrm{T}_{2}$ is exceeded the precharge circuit is disabled.
$\tau_{2}$ is the time constant of the charging process of C18 which can be calculated as

$$
\tau_{2} \approx 20 \mathrm{k} \Omega \times C 2
$$

as the sum of R4 and R5 is sufficiently large and thus can be neglected. $\mathrm{T}_{2}$ can then be calculated according to the following formula:

$$
T_{2}=\tau_{2} \ln \left(\frac{1}{1-\frac{2.4 V}{3 V}}\right) \approx \tau_{2} \times 1.6
$$

The voltage transient during the charging of $\mathrm{C}_{2}$ is shown in the following figure:

Figure 13 Voltage appearing on C18 during precharging process
The voltage appearing on the capacitor C 13 connected to pin 20 is shown in the following figure. It can be seen that due to the fact that it is charged by a constant current source it exhibits is a linear increase in voltage which is limited to $U_{S \max }=2.5 \mathrm{~V}$ which is also the approximate operating point of the data filter input. The time constant appearing in this case can be denoted as $T_{3}$, which can be calculated with:

$$
T_{3}=\frac{U_{S \max } \times C 13}{220 \mu \mathrm{~A}}=\frac{2.5 \mathrm{~V}}{220 \mu \mathrm{~A}} \times C 13
$$

TDA 5220
technologies
Applications

Figure 14 Voltage transient on capacitor C13 attached to pin 20
As an example the choice of $\mathrm{C} 18=22 \mathrm{nF}$ and $\mathrm{C} 13=47 \mathrm{nF}$ yields
$\tau_{2}=0.44 \mathrm{~ms}$
$\mathrm{T}_{2}=0.71 \mathrm{~ms}$
$\mathrm{T}_{3}=0.53 \mathrm{~ms}$

This means that in this case the inrush current could flow for a duration of 0.64 ms but stops already after 0.49 ms when the $\mathrm{U}_{\text {Smax }}$ limit has been reached. $\mathrm{T}_{3}$ should always be chosen to be shorter than $\mathrm{T}_{2}$.
It has to be noted finally that during the turn-on duration $T_{2}$ the overall device power consumption is increased by the $220 \mu \mathrm{~A}$ needed to charge C13.
The precharge circuit may be disabled if C 18 is not equipped. This yields a $\mathrm{T}_{2}$ close to zero. Note that the sum of $R_{4}$ and $R_{5}$ has to be $600 \mathrm{k} \Omega$ in order to produce 3 V at the THRES pin as this voltage is internally used also as the reference for the FSK demodulator.

### 4.1.3 $\quad$ AC/DC Characteristics at $T_{\mathrm{AMB}}=25^{\circ} \mathrm{C}$

AC/DC characteristics involve the spread of values guaranteed within the specified voltage and ambient temperature range. Typical characteristics are the median of the production. Currents flowing into the device are denoted as po-sitive currents and vice versa. The device performance parameters marked with $\boldsymbol{\square}$ are not part of the production test - either verified by design or measured in the Infineon Evalboard as described in Section 4.2.

| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| 2 | Slicer-Reference is <br> approx. 87\% of the <br> voltage at Pin 26 <br> (PDO) | $V_{\text {SSEL }}$ | 0 |  | 0.2 | V |  |  |
| 3 | Input bias current <br> SSEL | ISSEL |  | -10 | -19 | $\mu \mathrm{~A}$ | SSEL tied to GND |  |

■ Not part of the production test - either verified by design or measured in the Infineon Evalboard as described in Section 4.2.

### 4.1.4 AC/DC Characteristics at $\mathrm{T}_{\mathrm{AMB}}=-40$ to $105^{\circ} \mathrm{C}$

Currents flowing into the device are denoted as positive currents and vice versa.

Table 10 AC/DC Characteristics with $\mathrm{T}_{\mathrm{AMB}}=-40^{\circ} \mathrm{C} \ldots+105^{\circ} \mathrm{C}, \mathrm{V}_{\mathrm{VCC}}=4.5 \ldots 5.5 \mathrm{~V}$

| \# | Parameter | Symbol | Limit Values |  | Unit | Test Conditions/ <br> Notes | ■ |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
|  |  |  | min. | typ. | max. |  |  |

| Supply Current |  |  |  |  |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 1 | Supply current, standby mode | $\mathrm{I}_{\text {SPDWN }}$ |  | 50 | 400 | nA | Pin 27 (PDWN) open or tied to 0 V |  |
| 2 | Supply current, device operating in 868 MHz range, FSK mode | $\mathrm{I}_{\text {SF } 868}$ | 3.9 | 5.9 | 7.9 | mA | Pin 11 (FSEL) tied to GND, Pin 15 (MSEL) tied to GND |  |
| 3 | Supply current, device operating in 434 MHz range, FSK mode | $\mathrm{I}_{\text {SA } 434}$ | 3.7 | 5.7 | 7.7 | mA | Pin 11 (FSEL) open, Pin 15 (MSEL) tied to GND |  |
| 4 | Supply current, device operating in 868 MHz range, ASK mode | $\mathrm{I}_{\text {SA } 868}$ | 3.2 | 5.2 | 7.2 | mA | Pin 11 (FSEL) tied to GND, Pin 15 (MSEL) open |  |
| 5 | Supply current, device operating in 434 MHz range, ASK mode | $\mathrm{I}_{\text {SA 434 }}$ | 3 | 5. | 7 | mA | Pin 11 (FSEL) open, Pin 15 (MSEL) open |  |

Signal Input 3VOUT (PIN 24)

| 1 | Output voltage | $\mathrm{V}_{\text {3VOUT }}$ | 2.9 | 3.1 | 3.3 | V | 3VOUT Pin open |  |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| 2 | Current out | $\mathrm{I}_{\text {3VOUT }}$ | -3 | -5 | -10 | $\mu \mathrm{~A}$ | see Section 4.1 |  |

## Signal THRES (PIN 23)

| 1 | Input Voltage range | $\mathrm{V}_{\text {THRES }}$ | 0 |  | $\mathrm{~V}_{\mathrm{S}^{-1}}$ | V | see Section 4.1 |  |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| 2 | LNA low gain mode | $\mathrm{V}_{\text {THRES }}$ |  |  | 0 | V |  |  |
| 3 | LNA high gain mode | $\mathrm{V}_{\text {THRES }}$ | 3 |  | $\mathrm{~V}_{\mathrm{S}^{-1}}$ | V | or shorted to Pin 24 |  |
| 4 | Current in | $\mathrm{I}_{\text {THRES_in }}$ |  | 5 |  | nA |  | $\square$ |

Signal TAGC (PIN 4)

| 1 | Current out, <br> LNA low gain state | $\mathrm{I}_{\text {TAGC_out }}$ | -1 | -4.2 | -8 | $\mu \mathrm{~A}$ | RSSI $>\mathrm{V}_{\text {THRES }}$ |  |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |

| 3 | Input bias current <br> FSEL | $\mathrm{I}_{\text {FSEL }}$ | -110 | -200 | -340 | $\mu \mathrm{~A}$ | FSEL tied to GND |  |

## Signal SSEL (PIN 16), ASK-Mode

| 1 | Slicer-Reference is <br> voltage at Pin 20 <br> (SLN) | $V_{\text {SSEL }}$ | 1.4 |  | 4 | V | or open |  |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| 2 | Slicer-Reference is <br> approx. $87 \%$ of the <br> voltage at Pin 26 <br> (PDO) | $V_{\text {SSEL }}$ | 0 |  | 0.2 | V |  |  |
| 3 | Input bias current <br> SSEL | ISSEL |  | -11 | -20 | $\mu \mathrm{~A}$ | SSEL tied to GND |  |

- Not part of the production test - either verified by design or measured in the Infineon Evalboard as described in Section 4.2.

### 4.2 Test Circuit

The device performance parameters marked with $\square$ in Section 4.1 were either verified by design or measured on an Infineon evaluation board. This evaluation board can be obtained together with evaluation boards of the accompanying transmitter device TDK5110 in an evaluation kit that may be ordered on the INFINEON Webpage www.infineon.com/Products. More information on the kit is available on request.
